The *Conseil des Prudhommes* is a simple court of equity appointed by the state through the local authorities. Each court consists of one manufacturer and one workingman. It sits daily, and is a court of appeal in cases of dispute. Its machinery is very simple. In a case of dispute a complaint is lodged with the *conseil*, say, by a workingman. A note is sent to his employer, requesting his attendance on a certain day. Both parties to the dispute then appear before the judges. Each states his own case, and the quick good sense of the judges, who for the most part learn to see together, irrespective of their class affiliations, generally reaches to the heart of the difficulty. The advice which is tendered is for the most part accepted, and the difficulty is composed without further trouble. If, however, one of the parties proves fractious, the

Digitized by Google

law backs the decision of the court, and the penalty that it enjoins is enforced. So general is the respect felt for these courts, apparently, that their decisions are mostly acquiesed in without a resort to the final proceedings. Here is a machinery simple, easy of application, involving the slightest possible expense, which is ever ready at hand and has no cumbrous routine of law to be put in operation; providing an instrumentality which proves entirely sufficient.

### THE DUTY OF THE UNITED STATES REGARDING ARBITRATION.

Why could not our National Government spread broadcast through the country information concerning such simple devices for the conciliation of labor and capital, and our State or city governments, if need be, take a lead in instituting them? It is often the case that nothing more is needed than knowledge of an adequate instrumentality of justice to lead to a resort to that instrumentality, and so there is relief of the situation which otherwise would be one of great strain. And should more be needed, would it endanger the fabric of civilization and overthrow the gods of the economists if a city like this should appoint an arbitration board, composed of men whose names carried the weight of judgment and justice? Back of such a board public opinion would gather with a force commanding corporations and unions alike to resort to it before embroiling the community in strife.

### (3.) THRIFTLESSNESS OF LABOR FROM LACK OF EDUCATION IN HABITS OF SAVING.

The thriftlessness of the mass of unskilled labor brings other classes into responsibility besides labor itself. Thrift is a habit into which men and women must needs be trained. Since it is the basic virtue, according to political economy, one would have supposed that an industrial society would have been at pains to see that it was systematically cultivated in the people's schools. But among all the *isms* and *ologies* of our common schools, what help is ever given to children in the formation of habits of thrift? In some of the departments of France it is taught as a duty, and, for its culture, saving funds are formed among the scholars; and the teachers train the children in the habit of laying something by weekly from their little spending money. Some such plan as this has been in successful operation in many reform schools of England. Can it not in some form be engrafted upon our common-school system?

### POSTAL SAVINGS BANKS NEEDED.

For adults we have provided savings banks which have proved an invaluable means of developing the habit of thrift. They are, however, not plentiful enough in many portions of the country, and in large portions of the country they have become to the workingmen "suspect," through the great number of failures that have occurred in their management. Nearly all the Third avenue savings banks failed between 1873–'77. What is needed to the country at large is some system whereby the poorest man in the most isolated portion of the country may feel that he has within reach an institution into which may be placed his little savings, and where he may feel as secure of them as the capitalist now feels when he puts behind his thousands of dollars the resources of the nation. In other words, we need the introduction of the postal savings banks which in England, for example, have within a few years developed so largely the habit of thrift among the poorer

Digitized by Google

classes. Two hundred and fifty-seven thousand accounts were opened last year in England alone, with deposits of $200,000,000. Canada, our neighbor, has developed this useful institution. At the close of a late fiscal year (date mislaid) it had 27,445 accounts open, representing a deposit of $3,105,190.80. The post-office is everywhere, and back of the post-office is the Government, and back of the Government are the whole resources of the people. This is the security that our poor people demand. These are the facilities that they need. We all remember that a few years ago, when ten-dollar bonds were issued by the United States Government, the demand for them was so eager as to lead to the formation of long lines of applicants waiting for hours at the places of issue. The experiment needs to be carried still further.

### POVERTY AND INTERMITTENT OCCUPATION CAUSES OF THRIFTLESSNESS.

Not only does society give little help in the formation of early habits of thrift, and an insufficient help to the formation of these habits in later years, but in many ways thriftlessness and its kindred vices are directly encouraged in the poor by the general conditions of the social and business world, and by our defective methods of government.

The broad fact of the great poverty of the large class of unskilled labor in this country is itself the prime factor in the thriftlessness of that class. Nothing is more clearly established in political economy than the truth that habits of thrift are only begun when labor rises above the level of despair. While men feel that there is no use in endeavoring to better their condition they will not make much effort. While they feel that all their resources will be unavailing to procure them independence and comfort they will be apt to sink those resources, small as they are, in immediate indulgence. Provision for the future is made at the cost of the present only when the future opens promisingly.

The intermittent character of our modern industrial system forms a strong discouragement to thrift. With steady work all the year round, year in and year out, men soon come to calculate their possible savings and to lay by for the future. Fixity of income is a great stimulus to thrift. But panics come, employers fail, mills are closed, slackening demand in the market leads employers to declare a reduction of wages, and, in its resistance, to make excuse for a lock-out; and in those and other ways the workmen are so frequently thrown out of employment that they get used to seeing their scanty savings used up in idle times and their families getting little ahead.

Now, of course, this ought not to be. The existence of such a state of things is an additional reason for thrift, but unfortunately human nature is such that little effort at self-denial is likely to be made with such a prospect. It is the hope of getting ahead which nerves men to do without a present good in order that they may have a more comfortable future. Destroy this hope and the energy of saving relaxes, as all history shows.

### BUSINESS STAGNATION: A HEROIC REMEDY.

The remedy for this intermittent character of work is not plainly at hand. The experiment proposed in France was not fairly tried. It is an easy thing to heap ridicule upon Government national workshops in time of distress, but the experiment of the *ateliers nationaux* was so conducted, *purposely*, in France as to bring opprobrium and ridicule upon it. Possibly the passage of a law compelling employers to support labor

Digitized by Google

during such times—radical and heroic as the measure might seem to be—might open their eyes to devise some means of preventing these periodical fits of stagnation. The permanent escape from these periodic spells of enforced idleness is not likely to be found until the anarchy of our present systemless production is corrected by some rational co-ordination of the various industries, so that there may be a proportionate production.

### WAGES: THEIR PURCHASING POWER, 1860–1881.

The increase of prices which is going on in our society is imposing a constantly growing burden upon the resources of labor. Mr. Carroll D. Wright, in the Princeton Review for July, 1882, says that from 1860 to 1878 there was an average increase of wages of 24.4 per cent., and of prices of 14.9 per cent.; that from 1878 to December 1881 there was an annual average increase of wages of 6.9, and in prices an average increase of 21 per cent.; and that covering the whole period of 21 years there was an average increase in wages of 31.2 per cent, and in prices 41.3 per cent. In other words, between 1860 and 1881 our workingmen had suffered a reduction of ten per cent. on the purchasing power of wages, and this between a dead level year and one of general prosperity.

Under tendencies thus forcing prices up, the slight increase of wages where it may be found is relatively outdistanced, and the resources of labor are thus steadily diminishing. How hopeless, then, the preachments upon thrift, as the alone salvation of the poor man, become when his resources are steadily decreasing.

### NEEDLESS TAXATION.

The resources of labor, such as they are, are still further burdened by the needless taxation which is imposed directly by the Government and indirectly by the monopolies of the country. This taxation itself claims annually what would otherwise make a very substantial margin for possible savings on the part of the average workingman. I do not wish to enter the mazes of tariff discussion, and so simply observe that over against the higher wages which may possibly grow out of protection, if this much be admitted, there remains to be placed the higher prices imposed on so many of the necessaries of life by our revenue system.

In addition to this burden we have a heavy burden laid on our working people, as on us all, from the indebtedness of our national, State, and municipal governments. The United States census for 1880 puts the debt of the National Government at $2,120,415,370.63, and the indebtedness of States, Territories, counties, cities, &c., at $1,201,803,177.

One of the urgent needs of our workingmen's movement is that it shall turn its forces in the direction of purified government, and especially of purified municipal administration. All burdens fall ultimately upon labor, and although the taxes paid may seem to be paid by wealthy capitalists they all come out of the pockets of the laborer, in increased rents and increased prices. The corruption and maladministration of our municipal governments, which have imposed a gigantic burden of taxation upon our citizens—allowance being of course made for the proper works of public utility—means simply so much taken out of the pockets of the workingmen per annum. The debt of New York in 1877 was $132,096,992; imposing a taxation of $31,105,533. And yet to-day the cry of municipal reform is one of the last which seems to show any power of appealing to the workingman. He will throw up his cap for all manner of political schemes, but when

Digitized by Google

a citizen's movement is originated in a great city like this to place the administration of municipal affairs upon a strict business platform, it only appeals to the nominally tax-paying community; and the portion of the community which thinks itself to be non-tax-paying passes it by in entire indifference, and so saddles these burdens anew upon its own shoulders. Mr. Frederick Harrison, in his address to the Trades Union Congress already noticed, appeals to the workingmen of England to throw every influence, through their organizations, at once into the problem of uplifting and purifying municipal administration. The appeal is still more urgent in our country, where municipal government is less developed than in any other portion of Christendom. Berlin, a city of about the same size as New York, and, like it, having grown very rapidly, with immense public works thus necessitated, had a budget for 1882 of nearly $6,000,000, of which "every penny has been well spent and accounted for." (Nation, No. 958.) New York's budget for 1880 was $29,642,991.98; nearly five times as much as Berlin.

### EXORBITANT PRICES OF NECESSARIES OF LIFE.—COAL.

But, in addition to the burdens of extravagant, wasteful, and dishonest government, we have another heavy burden laid upon the working people, as upon all others in the community, from the irresponsible power left in the hands of our great corporations. Take the case of a few prime necessities. The Anti-monopoly League issues the follow- statement, which I have not seen refuted:

The following is an itemized statement of the approximate cost of mining and delivering anthracite coal in New York at the present time, with profits included. By varying the items and distance the rightful cost can be calculated at any point:

| | |
|---|---|
| Royalty to land owner 12½c. to 25c., say | $0 25 |
| Paid to miner per 2,850 lbs., 65c. yielding when prepared and placed on cars, say 2,500 lbs., or per ton of 2,240 lbs., say | 58¼ |
| Expense of preparation and placing on cars, maintenance of mine, profit of operator, &c., say | 55 |
| Transportation to tide water, say 120 miles at ¾c. per ton per mile, say | 90 |
| Lighterage from railroad terminus to New York, say | 22½ |
| Discharging from lighter, say | 14 |
| | 2 65 |
| Less difference between gross ton (2,240 lbs.) and net ton (2,000 lbs.), say ten per cent | 26 |
| | 2 39 |
| Cartage | 30 |
| Profit of retail dealer, say | 75 |
| Waste, say | 5 |
| | 3 49 |

If delivered from yard, or in small quantities, it would cost a little more, but most of it is delivered direct from boat, and at above figures full weight of coal can be afforded in New York on the sidewalk of the consumer and pay every person connected with the business a fair profit. The difference between this price and what consumers of coal are now paying represents the tax paid to monopoly.

For considerable periods during 1878 and 1879 coal sold at an average of $2.25 per ton of 2,240 pounds at the railroad termini, or say $3.25 per ton of 2,000 pounds delivered to the consumer. The coal roads formed a pool and prices were nearly doubled. The legislature ordered an investigation. The evidence showed that $3.25 to $3.50 was a fair price for coal, and that the coal roads had watered their stocks so that it was not reasonable to expect that ordinary dividends could, with justice to the public, be paid upon the enormous mass of obligations outstanding. The words of the committee referring to this were as follows:

"During the receipt of these enormous profits many of the coal corporations, as was the case with railroads not engaged in the coal carrying trade, unable, under their charters, or for other reasons, to declare dividends upon their stocks that would ab-

Digitized by Google

sorb their unexpended surplus, issued additional stock to the stockholders, for which they paid nothing, inaugurated what is commonly known as stock-watering, or a capitalization of surplus earnings, which is in substance exacting money from the people, creating an indebtedness representing the same, and making this the basis for forever asking the public to pay interest upon their own money so exacted."

Yet owing to railroad influence in the legislature nothing was done to put a limit to extortion.

### MILK.

We have just seen the Harlem Railroad reduce its rates on milk heavily, as a result of official investigation. Those rates had been, I believe, about triple the rates of roads running into Boston. And milk is the food of young children—their vital necessity; on which this heavy taxation was laid by a wealthy corporation.

### COAL OIL.—THE STANDARD OIL COMPANY.

The chief light of the poor is oil. Gas is too expensive for them even where it is at its cheapest. Oil is now supplied by a corporation which has established an almost complete monopoly; an organization, doubtless, with many good qualities, but an organization which is none the less, irresponsible to the people, and which taxes every can of oil that the poor man buys in a manner wholly unregulated by any law. Competition, the only self-regulating action which our society theoretically admits, is crushed out, and the Standard Oil Company can affix its own price, and that price must be paid.

Mr. Lloyd (Atlantic Monthly, March, 1881), thus estimates this tax:

To-day, in every part of the United States, people who burn kerosene are paying the Standard Oil Company a tax on every gallon amounting to several times its original cost to that concern. * * * In Pennsylvania the tax levied by the Standard above all expenses and legitimate profits is calculated by an expert at 14 cents a gallon. This makes a yearly tax on the light in most general use in that State of $2,555,000. The whole country consumed last year, at a low estimate, 22,000,000 gallons of kerosene. Putting the Standard tax, to avoid all possibility of exaggeration, down to 5 cents a gallon, we have a levy on the whole country of $11,000,000, besides the millions taken from the railroad in rebates.

One need be no foe to corporations to speak thus of the common defects of a governmental system which provides no superintendence of such corporations.

### MONOPOLIES.

The term "monopoly" is often used loosely against corporations. In the case of the Standard Oil Company its use is, strictly speaking, somewhat inaccurate. An accumulation or concentration of business which grows of itself naturally by the superior force of the brains of one man, or by the natural tendency of things in trade, can scarcely be called a monopoly; but the moment that legislation intervenes to give special rights to any corporator that moment true monopoly enters; and where a monopoly enters the play of competition ceases. Where, then, monopoly does enter there is bounden upon Government as special an interference on behalf of society at large as it has given to the corporations in their own interests.

And even where, as in the case of the Standard Oil Company, there has been no legislative privilege, yet if it has grown to so colossal a size as to absorb all rivals, we have the substance if not the form of monopoly, and the state is bounden, as the representative of the commonwealth, to see that the wealth of the commons is not impoverished to build up the private property of a company.

Digitized by Google

### GAMBLING IN THE NECESSARIES OF LIFE.

The transient monopolies of gambling combinations in the necessaries of life are coming to be a powerful factor in the disordering of prices, opening opportunities of immense profits by "corners," which drive the prices of wheat and other staples up into exorbitant figures—and as such demand some wise and careful exercise of governmental supervision. The remedy for the existing speculations in food stuffs is difficult to define, since this evil has existed and been legislated against from the time of Edward III and his statutes against "engrossing," and since our business has become so largely a dealing in "futures;" but that some remedy needs to be found is plain to all thoughtful people, and that such remedy shall be found is the specially appointed task of legislators.

### MINING MONOPOLIES.

The private or corporate possession of mineral resources, which the Creator has stored up in the earth for the needs of life, with the consequent power of taxing the necessaries of existence, is a right of so dubious a character that any monopoly in such resources seems to me to call peculiarly for the intervention of Government, at least so far as to secure something like an equitable adjustment of prices.

And yet the irresponsible greed of great corporations and the absence of proper governmental superintendence and of restrictive legislation in the interests of society, have allowed the access to these supplies of the most vital necessaries of life to be monopolized; that is, have allowed the mass of the common people to be shut off from their due rights in the bountiful provisions of the Almighty. The corporations which have assumed the charge of transfer of mineral resources to our cities, have entered into the speculative development of those mineral resources; the two agencies have become one; and the practical conclusion of the whole matter is that which was bluntly avowed by a leading stockholder of one of those great corporations a few years ago. When asked what the price of coal would probably be during the winter, he replied, "as high as Providence will allow and as low as necessity compels." In other words, then, we have placed in the hands of almost wholly irresponsible companies the royal right to tax our citizens as they will, and we sit supinely under the yoke that we have imposed upon our own necks.

### PRIVILEGE-LEGISLATION.

I recognize the tendency to consolidation as an inevitable one in the world of business, and, under proper safeguards, as a useful one. But all power needs to be limited and watched, and the greater the power the more carefully defined should be the limits of its exercise, and the more thorough the inspection kept over it by the state. Government owes it to all its citizens, especially to the largest and worst-off classes, to see that the private fortunes for which it provides the opportunity by its facilitating legislation do not impoverish the commonwealth.

The whole question of our administration of privileges needs, perhaps, to be more carefully considered than it has been with us. The inordinate extension of patent-rights creates monopolies of what, with an advancing civilization, come to be the necessities of the people. While the just right of the inventor should be regarded—which, however, is a different matter from the unjust rights of the patent agent, who usually intervenes, or of the combination of capitalists, who buy out the rights of the discoverer—while, I say, the just rights of the inventor should

Digitized by Google

be regarded, at the same time consideration should be given to the just needs of the people. As it is, every modern tool of labor is "protected" by a patent which saddles upon the neediest workman or workwoman an oppressive tax for its use—the use which alone can keep one from starvation. Franklin declined to patent his inventions, but then Franklin was an old fogy. Perhaps the notion is not so wild as at first sight would seem, that the state should buy patents from discoverers at liberal prices, and then give the results of these inventions to the mass of the people.

When these facts as to the burdens which society lays upon the wage-worker are duly weighed, a just judgment will, to say the least, greatly mitigate the sentence otherwise to be pronounced upon the thriftlessness of workingmen. That thriftlessness will thus be seen to be gendered in the anarchic business system of our age, and in the low level to which it and our vast system of taxation reduces the wage-workers, and the demand for thrift on their part to be almost a mockery when made by the classes who profit by our industrial and political systems.

### THE TASK BEFORE SOCIETY.

These and other similar considerations, for I have only touched upon the more salient features of the situation, should, as it seems to me, effectually disabuse candid minds of the illusion that the fault of the present condition of labor can be saddled entirely upon labor itself. Capital has its just share, and it is a large share, in bringing about the low estate of labor. Society at large needs to make the confession "we have left undone those things that we ought to have done."

And in all that has been said, there is nothing, as it seems to me, to which any just and open mind can take exception. These neglected duties of labor, of capital, of government, and of society at large, form, therefore, the tasks to be taken up at once if any improvement is to be made in the present state of labor, or if the undoubted tendencies towards a worse condition are to be arrested. Whatever other things will remain to be done when all these reforms have been carried out, will be much more readily perceived and much more easily effected after the education of both labor and capital has been led up to the level indicated in these changes. Indeed, I can see no way to any peaceable securing of more radical readjustments of the relations of capital and labor, such as must eventually take place, except through the gradual improvement of labor itself and of capital's attitude towards labor, which have been pointed out as now attainable. Most of the reforms which have been indicated involve a moral element. The whole problem is quite as much a moral problem as an economic problem.

Now, all reforms of character and conduct have this peculiarity, that one sees further and more clearly what there is to be reformed, as one earnestly tackles the job of righting the wrongs that *are* seen. However imperfect may be the perception of what is needful to be done, when one really sets at work to do that which *is* seen, his eyes open wider, and thus he grows gradually into a vision of the immensity of the task upon which he has entered—a vision that in the outset his conscience was not educated to recognize or his will to undertake.

I have understood this committee to have, as its primary aim, the drawing forth of suggestions that might lead to practical measures of immediate relief, and only secondarily the ventilation of ideas that look beyond the present to the future, and to a radical reconstruction of society on the ground plans of justice. But before I close I would like to say frankly that, in all which I have suggested, I clearly recognize

Digitized by Google

that only the surface of the problem has been uncovered. There are far deeper and far more serious aspects of the problem which will have to be opened when the time comes ripe. If all that I have suggested were carried out, the evils of the present condition of labor would be ameliorated but not cured. The old troubles would recur again, after an interval of comfort. Not until the seat of the social disease, whose ugly developments have called out this consultation, is reached, and an alterative is found, will any permanent cure be effected.

It seems to me that all thoughtful people ought to be at least opening their eyes to see the possibility of there being graver complications in our case than is ordinarily suspected. And I would like, therefore, to offer a few hints as to the nature of those complications, in so far as I can read them, and of what may now be begun in the way of constitutional treatment, and thus contribute my little bit towards the second aim of the committee, as I understand it.

## III.

### SOCIAL FORCES FAVORING CAPITAL AND LAND AS AGAINST LABOR.

As I read the problem of society to-day, there are large forces making for the interests of capital and land, as against the interests of labor—these three factors together creating all wealth.

#### (1.) LEGISLATION WORKS AGAINST LABOR.

Legislation has thus far been in the hands of the well-to-do classes, or capital and of land, and it has been shaped in this free country, as in Europe, in the interests of these two classes. There is very little legislation recorded on our statute-books that looks to the care of the rights of labor, while there is a vast body of laws in existence guarding every possible interest of capital. Our legislatures are overburdened with all sorts of special bills, devised to benefit private parties, but the measures of purely public utility are few and far between. We have in no one of our States any legislation at all comparable with the elaborate factory acts of England. Only a dozen of our States have labor bureaus, and these are all, with one exception, the growth of the last half dozen years. This great State has only just created such a bureau. This metropolitan city has, only within three years, as the result of a long agitation, obtained adequate sanitary laws for the tenement houses which shelter (?) 500,000 human beings, and a proper staff of officers to enforce them. Rich men have all sorts of carefully drawn up acts guarding the loaning and borrowing of money; but the poor man when he wants to borrow, has to go to the pawn-shops, over which, as he finds, to his cost, there is next to no restraint of law; so that after he has once deposited a valuable article, in time of need, and agreed to pay a ruinous rate of interest, he has no security that he will ever get back his property, even though able and anxious to redeem it.

It is the same story everywhere. The men at the top of the heap cry out, whenever an attempt is made to secure legislation for labor, "Hands off; the sacred principle of self-help must not be interfered with; the less legislation the better," and so on to the end of the gamut of stock-phrases which the press and the professors roll off with unctuous glibness

Meanwhile these very many-millionaires and these very gigantic corporations, whose counsel are so eloquent upon the danger of over legislation, have climbed to their high prosperity by the helping hand of

Digitized by Google

law through legislation specially enacted to further their schemes. They never could have been what they are but for special legislation. The hypocrisy of the cant of "non-legislation" is sickening to honest minds and must be irritating beyond description to those who are silenced by it. Labor is opening its eyes to see at last that a democratic country which rarely legislates for the *demos*, the people, is something of a fraud. Labor is preparing to enter the political field, and is making tentative essays in this direction. In England the pressure of the trades unions has already wrested solid victories from Parliament; and under the growing mental enlightenment and the deepening moral sentiment, an immense stride is being taken towards a new era of statesmanship; in which the state will look first of all, for its own safety and prosperity, to the rightful ordering of the conditions of life among the vast mass of labor, on which the whole social structure rests. We shall never gain a satisfactory adjustment of the problem until our governments, municipal, State, and national, concern themselves at least as much with the interests of labor as with those of capital. And this will never be until labor takes the field of politics in dead earnest, and compels attention to its long-neglected claims.

### (2.) INDUSTRIAL DEVELOPMENT WORKS AGAINST LABOR.

There are more puzzling factors than privileging legislation at work to handicap labor. Our century has witnessed a revolutionary change in the character of the industrial system—a change which has been steadily making for capital against labor, except in so far as its own excesses have wrought local and partial protest and reaction. The introduction of the system of aggregated labor in the factory, and the development of the principle of the division of labor, thus made practicable, have gradually reduced the once free artisan to a new serfdom, in which he is completely at the mercy of capital, except as by union he makes resistance. He no longer is master of a craft. He is a bit of a process. He does a fraction of a complete job. Of the rest of the process he knows nothing. Consequently he cannot stand by himself. If he loses his place he cannot set up, in a small way, for himself, even if the general conditions of the business would give him a ghost of a chance. In losing the home work of the artisan of the olden time he loses with it the foothold on the soil, though that soil were but a bit of a garden, which gave him the sense of freedom. He literally has no base for personal independence. He no longer offers his wares, the products of his handicraft, for sale in the market. He has neither the workshop, the tools, nor the knowledge of any complete process by which to make anything himself.

### LARGE WEALTH AND COMBINED LABOR NOW NECESSARY TO INDUSTRY.

Only large wealth commands the means of production, and only combined labor supplies the power of production. The workman awaits the offer, on the part of the capitalist of a workshop, of tools and of the fellows who can complete his fractional skill. He has become a part of a gigantic mechanism that is run by capital. He is utterly, absolutely helpless in himself. He therefore has to enter the "labor market" and offer for sale—no longer his works, but his working. He sells himself. Under what is, with grim sarcasm, called "the system of free contract" he engages on his part to make over to an employer his labor in return for that employer's finding him the means and conditions, without which he is no longer able to labor.

Digitized by Google

A new feudal system is set up, in which, through all the descending gradations, labor holds its little all by the grace of the feudal lord. It draws the feoff of life from its master and suzerain. Of course it is true that under the old home-workshop system there were journeymen who were in a certain sense dependent on the master, for whom the master found the workshop, to whom he paid wages, and whose products he sold; but each man could become a master of his craft and of his tools, and thus of himself. Each man looked forward to becoming a master workman, hiring other workmen, an expectation which, while we hear much about its being still a possibility, is becoming increasingly difficult of realization with each fresh turn of the wheel in the evolution of the factory system, and which, to all intents, is practically unrealizable already in most branches of industry.

It is not speaking too strongly to say that such a radical revolution as has thus been wrought in the condition of labor is without a parallel in the previous history of Christendom, and that it is fraught with dangers of the most ominous kind to society at large. Unarrested—or perhaps, let me rather say, led on to no further and higher evolution, in which its present action shall be corrected—this system would crush out the free manhood of the workingman.

### MEN BECOMING MERE TENDERS UPON MACHINES.

This factory system has been still further aggravated by the introduction of mechanism and of steam. Increasingly, the labor formerly wrought by man is being done by machinery driven by steam. One after another the processes of every old-time handicraft are being transferred to vast and complicated machines, and production is no longer to be called a manufacture, but a machino-facture. The skill which of old lay in the deft fingers of the craftsman is becoming lodged in steely mechanisms. Men become the tenders upon the costly and cunning machine. As such mere tenders, whose work is to feed and wait on the intelligent labors of these giant looms and presses, skilled workmen are no longer requisite. Poorer workmen take their place; women take the place of these inferior men; children at last come into demand in lieu of women. Poor workmen demand less pay than skilled craftsmen, women less than men, and children less than women. Thus wages fall, and a man's foes are they of his own household, very literally. The contrast between the New England operatives of a generation ago and those of to-day is very significant of the change which the factory is steadily working.

Nor is this all of the evil effect of the system. The introduction of mechanism displaces *all* human labor to an ever-increasing extent. One machine does the work of a host of hands. So these hands are thrown out of employment, and thus as mechanism enters one field of production after another men retire. Of course this action is mitigated, to some extent, by the opening up of other lines of occupation. The enormous development of industry in our age, and especially in our country, prevents us from feeling the full force of this tendency. But it is working among us at an alarming rate of speed.

Thus, in these various ways, labor suffers severely from the modern mechanical improvements, and from the monster forces which science has broken in to these engines. Its work is first robbed of interest and educating power, as already pointed out in the early part of this talk, and then taken from it. The labor market is crowded with the dispossessed "hands," who bid against each other and bid their wages mutually down.

Digitized by Google

The one beneficent effect of mechanism upon labor has been the cheapening of goods. Great as this benefit may be, its value seems to me much overrated when we consider the inferior quality of cheap goods, while it is as largely negatived when we note the lowered wages by which it is generally accompanied.

### THE TRUE *versus* THE FALSE FUNCTION OF MECHANISM.

Thus far it is questionable whether labor has derived any substantial benefit from the marvelous development of mechanism, at all comparable with the injury it has experienced from this revolution. It was fondly hoped, in the dawning of our era of mechanism, that all servile and exhausting toil was to be lifted from man; that all necessities were to be so multiplied that the poor would cease to want, and that leisure and its opportunities of culture would come to be a common blessing, through the immense increase of production, that is to say, of wealth. What a mockery these dreams seem now!

Yet these dreams were clearly no wild fancies. They were true visions of what might be, under any just system of controlling these genii whom science has summoned to the service of man; visions which may come true if ever *man* becomes their master instead of *men*—the commonwealth, and not private rich men. In any equitable distribution of the immensely increased wealth which mechanism has created labor would have been much better off. But it is precisely against such equitable distribution that mechanism has worked.

### THE INCREASED PRODUCTIVITY ENRICHES THE PARTY IN POSSESSION OF THE PLANT.

The party owning the plant and controlling the means of production has found its power multiplied portentously. It has been those means of production which have received the increase of productive power, and he who owns them gains the benefit of their increased productivity. Capital reaps the golden harvest. Capital's yoke takes a new clasp around the neck of labor—more its slave by each new improvement that dispenses with human skill. It is thus that capital—the party possessing the means of production—is becoming ever richer and more powerful, while labor is becoming ever poorer and weaker, save as it combines and, not being as yet wholly superfluous, stays the downward tendency; and save as other factors enter the problem, changing the equation.

### THE AWAKENING OF LABOR.

Labor's eyes are at last becoming opened to the fact that the present system plays almost wholly into the hands of capital. It is coming to see that the control of the increased productivity developed by mechanism must always remain with those who control the mechanism; that the bulk of the wealth thus created must go to capital. This is the meaning of the demand, now beginning to make itself heard from the ranks of labor, that the means of production shall not be left wholly in the hands of capital; that either directly, in great co-operative organizations, or indirectly, in the person of the state, labor shall have a share in the control of these monster forces. Sweeping measures truly, which, as a radical cure of the present disease of the industrial system, are coming to take possession of many minds, naturally impatient of mere mollifying ointments for organic disorders—ideas that if they once master the workingmen of a land where there is universal suffrage may work a rapid revolution, which, alike for labor and capital, is to be dreaded.

Digitized by Google

### THE IDEAL CO-OPERATIVE COMMONWEALTH.

Unripe revolutions always fail. No power on earth can make a new industrial system work ahead of its time. Men must be educated for all higher institutions. The greater the advance which a new institution would effect, the more the need of taking it slowly, step by step, as we work up to preparedness for it. Those who believe that the principle of such a theory is right, as I do, should be all the more careful to point out that it is an ideal, which can only be won by patient education in co-operation and by general advance of intelligence and power on the part of workingmen.

If such a change were to be made to-day, by any power under heaven, it would, in the present state of our workingmen, simply bring industry to a stand-still and introduce worse evils than those now endured.

If the co-operative commonwealth ever comes, as I trust it may come, it will come as the final generalization of a long series of integrations, of which the co-operative societies, now so much neglected, form the next step in advance.

### STATE OF THE DISCUSSION BETWEEN CAPITAL AND LABOR.

But none the less is the general discussion of the relative rights of capital and labor, growing out of these new powers of production, likely to go on with a deepening sense of unrest under the existing conditions. Through the able tutorship of German economists, whose sympathies are all with the workingman, labor is beginning to reopen the whole case of capital *versus* labor from the standpoint of labor; and with surprising conclusions, flowing from a changed order of the premises. Charles Kingsley said many years ago that the equation of the social problem, stated thus, "Given the few in affluence how to find the condition of the many," would differ rather widely from the equation reached when the problem should be stated thus, "Given the many in comfort how to find the condition of the few." Labor is coming to state the problem thus, and to draw its own conclusions. It says, "Labor creates all wealth, according to good authorities; why should it have only the fraction left after the quotient has been entered on the side of capital?"

Of course, answers, more or less full, are ready at hand for such a question. It is open to capital to point out that hands need a head; that brawn needs brain to direct it, to feed it with the ideas which give value to one form of labor over another, and to give it the grasp of affairs necessary for industrial generalship to-day; that the worker needs still the man of resources to provide the costly plant that is indispensable to modern industry; that the chief share of productive power is now really lodged in these marvellous machines, which the human hands only tend; that a fair return is due as interest on the plant, as insurance against risks, and as wages for the directing services, ever becoming more onerous as business grows more complicated.

### THE LOOK AHEAD.

Wise men among our wage workers are quite ready to admit all that is true in these propositions, and to assent to all that falls due to capital on these grounds. Only, then, they are very likely to drop into the despairing feeling that since these claims, and especially the claim from the ownership of the machine, which is *the* factor in production, eat up all the profits, the very order of nature is against them, and that there is no hope ahead, except through a growth so slow that not only will it never benefit them, but not even their children or their children's chil-

Digitized by Google

dren. And it must not be forgotten that wisdom is not any more lavishly scattered among workingmen than among other human beings, and that there are lots of foolish and unreasonable people in the class which by its numbers is everywhere a power, and which by its franchise may be here at any time the controlling power.

There are portentous significances in such an attitude, in which the sense of injustice on the part of man deepens into the sense of injustice on the part of nature; dark shadows of revolution and anarchy which may well "give us pause."

### THE DUTY OF THE HOUR.

Wise men among our capitalists and in our governments, it seems to me, ought to be stirring themselves to prevent such contingencies.

Capital ought to be seriously endeavoring to ally labor with itself, and to train it into capacities for a share in the possession and control of the means of production. The ownership of the means of production by the people and for the people seems to me just as certainly the ultimate form of the social order as government by the people and for the people is the oncoming form of the political order. And in society, as in the state, the choice for men is not that of accepting or rejecting an evolution of nature, but simply of resisting it and blocking its pathway, which means always French revolutions, or of guiding it slowly and peacefully along safe channels.

Perhaps the greatest benefactors of mankind to-day are those capitalists who, like Mr. Godin, are wisely training their workingmen for the higher order. No nobler discernment is shown to-day than where wealth recognizes that the gospel of demand and supply is after all an apocryphal gospel, not holding the secret of social salvation; that competition must needs be "ranked" by co-operation, as the next step toward an order in which the mighty resources and the monster forces of nature shall be the genii not of a few rich men, but of the commonwealth.

### WHAT THE STATE MAY DO.

Government's part in helping on this proprietorship of the people is not very plain. Yet that the State is supremely concerned in this matter of preventing the impoverishment of its people, and of seeing the mass of its citizens enter upon the possession and enjoyment of the productive power of our present civilization needs no argument. The National Government might certainly, for one thing, establish a national bureau of labor, to investigate the problem in a way that no one student has the opportunity of doing and to spread light upon it. Such a bureau might easily encourage and stimulate the self-acting efforts of both capitalists and workingmen toward the joint proprietorship of the means of production. I am not sure that, since the state grants subventions to railroads and steamers, and imposes a high tariff to aid manufacturers, it should not also grant subventions to properly organized societies of workingmen, seeking to develop co-operative production, as yet scarcely attempted with seriousness here.

### THE PROBLEM OF POVERTY.

The problem of poverty is to be solved not only by a larger production, but by a juster distribution. We do indeed need a vastly greater productivity in order to insure the comfort all crave; but we have enough now, if fairly divided, to do away with the worst horrors of our poverty.

Digitized by Google

And in any possible productivity the real question is of getting it equally distributed.

So level-headed an authority as Mr. Edward Atkinson, in an address made at the opening of the second annual exhibition of the New England Manufacturers and Mechanics' Institute, showed that the average annual productivity of our country, if equally divided among the men, women, and children, would give an income of 50 cents a day per capita to all our people. That would be the equivalent, for an average family of seven, to the present wages of a skilled mechanic.

The moral is one that I will leave so practical a thinker as Mr. Atkinson to draw. He says:

> By so much as some of you enjoy more others must have less. What have each of you done, what are you doing now, to entitle you to more than what a half dollar a day will pay for in food and fuel and shelter and clothing? Are you rendering service equivalent to your greater gain?

A question this which plainly is primarily a moral appeal. As such it is to be answered by a more enlightened conscience.

### THE DUTY OF THE PULPIT AND THE PRESS.

The church's business, as also the business of all public teachers, the press, the professors of political economy, &c., is to urge this appeal and to illumine the consciences to which it is made, that so, gradually, clearer answers may be given. We must look first of all to the creation of a public sentiment which will hold large wealth strictly accountable to society for its extra share, and which will frown upon the accumulation of very large fortunes, as—what they really are—fungoid growths, denoting an unhealthy circulation of blood in the body politic.

### THE FUNCTION OF LEGISLATION.

Can legislation do anything to help a better distribution? In attempting this it must make sure not to check production, as many remedies proposed would do. I should doubt the possibility of avoiding such a check upon production by any limitation of the right of acquisition. The right of transference is less open to this danger, as sound economists have recognized.

It would be a wholly safe venture to try the effect of limiting the right of bequest, upon the problem of excessive wealth. Such a measure would secure the recognition of the vital principle of the subordination of private property to the commonwealth, and if it worked well would open the way to larger measures.

### (3.) LAND ALSO WORKS AGAINST LABOR.

Land is the first resource of man, and the last. It is nature's provision for his wants. Civilization begins by man's settling down to cultivate the soil. It grows by man's constant development of the resources of the land. It has died again and again in the mass of men being shut off from access to its bountiful treasures, under unwise and unjust social systems, which has made land the monopoly of a few instead of the heritage of the many.

### LAND THE BASIS OF HUMAN EFFORT.

There is no doubt about agriculture being the basic industry, the germinal industry. All other forms of industry rest upon it. All other forms of industry grow out of it. They are *it*, transformed. It equals all the rest of the social productivity. Every manufacture and trade

Digitized by Google

represents a productiveness which is only possible as man is fed, and thus supplied with labor power. We all feel instinctively the absolute dependence of civilization upon the culture of the land in our anxiety about "the crops," in our forecast of a year's business by the state of "the crops."

### ALL HUMAN INDUSTRY MUST CO-RELATE WITH LAND-CULTIVATION.

Every industry, in a sound society, should be developed proportionately to the culture of the land. That such a proportion is necessary needs no argument, unless there is no law of stability in the relative proportions of the base of a pyramid to its height and mass. What this proportion should be is capable of being stated statistically from a study of different nations. Now this means simply that there is a close and exact relation between the whole mass of any society and its land-culture; that every atom composing society must have its due representation in the tilling of land. Food must be growing to supply the whole people and to drive their varied activities. And this, again, means that each individual of society stands in a real and necessary relationship to some particular bit of earth, which is being cultivated for him.

### EVERY WORKER THE EQUIVALENT OF A CULTIVATOR.

Whatever a man does, preach or write, handle tools or carry bricks, or keep store, some one is growing his food for him. In a simple state of society we see this readily, because no one is far removed from the original work of all. Every time the farmer drives into the village, and pays for the goods he buys at the store, in the wheat, or oats, or vegetables, or fruit that he has raised, this fundamental fact is seen. But it is just as truly a fact in a great city where there is no barter, and where we are so far removed from this simple state of society that we forget, often, our real relations to the soil. They are hidden in the complex web of society, but they are there none the less.

### MAN'S RELATION TO THE SOIL IN A SIMPLE STATE OF SOCIETY.

Now, if each man in a society stands on his own rood of ground it is his own fault alone if he cannot live. If, not being on it, but doing some other necessary work in the social mechanism, he can at any time get back easily upon his rood—*his*, and open to him—then it is equally his own fault if he starves. In a simple state of society the worst problems of poverty easily adjust themselves by the turning of men to the soil, in which they have their own place reserved for them, and to which they find their way readily. When the school teacher or the carpenter is hard up and can get no pupils or jobs he shuts the schoolhouse or the shop and goes back to farming—sure, at least, of a living. Thus no grave problems of poverty grow up while every man either stands on his own acre or by it.

### IN A COMPLEX STATE OF SOCIETY.

But as soon as this condition of things changes the whole state of a society changes with it; changes seriously and ominously. If a man who has left farming and gone to some other branch of social labor finds himself with no work offering, and finds that he has no longer left him his old farm, and that no other opens anywhere, then he is in a new and sad plight—face to face for the first time with absolute want. If no

Digitized by Google

work opens and no friendly help tides him along he is likely to starve to death. Take an island where the area of land is definitely limited, and the problem states itself at once to the mind clearly and conclusively. When all the island is held by others, who will not part with any of it, the man out of work is utterly helpless.

He, though a free man theretofore, will then be very ready to get a bit of earth on which to raise potatoes upon any terms. Necessity knows no choice. He will pay any share of the products of a bit of ground to the owner, so that he can squeeze out a bare living. He will even sell himself to the lord of land and become a part of his estate if thus he can have food and live.

If he is the only man thus situated his case is forlorn enough; but if he be one of many in the same situation, his condition is made worse by each additional hungry man seeking a chance to live.

Precisely what would thus come to pass on an imaginary island has actually come to pass upon our very real globe. In early and simple stages of society every man either held in reserve his own share of mother earth or knew that he would have no trouble in finding a bit of ground that he could till. The poorest man, busied with the other tasks, of society felt himself independent in the consciousness that he could get back on the land and take care of himself.

### CHANGE IN THE TENURE OF LAND.

In ways which we need not now follow, this early state of society has practically disappeared from every country of Europe, and is rapidly disappearing from our own country. Land no longer so abounds in Europe that any one can go out and take possession of a bit. It is all held for use in some way, if capable of any use. It is no longer held by society at large, as once was the case, securing every individual's share in the fields of the commune. It is held by private parties. There is not an available rood of ground in England to which a starving workman may turn and say, "I have a right to that; it will support me." As this state of things came into existence men who were unable to find work in other labors were rendered helpless; glad to be dependent, content to occupy a wee bit of ground on crushing terms, thankful at last in the worst extremities to enslave themselves to the lord of land, and become his personal property, like the land they worked for him, in return for food. These are well-known facts of history in Europe.

So to-day the worst feature of the position of labor in Europe is that, with the private ownerships of all available land, labor is practically helpless when the periodic stagnations of industry and trade leave it idle. Of course, I say "helpless" with well understood modifications. Colonization opens an escape for Europe; and colonization is being used now, as perhaps never before in the history of man, to relieve the problem. It does so simply by enabling men to get at land in other countries, where the process gradually repeats itself.

### ABSORPTION OF LAND IN VAST ESTATES ALL OVER THE WORLD.

The problem is made vastly worse than it need be in the Old World by the growth in most countries of land monopolies—the concentration of huge estates in single hands. About 7,000 persons hold four-fifths of the soil of Great Britain. Ten or twelve persons own half the land of Scotland.

Digitized by Google

Now, so long as the supply of land in some countries was practically unlimited it was possible to blind one's eyes to the bearings of the customs of land tenure upon the problem of poverty. But we are rapidly nearing the limits of available land in the countries which have hitherto opened outlets for surplus labor. As though nature meant to hurry up the issue of land upon our civilization, a perfect hot-house forcing of these tendencies to land monopoly is going on in these new countries.

In Australia, that magnificent empire of the South Seas, there is already the shadow of the Old World curse.

An Australian paper thus sums up the results of a commission appointed to inquire into the working of the land laws, under which gigantic speculations in land have been going on:

Nothing more damnatory of the existing system of land alienation by free selection, as well as by auction, can be conceived, and the details given of the war of classes it has engendered are perfectly hideous in their deformity.

"Vast tracts of country rendered useless by a carefully planned strategy of preemption, dummying, or purchase at auction; vast estates built up out of the wrecks of once thriving homesteads, or by the unauthorized yet successful amalgamation of adjacent squattages; whole districts, once the populous seats of rural industry, now desolate and silent. These are only a few of the tokens by which the advance of the fell destroyer, land monopoly, is traced.

RAILROAD LAND GRANTS IN THE UNITED STATES—208,000,000 ACRES.

What the process going on in our country is no one who keeps his eyes open needs to be told. The proper enough policy of encouraging the development of railroads in our newer sections has been pushed to such an excess, through the influence of powerful corporations, that the National Government has already deeded away to these companies 208,344,263 acres, an empire over six times as large as the State of New York.

Foreign capital is rapidly joining in the land speculation that is mounting higher with each new decade. Every few days we read in the papers of vast blocks of land in the south and west bought up by English and other capitalists and companies.

Of course both in the case of the railroads and of foreign capital these huge land holdings are to be broken up into small sections and resold to settlers or to lesser speculators.

AN ALMOST LIMITLESS DOMAIN EXHAUSTED IN OUR FIRST CENTURY.

But through this speculative rush for land on the part of capital it has come to pass that by the end of our first centennial of independence this nation, which thought it held an exhaustless reserve of land open freely to all comers, finds itself already practically at the end of its free lands. While engaged in experimenting in co-operative colonization a few years since I found out, to my exceeding surprise, that the United States Government held very little land open to occupation under the old homestead law that was worth occupying. Of course there is any quantity of good land to be had still of these capitalistic companies cheaply enough, but it is something of a shock to realize that we have already run through with the splendid dower of public lands, which was our pride and our security against the Old World social disorders. Carlyle used to say, in his savage way, that it was to our abundance of free land we owed our exemption from European pauperism, and he was right. This is what is making the outlook of labor so much darker of late in our country. Nature's provision for the relief of want is being rapidly closed against the poorest and most needy laborers, who, to get good land, must now go a long way and *pay* for it at the end of a costly journey. It is the beginning of the end of our day-dream of room for all and plenty for every one.

Digitized by Google

### BONANZA FARMS—ENORMOUS FOOD FACTORIES.

And to add to this evil, the modern tendency to vast capitalistic industry is making itself felt in agriculture in our country as nowhere else in the world, and with alarming results and more alarming prospects. We are in the midst of nothing less than an agricultural revolution. As by magic bonanza farms have sprung up in the West. Farms of thousands of acres are getting to be quite common. We hear of farms of 5,000, 10,000, and even, as in the case of the Grandin farm, of 40,000 acres. There is one estate of 350,000 acres, covering an area of 547 square miles. Of course these huge farms are worked under new methods, by the application of modern machinery. They are simply big food factories, with the temporary good of the factory system, the cheapening of its products, whether shoes or grain, but with the permanent evils of the factory system reproducing themselves in agriculture. These food factories are worked exhaustively, being mere speculations from which capital hopes soon to retire; and in which, therefore, it has no regard for the future fertility of the land. They are worked by machinery; that is, by few men. On the 350,000-acre estate 100 men are employed. These men are hired according to the needs of the different seasons; so that while during the three summer months there may be a large body of laborers employed, the winter finds only a handful on the ground. These men have no hold of the land they work, nor does the land hold them.

### THEIR EFFECTS UPON OUR CIVILIZATION.

In stead of a settled, free, farmer-population, building up homes, developing villages and towns, laying the foundation for a sound society, we have gangs of hired laborers, drawn from a distance, herded on the ground during the busy season and then turned loose to shift for themselves; men trained in alternate hard toil and loafing, making no homes, furnishing the recruits for those bodies of tramps which of late years, in dull times, the West has found roaming around with constant danger to society.

If this system continues and develops, it will turn out a class of agricultural laborers wholly new to our country, incipient paupers and criminals where we looked to see a hardy yeomanry. It may not continue. Theorists are cocksure that it will not continue; that it will speedily give way to other and safer forms of agriculture. Perhaps it will. But as it is simply the action in agriculture of the tendencies making themselves felt, and increasingly felt, in every form of industry—the tendencies developed by the monster forces of our age—the prospect is of an indefinite continuance of this state of things and of a vast increase of it.

### AMERICAN FARMERS BECOMING TENANTS AND MORTGAGEORS.

Back of all this we can trace the working of yet graver evil tendencies in our system of land tenure. A study of the United States Census Reports, such as that given to them by Mr. George and Mr. Moody, whose deductions I have not seen refuted, reveals the alarming fact that our farming population is steadily losing the character of free owners of the land, and becoming in reality a body of tenant-farmers. The number of farms held free of mortgages is rapidly decreasing, while the extent of the liens held upon them is as rapidly increasing.

## THE RELATIONS OF RENT TO LABOR.

A steady rise in rent is going on over the world, with, of course, local and temporary exceptions. Everywhere in the Old World we hear of "rent" as the burden that bears most heavily upon labor. When news of some fresh agragrian movement comes we have grown to expect to find complaints against rent, as in France and Spain and Germany and, notably, in Ireland. In the cities rent is literally eating up wages and small salaries.

There is no difficulty in accounting for this fact. Every work of society must be done upon land. They who control the land, control everything. All that is done to develop society makes for their gain. The more people that crowd a city or a country, the more demand is there for land, the higher the rent it will bring. The greater the skill and enterprise developed and the richer the accumulation of society in all that makes a civilization, the greater is the value of the land on which it all rests enhanced. Numbers and wealth alike run up rent. It grows without effort of land owners, by the efforts of every one else.

Now, this tendency we see being forced forward also on our soil. How preposterous have rents become in this city! They are revolutionizing the character of the city, and making it a city in which only the rich and poor will stay—a city of extremes. And while rents are higher here than elsewhere they are steadily becoming higher in all our cities and towns, as far as I can see.

Farming land is experiencing the same tendency. The selling price of good land in parts of the country where agriculture has any chance of profit in it, advances decade by decade; which is saying that rent advances steadily.

Thus the very progress of civilization makes for land as against labor, shutting men off from the free access to mother-earth, whose bounteous breasts are stored with the food of man; making the landless increasingly dependent, and laying ever heavier burdens of rent upon the landless, deepening thus their poverty.

## THE PROBLEM OF LAND NATIONALIZATION.

Christendom is wakening up at last to this truth. The problem of "land" is everywhere in Europe forcing itself to the fore front of the social agitation. The "nationalization of the land" is the cry which is evidently going to crystallize the forces of labor. The astonishing sale of Henry George's book, "Progress and Poverty," is a sign of the times which ought to open the eyes of the most optimistic believers in the gospel of "whatever is is right." In England, men like Mr. Wallace, the eminent scientist, and William Morris, the poet and artist, are heading the movement for the nationalizing of the land of England. A shrewd observer of affairs said to me several years ago that the Irish were evidently to be the instruments, in the hand of Providence, of working out the problem of our land tenure to its bitter conclusion, and of thus bringing on the issue of the true tenure of land. So it seems certainly.

Our own country will not for a good while find this problem the urgent one that it already is in the Old World; but it is only a question of time. The same tendencies are working, as we have seen, and are working toward the same results. Already an organization, bearing the taking name of "The American Free Soil Society," is in the field to open aforetime the agitation of this fundamental question.

## JOHN STUART MILL AND HERBERT SPENCER ON THE LAND QUESTION.

Sooner or later our civilization must face the task of a radical reorganization of its system of land tenure, and of the outworking of a system which shall in some way guard against land monopoly, and, yet further, turn private property in land into personal occupation of a public property, the common soil of the commonwealth. This is no brand-new revolutionary notion. Great thinkers and cautious, like John Stuart Mill and Herbert Spencer, have seen the oncoming of this question. They have discovered the principle that the soil of a nation belongs to the nation—the body of the people; that property in it has a peculiar character of its own, quite distinguishable from the character of property in anything else; that it is nature's provision for the common necessities of man, and as such must be regulated in the interests of the commonwealth; that it is perfectly open to a people at any time to refashion its tenure of land as may seem best to its wisest heads. Indeed this new theory is simply a return upon an immemorially old system; upon the feudal tenure which vested the title to the whole land of a nation in its king; to the land communism which ruled for ages among nearly all peoples, and of which traces still linger in "the commons" of England, the "All-mend" of Switzerland, and other archaic usages.

Life moves in a cycle, and society, like the individual, often takes up in manhood some custom or belief which it had in youth hastily thrown away.

## FIRST STEPS TOWARD THE PEOPLE'S PROPRIETORSHIP OF THE LAND.

As a practical aid to the re-establishing of better relations between labor and land, I would suggest the organization by the National Government of colonization. Colonization has always been the natural relief of overcrowded centers. In this way surplus labor has gone back to the soil. Our country has been built up by colonization. Now, the abler classes of labor will undoubtedly take care of themselves in this respect as in others. The mass of men, however, who most need this salvation need to have a helping and guiding hand in gaining it. They don't know where to go, nor how to go, nor what to do should they go. They must have the initiative taken for them by superior intelligence and power. Where colonies are planned and organized and directed by capable men the feeble and the dull can be led back to the land and made self-supporting on it. This has been amply shown on our own shores. What a wise work for the state! It can be done as business, and not as charity—in the form of advances by the Government. Thus the state would be relieving the East while building up the West and the South.

Plainly any refashioning of the tenure of land must come, after due education of the public mind, through legislation. And such legislation, like the education that precedes it—of which indeed it is but the continuation, an educative function of the state—should proceed slowly and progressively, in the application of the principle of the common ownership of the soil by a people. The principle must first be recognized by law in clear and simple cases, and then it can be led along towards further applications, as we ripen for them.

As such an initial measure of legislation, I would respectfully suggest an enactment by Congress making all mineral resources hereafter to be opened the property of the people; to be held in trust for the commonwealth by the state.

THE SOCIAL ALTERATIVES NEEDFUL IN OUR CIVILIZATION.

Thus, between the upper and the nether mill-stone—between capital and land—labor is ground as we see it to-day.

And, therefore, the true cure of our present social disorder will be found only in such social alteratives as will work an organic change in our civilization. The diagnosis of the disease is about as much as we can hope to achieve in our day. Then, through patient study and much experimenting, we may hope to grope slowly towards the true remedies. Meanwhile, it is all-important that we should recognize the gravity of our disorder, and its general nature, and thus encourage the consultations that the case demands.

The ameliorating treatment suggested in the earlier part of my talk is of value chiefly in getting the body politic ready for the more heroic measures, whether of medicine or surgery, which must, sooner or later, be ordered by our social doctors; one or two tentative experiments towards which I have ventured to suggest.

## IV.

### SUMMARY OF CONCLUSIONS AS TO THE CAUSES OF LABOR'S POVERTY.

To sum up the suggestions which I have to offer:

Labor is at fault, and needs to develop greater ability and interest in its work; more thrift; larger powers of combination and better methods in combination; the substitution of arbitration and co-operation for strikes; the building up in its trades unions of centers of political action.

Capital is at fault, and needs to develop greater personal interest in its employés; to create for them in their surroundings the interest that their work so largely lacks; to bind its men to itself through a system of industrial partnership; to prevent strikes by arbitration; to make out of its brains and means and position of control a real captaincy of industry.

The general world of business is at fault in its anarchic system of industry and trade, alternating between fevers of speculative production and congestive chills, in which labor is left idle in the market; in its vast monopolies of common necessities and common services; in its total disregard of humanitarian considerations in seeking investments.

Philanthropy is at fault in its unwise and obsolete methods.

Society at large is at fault in its thoughtlessness and selfishness, its luxury and extravagance, its manifold wastes.

Municipal governments are at fault in not taking civil administration out of national politics and making it wholly a matter of wise corporate management; in their dishonest and wasteful administration; in the burdens of debt thus imposed on the people; in parting lightly with valuable franchises; in encouraging intemperance, by their multiplication of grog-shops; in allowing the poor to be housed as they are.*

State governments are at fault in not providing a system of industrial education in connection with the common schools; in legislating freely in the interests of capital while neglecting the needs of labor; in establishing no control of the great corporations they charter and endow with munificent privileges; in allowing the present license of gam-

* The lines of responsibility of civic and State authorities overlap and are not readily separable at times.

Digitized by Google

bling in the necessities of life, and of monopolizing the most important resources of the people; in not establishing labor bureaus.

The National Government is at fault in various respects, concerning which I sum my suggestions into propositions, which I should like to see this committee submit to the Senate of the United States:

(1.) Tariff reform.

(2.) A national bureau of labor.

(3.) Legislation concerning the great transcontinental railroads, and the appointment of a national railroad commission.

(4.) The establishment of postal savings banks.

(5.) The further fostering of industrial education.

(6.) A better system of patent privileges.

(7.) The limitation of the right of bequest.

(8.) The organization of colonization from our crowded centers to our newer regions.

(9.) The reclaiming of public lands whose grants have become forfeited, and the return to the old policy of preserving all public lands for actual settlers.

(10.) The reservation of future mineral resources as public property.

Back of all which lie the responsibilities of our capitalistic system of industry and of our tenure of land, concerning which the time seems to me unripe for other action than that already suggested.

### OBJECTIONS TO GOVERNMENTAL ACTION CONSIDERED.

The propositions concerning the action of the National Government are, of course, open to one serious objection—apart from all other criticism that they may deserve. They look to a considerable increase of the functions of the state, already burdened with heavy responsibilities and developing now a dangerous bureaucracy. Our prevailing theories favor the minimizing of state action, and regard any further assumption of offices by Government as a reaction, and not a progress; a return towards the obsolete ideal of a paternal government. I recognize the danger in every increase of functions by the state; but I see the danger that lies in the avoidance of such increase of function, an even greater danger, as it seems to me.

Apart from any theorizing, the whole trend of our social life is forcing on our age such increased action by the state, in the very teeth of what is believed to be the gospel of political economy. Doctrinaires prove powerless before facts. England, the home of the non-interference dogma, has been driven on, from one step to another, in the direction of larger state action, out of the felt necessities of the situation.

Thus within a few years we have seen the development of the postal savings bank, the purchase of the telegraph lines, the organization of the parcels post. Within a decade the state has added to its functions the office of banker and telegrapher and expressman, and the country lives and thrives. Wisdom dictates a slow feeling of the way in this direction, which is all that I suggest. The state should avoid assuming any new office until that office is fairly forced upon it, by the demands of the people or the exigencies of society; but, then, it should not hesitate to take up the work thus plainly indicated for it. The work of the Department, in one of whose buildings we are now meeting (the post-office) is the best vindication of the possibility of capable and honest administration of a huge business, with which no private company could be trusted.

The introduction of a real civil service reform is the indispensable preparation for such higher functions on the part of Government.

SOCIETY AN ORGANISM.

If there is any truth in analogy we must expect society, as it grows more highly organized, to develop largely increased powers in government. Society is an organism, as Mr. Spencer has taught us. It is, as Hobbes quaintly taught in The Leviathan, a great man. The human organism, as the highest type in nature, certainly suggests the necessity of a head proportionate to the quantity and quality of the functions to be carried on in the body. The power of co-ordinating the functions of the body—the power of the brain—measures the place of an organism in the scale of nature. An acephalous body is not supposed to be an ideal sort of organization anywhere outside of political economy.

With the steady and rapid increase in the complexity of the functions of the body social, it is becoming more and more a vital necessity to evolve a great head capable of co-ordinating all these varied activities; a head which shall call to it the best blood of the body and build up a large and powerful brain.

PUBLIC ADVANTAGES OF LEASING MINERAL LANDS.

By Mr. CALL:

Q. I should like to ask you a question or two for my own information. You say that you think the mineral lands should be reserved for the use of the Government—for the use of the public—that they should not be sold in fee simple nor absolutely parted with, but might be leased or otherwise worked. In what respect would you distinguish the difference to the Government or people between giving a lease interest in mineral lands, and selling them entirely?

RESULTS OF PRESENT METHOD OF TREATMENT.

A. If you will compare the present manner of opening our mineral resources and of using them with what might be our action, the answer will be easily indicated. At present private parties, individuals, or corporations prospect for new mines; and when locating them proceed to open them, and use the treasures of nature's storing primarily for private emolument. Of course the people at large get a measure of good out of these resources—no thanks to our monopolizing friends, who find that they cannot make their Dives' feast without letting fall the crumbs for Lazarus. But the people have to pay vastly more for what they get than they should. Private owners put all the price on these supplies that they think they will bear. They thus, in getting control of mines, get control of a power of taxing the people. We allow nature's treasures, which no man creates, to become the feeder, not of the general comfort but of the wealth and luxury of the few.

RESULTS UNDER THE METHOD OF LEASES.

Now, think of what might be. Suppose that it was declared by law that all mineral resources hereafter to be discovered were to be held by the National Government, or by the State governments, as the property of the people; and administered for the benefit of the whole body of citizens. The mode of administering determined on might be direct Governmental management, in which all the profits, if the business was honestly carried on, would go to the public. It might also be the letting out of the privileges for a given number of years, subject to such conditions as should be imposed in the contract. Those conditions could secure for the people at large that the profits to be made out of

Digitized by Google

the mining by the lessees should not be above a certain per centum of the capital engaged. The public would be secured against extortionate prices, and these prices would drag down the prices of private mining companies to a fair level. Thus, the people would be relieved of the present incubus of taxation imposed by the private ownership of mineral resources, and every man's income would go very much farther in purchasing coal, &c. At the same time the Government, State or National, would be drawing a large revenue for public purposes from the rental of these mines. So that there would be a gain to the people at both ends of the line.

PUBLIC ADVANTAGES ON EXPIRATION OF LEASES.

Then, when the leases ran out, a new appraisal would be made, inuring (where there was an increase of value in the property) to the people in the person of the State. Thus the running on of any arrangement by which the people suffered would be prevented. With the increasing development of the mineral resources of the land, the commonwealth would be steadily enriching, and a vast possession be accumulating in the hands of the people to be used for no speculative purposes injurious to the community, and for no oppressive taxation of the people, but for the varied constructive tasks ot the State, public works, education, &c.

Q. Your idea is that there should be short leases?—A. Yes.

Q. If the policy of co-operation and organization is so good in respect of other matters, why should it not be so with mineral resources?—A. I am not sure that I understand your question. If you you refer to the associative action of capital in business enterprises, I would answer that in so far as this free combination of capital works well in other fields, it certainly indicates the best method of action in this field, if there be no special circumstances here affecting the problem. But I contend that the ordinary action of capital, while working so much good in other fields, is working a great deal of mischief, and that the necessity for Governmental regulation of this action is steadily drawing on upon us. The question will soon be how can the State best control this action in the interests of the people at large.

Now, here in the field of future mineral resources we have a clear coast for such experiments. Before the mines yet to be found become property at all, we can determine under what conditions they shall become property. This is a case of legislating for the future. And the case is precisely that where man's labor, which is said to create value, is at the minimum; where nature's action does nearly all the work. So that it is a peculiarly good case for the introduction of the principle of "the ownership of the people, by the people, and for the people."

Q. Under short leases, with the prices constantly increasing or diminishing, by Government you could not apply the principle of co-operation so well, could you?—A. I don't see why not. The leases would have to be long enough and at generous enough rates to attract capital. And with the increasing difficulty in finding investments, capital is becoming easier to attract. Capital likes to deal with the State. It is a safe party, and one open to public opinion in a peculiar degree, and not reputed to drive sharp bargains. Thus such leases would probably not lack lessees.

Q. For a short time?—A. For such short times as I have indicated.

INDUCEMENTS TO CAPITAL TO ENTER ON MINING OPERATIONS.

Q. Do you think that what you call "capital" would have the same inducements to enter into arrangement for such short periods of time?—

Digitized by Google

A. Perhaps not the *same* inducement, but a sufficient inducement, else it would not be induced. There would be no law compelling capital to lease Government mines. As I said before, the terms would have to be such as to attract capital.

Q. Your idea is that short leasehold interests might be adopted so that the Government should from time to time assess a new value and receive a better consideration?—A. Yes. At present the increment accrues to the private owners. Then it must enrich the people.

Q. Acquiescing entirely in the justice of that argument, and the propriety of it, and looking only to see which is the more economical and better mode of working the mines for the people, you hold that the return of the rents to the Government would be better for the people than the present plan?—A. Yes.

DIFFERENCE BETWEEN LEASEHOLD AND TAXATION OF MINES.

Q. In what way would that be different from the power of taxation? Why could not the Government tax now upon individual property just as it could, in the case of the rents, increase or diminish the amount at recurring periods?—A. Theoretically there may not be so much difference, perhaps; but practically there is a good deal of difference. "Taxation" has an ugly sound. Every attempt to raise the taxes upon such property is certain to be met with strong opposition. The raising of rent at the end of a lease seems much less obnoxious than an increase of taxation. When the lease is out, a readjustment comes naturally and is expected. Increase of taxation is almost never thought to come at the right time. The owners would be sure to "howl".

Q. Nobody would "howl", in that case, except those who paid the taxes?—A. Doubtless there would be echoes to the howl. The owners would at once raise prices, and Government would be powerless to guard against this effort at recouping. So the people generally would howl a little. And in particular all other affiliated capitalistic interests would join the chorus. On the recent telegraphers' strike the newspapers said that while at first there was a disposition to sympathize with the operators, yet on sober second thought, as employers came to see that the same principle might be applied to themselves, there was a change of sympathy. The solidarity of interests would act in this case as in that.

Q. Do you not think that the same solidarity would lead these people, when the rents are raised on them, to "howl" a little?—A. I don't doubt it. But what could they do? They would have either to renew the lease or step out from it and leave the coast open to others.

Q. And a man can sell his property now or keep it?—A. Doubtless; but still there is a great difference in the position of one who says, "Government has taxed me so as to drive me out of the business," and of one who says, "Government has put up the rent on me, and so I have had to leave the business." The human mind works curiously. In the one case a company would be very apt to have public sympathy, in the other it would not get much.

Q. I only wanted to draw out from you whether, as a matter of principle, the taxing power was not the same now as it would be then, under that principle.—A. Practically the same.

Q. The question, then, would be as to which was the most economical and beneficial form for the public interest.—A. Yes. But there is a deeper ground of interest to me in the plan of the State's owning and leasing the future mines. It would be the recognition of a principle which has far wider application—the introduction of the thin edge of a

Digitized by Google

very big wedge, the driving in of which would, later on, break up the present uncontrolled individualism in the ownership of land and open the way to the State's control of it for the people.

Mr. PUGH. The power of taxation which exists in the Government over personal property is for a specific and defined purpose; the power of the Government growing out of the custody of the legal title to the public domain is a trust power that may be exercised, and is required by the existence of the power to be exercised, for the public good—the general good of the people. The power of the Government over the public domain, which it would exercise in allowing these leases that you speak of, is a trust power growing out of the legal title to the public domain, existing in the Government for the public benefit. The power of taxation in the Government is a very different power, limited and defined for a very different purpose.

The WITNESS. I agree to that, sir.

Mr. CALL. But he proposes to change the limitation.

Mr. PUGH. No; he proposes simply that, instead of granting individual ownership and corporation ownership to individuals and corporations, that right shall be reserved by the Government and kept in trust, as it exists under the Constitution, to be exercised by leasing them to individuals and letting the benefit to the public result from the lease and not from the ownership in a corporation or individual.

Mr. CALL. The Government reserves title now to the precious metals?

The WITNESS. Yes; theoretically. And the recognition of the public proprietorship that is involved in this action is most valuable. But practically what does it amount to? It is really given away.

Mr. CALL. But it is not given in perpetuity, only while then idividual works it. If he abandons it altogether and nothing is done with it at all, our law, as I understand, is like the Spanish law—that was the law of the old Latin nations—which never gave the land away but on a royalty.

The WITNESS. Has it ever been known that any corporation abandoned a profitable mineral right?

Mr. CALL. Very often they are not profitable.

The WITNESS. The point is, once in possession always in possession of what is worth possessing.

Mr. CALL. Thousands of them are abandoned in Mexico. By the way, I notice that a Yankee was over there lately.

The CHAIRMAN. I notice that he came back again, too.

Mr. CALL. Well, many are going. But that is the law now, and the Government reserves the power of taxation according to the State constitution defined and limited, but you can modify these limitations and apply them to the purposes indicated. We have lately adopted a mineral law in that respect. Instead of leasing we give, as I understand the law, during the period of occupation, subject to the imperial power of taxation.

## CAPITAL AND LABOR'S SHARES OF THEIR JOINT PRODUCT.

By the CHAIRMAN:

Q. I want to ask a question or two in another direction, not with the idea of controverting any of the positions you have taken, but to draw out your views somewhat in another direction. I gather from what you say that you consider the real difficulty one of distribution of the joint product of labor, capital, and land than otherwise?—A. I do.

Q. That, in other words, the stronger force gets a larger proportion than justly belongs to it, or than does the weaker force?—A. Yes.

Digitized by Google

Q. You think that labor does not get its fair share. I suppose, then, the more wealth there is created the better, because there would be more to divide?—A. Undoubtedly.

Q. Do you believe the proposition somewhat generally received, I suppose, that production ordinarily can be more stimulated under private than under public management?—A. Speaking generally, I do. I believe that has been the function of individualism in the development of civilization. Perhaps another force than individualism is necessary for rightful distribution.

Q. Then, if the proper distribution could be effected, you think it would be better that this combination of the factors of production should remain under private management rather than be consigned to public management?—A. Yes, if that could be secured, except in so far as there are works which from their nature the State is better fitted to do.

Q. In other words, you believe that the individual in society is more capable of successful administration or working of these great factors of production than the mass, the Government at large?—A. On the whole, yes.

Q. So it would follow from these premises that if the abuses, whatever they are, that have caused it, now existing in society, could be remedied you would be satisfied with the existing order of things so far as titles and the general administration of social and business life are concerned?—A. Yes, with that very big "If."

Q. Then, all that conceded, I want to ask you to specify such particular direction or particular ways in which there is waste or improper appropriation of the result of production. Certain parties get too much; others do not get enough. Specify a few of the directions in which you think the greatest waste or misappropriation against justice occurs.

### CAPITAL'S SHARE TOO LARGE.

A. Capital, as a rule, gets a disproportionate share of production. Figures, I know, are so handled by skillful statisticians as to becloud this fact; but fact I believe it is. The whole mass of labor in a factory, say 500 hands, is balanced against the one capitalist, and then it is said that "labor gets the lion's share." It is enough to look at the wealth so frequently accumulated in manufacturing, and to look then at the general condition of factory labor, to see through all sophisms on this point. Here is a great waste or misappropriation, speaking from the standpoint of society. It would be juster and better to have our capitalists less wealthy, and their laborers more comfortable, better educated, and better housed. Plainly, society's need is of the many getting more and the few less out of production. It is this fact which lends force to the socialist doctrine, that if, say, four hours' work rep resents the productivity for which a man is paid in the wages he receives the other six hours represents his labor appropriated to its own benefit by capital.

### DISPROPORTIONATE SHARE OF LABOR'S PRODUCT TO MIDDLEMEN.

Then there is misdirection of the results of labor in the huge accumulations of middlemen, traders, merchants, carriers, &c. They serve an equally important function with production proper, but they get a share of reward wholly disproportionate. Thus it is that great fortunes are built up most readily by the men who simply exchange what

Digitized by Google

others have produced. And in securing these great rewards, prices are run up high, so that while the producer gets but a small part of the value of his labor, when he needs to buy back that work, or some other branch of labor's work, he has to pay several times the value it had as a piece of production. Where are the colossal fortunes made? Not in producing, but in exchanging, including in this term, of course, carriage. So in other directions, through which it would take time to track the absorption into others than labor's hands of the value of labor's own production.

### THE GROWTH OF LARGE FORTUNES.

Q. You have mentioned the accumulation of very large fortunes in the hands of individual men.—A. As drawn to do so by direct questioning, otherwise I have not emphasized, I believe, that phase of the subject for more than one reason. These gigantic fortunes arrest attention, and so start questions and rouse antagonism. They serve to objectify a social tendency and to throw it into a strong and bad light. And all this I hold to be well. That tendency is unholesome, unsound, dangerous, especially in a Republic; so we are likely to hear quite enough about "the coming billionaire." But there is fear of overdoing the personal opposition and of concentrating upon a few men, perhaps personally by no means monsters, the indignation which ought to spread itself upon the wrongful social tendency. While the roots are in the ground it is of little use to mow down one crop of weeds.

### DIRECTING CAPACITY OF MEN OF FORTUNE.

Q. But generally take the fortunes of $200,000,000 that we read about in particular individuals. Do you think that these fortunes, as a whole, are better administered than they would be if they were vested in the Government at large; or, in other words, does it not follow, from the premises we have assumed, that Astor, Gould, Sage, Vanderbilt, Huntington, and others administer their large fortunes better than they would be administered in other hands?—A. Solely as a matter of production, possibly—probably, yes. Most of these men are admitted to have talents of an uncommon order. Commodore Vanderbilt was certainly a rare genius in organization, and Mr. Gould is often called a Napoleon of speculation. Less gifted men could not, perhaps, develop such enterprises as these men have done. But even then there are qualifications to come in. Perhaps no one man could as well manage Commodore Vanderbilt's lines as he did. But a large and well-organized system of officering can possibly do it as well. The Pennsylvania Railroad to-day is a splendid specimen of corporate capacity, with no one such man at its head. We are increasingly being driven into the peculiar power of administration that lies in well-organized companies. This is the new tendency already making itself felt over the older force of pure individualism.

### THE QUESTION OF BEST USE OF LARGE FORTUNES.

Then, moreover, it is open to ask how well for *public good* most of these gigantic private fortunes *are* administered? They seek investments solely with reference to dividends, and with an almost sublime indifference to every consideration of what the people most need. A host of urgent improvements may be waiting to be carried out right at their doors; are so waiting, with every promise of fair returns to the capi-

Digitized by Google

tal invested. But huge fortunes rarely care to engage in such enterprises. They are filled with schemes of vast aggrandizement, with dreams of immense combinations, giving unheard-of power. They tend to go out into speculative enterprises; and these stimulate the country unhealthfully and help on the inevitable reaction. They go out "wild-catting" in all countries of the globe and lend kings the power to wage war. English capital has sunk enough, probably, in Eyptian improvements, after Ismail's heart, in floating Turkey and in all sorts of out-of-the-way and generally harmful schemes, to have reconstructed the worst defects of London, while drawing a fair return.

### A QUESTION OF DISTRIBUTION AS WELL AS PRODUCTION.

But the question of administration covers that of distribution as well as that of production. And there can be, as it seems to me, but one judgment as to the influence of the sort of expenditure which huge fortunes encourage. It is bad. It gives work, as the same thousands would, however spent; but it gives the work which creates little or nothing, and which enfeebles and degrades the workers. It builds up the classes which minister to luxury, and they are economically unprofitable classes to the community, and socially are undesirable classes.

It is not a question between A's having $200,000,000 and the State's having it. It is a question between A's having it and all the rest of the alphabet having it. If the State ran all Mr. Gould's roads it would be the people who pocketed the dividends in one way or another, if the administration was honest. Men say A. has to put out all his $200,000,000 in investments, except the few thousands he can spend a year. True; but there is a great difference between the way he puts out $200,000,000 and the way 2,000 people would each put out $100,000; as between the way he spends what he can of his vast income and the way they would spend their $6,000 or $5,000 apiece. Here is the root of the matter. Which is the best for the country, the investments and personal expenditure of one man with $200,000,000 or the investments and personal expenditures of 2,000 men each having $100,000, or of 20,000 men each having $10,000?

Q. We have come to the conclusion that what wealth there is may be better administered in private than in public hands, as a rule. But, on the other hand, there is a fault in distribution, and labor suffers. We mutually believe that. The real thing to ascertain is just what portion of wealth is misappropriated and might be otherwise used.—A. That is rather a difficult question to answer.

Q. But there is a difficulty, and it results from the premises that we have assumed.—A. Yes, it does.

### HOW CAN THE LABORER'S RIGHTFUL SHARE BE ASCERTAINED.

Q. Is it not like this: The laborer, as you have pointed out, wastes a great deal in his personal habits; a portion of his wages is put to very poor use. Then, of this immense mass of money handled by the capitalist, whether invested in labor or otherwise, a great deal of that might be better distributed. Now, do some of these ways occur to you? To put the idea a little more distinctly, are we not drifting toward some fundamental proposition like this, that before there be any reinvestment for the benefit of capital in any form, and before there be any appropriation of the product of labor and capital for the unnecessary uses of any individual whatever—whether the laborer or the capitalist—

Digitized by Google

there must be first deducted from production all that is necessary to give to the producer the necessaries of life?—A. Certainly.

Q. If that is true, is it not necessary to take a position which, as far as I know, has not yet been taken or insisted upon before us—this primary position that there should be deducted from the price realized from production a greater sum than is now taken and appropriated to the wage laborer?—A. I believe that, thoroughly.

Q. Now, how can that thing be done?—there is no law for it. The law of supply and demand does not provide for it; the co-operative system does not provide for it, though perhaps it does so better than anything else—but under the existing laws of the land there is no provision for giving labor anything more of price than what it can demand under the laws of supply and demand in the market. Is it necessary, then, that there should be introduced into the laws of the country a proposition by virtue of the legal establishment of which labor should have a larger proportion in some way out of the price realized from production from time to time?

WAGES AND PRICES: IMPOSSIBLE TO REGULATE BY LAW.

A. I do not see how it is possible for legislation to effect such an end—at least not in the beginning of an effort for it. Legislation that was not backed by public sentiment would be inoperative. And if we have the public sentiment we can secure the end, perhaps without any legislation. At all events we should try for the creation of such a public sentiment before we try legislation. If legislation is needful it will soon be had, then. We have given up the endeavor to regulate prices and wages by law for good reasons. Law is too clumsy and unelastic a mechanism to adjust itself to the rapid fluctuations of the market. It seems to me that on such a point the teachings of our political economists are thoroughly sound. Here is the very case in which their theory of non-interference is right. Almost every other feature of the world of trade can be better interfered with than prices and wages. There is a simpler way.

THE POWER OF CONSCIENCE—ACTION OF MORAL FORCES.

The conscience of the community is uneducated on this point. Few suspect that there is any unwisdom or wrong in our present system of providing first for the luxury of the few and only after that for the needs of the many. What is, is right to the mass of men. The natural law of demand and supply does not necessarily exclude the action of moral forces. Immoral forces—greed and selfishness—weight these laws in one direction now. The sense of justice, the spirit of brotherliness, can weight these laws in the other direction without external action. Put back of our manufacturers a larger development of conscience, of conscience educated to discern the real ethics of the case, and the problem would soon be solved.

Q. Can you do that?

FOLLY OF CRYING DOWN CAPITALISTS AS A CLASS.

A. I believe it can be done. There are vast resources of moral energy among our people to be drawn upon for such action. The sense of justice is one of the strongest powers in man.

I have had a chance of seeing a good deal of manufacturers. Those that I know well I know to be men of kind hearts and real conscientiousness; who sincerely desire to do what is right, and who often are

Digitized by Google

anxious, deeply anxious, to add to justice, as they see it, kindness. It is folly to cry down capitalists as a class, because there are so many grasping, hard hearted men among them.

But conscience needs to be educated. It takes its tone from public sentiment, and looks to custom for its standards. And society calls the present division right, while political economists check any rising of dissatisfaction with it by hosts of reasons why it always was and ever will be as it is, world without end; calling all such feelings "sentimentality." And there is next to no attempt made by the churches, the educators of conscience, to enlighten men on the ethics of this problem, or to stir their wills to larger justice. Churches preach charity, not justice. One generation in which the churches seriously grappled with this task would answer the question you have proposed in the only way I think it can be really answered.

### ADVANTAGES TO SOCIETY FROM MORE EVEN DISTRIBUTION.

I believe it could be shown that such increase of wages would not be wholly the loss to profits that men suppose it would be. Better pay draws out better work. Productivity is increased and there is more to divide; so that while the capitalist would get relatively less he might get absolutely nearly as much as before. Henry Carey, who brings out this law, rightly calls it "the most beautiful in the book of science."

Q. With that increasing productivity is there not an increasing want or multiplication of wants, so that with advancing civilization the wants of the common laborer may in time become what the wants of the refined and delicate are to-day?—A. Yes.

Q. And we have to deal with the things of to-day—what is luxury to-day may become a necessity to-morrow. So would you find any remedy in that direction?—A. If we are satisfied that the tendency is in the right direction, let us act for our own generation. The next generation will be better able to deal with its own problems. We are surely moving in the right direction when we move towards creating noble wants—wants such as grow out of deeper and richer and more varied life. The ideal of man is that towards which nature is moving, and as we place in men's reach the means of enlarging and enriching their beings we are moving with nature. Doubtless she is secretly a good deal more interested in the development of a town full of happy, healthy, intelligent, and virtuous people, than in the development of a half dozen splendid specimens of the gentleman and lady. We must probably diminish the supply of prize specimens of man in order to improve the general stock. Let us take one step at a time.

### THE SOLUTION OF THE LABOR PROBLEM LIES IN EDUCATION OF BOTH CAPITAL AND LABOR.

Q. Then, if I understand you, the remedy is, after all, an educational one, partially, as applied to the capitalist, and still more largely as applied to the laboring classes themselves?—A. I believe the solution of the labor problem is to be chiefly found in education; education of both factors in the problem—capital and labor—though I should not count the education of one less important than that of the other.

Q. Then, if there is no legislation that can be of any use, does not the remedy lie primarily and substantially in improving the schools of the country; the public schools, the industrial schools, the normal schools, and higher schools, in their order, rather than in other directions?—A. I did not say that I thought there could be no helpful legislation; there

Digitized by Google

are many ways in which, as it seems to me, legislation can greatly help, some of which I pointed out in the body of my talk. I said that I did not think that legislation could do anything now to adjust the problem of wages. Education of the people is, however, certainly the primary question, an education which will fit men to win higher wages by doing higher work; an education of the whole man which will give labor the powers in which it can win its dues. Industrial education is the phase of education which has been of late most neglected and which needs most bringing up.

Q. But, whatever phase is developed, it requires more money?—A. Yes.

Q. And that must be got by legislation?—A. Yes, and by the increase of numbers and wealth.

Q. But do you think that there are large masses of capital that are now badly appropriated, and yet, as we ordinarily say, innocently appropriated, diverted to other uses, such as the extravagant expenditures in which many individuals indulge, as in dress, in buildings, and the like?—A. I do, sir.

### TENEMENT HOUSES IN NEW YORK.

Q. I suppose that in this city probably an expenditure of $2,500 on each of the tenement houses, whether in the form of improvements or otherwise, would give to each family occupying the house very much better accommodations than they now have?—A. Yes.

Q. Suppose, in illustration of the idea, that some one of these capitalists should erect a private residence at the cost of $2,000,000. He pays that $2,000,000 for labor in some form or other, does he not?—A. Certainly.

Q. If, however, that same amount of money were put out in the way of improving tenements at $2,500 apiece for a family, there would be the same amount of money spent?—A. Yes; while the results would be very different.

Q. How would the results compare?—A. Between the luxury of one man and the health and comfort and decency and virtue of large classes.

Q. In other words, do you think that there is any moral right on the part of the administrator of large amounts of wealth to so invest his money beyond his real necessities and comforts—those that seem to be essential to himself and his family—as to involve these extraordinary sums or sums beyond that limit?—A. I do not, most decidedly. A few years ago the question of tenement-house reform was agitated here. The papers took it up with great enthusiasm, and gave accounts day by day of what was being done in that direction. Some of the best men of business in this city were interested—not men themselves of enormous fortune—and for a time it looked as though a great change was going to be introduced. What was the result of that? No man of great fortune in this city came forward to give a lift to that movement; no man of those whose names would come naturally to your mind arose to help the effort. Although they had to invest their money, none of them saw fit to supply that crying need, even though it was demonstrated by the experience of the English, and of Mr. White, in Brooklyn, that it would make a good investment. Such is the tendency to invest money in purely speculative schemes, that the enterprise fell far short of its possibilities. One block of modern buildings has been put up, but what is one block in this city? *There* was an opportunity for men of these enormous fortunes, not to give their money away (I do not believe in

Digitized by Google

charity as the true mode of permanently improving the condition of poverty), but to invest their money in decent homes for our wage-workers; homes which should return to capital its due reward, while transforming the whole life of the poor. So feeble was the sense of social responsibility on the part of our men of great fortunes that not one of them came forward to this opportunity.

### NEITHER MORAL NOR ECONOMIC RIGHT TO MISAPPROPRIATE ONE'S OWN MONEY.

Q. Do you believe that the wealthy man has any moral right to thus misappropriate his money, any more than to burn it up?—A. No, sir.

Q. You do not believe that he has any more moral right to do that than to destroy his jewels by dissolving them in acid?—A. No, sir; and not only do I believe that he has no moral right to do so, I believe that he has no economic right to do so. There is no such thing as pure private property. No man makes his money by himself alone. Each man makes his money through the co-operating labor and skill of others. The manufacturer has his hands working with him and for him who really produce the goods out of which he makes his fortune. The trader or the carrier has the whole country working with and for him. We see this most clearly in the case of real-estate speculation. Did the first Mr. Astor make his huge fortune by himself? He doubtless had the foresight which others lacked; but what was his foresight? The vision of the hosts who would come here to build up a great city. They came and have kept coming, and *they*—the hosts of men who get a bare living as well as those who get comfortable fortunes; laborers, mechanics, manufacturers, traders, merchants, &c.—have builded up New York, and given to its land the enormous value in which Mr. Astor's lots have shared. The city has built up Mr. Astor's huge wealth. The city has not only a moral claim, it has an *economic* claim, hard and solid as his own land. It holds a first mortgage on every house of the Astor estate, which it is not charity but simple justice to recognize. And so with every other form of private wealth, though we cannot always as clearly trace the connection.

### PRIVATE WEALTH A SOCIAL TRUST.

Private wealth is literally a social trust. It is a function called into action by society for the good of the body. This matter can even be reduced to an arithmetical statement, which ought to satisfy the hardest-headed millionaire. And, lest I should be put down at once as a "sentimentalist," let me again shelter myself behind so unsentimental an authority as Mr. Edward Atkinson.

I have already quoted his remark, but its substance will bear repetition here. He showed his hearers that the sum total of the divisible amount per annum is a definite and knowable amount, yielding a definite and calculable income, when divided by the population of the land. He showed that the average annual productivity of the country represented an amount which, if distributed equally to every man, woman, and child, would give to each person 50 cents a day. And then he told them in the words which I have already quoted that by as much as any of them had more than this 50 cents per diem, some one or some ones had less, there being no alternative to such an arithmetical problem.

### SOCIETY'S RIGHT TO LIMIT PRIVATE FORTUNES.

Q. Then this matter of what you call absolute individual ownership is, from necessity, subject to some such limitation as that which may be

Digitized by Google

drawn by the law?—A. So it seems to me. Society has the right to limit the growth of the private fortunes which it really creates. If it finds them becoming excessive and so harmful, it can take measures to limit them. In such action it should, of course, proceed gradually and carefully, and in the light of the various experiments made by other peoples. It could limit the entail, devoting all over a certain amount to the state for public uses; or it could introduce a an income tax. Either of these resorts would be better than setting a limit to accumulation. That would be a dangerous experiment. We don't want to kill the goose that lays the golden egg. Indeed, I should deprecate the resort to legislation at all, until a fair experiment has been made of what can be done through the moral forces of public sentiment; an experiment on which we have scarcely entered as yet. Still, I think we might hold this rod of legislation over our great fortunes as an extra incentive to good behavior.

Of one thing I am sure. Society must either teach great wealth its duties, or prevent the handing down of these great fortunes, or even, as a last resort, their accumulation.

### WHICH HARMS SOCIETY MOST—THE PALACE OR THE TENEMENT HOUSE?

Q. Which does the most harm in society—and I ask it with reference to its effect upon the example of the classes below who are disposed to imitate what they see above them, as wealth, fashion, &c.—which does the most harm in society, one of those pestiferous tenement houses at one end of the city or the private palace at the other?—A. What do you mean by harm—physical or moral?

Q. Which does, on the whole, the most harm?—A. The tenement house breeds the most disease.

Q. Very well, which does the most harm in society?—A. I fancy that if the sum total of evil influences issuing from a luxurious palace could be admeasured; the impulse it gives to extravagance and luxury; the wasteful and costly fashions it sets; the strain it adds to the high tension of life; the temptations it thus open to business men, goaded to speculation and peculation to keep up with the "style"; the stimulus it gives to the idle and frivolous and sensuous life of women (and sensuous is not far from sensual); the inspiration it imparts to our worship of wealth; the alienation of classes it engenders by its wanton display of riches:—I say if all these and other far-reaching, subtle influences could be rightly admeasured, we might well say that a palace is more harmful to the city than a tenement house.

Take a fact which illustrates one point made above. A workingman was in the midst of a crowd that was looking at a great house lately built in this city. A person passing by observed this man, and saw his brow knit and his fists clenched. It was at the time that some beautiful bronze work was being put up. And then he heard the man mutter, "That 'll have to go to the melting pot one day." When poverty-stricken workingmen see such houses built, and near by stables for the rich man's horses, finer far and wealthier than any home they can ever get for themselves and their children, is it any wonder that mutterings are heard; the groanings of the blind sense of wrong, out of which come revolutions and anarchy?

Q. This extravagant expenditure in private architecture is everywhere.—A. It is certainly growing rapidly.

Q. I suppose you do not lose sight of the æsthetic effects of that?

Digitized by Google

### GREAT WEALTH A CORRUPTER OF ART.

A. Doubtless great wealth has always been a patron of art. There is a good side to this palace-building, I am well aware. Certainly, with the rapid increase of large wealth among us, taste in domestic art has wonderfully improved. And this is altogether good, in so far as the law of restraint is observed and art is prized for its beauty and not for its rarity or costliness. But here comes in the inevitable danger of the art which is fed from great wealth. That art is drawn aside from its simplicity, its high ideals, its just restraint, its purity and seriousness. Great wealth tempts art to work for high pay; to minister to the whims and follies of Crœsus; to pamper pride and ostentation; to stoop to frivolous aims, and to rest content with brilliant tricks; to whet the sensual appetite of its idle and pleasure-loving patrons. I am not drawing on my fancy. This is the story that all history reads. Art has always been seduced and corrupted by wealth; and then, art itself has turned procuress to the lords of hell! Athens and Venice and every other city of art tell the same tale. We have been rarely fortunate in having had in the man who, more than any other, has guided the domestic decoration of our city, a noble nature animating great artistic powers. His ideals have been the highest, and his canons of art the soundest; and he has done a vast service in starting our æsthetic progress along right lines. But how long will the early restraint be allowed by men eager to outshine their rivals? We are only in the first dawn of the art which wealth feeds, and it is too early to feel much of its corrupting touch. But this gifted genius to whom I have referred, who knew well what art was really desired by our very wealthy people, was anything but sanguine of the tendencies at work. No more severe judgment on this question have I ever heard or read than that of the man to whom our city owes so much. He knew too well with what ignorance, conceit, pride, ostentation, and folly art has to struggle when it accepts Crœsus as its patron. What do you think of an estimable family proposing to decorate a dining-room ceiling with a copy of the paintings to which the *demi-monde* look up in a celebrated café of Paris? A fine patronship of art is American shoddy! The one hope is, that it may be conscious of its own ignorance, and leave to a man who understands his vocation full liberty to do his best.

By Mr. CALL:

Q. Where do these ideas carry you? Would not that be true if one man lived in a plain house, and another in a house a little plainer, and the one that lived in the plainer house should say that he would like to live in a house like the other man's?—A. It is easy to push any principle, by mere excess, to a *reductio ad absurdum*. In every principle we must observe the golden mean. This principle is open to such a logical conclusion as you draw. But fortunately we don't live by logic. There is such a thing as common sense, and that saves us from the folly of allowing no difference between men because we have to restrain too great differences. History does not warrant us in expecting any such direful results from the principle that great wealth is harmful.

### INTEREST OF SOCIETY IN THE BEST EXPENDITURE OF WEALTH.

Moreover if great wealth only seeks to use its powers with decent regard to the rest of mankind, there is no envy felt of its luxury; while

Digitized by Google

if it really seeks the good of the community, the whole people will be proud of it. Who ever would have grudged dear old Peter Cooper the finest house he could have builded.

Q. That is another line of argument. But I want to know what harm there is in the building of that house by the gentleman you name, without reference to the question of whether he uses his wealth properly or improperly. What harm does building a fine house do? There is not any expenditure in the world that does not benefit some meritorious person, and go into the channels of employment in a proper and legitimate way, and even a beneficent way.—A. Doubtless. But if you will kindly recall what has already passed, you will find that we have discussed this point, and I have stated my views on the question. All expenditure employs labor. That is the law of the natural communism by which Dives has to feed Lazarus with the crumbs that fall from his table. But expenditures differ as widely as heaven and hell. I may, in spending money, employ labor at tasks that enfeeble its health, debase its mind, corrupt its character; or at tasks that build up body, mind, and soul. The man who patronizes a grog-shop, a gambling-hell, or a brothel employs people, and so does the man who goes to church. But there is some difference on the people employed and on society at large. It seems to me that only one-half the truth is told in the common sophism about luxury's employing labor. The other half is, at what and how does it employ labor? We have to consider the nature of the demand wealth makes, as well as the fact of the demand; its quality as well as its quantity. And then we have to consider the question, already discussed, of the moral bearings on society of extravagance and luxury, of which the palace is the type. In itself it may have employed labor well; but what is the sum total of the influence of this new departure in our American manners? That is the question.
quality as well as its quantity.

Q. You might spend your money in a liquor-shop and not do much good; but the finer the house you build the better for all classes of people.—A. Possibly. Certainly, if the house is truly fine and cultures the taste of the people. In so far as wealth stimulates true art it is doing a public service.

### ÆSTHETICISM AND LUXURY.

Q. Do you think that the æsthetic influence is good in human life?—A. Most assuredly. But it must be genuine æstheticism, and not the "Oscar Wilde" sort. And, as I have observed, I am suspicious of the sort of art that great wealth tends to call out, in the long run.

Q. That is not because of any rule or logic, that art cannot be developed out of luxury.—A. Perhaps not. But I incline to believe that the nature and constitution of things does ordain that no highest art shall spring out of mere luxury. Luxury always implies want over against it. It is, therefore, an unsound social life. And out of an unsound society how shall a sound art arise? How shall pure, high, noble visions be seen through the atmosphere of luxury, since luxury means thoughtlessness or indifference to the human suffering at its door, frivolity, or selfishness? We have pretty high authority for such a view of the relation of luxury to art in Ruskin.

Q. But Ruskin is not "gospel."—A. Perhaps not; though, as I think, whenever his ethical sense speaks he is about as near "gospel" as we often hear. But he does not stand alone.

### RELATIONS OF A DEMOCRACY TO ART.

Take William Morris, certainly a high authority in household art. His late book, Hopes and Fears for Art, is far more radical than my talk. He contends that art is made by common people; that it grows amid simple surroundings; that its defects and vices to-day are due mainly to its dependence on wealth; that if ever it is to be revived it must be in a true democracy. He distinctly says: "Indeed, I fear that at present the decoration of rich men's houses is mostly wrought out at the bidding of grandeur and luxury, and that art has been mostly cowed or shamed out of them; nor, when I come to think of it, will I lament it overmuch. Art was not born in the palace; rather she fell sick there, and it will take more bracing air than that of rich men's houses to heal her again." His love of pure art has largely driven Mr. Morris into socialism.

By the CHAIRMAN:

Q. You think that there is some moral responsibility attaching to expenditure?—A. I do.

Q. And it is a moral responsibility which it is very difficult for the law to define?—A. Very; much easier for the churches to make felt.

Q. Are there church buildings enough in this country now?—A. I imagine that there are, though I have not studied that question very much; enough, I mean, for the actual church-going population.

Q. You imagine that there are church buildings enough?—A. I imagine so.

Q. In all parts of the country?—A. Perhaps not in the newer parts, but in the great cities there are now more than can be filled.

By Mr. PUGH:

Q. When this spirit that is generated in the mode that you have mentioned explodes in revolution what is the most prominent thing it strikes at?—A. The big man.

Q. The development of wealth—of the power that they believe oppresses them is the first thing they strike down?—A. Yes; that was the story of the French revolution. Revolution is often blind, but in its blindness there is a certain instinct; at all events there is a warning for us here, as there has been for other lands. When Samson despairs he will pull down the building, even if it crushes him in its ruins.

### THE CHURCH: ITS POSITION TOWARD LABOR.

The CHAIRMAN. Men popularly known as leaders in the labor movement and organizations have been before the committee, and many of them have given testimony to the effect that evangelical Christianity is very rapidly losing its hold upon the masses of wage-workers in this country. I suppose you have studied that matter from a somewhat different stand-point. I would like to know what your views are as to that, and whether you think that is the fact.

The WITNESS. I fear that there is too much truth in this view.

Q. How do you explain that fact?—A. I explain it to my own mind partly by the intellectual movement of our age and partly by the social movement of our age, from both of which movements the evangelical churches have held back.

There is a general break-up of the old order of thought now going on—a sort of climatic change in the human mind, in which the growth

Digitized by Google

of former periods is disappearing rapidly from the world. The forms of belief of the middle ages find the conditions unfavorable for them, and are drying up of themselves; they are becoming unthinkable and unbelievable. About this fact, as a fact, there can be no manner of doubt; it is unquestionably true, and I shall not spend time in proving it.

### RELIGION INDESTRUCTIBLE.

By this change I do not at all mean a dying out of religion or of Christianity. Religion I hold to be the natural and necessary expression of man's spiritual nature before the mystery of the Power in which we live and move and have our being. The faiths of religion I hold to be the spontaneous and natural instincts and intuitions of the human soul; the affirmations it makes in the presence of the realities it fronts; the forms of its consciousness. As such I hold these faiths to be as valid as any other affirmations of human nature—as the cognitions of the intellect or the perceptions of the senses. Therefore, as it seems to me, there is no need of our worrying ourselves about the possible dying out of religion. It never has died out, except to find a resurrection in a higher form. While man's nature remains it is likely to remain with it.

### BUT NEEDS NEW FORMS.

But it may and does need new forms—new growths of thought—higher bodies of belief, in which the old spirit may live on after the death and burial of its wornout "bodies of divinity." And it is the business of the church to see that there is free play given to this natural development. If it does see it, if it changes its thought with the changing knowledge of man, if it grows with his growth, it will never be outgrown.

Now, Christianity is evidently passing through one of these critical stages of death and resurrection. The mass of open-minded, intelligent men have already made up their minds about the old theology. They find it simply obsolete. It doesn't translate itself into our speech or represent real thought and true knowledge of our age. If the fact were perceived and owned by the church, and if its doctors busied themselves in thinking the old thoughts over into the new forms made necessary by our age, all would be well. Religion would find forms in which it could live and act, and Christianity would take a new lease of life.

Instead of which the church doctors, for the most part, only repeat the old words more loudly, insist on the old thought more positively, and denounce the new knowledge as hostile to religion. They are simply driving off the intelligence of our age from the evangelical churches. And in this alienation the workingman shares. So much for that half of my explanation.

Now, as to the other half, there is a parallel story of obstructiveness on the part of the church, with similar effect.

### OUR AGE THE AGE OF SOCIAL SCIENCE.

Our age is pre-eminently, perhaps, the age of sociology. Social science—the latest born of the sciences—is felt to come as the natural head of them all. Every other study leads up to the construction of a true social order. And while it is the business of the sciences of political economy, sanitary science, the science of education, &c., to gather the materials of knowledge out of which to build this social structure, and to elaborate the plans by which it is to be reared, it is the business,

Digitized by Google

as I see it, of religion to inspire the spirit which is to energize this herculean task. It is religion's function to waken the enthusiasm of humanity, as the love of God, and to set this omnipotent force at work on the building of the City of God.

When true to itself it always has so done, and, so doing, has kept its grip of man firm and fast.

### ORIGINAL CHRISTIANITY A RELIGIOUS SOCIALISM.

Christianity ought to be by heredity a religious socialism. It is the child of Hebrew prophetism. And the most striking feature of the religion of the great prophets was that it was a social aspiration. The state of Jewish society then was a close counterpart to the state of things now existing. The old land communism of the early Hebrews had given way, and great barons were monopolizing land, and great traders were amassing big fortunes, while labor was being thrust by land and capital down into poverty and pauperism. Then the prophets began to preach such a gospel as "Woe to them that join house to house till there be no room left in the land." "Woe to them that *eat up* my people as if they were bread."

A new sense of justice and brotherliness was aroused; and when, long afterwards, the reformed religion of the prophets came into power and became the established religion of Israel, it produced the most remarkable social legislation that the world has seen—the Levitical legislation on economics. This legislation nationalized the land of Israel, and vested the title in Jehovah; forbade interest, and freed all debtors once in fifty years, when the land was reallotted. All this was to the end "that there be no poverty in the land."

Original Christianity, as we are now learning to read the secret history of its origins, was also a religious socialism.

### CONDITIONS OF SOCIETY AT THE OPENING OF THE CHRISTIAN ERA.

In that age Roman maladministration had broken up the peasant proprietorship of free Italy and developed vast landed estates, substituting slave for free labor. Rome itself was crowded with a degraded proletariat. The provinces were drained to support the luxury of the capital. Among the oppressed and discontented classes secret, underground societies were springing up, as if by magic; brotherhoods having a common meal as a sign of fellowship.

When the original gospel was preached among the poor of the great cities it acted on this mass of discontent and rising aspiration as the yeast in flour. It was told about from man to man that God had come down to earth again in the form of a carpenter's son. He had taught men to look up to an all-Father and to live as brothers. He had promised to come back from the skies at the head of legions of angels and overthrow the tyranny of man and set up the kingdom of God. Then the good time coming would come at last.

This I believe was really the secret of the quick working of early Christianity. Whatever the Christianity of philosophers and rabbins may have been, the popular Christianity appears to have been a religious socialism, such as I have suggested. The Christian communism of the early church at Jerusalem was a type of the social aspiration of the whole church.

Now, I believe that this was the real genius of Christianity, inherited from the Hebrew prophets. It was a religion that was expected to

Digitized by Google

make the world over. And in great revivals of Christianity, such as the early dawn of the reformation, about which men are thinking now, this feature has renewed itself.

If this strong social instinct had been kept alive, and the Christian church had continued to lead the aspiration of man for a better civilization, would it ever have lost its hold on men?

A sense of wrong is a mighty strong eye-wash. It will clear out a lot of sophisms which blind men's eyes.

### THE CHURCH HAS FORGOTTEN THE GOSPEL.

The well-to-do classes are not quick to see how completely the Christian church has forgotten its Master's gospel, and become the church of respectability and wealth and "society"; how it has become the upholder of civilization as it is; how it has accepted the anti-Christian dogmas of the older political economists, and in so doing really turned traitor to the ethics of Jesus Christ.

But the workingman sees all this quickly enough, his eye-sight, as I said, being sharpened by the sense of wrong. Is it any wonder that he turns away from a church that has no better gospel than *laissez faire*, no better brotherhood than the selfish strife of competition, no kingdom of God for human society here upon the earth, but only one up in the skies; a church which baptizes the kingdom of the devil with fine Christian names and asks the suffering mass of men to accept it as the will of the good Father in heaven? The only wonder is that in such an apostasy from its Lord's life and spirit the church has kept any hold upon the workingman.

### A CHANGE GOING ON.

But I believe that there is a mighty change going on in the Christian church. One sees the signs of it everywhere. Let me mention one fact. Four years ago I was asked to make a speech at the Church Congress of the Protestant Episcopal Church upon "Communism and Republicanism." What I had to say you can probably guess from my talk to-day. I expected to stand nearly alone in the position I took, counting only on Dr. Rylance, of this city, as being on that side of the question. To my surprise every one of the seven writers and speakers took very much the same ground, and the congress went in spirit with them.

### THE CHRISTIAN SOCIALIST.

Only a few days ago I came across a little paper published in London called "The Christian Socialist." It bears the name of the movement started a generation ago by Maurice and Kingsley and their friends, and is a sign of the times. The new movement in religious thought runs into the channel of a new social righteousness.

The Christian Union, which represents this movement in congregationalism, is thoroughly outspoken on questions of monopoly, strikes, &c. Indeed, the new Christianity which is coming on fast is going quite surely to find the old social enthusiasm. It will preach justice and not charity, and will inspire men to seek not so much to save their souls as to save society.

And then I have no fears about the attitude of the workingmen to the church of the Carpenter's Son.

Q. You believe, then, that one of the things essential is for the church to reform herself?—A. I do, most assuredly.

Digitized by Google

EXTRAVAGANT ATTIRE OF CHURCH MEMBERS.

Q. There has been some testimony by some representatives of these working people to the effect that most of them remain absent from the ordinary church ceremonies on the Sabbath because they are unable to clothe themselves that they can feel comfortable in church alongside of others who are more richly dressed.—A. That I have no doubt is true. Rich people are not wholly blind to this evil. I think that I have noticed of late years a sensible disposition toward a little more plainness of apparel in church. Just as people become really cultivated they get simpler; and as new wealth finds other and better opportunities of showing its "store clothes," it finds it unnecessary to go to church in order to display them.

Q. You think that the expensive and, as I have sometimes thought, the meretricious adornment of church attire has made common people feel somewhat out of place there?—A. Doubtless.

Q. Might there not be a little economy of money in that respect?—A. Certainly.

By Mr. CALL:

Q. That might interfere with your æsthetic idea?—A. I do not make a hobby of the æsthetic idea.

By the CHAIRMAN:

Q. Do you think that the æsthetic idea is best to be subserved in that way?—A. I do not think so.

Q. I suppose a bean-pole could be made as beautiful a thing as anything else, if it were properly fashioned!—A. Beautiful in its place.

---

NEW YORK, *September* 18, 1883.

Mrs. LILLIE DEVEREUX BLAKE examined.

By Mr. PUGH:

Question. Where do you reside?—Answer. No. 163 east Forty-ninth street, New York City.

Q. What position or pursuit enables you to state to the committee any facts relating to female labor in this city or elsewhere? Are you in any position, or engaged in any pursuit, that brings you into contact with the female laborers of this city?—A. I have been for a long time past very active in a great many different organizations here, and have written a great deal upon industrial questions, and in the course of my researches in the preparation of articles, &c., have collected a good many statistics, and I would like to present them to the committee.

Mr. PUGH. We should be glad to hear anything you have to say on that subject.

EFFECT OF PROGRESS ON THE INDUSTRIAL CONDITION OF WOMEN.

The WITNESS. I think that in investigating the condition of labor and education in this country, as your committee is now doing, the investigation cannot be made thorough unless the condition of women, as well as men, is gone into somewhat, and I think that perhaps gentlemen in your position scarcely understand or appreciate as much as women

Digitized by Google

do the great change in woman's position which the last century, and especially the last fifty years, have produced.

Fifty, or certainly one hundred, years ago women were occupied in a great number of pursuits which the development of machinery has now taken from them. The spinning was done by women and all the knitting was done by women. Also, the sewing was done by hand, and by women. All these different occupations and others went into the industrial pursuits of women, but women no longer have them. The introduction of steam took from them all this work, and gave them nothing in the place of it.

### RATIO OF MARRIED TO UNMARRIED WOMEN.

Another very singular result of the discovery of steam and the application of it by means of the steam-engine to the field of labor is that its universal adoption has caused men to travel, so that they have left the older civilization and gone out to colonies, and, as in this country, to new and remote parts of the world, leaving to the old civilization and more settled community a great number of women; so that marriage is not so much of an attraction as it used to be, or as it ought to be to women. For instance, in this State we have over 72,000 surplus of female population, and even supposing that every man was married, there still would be 72,000 women who could not have husbands even though they all wanted to be married, which of course all do not. One-third of all the women over 21 are not married. Marriage, then, is no longer a career for women, nor a means of support for them. We have to-day only 897,397 married women in the State, so that the remaining four or five hundred thousand women over 21 must be unmarried. Of course, these women are almost entirely obliged to provide for themselves.

It is on this account that this question of the position of women has assumed the importance that it has. It is not, as some people suppose, a question confined to a few agitators. It is not that there are a few unhappy widows or old maids troubling themselves about their position. But the fact is that there are great multitudes of women who are in a most unhappy condition from the fact that they can not better themselves. The agitation has assumed the proportions that it now has during the last thirty years.

### WAGES OF WOMEN.

All the women who are employed in this city, who are forced to earn their own living—a very large proportion of them, are earning very much less than men. In the occupation of school-teaching, for example, they get one-third or one-half the salary of men. In stores they get even a less proportion. In industrial pursuits generally women are paid far less than men. Sewing, for example, in all its branches, is not really a man's work, and must be done mostly by women. But see how it is compensated. I have found exact statistics on this subject very difficult to obtain. I have inquired of various authorities and written to a great many people, but have found it almost impossible to get reliable statistics. But it is certainly fairly within the mark to say that there are 7,000 women in the city of New York working for only $3 a week.

Of course, it is impossible for a woman to live respectably on so little money, for she has to pay that for her board alone. To-day, since I have been in this room, I have heard of a young woman who committed

Digitized by Google

suicide. She could only get work that would pay $3 a week, and she could not stand it. The other alternative, of course, is vice. That alternative is constantly presented to our young women. They are tempted to vice because of the inadequacy of their compensation. I know you will say, perhaps, that this matter of labor is a matter of supply and demand. Of course it is, but, after all, there is this about it, that without regard to supply and demand there is no kind of pursuit that a woman follows in which she is not poorly paid. A man gets a dollar a day very often for the same labor for which a woman only gets 50 cents.

Q. What proportion of unmarried females are depending upon their labor for their support?—A. Almost all of them. Of course there are some wealthy women, but they almost always marry. It is the poorer women that are left unmarried, and, besides, there are widows. I do not propose to go very far into this question, because I think Mrs. Croly, who will follow me, will give you some facts with regard to the labor of women in New York in more particular form than I could do. But, I was going to say this: I do not believe in men doing women's work or women doing men's work, except in the general way, where we all meet in common, such as writing, &c. But a man cannot, of course, run a sewing-machine—although there is one in our neighborhood who *does*—and women do not carry hods or dig ditches, but while a man gets a dollar or a dollar and a quarter a day for his special work, a woman, for the greater delicacy of perception and minute application to detail usually required in her work, gets only 50 cents a day. How can she live and clothe herself upon such compensation? And it seems to me that it is just as important for women to have food and clothing, no matter what their occupation, as it is for those who carry hods and dig ditches.

### POLITICAL POWER NECESSARY FOR WOMEN.

Q. To what do you attribute this difficulty as to the number of women who have to work?—A. I think, sir, that if women had political power they would be better situated; and it is on that account that I favor political power for women. No man cares what becomes of women. While you, gentlemen, are of course very good and kind to ladies, yet to men generally it does not matter what becomes of women. I heard the other day of a prominent politician who heard some of the testimony given before your committee with regard to this subject; and he said, "No matter what the men are, they all have votes." The women represent nothing. When they try to strike, or mass together for their betterment, nobody cares what they ask for.

Q. Do you not think that women exert a great influence on suffrage without having the right to vote?—A. No, sir; if they did, there would not be laws such as we have now. In your own State they have no property rights, I believe.

Mr. PUGH. Oh, yes; in my State, they have separate property rights.

Mr. CALL. And in mine.

The WITNESS. Well, in many States it is not so.

### LAWS RELATING TO GUARDIANSHIP OF CHILDREN.

In this State we have the most infamous law of any community in the world, I think. The children are given to the father. Such a law as that would not exist if women had votes.

Mr. CALL. That is not so when the father is a bad man.

Digitized by Google

The WITNESS. It does not make any difference. A father here, last fall, who was only a Chinaman, and not even naturalized, took a child from the mother's arms when only three days old and gave it away.

Mr. CALL. You are mistaken about the law here. That is not the law of New York or of anywhere else.

The WITNESS. That is the law, sir. It was passed in 1871.

Mr. CALL. The old English law was always that the court was the guardian of a child; that the father is primarily the lawful guardian, but that the court has the power to decide in such cases as you mention. The court has a right to take the child from the father and give it to the mother when the father is not a proper person to take care of it.

The WITNESS. The old English law was set aside here, I think, in 1860. I am sorry I have not got a copy of the new law with me. But I know it so well that I think I can undertake to repeat the substance of it: "The father of any child, though he be a minor, shall have the right to dispose of the custody and tuition of that child by his will or deed, and shall give to the person thus assuming the tuition of the child their entire rights in socage and otherwise."

Mr. CALL. You speak now of the custody after the death of the father?

The WITNESS. And by deed during his life. He can bind out the child during his life without the consent of the mother.

Mr. CALL. But that is the case of a father who is performing all his duties. What I say is, that if he is a bad man the New York law gives the court authority to change the guardianship of the child.

The WITNESS. I can only say that in the case of this Chinaman the case was brought into court by the Society for the Prevention of Cruelty to Children. The Chinaman was supposed to have killed the child; I do not know whether that was true or not. When the case was brought into court by the society the judge said to the man, "What did you do with the child?" He said, "I gave it to my brother to take to China," and the judge said, "You did perfectly right."

Mr. CALL. I certainly agree with you, if that is the fact, that the law is a bad one.

By the CHAIRMAN:

Q. What you complain of is that when neither party is in fault the mother has no control, or is not consulted?—A. Yes, I only instance that to show the necessity for women to have the ballot. But we should not have such laws if women had the ballot. However, I did not come here to discuss the question of the ballot, though I do hope that in considering the question of labor in this country you will consider that.

### WOMAN'S INFLUENCE IN EDUCATION.

Now, in regard to education the law does not give women their proper influence. We have women school officers throughout the whole State, but there are no women voting in this State, and the consequence is that it is almost impossible to get any woman on the board of trustees. Nine-tenths of the teachers in the schools of this city are women, but they have not a woman on the board of education. Yet women I think are specially well adapted to look after the interests of the education of their own sex. The education of women is one of the most momentous things that society has to consider. As long as you have to admit that women are no longer supported by those who are called their natural protectors, then, of course, you have to give them a respectable means of in-

Digitized by Google

come, or else you are apt to drive them to vice. And it seems to me that it is a paramount duty on the part of a republican government to do all in its power to so adjust the conditions of life for women as that such a terrible alternative may be taken out of their lives.

### MATRONS WANTED IN POLICE STATIONS AND JAILS.

There is another point upon which I am anxious to speak to you gentlemen. It is a question that we ladies have been very much interested in for several years. It is a crying necessity, and one that it seems to me must be met. That is the necessity of having women in charge of or connected with all public institutions where there are women prisoners or criminals. In our own city of New York, in the prisons and elsewhere in public institutions, women are entirely in the charge of men. We have here thirty-two police station houses, and a large number of women are obliged to sleep in those houses; not all as criminals either, but many as lodgers. Of course, the number of women prisoners is comparatively small when compared with the number of men prisoners. The statistics of last year show that, notwithstanding this fact, there were 3,000 men and 12,000 women that found lodging in the station-house, because women very often are obliged to find shelter who are not criminals. These people are entirely in the care of men in these station-houses. There is not a woman officially connected with any of the police stations in this city; and taking the very worst view of the subject, it is a shocking thing in such a civilized community as ours that even the lowest of women would be subjected to such a degrading necessity. For even when they have committed crimes, still we know that there must be, or must have been, a first offense, and perhaps good treatment in the first instance would render the commission of a subsequent offense less probable. From another point of view, this is a pitiable situation for women. Where a woman is arrested upon suspicion, as perfectly respectable women sometimes and indeed often are, in so large a city as New York, there is no women in the police stations to perform the necessary search. If a woman is called in to do the work it is a mere matter of grace and good will upon the part of the police authorities, and is not a necessity of the law. If a woman is taken down with sickness in the street she is taken to the police station, and there is nobody there to attend to her except men. We have tried to get a bill passed through the legislature to remedy these difficulties and to authorize the appointment of women inspectors in the police stations. Although the bill passed the legislature, it failed for want of the governor's signature. Another bill of the same kind failed for want of support from the police department in this city. In Portland, Me., there is such a matron for the police stations. In Brooklyn there is one woman, who is not, however, paid by the authorities, and has only a *quasi* authority.

Q. Is there a police matron at the New York City headquarters?—A. There is a matron in the Tombs, of course. I was going to speak of one such woman, Miss Foster, who was a most excellent matron. But there is no woman in any of the jails of this country occupying any such official position, and there certainly ought to be. I have a report of Mrs. Lord, who was on the State board of charities, in which she says that she found a horrible condition prevailing in the jails of this State, a condition that would not, of course, be tolerated if there were women in charge of the women prisoners, for she says, among other things, that the apartments of the men and women prisoners are not properly separated in many of the prisons.

Digitized by Google

She then goes on to speak of the effects of this condition of affairs. It seems to me a first principle of civilization and propriety that there should be women in charge of these institutions. Yet every time that we have made demands to have such women appointed our demands are thwarted. Of course, everybody knows that if women voted we should have all the police matrons that we wanted. Mrs. Lord and other ladies have tried to secure here a reformatory for girls. There is one for boys, but none for girls, notwithstanding the large number of young women here who are tempted to go wrong. We cannot get these things done because of our lack of political influence and power, notwithstanding the kindness of politicians and gentlemen generally, as individuals, to women as individuals. Last year, when we tried to have these women appointed in police stations, we asked but the very moderate sum of $500 apiece salary for them. There are thirty-two station-houses in the city, and we asked for the appointment of two women at each station. Our idea was that they should be able-bodied women, at least thirty years old; that is, not so young as to seem inappropriate, but old enough to have good physique and to have in their favor the presumption of maturity of judgment. Our idea was, too, that they might be perhaps the sisters or the widows of police officers, and, of course, they should be respectable people. The objection was made that we wanted so large an appropriation. Yet, with two women at each station, it would only have made $1,000 for each station, and that would make $32,000 for the whole city. The taxes of this State are paid in enormous proportion by women. Women pay one-third of the amount of taxes of this State directly; besides the enormous amounts of indirect taxes which they pay any way. The men asked for an appropriation of $700,000 to increase the salaries of the policemen and others, and they got it; we asked for $32,000 to protect our sex, and we did not get it.

## WAGES OF WOMEN.

I have here a little memorandum about the prices paid to women in this city for their work. I got these facts from the Working Women's Protective Union. I think there is a representative of that union here this morning, who may go more at length into the subject of the work of that association. I find that women are paid 3 cents a dozen for making button-holes. Now, no matter how badly the button-holes are made, it must take some considerable time to make a dozen of them, and they are certainly worth more than that price.

By Mr. CALL:

Q. How much can a woman make in a day at that rate—that work is done by machine, I suppose?—A. No, sir; it is done by hand. Some of them are clever enough to make ten dozen a day, but at that rate even, for that large number, the compensation is extremely small. Then, for making shirts they get 35 cents a dozen. For good shirts—shirts of the better quality—they get 8 cents apiece, and a clever woman can make a dozen a day. But the average which these women earn is from 30 to 50 cents a day. The difference in wages received by men as compared with that of women was very well shown in a recent article by Mr. Elliott in the North American Review. He said that the average wages for men was $15 a week, while the average wages of women was only $4 a week. Just think of it!

Q. How many hours a day do they work?—A. I was supposing that they worked ten hours a day. Now, it seems to me that if you gentle-

Digitized by Google

men would recommend the appointment of women for these official positions that I have referred to in the police stations and jails throughout the whole United States there would be then one very grave defect remedied in the application of our criminal law. The same principle should be applied of course in the case of the asylums for the insane and of public institutions having the charge of women. The details that have been given to me of the mismanagement of some of the county poor-houses and jails and other public institutions of that sort have been most terrible—things that can scarcely be spoken of, which could have been prevented had those places been in the charge of women.

Mr. PUGH. Those are matters under the sole control of the State legislatures.

The WITNESS. Of course that is true, but I presume you gentlemen have a broad scope for your recommendations. Even in the District of Columbia, where you have the power, you could appoint police women there, and that would set an example which might be followed throughout the entire country.

The CHAIRMAN. And Congress might extend the rule to the Territories as well.

The WITNESS. Yes.

The CHAIRMAN. And to all prisons where United States offenders are confined, and they generally are confined in the prisons of the States.

The WITNESS. For all violent crimes, I think, there are only about three women convicted to one hundred men. The statistics I have show that; that is, to-day, including burglary and every form of violent crime. For the desertion of children the difference of percentage is still greater of course. Women almost *never* desert their children.

## LEGISLATION REGARDING WAGES.

I have heard of your committee receiving a good deal of testimony with regard to the labor question generally, and it has been said that legislation should ameliorate the condition of the laborer. If that should be done, there is no reason why, if you gentlemen are going to suggest any measures of amelioration, you should not suggest some direct legislation looking to the better payment of women for their work; that is, where women do equal work with men. In the Departments at Washington women are not paid as well as men for the same class of work.

Mr. Spinner, formerly Treasurer of the United States, and other gentlemen have testified fully to the efficiency of the women employed by the Government, and they are paid very much less than the men. Among telegraph operators, as we have all lately had occasion to learn, men are paid very much better wages for the same class of work.

By Mr. PUGH:

Q. If the suffrage is any remedy, do you not think that there is already a good deal of neglect among men in not enforcing this remedy in the case of their own rights—the fathers and brothers and male relatives of the women?—A. Well, I think that if all you gentlemen should resolve that the women should have the right to vote we should have it very soon.

Q. I mean that this right of suffrage now exists in the fathers and brothers and male relatives of these women, and if the remedy lies, as you say it does, in the right of suffrage for women, do you not think that the men ought to exercise that right in the remedy of their difficulties, if legislative provisions would be a remedy?—A. As I have

Digitized by Google

just said, the larger proportion of these women who are earning their own livelihood and are suffering most have no male relatives. They are not married, and have nobody specially that they could influence perhaps in any direct way. We have, of course, men in every legislature who are willing to attend to the interests of women, and even generously so, where matters have been brought prominently to their notice. But I do not think men feel the interest in this question that women do. That is natural. You do not find the capitalist taking that interest in the laboring class that the laboring class feel for themselves. So it is with men and women. If you gentlemen occupied our positions and were disfranchised for a simple physical cause over which you have no control, simply because you had blue eyes or black hair, why you would call meetings and express your opinions and have a great deal of feeling about your position. Why even with regard to the disfranchising of the black men because of the color of their skin every white man was protesting. We women are the descendants of the founders of the Government; we have contributed our money to its support; we are law-abiding citizens, and yet we have no voice in that Government. I think that is rather hard.

Q. Have you finished all that you desire to say on this subject?—A. Yes, I have, I think.

By Mr. CALL:

Q. Have you any other facts in regard to the present condition of the laboring women of the country?—A. If you mean special statistics, I have not just at present.

Q. You think that as a general fact the industrial women of New York receive inadequate compensation?—A. Well, I notice that they pay the school-mistresses very much less than they pay the school-masters, and it is so through all the other occupations. The women among the telegraphers were paid very much less. In all occupations where women work side by side with men the women are paid less than the men.

### EMPLOYMENT FOR WOMEN IN THE CIVIL SERVICE.

Q. Have you given any attention to the opening up of new industries and employments for women?—A. Yes, that is being done all the time. Therein is one of the wrongs in their present positions. They are cut off from a vast number of employments. The civil service of the country should be open to men and women alike. I think that the new civil service act does give more help in that direction, and yet I saw the other day, that in examining people for the civil service they examined women only for women's special departments. If the entire service was open to women I think it would be a great improvement and help women. And when I say that I do not mean it to apply merely to the Departments at Washington (the Treasury or the Post-Office Departments), but I mean that it should include the whole civil service of the country, in contradistinction to the military service. So that my idea would include, of course, legislative and judicial vocations. If women had access to all these things (which they cannot have as long as they are not voters)—they should fill these places, and then there would not be this rush for the places to be filled by women in outside positions in life.

Q. But you are aware that you would not really get much relief by getting offices as a means of support for women, since the offices of the country are very few compared with the wants of the great mass of

Digitized by Google

people?—A. I saw an elaborate article in the New York Times which said that there were 600,000 men in the employ of the Government.

Mr. CALL. If the positions were divided equally between the men and the women it would give 300,000 positions to the women; that is your idea?

The WITNESS. Yes; that would be fair. There are 300,000 school-teachers in this country now, and if the school-teachers left that business and went into these other occupations the compensation for school-teaching would rise.

Q. Then you would open the whole civil service to women?—A. Yes. I would have the system based wholly on merit, pure and simple, and not upon sex.

Mr. CALL. I do not know anything that keeps women out now. There is nothing in the law which requires it.

The WITNESS. Perhaps there is not, but as long as women have no political power no politician will give them any office. It was said as soon as Mr. Arthur got into the Presidency that no women were going to get office, but that was promptly contradicted.

Mr. CALL. I think the President would be a man of very poor judgment to oppose the women of the country.

The WITNESS. That was telegraphed over the entire length and breadth of the land—that no more women were to be employed in the civil service, and yet, with all our newspapers, not an editorial was printed denouncing the statement; whereas if the President had said that no colored man or Irishman was to be appointed you can hardly imagine the number of editorials that would have been printed on that subject, denouncing it as a great wrong.

Q. Do you really think that the women of the country are not really a great political and moral and social force as they are without the suffrage?—A. Well, if you had a political mass meeting somewhere, and you found that the attendance was composed nine-tenths of women and one-tenth of men, would you feel as well satisfied as if the proportions were reversed?

Mr. CALL. I think I would. I think I would rather have the women on my side than the men.

The WITNESS. I have no doubt that women exert an influence. The part they took in the Frémont campaign shows what power they can exercise in certain circumstances. At the same time any man knows that a mass of women getting together exerts no such power as a mass of men, and their wishes are not attended to so well.

By the CHAIRMAN:

Q. Do you think, Mrs. Blake, that women know enough to vote?—A. Well, I think a few of them do. They tell a story about a man in Michigan who heard of a meeting to which people were going; somebody had handed him a notice about this meeting, and after looking at the notice, and showing that he could not read, he said to the person who handed it to him, "What is this about?" and the reply was, "It is a meeting in favor of giving women the vote;" he smiled contemptuously and said, "Why, women don't know enough to vote." Of course, I do not expect that giving women the right of suffrage would remedy all the trials and troubles that they now have, but I think it is a matter of justice and honesty to give women, who certainly are a part of the Government, and who pay taxes, a fair chance in life. That is all I ask for. They have duties of course, sometimes, that would interfere with their participating actively, but they ought to be given the opportunity.

Q. Can you give us any idea of what occupations a woman may re-

Digitized by Google

sort to for a living in case she becomes dependent upon her own exertions for her livelihood?—A. Well, there are now quite a good many occupations open to woman; but, of course, it is not the thing for women to be always sewing, and always school-teaching, and always keeping a boarding-house. Telegraphy and stenography and occupations of that kind are now open to women; but the women are of course paid much less than men. There was an instance of what I call great cruelty shown here a short time ago. A young woman was discovered to have disguised herself as a man, and she was detected, and was condemned to six months' imprisonment on Blackwell's Island—simply for dressing like a man; and she gave as a reason for thus dressing the fact that she could earn disguised as a man $9 a week, while as a woman she would only earn $4.

Mr. CALL. I think that was an outrage.

The WITNESS. It was indeed a great outrage, because the dress was worth $5 a week to her.

By the CHAIRMAN:

Q. It more than doubled her pay?—A. Yes. Really in this country you may almost say that it is a crime to be a woman. In fact the indictment in her case said that she "wore man's clothes, she being a woman," as if the offense which she had committed was that of being a woman. Everything that a woman does, if she tries to enter into competition with men, she must do not only as well as men but better. If a woman only does as well as a man she finds more criticism than is given to men. Of course, I do not mean to say that women always do their work very well; but at the same time there is a disposition to pick all the flaws possible in her work and in her conduct. If a woman, for example, had built this post-office building we should never have heard the last of it. You know how it was built; they had to put another story on after it was completed.

By Mr. CALL:

Q. Why should not a woman be a good architect?—A. There is no reason why, except that probably she would get no employment, or very little. There is one woman architect in Chicago, and there are several others now springing up in the country.

The CHAIRMAN. Is there anything else that you would like to state to the committee?

The WITNESS. I think not, sir; only I think that the committee ought to recommend that women should be paid equally with men wherever they do the same work, and wherever Congress has control of women's wages, and that, for that matter, they should be paid equal with men throughout the whole country.

---

NEW YORK, *September* 18, 1883.

Mrs. JENNIE CUNNINGHAM CROLY examined.

By Mr. CALL:

Question. Will you please state your residence?—Answer. No. 171 East Seventy-first street.

Mr. CALL. You may state to the committee such suggestions or opinions as you think proper regarding the subjects which we are investigating.

WORK THE BEST THING IN THE WORLD.

The WITNESS. I should like to say, in the first place, that I always was sorry to have work put in the position of being apologized for or

Digitized by Google

helped. In my life I have always found work to be the very best thing that there is in this world, and I do not think that it needs to be either helped or apologized for, whether for women or for men. In its normal condition it is the most beneficial and the most healthful thing that we have in the world; therefore, I like to have honor and dignity conferred upon work, or at least acknowledged in work, and not always have it put in the position of defendant. I would like to say also that I consider any legislation which discriminates in any way between men and women as workers creates obstacles which hinder and impede both men and women. It does not help them. Class legislation is not what work needs. What work needs is preparation.

### THE HARDSHIPS OF WORKING WOMEN.

I should like to say, too, that the peculiar hardships of women in this country are, I think, threefold: First, that they have not been trained to work for pay; second, that when forced into the labor arena they not only have to support themselves but to make up for the short-comings of some man; third, I should like to say, too, that a peculiar hardship in this country in the way of labor, both of men and women, is the high prices and the poor quality of so many of the articles that their money, earned by hard labor, has to purchase.

### EDUCATION FOR WORKING GIRLS.

To improve the condition of working girls I would raise the standard of useful work by education and special training. I would make the education of the common school compulsory. I would supplement this common-school education with technical or industrial schools, where they would be made thorough mechanical draftsmen, engravers, modelers, designers, dress-makers, embroiderers, laundresses, cooks, and tailors. I would limit the public high school to its normal vocation of training teachers, and give the useful arts, upon which the health and prosperity of the nation depend, as much chance as the single vocation of the teacher. This single vocation has heretofore received all the benefit of the public purse, and it has therefore become overcrowded, while the trades are supplied by men and women from abroad.

### TRAINING IN THINGS INSTEAD OF IN WORDS.

The training of the hands and the training of the eye is as needful in life as the training of the memory, and one is as much a duty we owe to our children as the other. In short, I would reorganize supplementary education, at least make it a training in things instead of in words. Above all I would teach work as something to be rejoiced in, not to be gotten rid of; the pride of the world, not its badge of disgrace.

### HOMESTEADS SHOULD BE INALIENABLE.

To help women permanently I would make the homestead in city or country inviolate, inalienable for debt, and not subject to mortgage. I would make it the absolute property of the family, and vest it in the wife up to a certain rate of value, say $10,000 in the city and $5,000 in the country. This would place the home upon its proper footing as an essential element, a potent factor in all civilization, and as lying at the base of all possible government. It would in effect "moralize" our sys-

Digitized by Google

tem of politics by introducing into it an element of justice which it now lacks, and a recognition of the best things in our lives—the one which offers the best guarantee of stability and true growth. The State ought to recognize married men and women as more than mere individuals—as a complex body called the family—and it has a right to protect itself by exacting a measure of protection for the children of this family in the shape of a home that cannot be wrested from them. I think, also, the formation and maintenance of a homestead by a woman, married or single, should be acknowledged as a qualification for citizenship.

RECOMMENDATIONS FOR IMPROVING THE CONDITIONS OF WORKING WOMEN.

To summarize these points I would first make elementary education compulsory. Second, beyond this, public teaching should be technically a preparation for earning an honest livelihood, thus filling the gap between ignorance and mastery. Third, a valuable element in education is raising the standard of useful work. The majority must live by work and ought to be trained for it—ought to be taught to think more of work itself and less of its rewards. Fourth, the value of the home and of the family should be recognized by making the former inalienable for debt or by mortgage. Fifth, the responsible headship and control of a homestead should be a qualification for citizenship.

Q. Have you had opportunity of observing the conditions of the working women?—A. Yes, sir.

DIFFICULTIES OF WORKING WOMEN.

Q. Please tell us something of the difficulties that women encounter in the manner of their lives and in the expense of living.—A. The difficulty of the working girls in this city is because there is no relation between the money that they can earn and the supply of accommodation; that and one other; the principal hardship which they suffer is from the fact that they are not able to leave their miserable homes. It is as I said; the working girls of this city are not in a normal condition; they are not the natural outgrowth of the needs of the country; they are forced into the labor arena by the short-comings of some man, by the drunkenness or laziness of the father or husband. You see in that case it is not a normal condition. They have their work at home; they have the requirements of a household very often when married, and the girls have nearly always to turn the larger part of their wages into the home to sustain the mother and the rest of the family. That is the case with nine-tenths of the poor working girls of this city. They cannot accept even gratuitous homes that could be made for them because their little means are required to sustain the family at home.

WORKING CONDITIONS IN EUROPE AND AMERICA CONTRASTED.

It is not as it is in other countries, where labor for pay is the normal condition of the whole family, where the children are put to work as soon as they can begin to earn money, where they take some little branch of their father's trade and work at it. Here, if a man is a hard, industrious working man he is ambitious for his family. He wishes his family to be better than he was himself. He wants to educate them better. He sends them to school; above all, he sends his daughters to school as soon and as long as he can; but when he cannot do that any longer,

Digitized by Google

when the girls are forced out, the conditions are doubly hard for them; it is the strain at home and the strain abroad, added to poor food and no comforts; no supplies necessary for strength and not even enough for warmth. These are the conditions that make it so hard to bear. I have myself seen whole families die off. I have seen the five daughters of one family die off, one after another, simply for the want of food and proper accommodation, whose little means of $5 a week were taken to their mother for the support of the family, and very often these were absorbed by the father in drunken freaks. I mention that as one instance. We very often think that those are isolated cases, but they are not isolated in this country or in this city. The normal condition of the working women, of course, is doubly hard because they have the strain upon them, as I have stated, both in their work and in their home. They have to buy, at high prices, poor articles, and have to pay very high prices for such accommodation as they get, for meats and everything that they need, for which their money is expended, while all the time the pressure from the outside is to reduce their wages and to make the circumstances so hard for them that they can hardly live.

### WAGES DEPENDENT ON SKILL.

The wages of girls in this city are, of course, graded by their skill; and that is why I place so much importance upon the training of girls in these trades. It is a curious fact that to-day, while girls are starving, while they are making miserable pittances by making shirts and overalls and doing slave work for $3 a week, yet if they were trained to labor they could earn from $10 to $15 a week. There are plenty of places that are open to women that they cannot fill. I myself have had a great many opportunities to put women in places, but I could not find the trained women.

### TRAINING WANTED BY WOMEN.

It is training that we want for our girls and women in order to make them able to support themselves. I disagree with Mrs. Blake in her comparison between the laborer at $1.25 a day and the sewing woman at 50 cents per day. The sewing woman earns 50 cents per day because she cannot sew; the washerwoman earns a $1.25 per day because she *can* wash. Wherever a person can do anything, can *do* it in a proper sense, they can always earn a living by it; they can always get a certain amount for it; but, I do not approve of encouraging women or girls to think that because they can only earn $3 a week it becomes, therefore, only a question between starvation and vice. One can live on $3 a week a great deal better than one can die morally, whether for more or less.

Q. What is the cost of renting comfortable rooms such as are ordinarily rented or suitable for people of small means?—A. Within a few months I have had interviews with a great many working girls, because I have been writing a number of articles in regard to the way we live here in New York, in regard to the methods of living among the working women.

By the CHAIRMAN:

Q. Where are those articles published, please?—A. I have one of them here, and I will, if you will permit me, read you what a working girl herself told me.

Digitized by Google

## STORY OF A WORKING GIRL.

An intelligent cigar girl, recently on strike, said that of all the girls she knew, who had grown up with her and worked with her, the worst off were those who had married, for they had, almost invariably, to support the family, and suffer abuse and ill-treatment besides. This young woman is perhaps twenty-five or twenty-six years of age; she is by no means ill-looking, and is one of the most sensible and thoughtful of her class. She has always, as she says, had a comfortable home. Her father was an honest, industrious man; her mother a kindly, home-loving Englishwoman, who cooked, and washed, and ironed, and took the best care of her family. When the husband died she took in sewing and washing, and kept the children together, with their help, till a son and daughter married, and then the mother and only remaining daughter lived together, the daughter supporting the mother, and the mother taking care of the daughter, doing the little housework and all of the sewing, and occasionally helping by doing something in the way of sewing or taking care of children for a neighbor. "I never knew what it was to hear an unkind word," said the girl, when she related to me this little history, "and mother was never tired of doing anything she could to give me pleasure. I would far rather have had to support her than not all my days, and since she has been gone I still live alone and keep house, for I can't bear to part with her bits of things, and I feel more independent like in my own room, where I can come and go just as I please."

### COST OF HER SUPPORT.

"How much does it cost you to support yourself in your room?" I asked. "Well," she replied, "I have two little rooms in a rear house, but it's clean, and one of them has a window as looks out where it is quite fresh and pleasant. For these I pay $6 a month, and my living, I reckon, costs me, what with coal and wood and light, about $4 a week." Your washing, then, I remarked, would bring your weekly expenses, without extra fare, clothing, and the like up to $6 per week. "I do my washing and ironing myself," she said, "on Saturday afternoons, but you may count it $6 all the same, for it comes to about that."

### HER EARNINGS.

"How much are you able to earn, then, at cigar-making," I inquired. "Well, cigar-making used to be a pretty good business for first hands," she replied, with a pleasant look, at the thought of those old times. "I've seen the time when I could make $12 and $13 a week at cigar-making; but you can't do it now, and that was the reason why we struck; it was not for a rise; it was to have the superintendent back as was good to us, and give the girls some chance as well as the bosses."

### DIFFICULTIES OF HER WORK.

"How did the change of superintendents affect your interest," was asked. "Well, you see, we had been getting 80 cents a thousand, and a smart worker can make 2,000 cigars a day, counting a day from 7 o'clock in the morning till half past five in the afternoon, with half an hour for dinner, which is a regular ten-hours day. But sometimes, when we are very busy, like now, we'd have to work till 9 o'clock at night, and then we'd make 2,500, may be, and earn $2 in a day; but that would only be for a little while, and we could not do it for long. Besides, we never get the full count; if there is the least little flaw the inspector throws it out, and these do not count at all; but they always go through another sorting, and more than half of those that have been thrown out and are not counted in the girl's work are counted in as good all the same. Our superintendent and his inspector were very good to us; they didn't throw out unless there *was* a flaw; and they looked out that the tobacco was in good condition for rolling, neither too dry or too damp, for this makes a great difference in the doing of the work; so they made up their minds that this superintendent was too good and too much of a gentleman, and they discharged him and put a regular rough in his place, a man who bullied the girls and never spoke a civil word in giving an order, but just swore at them; and when he found how much the best hands could earn he cut the prices down from 80 to 65 cents a thousand and threw out at such a rate that the loss of pay went up from $1 to $2 a week; you see $1 a week out of each girl's wages, where 500 girls are employed, mounts up to $500, and is an item, but it cuts the wages of the girls down to a little over half what they used to be, and a good many of the best girls have given up the business. I think I'll give it up myself, for I can't earn enough to keep myself in a home of my own, and I don't like boarding."

Digitized by Google

### THE MANNERS OF ROUGH WORKING GIRLS.

Subsequently I asked her how it had happened that she had not married since her mother's death. Her reply was characteristic. She said, "Men was too sassy." She woudn't mind so much supporting a man for company, but she didn't want to be abused for it." A good deal of the slang among the rougher girls, who work with men, is the same as that commonly used by the rudest men; but it would give a bystander, who might be shocked by it, a very false impression, if it were supposed that they were moral delinquents, and not abundantly able to "take care of themselves" They pride themselves on being "tough," able to "give as good as they get," but it is the universal testimony of men themselves who work in these shops that it is not these apparently rude and aggressive girls who fall; it is more frequently the gentle and timid, who crave affection and companionship, and must take them in any form in which they can get them. The manner of the majority of the girls is derived from their often dreadful associates and surroundings. Even correctness of language would be looked upon as "airs," and punished accordingly. Yet that appreciation, and even ambition for a different life exists in common with rough habits, and almost brutal surroundings, there is sufficient evidence. In one of the worst neighborhoods in the lower part of this city there live in two rooms three girls. Dens of wickedness are on either side of them and over the way, and the girls themselves would perhaps be taken by a superficial observer for specimens of the lowest order. For they can swagger, and even swear, and "talk back," but if rude words proceed beyond their limit they would not perhaps hesitate to hit back, and hit "straight," for no man who knows them in or out of the shop but respects them for all their free talk, and is well aware that they "don't stand no nonsense," and that they "know how to take care of themselves." The girls work in a type-foundry, and earn from $5 to $7, and $8 per week. Their father died in a drunken fight; their mother, as soon as they were old enough to do regular work, they relieved from outside labor, keeping her at home, "like a lady" and maintaining also a brother at school. Upon this brother their hopes and ambitions rest, and they are devoting all their young lives to him. Their mother died, but they retain their home, such as it is, and, inside, it is home to them, after all, and they have educated their brother at a high preparatory school and now at a medical college, for he is to be a professional man and a gentleman, and he is to be made so by their labor and sacrifices. Will he remember and not be ashamed of the sources from which he derived his inspiration and opportunities?

### HEROISM OF WORKING GIRLS.

It is almost a hopeless task to present in one brief paper even a glimpse of the heroic lives which are to be found behind the dreary and common-place exteriors of many working girls' homes. Doubtless these are, in some of their details, exceptional; but the girlhood which grows up to young womanhood in the dark and cheerless places, the youth which knows nothing of beauty and brightness, the age which has no loving, cared-for past or restful future, these are not exceptional. Meeting with individual cases which present features of great severity, we are apt to think that these are unusual, until more intimate knowledge proves them so common as to have become commonplace and incapable of exciting sympathy. A quiet girl, employed in a foundry down town, attracted attention simply because of her reserve, her extremely gentle bearing, and freedom from the usual defects of loud talking and free manners. She proved to be the daughter of a man who came to New York after a fire which had destroyed his home and business, ruining him financially and, as it proved, mentally. The family struggled along for awhile, the daughter being the chief dependence. Then one by one two younger children died and were soon followed by the mother, who was worn out by grief and want of nourishing food. The repeated shocks prostrated the father, who had been able to find no steady employment, and he became an imbecile, dependent entirely upon his daughter, not only for support, but for care and protection. This daughter has, through all the years of her youth and young womanhood, since she was fifteen years old, worked in a shop and supported the family on her earnings of $7 per week. At the same time she has spent her evenings and early mornings in doing the work of the poor room they occupy, her nights, many of them, in nursing and tending the sick, and days in one eternal round of hard mechanical work. She is now more nearly broken down than at any previous time in her life, for her father is a constant anxiety as well as burden. She must have a place they can call home, because that is the only way they can live, and she cannot relinquish her steady hold upon the hard routine of her life for one day, one hour, or one minute. Talk to this girl about two weeks at a "seaside home!" One of the terrors of her life, though she can hardly drag herself to her shop, is that she may be deprived of her work.

### PHYSICAL STRENGTH AN ELEMENT IN WORK.

The silk manufacture of this country is of comparatively recent growth, and the papers frequently contain congratulatory paragraphs concerning its rapid development and future prospects. Already it has built up the fortunes of manufacturing firms engaged in its production and enlisted the labor of thousands of operators, the majority of whom are young girls. The work requires constant standing at a loom and incessant activity in manipulating threads; the standing behind a counter with the counter to lean upon, and the body exercised easily and in a diversity of ways, is nothing to it, yet a crusade was organized in favor of seats for the shop girls, while no one dreams of making a protest for the benefit of the loom-tenders, the silk weavers, carpet weavers, stocking weavers, woolen-cloth weavers, and others. Why? Because we do not see it, and do not realize it, and also because bread is the first necessity of life, and bread must be had by whatever hard and cruel means it is obtained.

People, particularly girls and women, who are naturally inclined to accept whatever falls to their lot, can "get used" to almost anything, but sometimes the flesh breaks down, even though the spirit be willing. The pay for weaving a yard of silk is from 7 to 10 cents, and an expert operator can weave from 10 to 12 yards per day; less skillful hands do not average so much, and wages range therefore from $4 to $8 per week. A young Russian girl, well brought up, tenderly reared, with property in her own right, left her own country and her possessions because, upon the death of her parents, she was tyrannically controlled by a brother and an aunt, and because she had become an enthusiast of republican ideas. She was willing, in her own words, "to go anywhere, and to do anything to be 'free,' and to say the words that were in her own mind." She arrived in New York with a party of thirty of her countrymen and countrywomen. Their dreams of a new Atlantis and of a model community in the New World were somewhat rudely dispelled, and a number of them returned to their native land. But the remainder resolved to stay for a few years at least, and see what there was in this land of promise which would be worth garnering and taking back to their own countrymen and countrywomen. Among the remainder was the young girl alluded to. They had made common cause and common purse. She obtained work in a silk factory, earning $4.50 per week, and living in a little attic under the eaves, and with only a skylight, that she might divide with those who were not earning anything. The work, to one unaccustomed to manual labor, was almost impossible. She suffered tortures from the heavy, incessant movement, the noise of the looms, and the standing from morning till night, with half an hour of interval for rest and dinner. At the end of four weeks she broke down, but rallied and went to work again. She can better sustain the difficulties of her position now, but she is not of the kind who will ever quite get used to them, her sensitive organization and more delicate bringing up precluding such a possibility. The one strong reason she gave for endeavoring to overcome the hardships of this species of mechanical labor was that it was "clean," which she remarked was so "all-important" to her.

### PERMANENT, NOT TEMPORARY, MEANS OF ADVANCEMENT WANTED.

I could go on multiplying instances through a volume, for the class is so numerous, and they are re-enforced from sources so wide and diversified, as well as by the ever-increasing pressure of the labor-seeking millions who throng to these shores, that it must forever increase instead of growing less. What is needed, therefore, for their benefit is not temporary help so much as permanent means of advancement, higher ideals for the majority, associative effort for strength, protection, companionship, and a social life, brightened by all gracious influences. They need to be inspired by self-respect and a knowledge of their own powers and possibilities, by a consciousness that instead of pariahs they constitute the best elements of society, according to the excellence of their work, and the courage and constancy, the truth and honesty they put into it. It is an infinite pity that all the appeals that are made to them, nearly all the evidence of sympathy that reaches them, come in the shape of demands for wages and cutting down hours of labor, irrespective of the work or worker. This has a distinctly detrimental influence; antagonisms are fomented, there is no enthusiasm for work, or the attainment of excellence, and the only object set before any employé is to do as little and that as poorly as possible for the money he or she receives. This is immoral, and the results are as bad for employer as employed. It is not a question for the conscience of the worker whether the work is sufficiently paid; it is whether it is well done, and the conscience must be cultivated as a basis of permanent advancement, whether by those who labor or those who employ labor.

### A GREAT MISSION FOR WEALTHY WOMEN.

"Wealthy women, educated women, socially protected women have a great work lying right at their doors, in the isolation and needs of these armies of poor working

Digitized by Google

girls and women. Is there any reason in what either do, or in what they are, why one should walk always in darkness, the other always in light; why one should enjoy all the sweet, the other all the bitter; why one should know the earth only as a driving wheel, the other as a garden of exquisite delights? The conditions are perhaps not so wide apart as they would seem, for in work there is compensation, in all idleness dreariness; but conscientious endeavor on the part of those who hold the power in their hands would build a bridge, over which angels might walk from one to another, bringing to one light and warmth, beauty and enlargement, and to the other elevation of character, which comes from a knowledge of duty and its performance."

By the CHAIRMAN:

Q. What have been your opportunities for learning of the condition of women in New York and elsewhere?—A. Thirty years of work among them, sir.

Q. From the very proper and eulogistic manner in which you speak of work, you have no objection I presume in telling us what kinds of work you have been engaged in?—A. I have been a writer for newspapers and I have been an editor and journalist all of that time.

Q. Will you state to the committee the name under which you have usually been known to the public?—A. I have no objection to stating it, though I do not feel proud of it, because it was a young name and was intended for a young girl and not for an old woman. It is "Jennie June."

The CHAIRMAN. You may permit others to be proud of it, however. I should like if you would state to us a little more at large from your experience and observation what you have come to know of the actual condition of the working women of this city, and if there is any under side to their life give it to us a little more fully.

### ONE GREAT NEED OF WORKING WOMEN: TRAINING.

A. The under side to the lives of the working woman of this city seem to me to come from the lack of two or three things. One is, as I have said—and I have mentioned it in the little memorandum I have made—I think elementary education ought to be compulsory, because girls now are put into work as little cash girls in the great business houses of this city when they are scarcely able to come, when they are certainly not strong enough to stand on their feet all day and run around, when they ought to be in the home or school-room; they are made little "exclamation points" of business; they do not know anything but just "Change!" they do not know anything but how to get change for a dollar, and when they grow up in life what kind of women are we to have in the future out of such little girls? I think, therefore, that education ought to be made compulsory up to a certain age. Then there ought to be, I think, industrial schools, and I think, above all things, we ought to have those girls trained for sewing—the thing that they despise so much. We have to pay $25 to have a dress made because we cannot get anybody but what is called a "first-class dress-maker," and these first-class dress-makers are never American women, but are women from over the water, who spoil the material while our own women are not trained to make dresses. We want tailoresses, but we want them trained. The great work of the world for women is always crying out for *trained* women, and the school ought to put into their hands the means of livelihood, and so not leave them at "the mercy of the winds and the waves." There is another point: when the conditions are normal; when you have a well-trained woman, who can do skillful work, I do not consider that she is pitiable when she has got to work, but I consider that

Digitized by Google

she is happy. Work, to a well-trained woman, is a happiness and supplies the place of a husband. She can get out of her life just as much as a man can, provided she can earn the money to pay for it, and she can do that if she is paid for it. On the other hand, there is this large class of girls as to whom, even if they were trained, there must be a large number of them who ache for a great deal that they cannot put into their lives, that they cannot get.

ANOTHER NEED: THE SYMPATHY OF THEIR KIND.

It is not the province, I suppose, of this committee to deal with the point that I am now going to mention; but I think it is a great lack that our rich women do not understand their duty and do not fill this gap between themselves and this great mass of working girls. We ought to have a ladder stretching from here to Heaven, and have these women walking up and down continually, like a Jacob's ladder, so that those at the top and those at the bottom shall be brought into close contact. What the working women need above all things is friendship, sympathy, and acquaintance. It is hard now to get into their confidence, because they have a bitter feeling toward women who have better opportunities than they; but when they are reached there is a mine in them. They are just as good and true and tender, and as desirous of doing the best things if they only knew how. There could be so much that is comforting put into their lives and got out of their lives if women who can do so would only help them to reach it.

PHILANTHROPY MERELY PERFUNCTORY.

There have been little spasmodic efforts made, but it cannot be done in that way; it must be done in a larger and broader way; and if the Government in our country only showed some human interest, if it only showed that it has something else at heart beside the success of an election, it would help largely to cultivate human sympathies. As it is, all our philanthropy is perfunctory. It is all adapted to the special wants of some particular interest. It builds up institutions of brick and mortar, with strong walls and fine floors and high ceilings perhaps, but it simply ends in being a little asylum for the relatives of the founder or of somebody interested in it. It does not reach the cases that need help. If you find an individual case of want you probably cannot find an institution that helps it.

By Mr. CALL:

Q. Do I understand you to say that there is no charitable institution here where you can apply for help in cases of individual wants?—A. I should be sorry to say that, but I mean that I myself have never found one that could reach the particular individual that I wanted to help.

FEW RECREATIONS FOR WORKING GIRLS.

By the CHAIRMAN:

Q. As to the large numbers of these poor girls that you speak of, what opportunities are there for them in the way of recreation, in the way of reading or any of the ordinary pleasures or relaxations in life—what is a girl going to do if she has half a day of spare time?—A. Well, in the first place, such girls do not care much about sitting down to read. If they have half a day of spare time they want to get out of doors, they

Digitized by Google

want air. These poor girls do not see daylight only a little while perhaps on Saturday afternoon or on a public holiday, such as the Fourth of July, or occasionally on a Sunday; in all probability not even then. In all probability they are required to spend the day at home doing something for somebody. The great trouble, is as I have said, that they have their home duties as well as their outside and public duties. Earning a living is not much. Almost any body can earn a living, and earn a living for themselves. But the difficulty is, they have to earn their living and do the work at home besides. These poor girls when they get home are worked almost to death. I think that the training of women is so important in their own lives because they need all the help they can get if they have to earn their own living. The physical organization of women is more complex than that of men; they cannot endure the long strain with the same ease that men can; it tells upon them in the long run. And when this double strain comes they cannot throw it off, for their sense of duty is too strong to enable them to do so; I know it, because I have been among them for a great many years. Their sense of duty is so strong that they cannot leave their homes, or such rooms as they call their homes, when something calls them there, not even to get necessary air or recreation.

### THE READING OF WORKING GIRLS.

And as for reading they want something very different from what they have in their daily lives, and so they run to the story papers that contain flashy stories; that tell about the fine ladies and how many dresses they have, and that tell about the worst murders and the most exciting incidents that they can get. And I do not blame them for it. They are crazy for something that is outside of themselves, and which will make them forget the hard facts of their daily lives.

### LIMITATIONS UPON LEGISLATION.

I do not think that legislation can be applied to all these minor cases. Legislation cannot be applied to remedy all the difficulties of individuals, especially in a country like ours, where the labor does not grow normally up out of the condition of the country, but is forced upon us from other countries. It is, therefore, a much more complex and intricate problem here than elsewhere. The only thing we can do, therefore, is to furnish the means of preparation. We can furnish the means of preparation to enable them to perform their work to the best advantage, and that is the best thing we can do for them.

Q. To accomplish that you think there should be schools established or organized for the purpose of instructing in such industrial occupations as women are fitted for.

### INDUSTRIAL TRAINING FOR GIRLS.

A. I think so. I think the industrial training of girls is the most important thing needed by this generation. It seems to me so obvious that it hardly needs discussion, because the whole force of the country now is put to training women and girls as teachers, and that profession is greatly crowded. Every girl who wants to earn a living wants to become a teacher, and necessarily we have five times as many teachers as we want. I know myself at least five graduates of the normal college who have been compelled to wait three years for positions

Digitized by Google

as teachers. Now they are starving themselves in trying to sew—a vocation for which they have had no preparation at all. And they live in a little room and do the work of common seamstresses, while they might have been trained in an industrial school as engravers or draftsmen or milliners or something that would pay them well.

Q. Would these same women be willing to go to other parts of the country if they had places offered them?—A. Certainly. They have no political influence, but they have had friends looking for something for them.

Q. To teach?—A. To teach.

Q. But teaching does not depend on political influence?—A. It does, sir; in this city. Still, I do not place any stress upon that.

### WORK MORE IMPORTANT THAN A VOTE.

I think work is infinitely more important than a vote and infinitely better.

Q. If, however, a vote was a means of getting work you would not object to the vote?—A. No, I honor the women who have worked so hard to get what they believe to be the best thing.

Q. Is there any other suggestion you desire to make to the committee?—A. No, sir.

---

NEW YORK, *September* 18, 1883.

Mrs. Dr. CLEMENCE S. LOZIER examined.

By the CHAIRMAN:

Question. You are a physician?—Answer. Yes.

Q. State how long you have been practicing that profession.—A. Forty years.

Q. In this city?—A. Thirty years in this city. Previous to my graduation in medicine I was a school teacher. I taught a young ladies' seminary in this city for eleven years, and, from sympathy and practical knowledge, I really became a physician of my school and practiced medicine for ten years without a diploma, because I could cure, and the people would have me.

By Mr. CALL:

Q. Of what school are you a physician?—A. The homeopathic.

By the CHAIRMAN:

Q. I understand your practice has been very extensive in the city?—A. Yes.

Q. And your general opportunities for becoming acquainted with the question that we are investigating here have been considerable?—A. I think so.

Q. Will you please state to the committee such facts and make such suggestions as seem to you to be pertinent to our inquiry. You may do that in your own way, taking your own time, and resting assured that you can have all the time you want, in order to make the statement as full as you please.—A. In 1841, 1842, and 1843 I was one of the active workers in the Moral Reform Society, in this city, now known as "The Home of the Friendless," and was one of their visitors and book-keepers; that is, I kept their books for a short time; that was after the dismissal of my school. I became an active worker in that cause. I vis-

Digitized by Google

ited extensively among the poor and among all classes of working-women, as well as degraded women, with Mrs. Morgan Pryor and Mrs. Hastings, and some of our older ladies, in a moral reform way, and I am prepared to coincide both with Mrs. Blake and Mrs. Croly.

### DISFRANCHISEMENT THE BASIC FACT OF WOMEN'S INFERIOR POSITION.

I think, sir, that labor needs to be dignified, above all things, among men and women, and we should have, therefore, preparatory aids for labor, for honest toil and self-support; and I believe the ballot is necessary for that self-support, and to bridge over the chasm between rich women and poor women. We see how it really relieves the men in a republic. The black man was always degraded until he got the ballot; just so women are degraded to-day; the disfranchised class are always degraded. And I have come to feel that that is really the basic fact in woman's degradation. It not only degrades her, morally, I was going to say, but socially—that is the word I want—feeling that she is placed among a class—of what? She is ranked among idiots, minors, criminals, and Indians not taxed, even lower than the paupers of our cities, who are supported largely by women's taxes. They are permitted to vote, while we feel that for want of the ballot our employments are crippled and our wages are lessened. I think that, therefore, our disfranchisment is the basic fact of woman's degradation in this country. The women of England have larger liberty in that respect than we have, even though they live under a monarchical form of government. We all know that persons feeling themselves inefficient, and needing something that others have, but which they cannot get, become discouraged and lack self-respect. Suffrage would give this to women, besides broadening their sympathies and activities. Why, we all say, it is a self-evident axiom that "the ballot educates;" it is an incentive to education it gives us equality of feelings and sympathies with the opposite sex and with each other, and I can see how it would cause the rich women to have sympathy and interest in the poor women, which, as Mrs. Croly has observed, does not exist to day, and I know that very few working women can obtain a decent room, however small or large, enough for her to breath and sleep the night in, for less than $3 a week; indeed, I do not know of any for less than $6 a week, and I have visited extensively in this city. My profession has called me in among the sick women, sick mothers, who are toiling for children and doing the best for them, and it is for want of better wages that they are suffering, and that difficulty would, I think, be very much helped if we had the ballot, as Mrs. Blake observes. The politician would help us; they would plead for a shorter day's work and equal pay for equal work done. We know that in many instances they do their work as well as men, with the smaller opportunities that they have had for education.

### A PLEA FOR PRACTICAL EDUCATION.

I would plead for practical education. I know that that is very necessary; our educational establishments are nothing more than literary establishments, and teach children nothing that they are expected to do in adult life, in manhood or womanhood; and while I would have equality between the sexes, I do not mean that a woman should become a perfect man, or a man should become a perfect woman; we are dissimilar, but equal in our responsibilities to law, whether we under-

Digitized by Google

stand the law or not. You know that a voter is more thoroughly induced to study the law that governs him than if he had no ballot; there is where women suffer very much. They are ignorant of the laws that govern them, and they are frequently punished when they think they have done no wrong; I have known many instances of that. Mrs. Croly has covered the ground of education so beautifully and so pathetically that I feel that I can give little in addition to what she has stated.

I should like, however, to say that I think physiology and the laws of hygiene and the chemistry of food should be taught in the schools to boys and girls alike. Home duties belong as well to men as to women. The family is a compact, and the laws of life and hygiene affect all alike; healthful cooking and healthful selection of food in marketing are indispensable to the health of the individual. Very few persons understand how to select healthful food or how to cook it or how to cultivate the appetite and tastes of children for healthful food. Women are very responsible for the health of their children. That is admitted everywhere. But they are expected to make brick without straw. They are expected to know it without having been taught it. We see a great deal of ignorance among women of wealth, as well as among the poor working women, and mothers of all classes are but little prepared to help their daughters.

### THE NEW YORK MEDICAL COLLEGE FOR WOMEN.

I have devoted my life for the last twenty years to the establishment of the New York Medical College and Hospital for Women. It is a very active institution, and has been supported, I should say, enthusiastically by its friends, and has done a great deal of good with little or no means. Neither the city nor the State gives us anything, while I think the institutions of men of a similar character are supported or very much aided by the resources of the Government. I have applied several times to our State legislature, but found that it was impossible for them with their hands so tied with what they thought more important interests, to get the least assistance from them. And for many years before I was called upon to pass through some financial straits, I nearly supported this institution myself—poorly, perhaps, but to the best of my ability. For the last five or six years others have come forward to assist me by voluntary contributions, and men and women of the best of noble ability have taught in our faculty, and, although our students pay the usual fee, the professors have, each of them, donated their fees immediately to the hospital and to the sustaining of the institution for the last five or six years. I am not here to represent that, but merely to show how we women are doing with small means a great deal more than rich women are doing. It is a great pity, as Mrs. Croly has said, that rich women cannot see the needs of their sisters. And I think that as the ballot has done so much for men—and the ballot is lauded all over the universe for what it has done—I do not see why it should do less for women, and so indirectly elevate men still higher, if women were allowed equal franchise with men.

I believe I have said all that I had to say.

### SANITARY CONDITIONS.

**Q.** I would like to hear anything you have to say as to the sanitary, or perhaps the unsanitary, condition of the dwellings of the poor in this city, and any special facts that may have come under your observation in regard to the condition of working women and their residences, &c.—

**A.** We have graduated one hundred and eighty-two practicing phy-

Digitized by Google

sicians within the last thirty years. Ten of that number have deceased. Our graduates are supporting, I think, eight dispensaries in this city and visiting the poor, and aiding them at their private dispensaries. We have one up at 215 West Fifty-fourth street—a large dispensary, at which a great many thousands are treated every year by graduates from our own college. Then, we have about thirty-six beds in our hospitals, and as we go into the families, both rich and poor, we endeavor to instruct the women in the matter of ventilation in their own homes, and in cleanliness, and in the conditions necessary to avoid sewer-gases, and give instruction as to disinfectants, &c. We give not only health to the people, but we give them sanitary instruction as well. I think that mothers and women generally will listen to female physicians as they will not to male physicians, or perhaps as male physicians would not feel the obligation, or, even if they felt the obligation, cannot take the time or do not think it necessary to the same extent to give that we women can and do. We can use the familiarity of our sex as the opposite sex could not. So that we really need both sexes in this work. It would be a miserable world if we had only women physicians, and I must say I think women physicians are as necessary as men physicians.

DEMAND FOR LADY PHYSICIANS.

Q. What opening is there for competent lady physicians?—A. They are in great demand. I am constantly importuned by our various missionary boards for women physicians.

Q. Foreign missionary boards?—A. Yes, and home missionary boards. I wish I had brought here our statistics to show just where our graduates have settled, but everywhere they have done themselves credit and the people great good, I am sure. They have succeeded admirably, and from year to year I can truly say that the demand is increasing for educated female physicians.

Q. How about the supply?—A. I think it is too small. There are about 300 lady physicians in practice.

Q. Is there an increasing supply; that is, are women more and more resorting to the profession?—A. I think so. Of course it is an arduous profession; very few, comparatively speaking, would seek it but those who are very earnest, and as they succeed others are encouraged. Our class gradually enlarges from year to year. At first we had but 22; last year our number was 42. It is of slow growth, but of course it has had considerable opposition from the opposite sex.

Q. You mean of the same profession?—A. Yes.

Q. I suppose during your time other institutions like yours have been established?—A. One has been established since ours by two sisters—Doctors Blackwell They are more distinctly allopathic.

Q. To what extent, as you have mingled with the people, have you found that the houses were badly constructed, with reference to ventilation, and sewerage, and the like?—A. I do not know that I understand the question exactly.

Q. In what part of the city has your practice principally been?—A. In the northwest part of the city. For thirty years I have practiced in the neighborhood where I now live—Thirty-sixth street and Thirty-fourth street, and now Forty-eighth. I think *that* part of the city is, perhaps, more healthy than almost any other part of the city.

The CHAIRMAN. I do not know that there is anything further that we desire to ask, unless you have something in your mind which you would like to suggest.

Digitized by Google

COMPULSORY EDUCATION.

The WITNESS. I think that public school education should by all means be made compulsory. I know that physiology is professed to be taught in the schools, but it ought to be taught by a lady professor who understands medicine; and it should be taught more thoroughly and simply. It should be simplified, especially as to the laws of hygiene and personal habits, for children, because the misery of poverty is sickness.

Q. Do you find parents, as a rule, unable to give that sort of instruction?—A. Yes.

MEDICAL EDUCATION FOR WOMEN.

The medical colleges have been closed to women, you know. It is only within the last thirty years that they have been open. The eclectic school of medicine has permitted women to study for some years past. I am myself a graduate of the eclectic school, although I studied with my brother, who was a regular allopathic doctor. And after Miss Blackwell graduated at Geneva no lady has been allowed to enter the allopathic college. Homeopaths have broadened the line of professional training for women and so has the eclectic school. You know we have three schools of medicine, chartered by the laws of the State—the allopathic, the eclectic, and the homepathic. I am happy to say that most of our schools are selecting the best from all the schools, and there is much more liberality among the schools of medicine than there used to be. I have only in one instance since my commencing to practice, thirty years ago, in this city, been denied a consultation with any school of medicine. I have been fortunate, having been known in this city so many years ago as a teacher. That, I think, opened my way very much. My pupils and their children, and even grandchi dren, employ me to this day, and I have friends in all the different schools of medicine, and I have had very little difficulty. To be sure, I have heard of unpleasant things being said, but never have I heard them said to me personally. I think if medical women had the ballot they would be able with greater force to urge the necessity of this practical education, especially in hygiene and in physiology and chemistry, which is the foundation of medicine. I think they would be of great service to the people.

Adjourned.

---

NEW YORK, *September* 19, 1883.

The committee met at 10 a. m.

Mrs. Dr. CLEMENCE S. LOZIER recalled and further examined.

By the CHAIRMAN:

Question. There are some additions or corrections which I understand you wish to make in your testimony of yesterday; if so, you may proceed to make them.

SANITARY CONDITIONS OF THE SICK POOR.

Answer. Yes. In reply to your question regarding the sanitary condition and surroundings of the sick poor as I saw them in my professional practice, I wish to reply that they are generally deplorably deficient, and mostly on account of the ignorance and inefficiency of the

Digitized by Google

people themselves. Small, close sleeping rooms, and the fear of drafts of air, which can scarcely be avoided in narrow flats and in basement tenements, are great troubles that this class of people have. Dark bed rooms between the light rooms are also a great difficulty. No attempt seems to be possible of success in the matter of ventilation without dangerous drafts of air; and, of course, the drainage is often very defective. We are all aware that the water supply of our city is also quite limited; although I hope that that will soon be remedied.

### WOMEN PHYSICIANS TO INSPECT TENEMENTS.

I would like to suggest that women doctors, in suitable proportion, should be appointed to visit the tenements of our cities. We have a committee already of fifty gentlemen physicians in our city, under the support and pay of the city, and I should suggest that a suitable number, perhaps as many, or only half as many, women doctors be appointed and also paid for visiting among the tenements of our city, as a committee either by themselves or in connection with the committee already formed of gentlemen physicians.

Q. That I understand you to suggest as applying to all places where there are similar conditions, that is, to all cities and populous places, wherever medical inspection is necessary throughout the country?—A. Yes; the small number of lady physicians in the country would perhaps make it difficult to find them in small places, but where they can be found I think they should be appointed.

Q. Probably the appointment of a few would tend to multiply the number of those who would become lady physicians?—A. I think it would, sir. I think that the general acquaintance by women with women physicians, and by children as well, would be a very good thing for the women and children. They would understand them better, and suggestions from women physicians would be perhaps more readily received and taken advantage of by the poor. Women are more patient, frequently, I think, with women. They see their needs quicker than men do. The schools should have the services of women physicians as instructors in sanitary needs and studies.

### ETHICAL TEACHING IN SCHOOLS.

There is a code of moral ethics, as elaborated by Mrs. Matilda Fletcher, a lady from Iowa, which, if it could be introduced into our schools would be less taxing to the minds of children than so much memorizing of names of generals, and of cities and rivers. We all know that the geographical names of rivers and cities change frequently. This taxing of the nervous system and of the brains of children to remember those tedious and unpronounceable names seems to me so useless and injurious to the children that I would like to have this committee to look over this system of practical moral ethics, or whatever it may be called, ethics at any rate, that teaches how to understand one's own self, and how to conduct one's self toward others in this world.

Q. Can you suggest some one who could make a more definite explanation of the system to us?—A. I think my son, Dr. A. W. Lozier, who is present here, could do so.

Q. Is he familiar with it?—A. Yes.

Q. Do I understand that it is a system which you know so well that you would recommend its general introduction into the schools?—A. Yes.

Digitized by Google

Q. Is it a simple system?—A. It is simple, but yet profound; it is very easily understood. Ethics, I think, lie at the foundation of character, and so a book of this character would be exceedingly valuable in the teaching of children.

Q. Is it a matter difficult to convey to others by a teacher?—A. Not at all. It is already introduced in the public schools of Massachusetts. Five years ago Mrs. Fletcher visited Washington and presented it to Congress and endeavored to have it adopted in the schools of the District of Columbia, and came very near succeeding—within a few votes, I think—of having it introduced into those schools.

Q. Do you understand that it has worked well where it has been introduced?—A. Very well, indeed.

Q. At what time could your son explain this to the committee?—A. This afternoon, if you please. It has been introduced into the city of New Haven, Conn., not into the public schools, but into one of the Sunday schools there. I visited the school, perhaps, a year and a half ago, and then it numbered two hundred members, adults and children, in the school of ethics. The Rev. Dr. J. P. Newman, who was my pastor, observed to me that he thought it the best system that had been elaborated in the last two hundred years. I really would be very glad to have it instituted.

The CHAIRMAN. The committee will examine it.

### PHYSIOLOGY AND HYGIENE IN PUBLIC SCHOOLS.

The WITNESS. Especially should the department of physiology and hygiene be taught in the public schools by lady physicians. The chemistry of food, and how to select healthful, unadulterated food should be taught, as well as the science of cooking it, so as to secure the best nutrition from it. I think, too, that the circulatory system should be taught to children, and the means of securing equal circulation to the arterial and venous blood.

---

NEW YORK, *September* 19, 1883.

Miss HELEN POTTER examined.

By Mr. PUGH:

Question. Where do you reside?—Answer. In this city.

Q. Upon what subject do you desire to make a statement to the committee?

### SANITARY CONDITIONS OF THE POOR.

A. I propose to take up some of the points regarding the sanitary conditions of the poor in this city.

Mr. PUGH. You may proceed to give the committee such information on that subject as you think proper, and in your own way.

The WITNESS. First, in order to have a good sanitary condition we should have plenty of water, which we have not. The water in the highest parts of this city will not flow above the second floor at its best. There is not a sufficient supply to protect the people and to keep them cleanly, to say nothing of affording protection from fires. We read columns in the newspapers about the protection of large store-houses of rich goods, but not a word about the condition of the poor people who have not water enough to get a bath, or even in some cases to wash their faces.

Digitized by Google

### CROWDING IN TENEMENTS.

Human beings are crowded together in hundreds in the tenement quarters, 20 or 30 or 40 in a room, without water to keep themselves in a normal condition, to bathe themselves or keep themselves clean.

Q. What is the size of such rooms as you speak of, where so many people live?—A. There is a school building on the corner of Fourth street and Avenue C in which there are 300 pupils, and there is only one place where they can get water, and that has to supply also a store and a stable, and if the store or the stable wants water the children have to go without it. At No. 310 Houston street there is sometimes no water in the house at all, and when there is it has to be brought in from the yard for the large number of people who inhabit the tenement, so that the indolent, the inefficient, and the poor, especially the children, are suffering from the want of a good water supply. At No. 110 Ridge street is a rookery, an alley that people crowd into and mass together, without a sufficient water supply. People cannot be moral if they cannot be clean. The first step to everything that is good is cleanliness. At 161 Lewis street is another large tenement house without water supply sufficient to the needs of the people. And so far as cleaning the streets is concerned, or using water to clean their apartments, it is totally impossible to get a sufficient supply to do it. I cannot go into the technical details as to pipes, &c., or where we are to get the water supply from, but with all the brains that are to be found in the metropolis of the United States it seems to me that water enough might be found somewhere in the vicinity and arrangements made to conduct it here, so that poor people might keep themselves and their children clean.

### WATER SUPPLY OF NEW YORK CITY.

There is a heavy tax also on any unusual use of water when the reservoirs are low; and every house pays $10 for the use of water. I should estimate that we need at least double the present water supply for sanitary purposes, to say nothing of fires. If all the goods in the city were in danger, we would need twice as much as that, in order to secure cleanliness to the people.

### BAD AIR AND DEFECTIVE DRAINAGE.

The second condition necessary for the advancement of the poor people is pure air. We have not pure air in a large part of this city, and the reason for that is bad drainage—bad sewerage—and nuisances in the shape of garbage and refuse matter from the manufactories, which render impure the water which surrounds the city.

### GARBAGE IN NEW YORK HARBOR.

The garbage of this city is dumped into the harbor, ruining the harbor by filling it up, as this stuff must accumulate at the bottom, and when it is stirred up by the machinery of vessels passing around the city it produces a very offensive odor—an odor that is offensive to all people, no matter how low their condition. On the old maps of the city there are shown creeks of running water, and, in building up the city, these creeks have been filled up with garbage and built over. Some of the most fashionable parts of this city are built over filled-in ground, some 30 or 40 feet deep. On Fifty-seventh street and Fifth avenue

Digitized by Google

there is 40 feet of garbage, and there is no subdrainage. The result of this is that when the tide comes in the water is backed into these old creeks or vats, and the cellars and basements become damp and in many instances flooded. In Harlem this is often the case. Do you desire me to speak as to anything outside of this city?

The CHAIRMAN. Yes, anywhere.

The WITNESS. Well, in Toledo Ohio during the present spring flood, the sewerage being similar there, when the floods came up they brought matter from the sewers into the basements and around the walls. The walls and boards had to be scraped to get it all off, so bad is the sewerage and drainage system of the cities of the country. There is really no one subject more important to the health of the country, nor one so much neglected.

Q. That condition must be known to the officials of the city government?—A. It is. It must be known to them.

## NUISANCES IN NEW YORK CITY.

I want to speak particularly of some of the special nuisances in New York. The dumping of the garbage in the harbor around New York has affected the bathing, and makes it very disagreeable to people who resort to Coney Island and places around the city for bathing purposes in the summer time. There is a factory on Long Island where a refuse is given forth which is bad enough when you are a mile away from it without going any nearer to ascertain exactly what it is like. It is clear to thinking people that the garbage of this city should be taken out upon the ground and placed between the sun and the earth, where it will help the earth; the soil needs it. The reason why this is not done is strange; it is past my comprehension. Mr. A. T. Stewart, the rich merchant, who recently died in this city, and also his successor, Mr. Hilton, offered to clean the streets of New York City and take all the refuse out of the city, free of expense, on their own barges, if the city would allow them to do so; but the city would not allow them to do so. Farmers in the vicinity of New York have endeavored to obtain this garbage to enrich their lands, but they have not been allowed to take it. Why, it is against the law for a person to dispose of any portion of the refuse of this city, even if it is upon their own grounds and produced from their own homes. I could not sell, on my own place, a barrel of refuse, or even give it away or take it out of town and put it on my own ground if I wanted to do so. Why that is so I do not know. Within a stone's throw of this place there is garbage that has been there three years, so that the things that have been thrown into it have become skeletons. No one has ever seen those streets but the folks who live there, for the tax-payers do not go there, and ladies do not go there, and the municipal officers evidently do not go there, and when you ask them to go down and see to matters in that neighborhood they have a headache or are otherwise indisposed. Property there has depreciated to such an extent that within a stone's throw of the city hall property is almost valueless, it is in such a bad condition. Miss Susan A. King, who was here yesterday, but did not give evidence, told me to say to the committee that she was acquainted down there, and had property there, and had dealt in real estate there sufficiently to know the quarter. She said that she had taken some of the city officers and insisted upon their going down there to visit these quarters, and they have never been heard of since. She does not advise the committee to go down there unprotected, as it might not be safe; but if they will appoint a time

Digitized by Google

she will escort them. She thinks she might pilot them through safely. Then, there is Thompson street, and Mulberry street, and Bayard street, and Baxter street, and Chinatown, and Irishtown, and Italiantown right within reach of a short circle of the city hall. At No. 200 Mulberry street is situated the headquarters of the bureau of police, and actually of the board of health, and how they can escape seeing all these unsanitary conditions is wonderful to me.

CROWDING IN TENEMENTS.

In Baxter street in one room there are eight families, composed altogether of forty-two people, and three-quarters of them are so destitute of clothing that they cannot go into the street even to beg.

By the CHAIRMAN:

Q. Where is this room; is it above ground or under ground?—A. Well, it is a basement, a half-cellar, and, when the tide comes in the water is eight inches deep on the floor; they have to put scantlings and slabs across to put their clothes on. One small stove is all that can be found in that enormous room to warm a whole crowd of people in the cold weather.

By Mr. CALL:

Q. Do you say that there are eight families in one room?—A. Yes, sir.

Q. What is the size of the room?—A. It is a large room—a whole basement. It is, perhaps, longer but not as wide as this room—it extends back.

By Mr. PUGH:

Q. Do you know how the people who live there employ themselves?—A. I think they are rag pickers, mainly. I say that the houses for the poor in this city are too dark, too damp, too much crowded, too poorly ventilated, and have altogether insufficient water, and hence are too vile to live in. I refer to the tenements for the masses. Who it is who owns these houses I do not know. I have been told that some of these tenements—places of the lowest order—are owned by people like the Astors. How they can ride in their carriages, and dress in silk and velvets, or sleep peacefully at night while they permit their tenants to have such dwellings, I cannot understand. I suppose we are obliged here to speak within the limits of what the law can help; but the law could oblige builders to make buildings strong enough so that they would not tumble down, and to make them dry and substantial; and I suppose that the department which has charge of the sewerage in the cities could manage so that the sewerage system would be more efficient than it is. I suppose, too, that the building department could compel builders to have means of ventilation so that these houses would be habitable, and that they could compel them to have proper lights and windows and communication with the outer air, and the law could certainly compel them to put more than a small four-pane window in a place large enough for forty people to get into, to say nothing of their living in it.

NECESSITY OF FIRE ESCAPES.

The law should compel builders, also, to have plenty of fire escapes, and not allow buildings to be made in such a way that at the tops of hotels, and in corridors, and away off in remote and inaccessible parts

Digitized by Google

cannot afford that. So they suffer along as they are, because they cannot get out. A woman who sews for me on One hundred and fifth street has a corner lot which she has worked for for twenty years and paid for. She pays $23 tax on that little corner without any exit; it goes nowhere. She has bought it, however, on her wages as a sewing-woman at a dollar a day. There is a church in this city that cost $2,000,000 and is rolling in wealth, and it is not taxed at all, while this poor women is taxed $23 a year for her little corner; and yet this church sets up to teach her morals and says she is a miserable sinner.

Q. Whose chances would you take for the future, this woman's or those who belong to that church?—A. Well, sir, there are very few people in this world who have the strength of charactor to say what they think, and I do not know that I have; so I will keep still. I have been connected with churches a great portion of my life, as I was so placed in business that it was necessary and proper that I should go to church as an example to others, having been connected with colleges and schools. The churches tell me that I am an inferior being, that I must obey the laws, and be tried by the laws, but I have nothing to say about making the laws, and they say I must stay at home and mind my business, but as I have no home to stay in, I cannot stay; that is, I have no husband and children, and that is what they expect us to have, whether we can or not.

Mr. PUGH. You give some very forcible facts, and some strong opinions as to how the law ought to be and how it ought to be executed.

INFERIOR POSITION OF WOMAN.

The WITNESS. The church tells me that I am not made for myself; that I must obey man; but I have not seen the man that has the right to command me, and therefore I do not obey. Therefore, I am breaking the moral law all the time, because I cannot obey anybody. My father is old, and is out in the West, and my brother is dead, and I have no husband; so I have nobody that I can obey, but if I did obey a man I should expect him to be responsible for my actions; if I did anything wrong he should suffer the penalty; otherwise he might tell me to murder somebody and I might be hung for it.

The CHAIRMAN. That would be a good way of getting rid of you. You have certainly stated some very startling facts.

The WITNESS. It is really an important question—this of the condition of women in our community. When I was a young girl I had some ambition, and when I heard a good speaker, or when I read something written by a good writer, I had an ambition to do something of that kind myself. I was exceedingly anxious to preach, but the churches would not have me; why, they said that a woman must not be heard, and to-day, to show the prejudice against us poor creatures, who are really slaves, public sentiment is such that the reporters in public meetings will report nothing that a woman says.

Mr. PUGH. I understand that Mrs. Croly has made a fortune with her pen.

THE BALLOT FOR WOMEN.

The WITNESS. Mrs. Croly is a very remarkable and strong woman; no better woman lives in New York; and I was very sorry to hear her say that women want education without the power to vote. Any woman that wants to vote cannot get into the newspapers. We are so placed that we get no hearing. Churches tell us to stay at home. But what

Digitized by Google

is the home of these poor girls? Take a girl who works from seven in the morning until six at night in these large stores—behind counters all day—when she gets back to her home, where does her home lie? It is to be found in some tenement house, with 30 or 40 other families. There is no base-ball club for her, no bowling-alley for her, no gymnasium, no reading-room, no art gallery open on Sunday, no anything for this poor girl when she is at liberty—nothing but a den where there are 30 or 40 people huddled together; she has not even facilities for bathing. How can she grow up to be a great and good woman? Men can go to concerts and entertainments, but women have to wait for invitations. The church tells us this poor girl should go home—perhaps to a drunken mother or a vile father. Where is her home? Will the church provide a home for her? If you gentlemen were in our places you would feel our degradation with a feeling such as no pen or tongue can describe.

By Mr. CALL:

Q. You surely do not mean to say that this is a picture of the condition of the women of New York generally?—A. I say it is the picture of those who have not money enough to take care of themselves—who have not money enough to get any better homes.

Q. Do not men go to these same homes and live in that same condition of poverty?—A. Yes, they do. I have spoken on a broader basis than sex. I speak of the whole human family.

### PICTURE AND ART GALLERIES SHOULD BE OPEN ON SUNDAYS.

The picture galleries ought to be open on Sundays, when the poor men and women can get to them. In Coldwater, Mich., there is a man named Lewis who owns some eight or nine hundred pictures from the very best masters, some originals and some copies. Every Saturday his gallery is open to the public. While waiting for a train on one occasion I went to look at this gallery, and I saw little girls and boys come in with their toes out of their shoes, children of the poorest people apparently, and only five or six or seven years old; but they came into this gallery and walked breathlessly about, not touching anything and scrupulously observing the rules; they looked up at these things and their little minds could not help being elevated by them. The children of this city, with all its great galleries and museums, cannot get such advantages as those. On Sundays, when their fathers or mothers could best take them to these places, the places are closed. The rich people can go to the art museum every afternoon and can show their fine turnouts. They can afford even to buy whole galleries of their own, and put them in their houses, and so *they* do not need the public galleries.

There is a man in Boston who has a fine collection of statuary—Mr. Appleton, whose gallery is open to the people every Saturday. The rooms are warmed with large hospitable-looking stoves, and everything is made pleasant and welcome-like for people. They are requested by placards not to enter any other part of the building than the gallery, and when I was there I saw no one attempt any infraction of this rule. The poorest people whom I saw there never attempted to overstep the line.

Q. In contradistinguishing the classes of people here in New York as "rich people" and "poor people," do you not make a mistake? Is not wealth here, as elsewhere in the United States, exceptional?—A. Oh, I did not speak of it as isolated or confined to this place at all.

Q. Like all other places in the United States, and elsewhere, is it not

Digitized by Google

the fact that in New York the majority of the people approach something like the conditions existing elsewhere—that is to say, the property of the community is distributed among the people at large, perhaps 90 per cent. of them being poor in that sense?

RESPONSIBILITIES OF THE RICH.

A. There is no reason why people, whether men or women, should not accumulate property, all that their brain will allow them to accumulate; there is no objection to that; for if that were not the case there would be no stimulus to advancement of any kind. The wealthy people have done great things for the country, undoubtedly, but very much remains to be done. Builders should make habitable homes, and railroads should charge such rates that people may be able to get fair homes in the suburbs of cities, or in the country, and that farmers may get their produce to market at reasonable rates. They should be governed a little by the interests of society. We want wealth, and must have wealth. There has never been a time in history when there has not been wealth, and if the property of this island were all distributed among the people to-day it would not be sundown to-morrow before the relations would be changed. Some people cannot keep money. The strong and clear-headed should be like tug-boats to carry those people on, instead of neglecting them and shutting the doors against them. If a person is born with a small brain he cannot help it. If he has no power of accumulation he cannot help it. If each does his best, that is the most that we can expect of him.

SUFFRAGE FOR WOMEN.

I had not intended to touch on the woman question, because it is really a matter of adjustment, I think, before women can become educated and established and have ways opened for them. We will have to submit to that. I do not say it in any bitterness, because humanity is always the same. There are grand and noble men and women everywhere, and there is no distinction in that regard. But if you gentlemen should take a whole day to think it over, and each of you imagine yourself a woman, with all woman's relations and limitations, I think you could understand it. Take a whole day to it and think it over, and reflect how, if you were a woman, you could not do thus and so—you could not do so many things that are within the grasp and scope of man's power in the community.

Mr. CALL. They do not treat women so badly anywhere that I know of, unless it may be, as you say, here in New York. I acknowledge that things are very bad, certainly, if that is the way they treat their women. But the suffrage question would not help that.

The WITNESS. Do you think, sir, that if I were a member of the board of health I should permit the sanitary conditions that I have referred to to exist as they are? Why, if you should go and ask these people at our city hall here to do their duty in regard to these sanitary conditions, they would simply tell you to go home and mind your own business.

Q. Do you mean that women have no political influence?—A. Well, I suppose every human being has an influence, but in our case it seems to be so little that we can accomplish nothing. What can we do?

Mr. CALL. You can make a man vote the way you want him to.

The WITNESS. Where is mine?

Digitized by Google

Mr. CALL. Well, if you have not got one it is your fault; you must not blame that on the men.

The WITNESS. Well, I will not go into that question. But, in all seriousness, I think it would take perhaps two or three hundred years to get women into a condition, as voters, to thoroughly understand or resort to the tricks of men in politics. It would take that time to "educate" them.

WOMEN AS VOTERS.

By the CHAIRMAN:

Q. I suppose you have an idea that women might abolish some of the tricks of the politician's trade?—A. Well, sir, it would take them a long time to learn to dare to do those things that men do in the way of politics—to sell and buy votes.

Q. Do you think that if they could have a vote they would have any anxiety to acquire those tricks?—A. Some would, no doubt, and some would not. If a woman learns a trick, however, she can soon excel a man at it.

Q. If that be so, what would be the effect of conferring suffrage upon women? Would not the effect be injurious to the moral character and high influence of woman, if she should devote herself to the tricks of the politician's trade, which you very properly criticize so severely?—A. If you will permit me to say—I am always a little afraid to tackle these subjects; they are a little too deep for me—but if I may say what I think——

The CHAIRMAN. That is just what we want.

INFLUENCE OF WOMAN SUFFRAGE ON THE CHURCH AND STATE CONNECTION.

The WITNESS. The only unpleasant result that I should anticipate from woman's suffrage is that which might possibly occur from a union of the church and the state. Nine-tenths of the church members are women. They are more devotional, more religious, and more moral than men. I say this, too, with all respect to men, for I think there are most excellent men. Women forming, however, a large proportion of the religious element would naturally place the power more or less in church hands, and there would be perhaps a tendency toward the union of church and state, which a republican form of government should avoid; indeed I do not know but that every other form of government should also avoid it.

Q. You think that by virtue of her being better——

The WITNESS. [Interposing.] More religious, say.

The CHAIRMAN. That it would therefore be dangerous to give her the ballot?

A. Well, it is in that regard only that I see any reason for doubt. I certainly think it would clean our streets, and I think it would purify politics, at least for the next two hundred years. It would take about that time to get women to understand the tricks of politicians as at present practiced. I do not think that women would be injured by it. Men and women are raised in the same family, they go to school together, they marry together, they go to church together, and why they should separate just at that point I do not quite see. It does not contaminate a woman to sit side by side with a man in her own family, or in the church, or at the theater; why should it do so to step up to a box and drop in a ticket stating her wants.

Digitized by Google

PROPERTY HOLDERS' RIGHTS.

There is a woman in this city who pays taxes on perhaps a million dollars' worth of property, but she has no vote. A man across the street, who cannot read or write, and who shovels dirt for the plants and flowers and wheels a wheelbarrow in the garden of this same lady, has a voice to say whether a street shall go through her property, and whether her house shall be torn down or not. This woman came to the city of New York thirty years ago, with 20 cents in her pocket, and by her own skill and knowledge of values, and business capacity, has become worth a million of dollars through real estate in this city. Yet she has not a chance to say one word as to the taxes she shall pay or as to the disposition of her property.

Q. Is that the lady who was here yesterday, Miss King?—A. Yes, sir; she has no voice, as I have said, in the disposition of her property, or whether she will have in this city more water works, or less, or whether we shall have to suffer all the inconveniences that result from bad laws and a bad political system, while this Irishman across the street, who works for her, can say what shall be done with her property. Put yourselves in that condition, and see how you gentlemen would like it. She is not a married lady; there is no law to compel her to marry, and if she chooses to remain single why should she not be permitted to have the same right of disposition as to her property that a man has?

By Mr. CALL:

Q. Is not that so with all property owners under a system of universal suffrage? The unit of power that one man has is nothing. Every man's property is disposed of by others, in a civilized community, depending, as ours does, upon universal suffrage.—A. Well sir, suppose you reverse the thing. Suppose that *we* had all the power.

Q. I was only saying that in that respect the point is not well taken. For instance, every property holder here lives in a town where universal suffrage prevails, and where taxes are imposed by the general voice of the people. Property holders are comparatively few, and the people who largely control the Government are non-property holders. Is not that true of people who hold property in every municipality?—A. Well, in a republican form of government the very basis of it is that those who are governed should have a voice as to the action of the government; while with us, one-half of our people have no voice at all, though they can read and write, and are considered fit companions for the other half, who are so very superior to them in political wisdom. This Government is based upon the will of the people—women are "people," yet we have not a word to say about the laws. You will hear women in the course of your acquaintance say they wish they were men; I never heard a man say he wished he was a woman.

Q. Do you think the only reason for that is that they want the suffrage?—A. Yes, sir. They want the power, and I do not blame them.

WHY WOMEN DO NOT GET THE SUFFRAGE.

By the CHAIRMAN:

Q. Why do you think that the suffrage is not extended to women by men—what is the true reason, the radical reason, why men do not give up one half their political power to women?—A. Well, it may arise from a false notion of gallantry. I think most men feel like taking care

Digitized by Google

of, and protecting the ladies. They do not stop to think that there are in New England alone 150,000 unmarried women, who can have no help, as things are. It would be all very well, perhaps, if all women had representatives, and if all had a generous, straightforward honorable man to represent them. But take the case of a good woman who has a drunken husband; how can he represent her? He votes for liquor and for everything he may happen to want, even though it may ruin her and turn her out of doors, and even though it may ruin her children. If the husband is a bad man would it not be better for that woman to represent herself?

Q. If she could vote, wherein would anything be changed?—A. I think the children raised would be better in every way. The mother could have something to say as to whether she should have a liquor saloon on each side of her home, so that her children would not have this terrible temptation constantly before them from the time they are brought into the world until they are grown up. If she had a vote she would have nine out of ten of these places put out of the way. It may be said, perhaps, that there are drunken women, too; but for one such woman there are nine or ten drunken men. In the two extremes of life you will sometimes hear it said that there is some drinking. They say that there is drinking in the very highest classes of society and in the very lowest classes, but less in the middle class; but I think that nearly all women of the middle class, all those who have to work for a living, are honest and industrious women, and women whom you could trust if they had a vote—and they are in the majority.

EFFECTS OF SUFFRAGE ON THE MATERIAL CONDITIONS OF WOMEN.

Q. What effect do you think the extension of the suffrage to women would have upon their material condition, their wage-earning power and the like?—A. They would get equal pay for equal work of equal value. I do not think a woman ought to be paid the price of an expert, when she is not herself an expert, but I believe there would be a stimulus for a woman to fit herself for the very best work. What stimulus is there for woman to fit herself properly, if she never can attain the highest pay, no matter what sort of work she does? If women had a vote I think larger avenues of livelihood would be opened for them and they would be more respected by the governmental powers. I do not say it with regard to myself particularly, but I do not see any reason, for example, why it would not be just as proper for me to sit down and copy deeds in a nicely carpeted, well-ventilated room, out of sight of the world in the register's office, or similar offices. Why could not I do that and be entirely respectable and retain all my moral qualities, as well as a man? There is no such place open at present for women. There are over six thousand municipal offices in this city, and not one for a woman, no matter how much taxes she pays.

By Mr. CALL:

Q. Have you heard the testimony before this committee as to the very large number of men that are out of employment in this city—the number that cannot get copying to do or anything else?—A. Well, sir, I have not read it, but I know that such is the fact.

Q. And have you heard or do you know of the very limited amount of wages that men receive?—A. Yes, sir.

Q. Then do you not see that having the ballot does not cure that

Digitized by Google

evil; it does not give employment to all these men, nor put them in trades; how could it do so for a woman?—A. All these men are not perhaps fitted for these offices.

Q. But they have no employment of any kind, and how much better would it be for a woman?—A. Well, possibly, if the franchises were equally distributed some of these offices would be given to women—the women would have to take their chances. I suppose some of them would be out as some men are out.

Mr. CALL. There are a number of women employed in the Departments at Washington, and I am in favor of giving them all the offices that they can competently fill, yet I am a man. You could not do any more for them if you had my place.

The WITNESS. Certainly not. But men are always saying, "I let my wife do just as she pleases;" that "let" is good.

Mr. CALL. Well, that is not the way with me. I do as my wife pleases. She "lets" me; and I expect that is the case with a great many men. You do not know all men.

The WITNESS. I know there are a great many good men. But I am serious on this point. I am earnest and honest in my belief that it would advance woman's condition if she had something to say with regard to the laws that govern her. We hear a great deal said as to the freedom of a people who make their own laws, while the fact is that half of us have nothing to say about the laws which govern us.

By the CHAIRMAN:

Q. You make these suggestions, I suppose, on the ground that so far as woman is a laborer, or a capitalist, the relations between labor and capital are largely influenced by the fact that she lacks the suffrage?—A. Very much, indeed, sir. For example, in this city a year ago they reduced the salary of all the lady teachers in the public schools 3 per cent., and all those in Brooklyn 10 per cent.; and at that very same time the salary of the principal of the grammar school was advanced either $1,500 or $2,500 a year. I think he had $4,500, and he was to have $6,000, or something of that kind. Now, they said the treasury was low, and if they did not have money enough to keep these poor women on $600 a year I cannot see the logic of increasing the salaries of others. These poor women are generally the support of somebody—some crippled brother, or aged mother, and when the argument is used that a man's salary is increased because he has a family, the argument is just as good for the increase of the women's salaries, for in almost every case there is somebody depending upon them. There are thousands of women in our cities who are supporting families on half and some of them upon quarter of the pay which men would get for similar work.

MRS. LILLIE DEVEREUX BLAKE. If the committee will permit me to say a word at this point, I would like to state the fact that at the time this reduction was made in the salary of school-teachers, it was the only city department that was touched, and it was the only one that had non-voters. They never touched the policemen or firemen; nor did they touch the salaries of the male principals of the public schools, or of the janitors. There are 3,000 teachers, and nine-tenths of them are women.

The WITNESS. If these women were all voters that never would have been done. It is unjust and unfair. Girls are induced to go through the normal school, to prepare themselves for teaching, and after going through they cannot get anything to do.

### TOO MUCH CLASSICAL EDUCATION.

The fact is, however, I think we have too much classical education in this country. I have been in the business myself, and have taught all the way from the log school-house up to the highest colleges, and my conviction is that we have too much classical education.

I am very sorry that Cornell University, which was meant to be an industrial school, was turned into a classical school through the influence of the president, who could not bear to have his school rank lower than Yale or Harvard, and the consequence is that the poor farmer's boy, whom it was intended to help to some education, cannot go there. The prices are high, and there is a spirit of aristocracy that keeps such a boy away. It is turned into a classical school, instead of an agricultural or industrial school. If we could have some schools founded by large-hearted men, which would help poor boys to get an education that would fit them for after-life, and where the school would be kept up to its true object and not permitted to fall away, some good results would be reached by it. I do not know how we are going to do that, however. It is an anomaly as it stands. The number of teachers graduating out of our normal schools and colleges have flooded the country with half literary people who cannot find employment, but we have not enough workers.

### TECHNICAL EDUCATION NEEDED.

If the technical part of our education were elevated, and the classical part a little depressed, leaving the Latin and the Greek for those who really have the leisure and the need of them, and giving boys and girls more thorough practical knowledge, it would be much better. When they graduate from our present schools and colleges they are above all manual labor; they are too great "gentlemen" and too fine ladies to do any actual work, while perhaps they are living—some of them at least—on their friends; and, after visiting about in an aimless and useless way for awhile, finally drop out of sight and are never heard of more.

There are hundreds of graduates of normal schools, and of law schools and colleges who are in that condition. They cannot find employment; but if they were to go into trades, or to work in some way with their hands, they might get constant occupation. They are unfitted for this by their classical education. They get their ideas too high. They may all be Presidents. The causes of this are somewhat complex.

### CHANGES IN THE CONDITIONS OF INDUSTRY.

Farming being done so largely now by machinery, and in so large a way, the small farmer is crushed out; he rushes into the cities and small towns and there he becomes lost. Then, there are no small dairies any more; it is one enormous factory. There are no small grain-growers; the grain grows in immense fields now.

So it goes with everything else. Everything is done by steam or electricity, and these people, being thrown off their little farms, come into the cities to find something to do.

If we had evening schools for technical education, boys and girls could prepare themselves for some of the finer handicrafts. There are many forms of decorative art, for instance, that might occupy hands that are now idle; and it seems to me that if some of the public money

Digitized by Google

were appropriated to establishments for the education of all this superfluous population we should have the benefit of a great advance in the decorated and ornamental arts and in improved architecture, of which we have a very poor style, I am sorry to say, in this country. There is no reason why smart girls should not grow up to be cultivated, practical chemists, and do many other things that they cannot do now for want of opportunity.

AGRICULTURE AS A MEANS OF LIVELIHOOD.

By Mr. PUGH:

Q. These idle people, by cultivating the soil, could secure sufficient food and shelter and health, even if they could do no more, and all this they lose by coming into the cities.—A. They come to centers. I do not know that we can help that.

Q. Well, they are to blame for that, are they not?—A. Are they to blame—or is the person to blame who buys up all these lands?

Mr. PUGH. There is plenty of soil that they can get; there is abundant opportunity for those who work the soil to secure an abundance of food and good shelter, good clothes and good health.

The WITNESS. How are they going to pay their taxes?

Mr. PUGH. They would not have to pay taxes if they did not own the land; there are plenty of farmers who would employ them; or they could get good homesteads, as a free gift, from the Government.

The WITNESS. It costs more now, you know, to bring a car-load of wheat into town from a place between here and Albany than it does to get it from Chicago.

Mr. PUGH. I am not speaking of the surplus food-crop that they could sell. I am speaking of how they could better their condition by cultivating the soil. You have described the large number of people who live here in tenement houses without good air or good food or good shelter.

The WITNESS. I was speaking then more of the middle classes, who come from the farms and huddle about the towns.

Mr. PUGH. But they came from somewhere and paid their transportation. Instead of coming here if they had gone where they could get free soil they would certainly have secured for themselves plenty of food and plenty of pure air, and good shelter, even if they got nothing more. All these are great blessings, and they lose them by coming to these cities and staying here in filth and rags, and disease and crime.

The WITNESS. The lowest population of this city are not of that class. They never came that way. They came from across the water. Those that are living in the most miserable quarters are not our people.

Mr. PUGH. I can show those people millions of acres of land already opened and fenced and with houses on them, that are unoccupied, where they would have health and would have plenty to eat every month of the year.

The WITNESS. Theoretically this thing works beautifully, but take it practically; here are fifty little farms, with a farmer and his family on each. A man comes along and buys them out one after another. Of course you will say they need not sell, but perhaps they have mortgaged their farms to educate a son at college or something of that kind—the mortgage is foreclosed and the man has nothing left, or hardly anything. Do I understand you to say that you want these farmers to hire themselves to this rich man at a few dollars a month and stay away from their families?

Digitized by Google

Mr. PUGH. You do not. That is wholly unnecessary. It is true that these mortgages and such things as you speak of exist, but the people who make these mortgages are themselves responsible. If they would remain satisfied with the condition of a farmer, and a worker of the soil, they would be all right. They would make every year food enough to feed themselves and their families well; clothes enough to keep them warm, have good houses to shelter themselves, and they would have robust children and good surroundings. There is no doubt about that.

The WITNESS. I believe that, sir; but what is exactly good for a man or woman is a very difficult question. In the State of Iowa, one of the richest in the United States for farming, and out of debt, and having the largest public school fund of any State in the Union, forty-nine farms out of fifty were mortgaged to enable their owners to visit the Centennial Exposition.

Mr. CALL. I should think "forty-nine out of fifty" must be an exaggeration.

The WITNESS. I have seen it stated at about that proportion.

Q. Is there any legislation on earth that would remedy that?—A. Well, the question was whether they were not greatly benefited by seeing what they did. Do you not think that a world's exhibition, if properly organized, is of great benefit to people?

Mr. PUGH. I think a man had better keep his money to supply his family with food.

By Mr. CALL:

Q. You think that if the titles had been in the women they would have had better sense than to mortgage the farms in order to see the Centennial Exposition, do you not?—A. Well, I don't know, sir.

The CHAIRMAN. The difficult point in the evils as they exist is to make the connection between the poverty-ridden people in the cities and the free soil at a distance, where, perhaps, if located, they could raise good crops, but as to those people who are in New York and other large places, I do not know how they are to get on to the homesteads that "Uncle Sam" proposes to give them.

The WITNESS. I do not know either.

### FOOD GOING TO WASTE.

In California there are tons of delicious fruits that rot on the ground, and wheat that rots in the fields. In Kansas I have seen corn-fields unstacked, by the acre, while people were starving in the city of New York. They burn the corn in the stoves as fuel. Wood is scarce, and coal mines are far from Kansas, while the soil is fruitful and produces great crops of corn, which they burn as fuel. I do not mean to say that a man does not get his living there, and good air, &c., but he cannot make his own clothes, and he has to pay his taxes.

By Mr. PUGH:

Q. What hope has he of doing these things in the city?—A. It is not that class of people who are in this city that are so badly off, it is these iimmigrants

### ADULTERATION OF FOOD.

By the CHAIRMAN:

Q. Please give us your views with reference to the adulteration of food and topics connected therewith.—A. The working people in our city suffer much from adulterated food. Bread is often made with bad

Digitized by Google

baking powder and alum. The English Government attaches a penalty to the sale of deleterious baking powder or of bread made with it. The milk, which forms so important a part of the nutrition of little children, is not always good in the cities. Poor and swill-fed milk produces disease. Under the microscope good milk is found to consist of fatty and albuminous round globules floating in a yellowish water, the globules moving about all the time. Swill-fed milk does not show the same roundness of globule. The globules are elongated and stick together, and, instead of floating in a yellowish, float in a bluish water. There is also found in it foreign matter, no doubt fungus or animal germs. At twelve hours' standing this milk shows *bacteria fungi fibriones*, which Professor Tyndall describes as long, eel-like organizations, tossing the globules aside and wriggling across the field of the microscope. Professor Law, of Cornell University, says that cows drinking water from impure pools containing fungus germs will have these low vegetable growths conveyed into the circulation of the blood and from the blood it is transmitted to the milk. It does not show at first, but, after standing, it shows under the microscope—the same fungus vegetation shows in the milk as was seen in the water. Swill-fed milk has not only fungus but particles of pus. I have here an analysis of pure milk as compared with swill-fed milk, which I would like to have made a part of my statement.

| Pure milk: | | Swill-fed milk: | |
|---|---|---|---|
| Water | 87.40 | Water | 94.00 |
| Butter | 3.43 | Butter | 1.8 |
| Caseine | 3.12 | Caseine | 3.4 |
| Milk, sugar | 5.12 | Milk, sugar | 0.7 |
| Salts | 0.93 | Salts | 0.1 |
| | 100. | | 100. |

You will see from this that swill-fed milk has six per cent. more water and is deficient in the particular of butter.

The packing of live chickens, for transportation, into close quarters, as if dead, and their being sold for food after the long delays of transportation, may be mentioned also as one of the unsanitary features of food.

---

NEW YORK, *September* 19, 1883.

Mrs. M. W. FARRER examined.

By Mr. CALL:

Question. Please state your residence?—Answer. No. 439 West Seventy-third street.

Q. Are you connected with any association for the improvement of the working men or women?—A. I am connected with the "Working Women's Protective Union."

By the CHAIRMAN:

Q. Are you the superintendent of that?—A. Yes, sir.

Q. How many years have you been in that position?—A. Since it was established—nearly twenty years ago.

By Mr. CALL:

Q. Will you state to us the nature and objects of the association, and generally such facts as are within your knowledge relating to the con-

Digitized by Google

dition of the working women of New York, and any measures which may occur to you for their improvement, either from voluntary sources or by legislation?—A. I am afraid my opinions would not be worth much on that subject, but I will give you some facts.

### THE WORKING-WOMEN'S PROTECTIVE UNION.

The Working Women's Protective Union was established during the war for the employment and protection of sewing and trades women especially—more especially to protect them from frauds by unscrupulous employers, to see that justice was done them; that their money, when honestly earned, should be paid; and the institution was organized for the purpose also of seeking employment for them in the various trades and callings in which women are employed, except household service. That was excepted entirely. We do not furnish anything of that kind. We deal with all classes of trades, however; teachers, housekeepers, and all sorts of out-door labor. We also exclude household service in our collections for the reason that the woman who lives at service has her home where she is, and at least her board, while the poor woman that works out by the day is often deprived of her shelter, and turned into the street when her wages are withheld. In one case I knew of a young girl who sat in the hall-way of her working place all night, when she could not get her pay, because she was afraid to go to the house where she lived. She would not be admitted. She was told in the morning that she need not come back if she could no bring her money. It was to assist that class of women that the institution was established. We receive complaints from working women and attend to their wants as far as possible. We investigate every complaint that comes before us of cases of withheld pay, and if we find it just, we make efforts at the collection of the bill. If necessary, we sue, and, if possible, collect, and the whole amount collected is paid over without any charge. We also keep a bureau of employment, in which we seek by every means in our power to obtain employment for which the women are fitted.

By the CHAIRMAN:

Q. Is it an incorporated institution?—A. Yes, sir; it has been incorporated for a number of years.

By Mr. CALL:

Q. How is it supported; by voluntary contributions?—A. Entirely.

Q. Can you state to us the amount received every year from contributions; how much money do you generally get in the course of the year for the support of the institution?—A. The amount varies; we get anywhere from $3,000 to $5,000 a year; sometimes more and sometimes less, according to the generosity of the public.

Q. Do you rent your house?—A. Yes, sir.

Q. Do you give shelter?—A. We do not give shelter, and we do not give charity. We furnish employment, and we furnish advice and protection, and open, as far as we can, avenues of labor to women.

Q. You collect their wages, I understand you to say?—A. Yes, sir; the wages of sewing and trades women, not of household servants.

Q. You confine yourself to sewing and trades women?—A. No, sir; we help all classes of labor except household servants.

Q. I suppose you mean that you receive their wages where there is any dispute or controversy?—A. Yes, sir; we sue for the wages if necessary, pay all the legal expenses, and take charge of the matter, and

Digitized by Google

make it our own matter until it is all settled. Then the wages of the girl are paid over to her without any reduction whatever.

Q. How many people have you found employment for during the last year?—A. Well, sir, we find employment for about from one thousand five hundred to two thousand a year. We have a great many applicants that we are not able to find any employment for. Some are not competent, while others are. We endeavor to suit the person to the work as far as possible.

### THE WORK OF THE UNION GRATUITOUS.

Q. Does your union receive any compensation for getting employment for these people?—A. No; no charge is made either to the employers or the employés. There is no charge or fee of any sort paid to us.

Q. What are the classes of people, in respect to their antecedents in life, that have passed through your hands?—A. I think I may say almost every class, from those who have occupied very fine positions in society, down to the lowest. We have highly educated women applying to us, not only for protection, but also for employment.

Q. What class of employments or pursuits are you able to obtain for them?—A. Employment in the different trades and callings.

Q. In what trades?—A. In paper-box making, for example.

Q. Do you find positions in stores and as clerks, &c.?—A. Yes, sir; as cashiers, accountants, seamstresses, dress-makers, and in fact all the pursuits in which women work. In the higher callings, after they once get established, they are able to take care of themselves.

Q. Do you know how many women there are employed in the different trades and arts in this city; have you ever looked into that subject?—A. I do not know, sir; I could not on the instant tell you.

### COMPENSATION OF WORKING WOMEN.

Q. What are the rates of wages that these women generally receive for whom you get employment?—A. Well, they get different rates of compensation. There are women working in the city of New York making shirts as low as 35 cents per dozen, and some even as low as 25 cents a dozen.

Q. How many can they make in a day?—A. If a woman is a very smart worker she will make a dozen and a half, perhaps, and possibly she might make two dozen. They are very common work, of course.

Q. How many hours would it take her to make two dozen shirts?—A. Well, I think she would work twelve hours, probably a little longer.

Q. At 25 cents a dozen for the shirts?—A. Yes, sir.

Q. They generally get more than that, though, I suppose, say, 35 cents?—A. Prices vary according to the competition in trade.

Q. Does that amount furnish anything like a reasonable support for them?—A. I should think not. They manage to exist; that is all.

Q. They manage to get enough from day to day, I suppose, and no more?—A. I do not think they get enough to eat. I know there are many that do not get enough to eat, but they have to get along with what they can earn.

Q. Do you know how many are employed in that business of making shirts at 25 or 35 cents a dozen?—A. There are thousands. I could not estimate. It would be impossible to estimate how many there are.

Q. Very large numbers, I suppose?—A. Yes, sir; very large numbers. Women are also engaged in tailoring, and the work in that line of business is a little better.

Digitized by Google

Q. How much better?—A. Well, not a great deal in the poorer lines.

Q. How much can a woman earn a day in the tailoring business?—A. If she is a good tailoress, and understands her trade thoroughly, she can earn from $7 to $8 a week. If she is an indifferent worker she may not earn more than $3 or $4 per week, according to her capacity.

Q. How do you regard the condition of the women generally in New York, in regard to compensation?—A. I think it is very poor.

Q. Do you mean to say that it is entirely inadequate for their comfortable support—for the procurement of the necessities of life—a reasonable place to live in and good food?—A. Yes, sir; I think it is inadequate to their wants. But, of course, that is not easy to regulate. A competent worker may earn a comfortable living, and a person not so competent suffers accordingly.

Q. I speak of the average. Do they earn enough to give them a good place to sleep in, and good food and good clothes?—A. No, sir; I think not.

Q. You think it is entirely inadequate for them?—A. Yes, sir; I think it is.

Q. Even for the wage workers?—A. Yes, sir.

Q. And if there is any one dependent upon them, how is it then?—A. Of course it is worse then. Nearly all of them have somebody dependent upon them, either an aged father, or brother, or sister. There are very few workwomen that have not got somebody dependent upon them besides themselves.

Q. Besides these voluntary charities, what other remedy would you propose for this state of things?—A. I am afraid that I shall have to leave that to wiser heads than mine, sir. I do not think it is a subject on which I could give a practical opinion.

Q. There has been no effort in that direction, so far as your association is concerned?—A. We endeavor, as far as possible, to get adequate pay for them.

Q. You do that by personal solicitation?—A. Yes, sir; by using our influence personally, and as a society, to get the best possible pay for the labor required.

Mr. CALL. Your society is a very admirable one, I have no doubt, and is doing a most excellent work.

The WITNESS. I have brought with me a copy of our last report, and also a copy of our constitution, if they will be of any use to you.

Mr. CALL. We shall be glad to have them.

Q. What other charitable associations are there, within your knowledge, having the same object as yourself?

### THE YOUNG WOMEN'S CHRISTIAN ASSOCIATION.

A. There is the Young Women's Christian Associations.

Q. Does that afford relief to a large number?—A. Yes, sir; that, however, is sectarian. I omitted to state that ours is not.

Q. What do you mean by that?—A. That we do not ask what is the religion or nationality of a person.

Q. Whether they have religion or not you receive them all the same?—A. Yes, sir.

Q. Does not the Young Women's Christian Association receive them if they have no religion?—A. That I could not answer; but they do not aid anybody excepting Protestants, while we do. That is the difference.

Digitized by Google

Q. They are confined to Protestants entirely?—A. Yes, sir; they confine themselves to Protestants entirely, while we are not confined to any religion, nationality, or color.

By the CHAIRMAN:

Q. Have you had occasion to help girls of the colored race?—A. Yes, sir. We furnish them employment, and have also collected their wages.

Q. Are there many such in the city?—A. Yes, sir; quite a number; not so many, though, who come to us, in proportion to the number in the city, because colored women are more exclusively engaged in household service. There are not so many of them seamstresses and workers outside.

Q. What is their relative condition as a laboring population, compared with the white laboring population of the city?—A. I think it is good; quite as good as the white population; indeed, I have seen a great many colored women come to us who seemed a great deal more comfortable than many white women that came.

Q. You think they hold their own in competition with their white friends in this city?—A. I think they do; yes, sir.

DIFFICULTY OF COLLECTING WORKING WOMEN'S WAGES.

By Mr. CALL:

Q. Have you observed whether there was any difficulty in making the collections of the wages of these workwomen when they were intrusted to you?—A. Oh, yes; many times great difficulty. We sue these cases, and have sometimes very great difficulty. We do not always collect when we get judgment, but there is in this State a law of imprisonment which enables us, for anything under $50, to imprison a man for fifteen days if we are not able to obtain any money. I need not say, however, that we do not exercise that privilege unless it is a case where we know they have money, and can pay if they want to.

Q. Do you not think that is a pretty severe law on the poor people?—A. No, sir; not as we exercise it; we only wish that it could be exercised against women as well as men, because there are many among the women who are very unjust to their sex—quite as much so as the men.

Q. Are there not a great many who are honestly unable to pay their debts?—A. Well, when we are satisfied of that we do not press them. We have to use great caution on this subject, and be satisfied about it.

Q. Are the women in favor of a law imprisoning the people for debt?—A. Well, sir, I think some of them would be that suffer from not being able to collect their wages.

Mr. CALL. Under the old Roman law they used to sell them into slavery.

The WITNESS. Well, they do not suffer much here by fifteen days' imprisonment. However, that law does not apply to women at all, though the intention of the law was to apply it to them as well as to men. There was some omission in the act as it passed the legislature at Albany—just enough for them to escape. We do not have to exercise that law very often, but we do occasionally.

Q. You do sometimes?—A. Sometimes we do; we are not called upon to do it very often, and when we are called upon to do it we generally get the money. They find that they are able to get the money then.

Q. What are the amounts that you have to sue for generally?—A.

Digitized by Google

We have claims of from 50 cents up. The highest we ever had was $300. We had a breach of contract for $300. We take a claim if it is only 50 cents.

Q. But you would not put a man in jail for 50 cents?—A. No; we should not need to, because he would pay rather than go to jail.

Q. You think it would be better if the law were extended so as to include women too?—A. Well, I do not think it would do some of them any harm. I do not wish, however, to express any decided opinion on the subject, but my experience shows me that we could get the money if the law applied to them as well.

Q. Are there any other facts which you would like to present to the committee in reference to the condition of the working women of New York?—A. I do not recall anything special, unless you desire to question me; perhaps my experience would enable me to answer any questions on that subject that you might ask.

### THE HOME CONDITIONS OF WORKING WOMEN.

Q. Have you any information in regard to the condition of the laboring people, in respect to their homes?—A. Yes, sir.

Q. And as to the rents they pay?—A. Yes, sir.

Q. And the number of persons in the families?—A. Yes, sir. That sort of information comes to us many times a day. We ought to know in regard to their rents and the amount of money they receive.

Q. Please state any facts within your knowledge in relation to these subjects; what kind of premises they occupy, and what they pay for them.—A. Perhaps I cannot illustrate it any better than to give the history of a young girl to whom we had taught the use of a sewing-machine for the purpose of helping her along. She had a mother in ill health, and a little brother and sister. They lived in a rear building, a poor place, somewhere on Nineteenth street. That girl was less than eighteen years of age when we taught her the use of a sewing-machine, and she used to walk every morning from Nineteenth street down to Canal street to her work.

By the CHAIRMAN:

Q. How far is that?—A. A mile and a half probably. I do not know the exact distance. She used to walk down every morning and walk home at night, and do her work in the mean time, and when she got home she would get the supper for the children and get breakfast for them in the morning, and she went through this labor every day. She had to pay $6 a month for rent. There were four persons to be supported by her labor. Her mother was unable to do much, and her little brother and sister were too young to work.

By Mr. CALL:

Q. What wages did she get?—A. She used to earn about $6 a week, so you can judge of her condition. She could earn that much by working very hard.

Q. Out of that she had to pay $6 a month rent?—A. Yes, sir; and food had to be provided for four persons, and she had to get such clothing as she could get on her means. Sometimes she had a little help from ladies.

Q. That is rather a better rate of wages than the average for a girl of eighteen years of age, $24 a month?—A. Well, she was a clever girl. While she could earn $6 a week there were others who could not earn more than $3 or $4.

Digitized by Google

Q. You consider that that compensation is greater than is usual?—A. Yes, sir; for a girl of that age it is unusual. She must be a pretty smart girl to earn that, week in and week out. She knew the necessity of remaining in her place. She was in one place six years.

Q. Upon the whole, you regard the compensation of working women as entirely inadequate for their reasonable wants?—A. Yes, sir.

Q. And in respect to the character of houses that they are compelled to occupy?—A. They are very poor.

Q. Are they healhty in their arrangement and condition?—A. I do not see how they can be healthy. It is not possible that they can be healthy with so many people crowded together and with poor ventilation.

Q. Are they generally tenement houses?—A. Yes, sir; they must be. The rents could not be obtained at these prices in any but tenement houses. This young girl's dwelling was in a rear building.

Q. Such apartments rent at from six to ten dollars a month?—A. Yes, sir; and more than that. I do not know of any one who gets rent at less than $6 a month for one room. This family had only one room.

Q. Are they not generally in suites of three rooms together—a kitchen and two bed-rooms?—A. Not usually. Of course there are places, flats and floors, that they could obtain in that way, but as a rule the very poor classes of women, who are obliged to support themselves and families, are not able to pay the rent on such places.

Q. They occupy still poorer apartments?—A. Yes, sir; according to what they are able to pay.

### RENTS IN NEW YORK CITY.

Frequently a whole family will live in one hall-room; it is no uncommon thing for five or six persons to be found living in one room. I understand that from six to ten dollars is the rent for one room per month and fifteen dollars or more for two rooms.

By the CHAIRMAN:

Q. I would like to have you give us some idea of the actual domestic condition of these working people that you have come in contact with; what their idea is of moral and religious instruction, and something of their relaxations and of their social life, what becomes of their children, what sort of education they receive, and some such particulars as these. What we want is a somewhat definite picture of the sort of domestic life that these people live, and their chances in this world, or in any other.

### AN ACCOUNT OF A WORKING WOMAN'S TREATMENT.

A. Well, I sometimes think that their lines fall in pretty hard places. It is no uncommon thing to have a woman come in who has four or five children to support by the labor of her own hands, and that woman may be making shirts for 35 cents a dozen. We have known, in our institution, a case where a woman sat up nearly all night to finish two dozen shirts, and she carried them in on Saturday afternoon and was refused her pay.

Q. Why?—A. She had not got the work in quite in time. It was a little too late—perhaps half an hour. That woman, the one I specially refer to, came to us with tears in her eyes, saying that she had not a mouthful of bread for her children and she could not get her money.

Q. Did she explain these facts to those who owed her the money?—

Digitized by Google

A. Yes, sir; and we stated it to them in a letter. We collected the money.

Q. Why did they not pay her?—A. Because, as I have said, she had been perhaps a half hour late.

Q. And they knew her condition?—A. They knew her condition.

The CHAIRMAN. I can imagine how a devil might have done such a thing, but do you mean to say that human beings do such things?

The WITNESS. Yes, sir; quite often.

The CHAIRMAN. It is quite apparent that nobody but a devil would have done such a thing.

The WITNESS. It would certainly seem so.

Q. Your association took some action and got the money?—A. Yes, sir; I gave her the money that night for the work on the two dozen shirts which they owed her, and I told her that we would collect it. I thought the children ought to have something to eat on Sunday. We afterward collected the money for her.

Q. That is one of the many cases, do you say?—A. Yes, sir; that is one of many cases.

Q. Who was it that did that—who was the defendant in that action?—A. Well, I should have to refer to the books to tell you the name, sir.

Q. It was not so exceptional a case that you remember the name, even though knowing the fact?—A. I cannot remember the name, because we have hundreds and thousands of names in the course of the year, and while I could refer to the books and ascertain the name, I could not tell it without referring to the books.

Q. Do you mean that that is anything like a rule?—A. No; that is an exception to the rule. There are many honorable employers in New York. But there are men who do such things.

Q. Do you recollect anything of the number of employés working for the employer in that particular case?—A. No, sir. We did not inquire into that matter, but it was quite an establishment.

Q. What was the work?—A. Making shirts.

Q. In the making of what garments are these sewing women employed here in the city—they make shirts and what else?—A. They finish pants, and are engaged in tailoring, and dress-making, and in making underwear, and almost everything that is worn.

### HARSH TREATMENT OF WOMEN BY WOMEN.

By Mr. CALL:

Q. Is it your observation that these cases of refusal to pay occur more frequently with women than with men?—A. In cases of refusal to pay, I think, as a rule, we have quite as many refusals from women as from men.

Q. Not more?—A. Perhaps more; but we have plenty of them from men too.

By the CHAIRMAN:

Q. Do you collect for men who cannot get their wages?—A. No, sir.

The CHAIRMAN. Then you misunderstood the question.

By Mr. CALL:

Q. I mean is it more difficult for women to collect their wages when in employment than it is for men?

The CHAIRMAN. Do they oftener refuse to pay women?

The WITNESS. I presume they would, although I cannot speak de-

Digitized by Google

cidedly on that subject. Of course women have not the power to protect themselves. In the first place these women have not the means to obtain legal redress, only as we can afford it to them. They may not be able, unless they come to us, to get any legal redress whatever.

By the CHAIRMAN:

Q. What classes do you say you aim specially to protect?—A. All classes of sewing and trades women, all women who earn their living excepting those in household service.

Q. You have spoken of those instances where sewing women fail to get their pay and have suffered great distress in consequence. Can you say anything of women that work in other departments? What do you mean by trades women?—A. I mean those who work, for example, at paper-boxes and cigarettes, and at press-work, and the different trades.

Q. Are cigar-makers included?—A. Yes, sir. Everything of that kind, everything at which women are employed.

### MALE EMPLOYÉS BETTER OFF THAN FEMALE.

Q. On the whole, which are the worse or the better off, the male employés or the female employés of the city?—A. I should say the female employés are not so well off as the male. They have not the same means of helping themselves.

Q. Do they get as good pay?—A. No, sir.

Q. And as a rule they suffer more distress, perhaps.—A. Yes, sir.

Q. Which, as a rule, devote their earnings to the greatest extent to the legitimate support of those who may be dependent upon them; that is, whose personal habits are the best?—A. I do not know that I can judge as to the men, but I know the women, as a rule, do devote all their earnings to those dependent on them.

Q. Do you know that they spend for cigarettes or amusements any large portion of their earnings?—A. I do not know of any that do. I know of some perhaps that take more liquor than they ought to. I have seen some of those, but I do not know of their smoking any cigarettes, or anything of that kind.

Q. Then work women do indulge in liquor?—A. Not the class to which I refer—not the sewing and trades women; but there are some women who do some kinds of work, not employed in household service, who do indulge in it—as those engaged in the laundries, for example, and different kinds of rough work.

### NO ORGANIZATION FOR HOUSEHOLD SERVANTS.

Q. Are there organizations that look after this other class that you speak of in their special way, or are they left pretty much to themselves?—A. They are left pretty much to themselves, I think. I do not know of any organizations that have that class in charge.

### THE YOUNG WOMEN'S CHRISTIAN ASSOCIATION.

This other association that you mention, the Young Women's Christian Association, does that perform the same service that your society does, only that it confines its efforts to Protestants exclusively?—A. Well, it does not collect their wages.

Q. What does it do?—A. It finds them employment as far as possible, and I think there are some trades taught there. Type-writing is taught there and several other trades.

Digitized by Google

Q. How is it about the children of these women, or their schooling?—A. Well, they are compelled to take their children from school and put them to work, but if the woman is active and intelligent she will send her children to night school.

Q. Are there other organizations besides yours in the city whose business it is to assist to legal redress when it is wanted?—A. No, sir.

Q. Do you know of such a society anywhere else in the country—in any other city of the United States?—A. They have attempted to establish one in Chicago, and also in Boston, but I think they work differently, and I do not know whether successfully or otherwise. We have had requests for information as to how our society was conducted, saying that they desired to establish such a one in their cities.

Q. Undoubtedly the fact that your society exists and would enforce the law has led to the prompt payment of wages in many instances when without that there would have been wrong done?—A. Yes, sir; we feel that the fact that our association exists saves thousands of dollars that we know nothing about, and it is not so much the amount that we collect as the amount we make it unnecessary to collect that is to be taken into account.

Q. From your knowledge and experience, I suppose you would say that an organization of this kind would be very serviceable to the class who are under your protection in every large city probably in the country?—A. Yes, sir; I think it would be very beneficial in every large city.

Q. If there is anything further that occurs to you that you would like to say to the committee we should be glad to hear it?—A. I do not think of anything else.

---

NEW YORK, *September* 19, 1883.

Col. EMMONS CLARK, examined.

By the CHAIRMAN:

Question. What position do you hold in the government of this city?—Answer. I am secretary of the board of health.

Q. For how long a time have you held that position?—A. Since its organization, in March, 1866; something over seventeen years.

Q. You have been in military life somewhat?—A. Yes; to a limited extent.

Q. I think you are now the commander of that famous regiment, the Seventh, are you not?—A. Yes, sir.

Q. I presume you have seen a copy of the resolution of the Senate authorizing the investigation upon which we are now engaged?—A. Yes.

Q. We are anxious to learn what you can tell us as to the sanitary condition of the people of this city, and to obtain from you such suggestions in respect to those conditions as you think may be of service in improving the condition of the workingman either in this city or in the country at large. We should be glad also to have any statistics that you may be able to furnish, derived from the operations of the board of health of this city, in order that the country as a whole may make them available. You may make the statement in your own way?—A. I think, perhaps, you would obtain the information you desire to better advantage by questions. I am not very much of a talker—"not in the habit of public speaking," and for that reason I think you would ac-

Digitized by Google

quire more information by leading me to some particular point which you may have in mind.

Q. Well, then, you may, in the first place, state to the committee what you do in the discharge of the functions of your office.—A. The duties of secretary of the board of health of New York are much like those that belong, rather naturally, to the position, from the name it bears. The minutes are kept by him and the correspondence is conducted by him with different parts of the country and also the correspondence with citizens of New York; he receives complaints, and has in general a non-executive charge of the affairs of the department. This, of course, would naturally give the secretary a practical knowledge of everything that is being done by the Department through its executive and otherwise.

### THE NEW YORK HEALTH DEPARTMENT.

A department of health has two objects in view, one entirely of a public character, and another of a humanitarian character. The lives of laboring men are supposed to have a public or a business value. It is estimated, I think, that every person that comes to this country as an immigrant, and every laboring man, has a productive value of $1,000 or more. That, I believe, is the minimum which has been fixed by the gentlemen who devote themselves to that line of thought. That being so, it is to the public interest that the lives of laboring men should be preserved, and also that their health should be preserved, in order that they may settle their families and keep them from being subjects of charity. A board of health, therefore, in a city like this, and, indeed anywhere, has for its primary object to preserve the health of the people, to prevent contagious diseases from spreading, to prevent malarial diseases, and also to preserve the lives of the people from the various other diseases which belong to a community like this. On its organization the New York board of health found that no particular attention had been paid to sanitary matters in this city.

Q. When was the board of health organized?—A. In 1866.

Q. Until then there had been none in this city?—A. No, sir.

### ITS GOOD EFFECTS.

At that time the streets had been very indifferently cleaned; the slaughter houses, and other houses connected with the consumption of slaughter house material, were located in all parts of the city—in fact, in some of the tenement districts there were large butchering establishments where animals were butchered in view of men, women, and children, as they passed through the streets, and the blood ran into the gutter in the sight of everybody. The city was suffering from many establishments whose business produced offensive odors. They found that in most of the houses, excepting very modern houses, the only accommodation for the necessary purposes of life were large privies, which were very foul in the summer season, and were not connected with sewers. They found at that time, also, that no provision existed to prevent the spread of contagious diseases. When contagion occurred, measures were inaugurated to put a stop to it, but no preventative measures had been exercised. I mention these things to show what progress the board has been able to make in this city in the way of securing improvements. The public mind (and by the public mind I mean the property owners) was not much disposed to make improvements in the

Digitized by Google

interest of health. There was a prejudice, also, among the laboring people against what seemed to be an interference—a prejudice against people coming about their habitations for information, or anything in the nature of inquisitorial intrusion. For several years that was a difficulty. That, however, has been removed, and the inspectors of the board of health are now welcomed to all parts of the city, not only by the rich who suffer in any way from defective drainage equally with everybody else, but also by the very poor. That is a very gratifying progress in public opinion.

### THE NEW YORK TENEMENT-HOUSE LAW.

Soon after the establishment of the board of health there was a tenement-house law passed, giving the board of health special powers to look after the habitations of the very poor. The tenement-house population of this city is very large—larger than that of any other city in the world. By a tenement house, under the law of the State, we mean a house that contains more than three families. Under the law of New York any house is a tenement house that has four or more families.

### TENEMENT HOUSES IN NEW YORK CITY.

Q. Can you give anything like the approximate number of persons who live in these tenement houses?—A. Yes; I had that in mind when I came here. The only figures that I have brought with me are in respect to that. From its peculiar location, New York City has an enormous tenement-house population; that is to say, we are obliged to build houses high here. There are some parts of the city where we have more families to an acre of ground than any part of Paris, London, or Berlin.

Q. Do you know how we compare in that respect with Asiatic cities?—A. I do not know, but we all know that Asiatic houses are not high houses, and it is believed that there are not there anything like so many persons per acre as there are in parts of Europe. This city being situated as it is—surrounded by water—the tenement-house system seems to be a necessity. It was hoped that by the building of the elevated railroads and other means of communication with the surrounding country, as in Philadelphia, for example, the evil of over population might be removed. But that does not seem probable. There is no result in that direction at present. In fact, it seems to be well established that workingmen like to live near their work.

Q. Do you think that that is by reason of any other fact than that it is on the whole cheaper to be near where they work? Suppose the means of transportation out of the city were reduced to the penny rate, how would it be then?

### WHY WORKINGMEN CROWD INTO CITY TENEMENTS.

A. It is not only the expense that seems to be an objection to these workingmen, but the working houses being from 7 in the morning to 5 or 6 in the evening, the time necessary to go to and from their homes, if at a distance, is also an objection. And there seems to be a fascination about a city like this for the laboring people. They are particularly anxious, it seems to me, to be near their work. I have observed that during the last fifteen years, and I am fully satisfied that we are never going to relieve New York of its crowded population by carrying them to homes 5, 10, or 20 miles away. That is, perhaps, an opin-

Digitized by Google

ion different from those that have been entertained generally; but I have grown to be of that opinion from observation. That being the case it is the duty of the board of health to look after the habitations of those who are obliged to work with their hands; men whose incomes from their labors are limited. The design of the board is to make the houses which these people occupy as good in every respect as possible; to give people air, light, and plenty of water for the purposes of cleanliness; to make the drainage and plumbing conditions as perfect as possible, and free from any possibility of disease to the people occupying these crowded tenement houses. That has been for several years the effort of the board of health of this city. Their efforts have been confined almost entirely to the improvement of the habitations of the laboring classes and the poor classes generally. Incidentally, the habitations of the well-to-do and of the wealthy people receive the attention of the board, but never except, upon a complaint or upon a call from that class of people. The inspection of tenement houses, however, is a constant routine work of the inspectors.

SANITARY CONDITION OF TENEMENT HOUSES.

Q. Will you give us an idea of the work itself and of the condition in which you found the tenement houses, and what gradual improvements have been accomplished; what the present deficiencies are, and what you would deem advisable to supply these deficiencies? State, in the first place, the condition in which the board of health found the tenement houses of the city in respect to drainage, ventilation, light, general convenience, and whatsoever affects the health and comfort of those living in the tenements.—A. When this board came into existence there were two kinds of tenement houses; one built on purpose for the occupation of many families—four, eight, or twenty families, as the case may be. Another class of tenement houses were those which had been originally private dwellings built for one family, and as the city changed in the business locations and in the location of people able to have a house in a large town like this, the private house became the boarding-house, and finally became the tenement house. Now, houses built for tenement houses at that time were mostly built on lots 25 feet by 100. The object of the builders was, apparently to cover space so as to crowd as many families into it as possible, and the question of light and air had received very little attention.

Q. Had these houses been built without any legal supervision?—A. Without any legal supervision whatever.

Q. According to the will of the owner?—A. Yes; the way lots are laid out in this city; they are in the form of 25 feet front by 100 feet deep. The result was, in regard to the tenement houses, that all the sleeping-rooms—all excepting the rooms fronting on the street and the rooms in the rear of the house—would have no light and no ventilation.

The new tenement houses built at that time, and, in fact, for some time after that, were all of a character in which light came only from the front and rear, and sometimes the rear was obstructed and gave little or no light. But in any case the sleeping apartments were altogether destitute of light and air.

At that time, also, there were tenement houses built two on a lot 25 by 100, leaving a space of 10 or 15 feet between the two houses; and in this space would be a privy, the smells from which in the hot weather would be very offensive to people living in the neighborhood. In many cases these privies were not connected with the sewers, and of course

Digitized by Google

the system of scavengering at that time was of the crudest nature; open carts or buckets were used once in a month, or, perhaps, only once in a season, and the whole neighborhood would be made uncomfortable on the emptying or cleaning of these privies. Previous to the existence of this board of health there was no provision by which the owner of the house could be compelled to take care of his property, if it were out of repair or in a filthy condition.

Q. You are speaking now of what sort of houses?—A. Of the new houses that were built on purpose for several families, before there was any legal provision or restriction upon the methods.

The CHAIRMAN. You will not lose sight of the other class?

The WITNESS. No; I am speaking now of houses worse than those—the private houses which had been the habitations of rich people in former years, but had degenerated into being the habitations of the laboring classes; perhaps of a lower and dissipated class. Those were worse even than the houses first described, because, having been built for a single family, all arrangements for drainage, &c., were calculated for a single family, and were of course not adequate to the condition of four, six, or eight families. Domestic privacy in these houses was impossible. There being but one common entrance, the moral effect of habitations converted in that way was anything but good.

Q. How extensive, relatively, were those classes of accommodations or tenement houses?—A. As to the number of tenement houses, we have had two different surveys of them. The most complete survey was made in 1879. Fifty inspectors were employed, men of education and intelligence, to visit every tenement house in the city, to find out the number of families in each house, what the condition of the drainage was, what the condition of sewerage and of the ventilation was, and whether any particular room in any house was overcrowded so that there was danger to life. A complete survey was made and a record made of every house.

STATISTICS OF POPULATION IN NEW YORK CITY TENEMENT HOUSES.

The number of tenement houses in this city at that time—four years ago—(in 1879) was 21,163. In those 21,163 tenement houses there were 160,362 families, making an average, as you see, of about 7½ families to each of the tenement houses of this city. Statistics collected at that time show that the average number in each family is about 4½. 160,000 families in tenement houses, with 4½ to each family, make 720,000 people living in the tenement houses of this city in 1879. That was when the tenement house act was amended, by which every man building such a house is required to submit a complete plan of what he proposed to build, and that plan must be approved by the board of health before he can proceed with the erection. Since the law was passed, and since the improvements referred to have been required, there have been built about 4,500 tenement houses, which, also include what we call here "apartment" houses or "French flats," some of which are very large and elegant, but still, under the definition of the law, come under the operation of the tenement-house act. They are, however, but a small factor in the whole number.

Q. Before this act of 1879 had such buildings been erected without any public supervision?—A. Yes; except as to the strength of materials. We have a department of buildings, and they look after the question of the strength of the walls, &c.

Q. But without reference to sanitary conditions?—A. No.

Digitized by Google

Q. That department, I suppose, existed before the board of health was organized?—A. Well, I think about the same time. Formerly there was no supervision at all, even of the strength of the walls; but owing to the falling of buildings occasionally, from weakness of walls, a department of buildings was provided.

### NEW TENEMENT BUILDINGS PER ANNUM.

Since 1879, when this law was passed, there have been erected 4,500 buildings, being at the rate of about 1.500 buildings of that character each year. And this includes, as I said, the fine apartment houses in the upper part of the city, though they are a very small proportion of the 1,500. These 1,500 houses, built during each of the last three or four years, are designed to accommodate 30,000 people.

So that now, besides some houses that four years ago were tenement houses, but have been converted into warehouses and stores, it is safe to estimate that the tenement-house population of the city of New York to-day is something over 800,000 persons.

### OVER ONE-HALF THE POPULATION OF NEW YORK CITY LIVING IN TENEMENT HOUSES.

Mr. PUGH. Over half the population of the city live in houses having more than three families?

The WITNESS. Yes.

Q. What is the population now of the city?—A. I cannot say exactly.

Q. Something like 1,200,000, I suppose?—A. Yes. It is to be supposed that some tenement houses are torn down to build factories and stores, and people have moved into others that have been constructed.

Q. And then the population grows largely, of course—thirty to forty thousand a year?—A. Yes, the population is of course growing rapidly. That we know from statistics.

### NEW TENEMENT-HOUSE ACT.

In 1879 a very stringent tenement-house act was passed by the legislature, instigated by the board of health and a great many gentlemen of this city interested in sanitary reform, who believe that the interests of the city require that inasmuch as we are obliged to have these tenement houses here to a greater extent than in any other city, they should be made as comfortable and healthful as possible. This law requires that before the foundation of a house is laid the party proposing to build it must submit to the board of health an exact diagram showing the elevations and ground plan, and showing exactly how each room is to be ventilated.

### LEGAL RESTRICTIONS IN BUILDING TENEMENT HOUSES.

This law requires that there shall be no room in a house erected after the passage of that act without an opening directly into the open air. That is a very important point, as you must observe. This law requires that a house shall cover only a certain percentage of a lot. Formerly a house might cover a whole lot. Now they can only cover 65 per cent. of it, but if the plan secures ventilation and light in a proper manner the board of health can increase the extent which the house may cover to 78 per cent. of the lot, and no tenement house can be built within ten feet of the rear line of the lot.

Digitized by Google

By Mr. CALL:

Q. They are allowed to cover seventy or eighty feet, you say?—A. 65 per cent., but the board of health may consent to their covering more, provided proper provision is made for ventilation and light.

Q. How much more may they then cover?—A. The board of health have adopted 78 per cent. as the maximum.

By the CHAIRMAN:

Q. What spaces are there on the exterior of the lot?—A. The general tendency is to build on each side, midway, a large shaft, into which all the interior rooms, such as bed-rooms, can open, and that shaft either opens directly into the open air or has at the top of the shaft a covering with louvres, giving an air space equal to the entire space of the shaft.

Q. There would be no party-walls, as they are called, but a space between the tenements?—A. Well, no. There would be a party-wall for a part of the distance; for instance, a party-wall running back twenty or thirty feet, then a large shaft, then again the party-wall would continue.

PROVISION FOR LIGHT AND AIR.

By Mr. CALL:

Q. You mean by a "shaft" an open space?—A. An open space running from top to bottom.

By the CHAIRMAN:

Q. Like a chimney?—A. Yes.

By Mr. CALL:

Q. When you have not that you have it open at the top?—A. The shaft may be open at the top and with a drainage at the bottom, so that the air and rain may come in, or they generally have it covered and with louvres or openings at the side like a window shutter. The law requires that that amount of opening in the louvres shall be the same size as the shaft itself. That is the way with the cheap houses, but in the large apartment houses instead of having a shaft they have a slot running in; what I mean by a slot is something from the rear running right in. In the large houses they run large slots, as I would call them, into a house to give light, but in these smaller houses shafts are built.

By Mr. PUGH:

Q. That law does not affect tenement houses built before its passage?—A. No, sir.

The original tenement-house act gave the board power to improve tenement houses and they have been doing that constantly by compelling the owners, where there are no openings into the the external air, to cut windows into the archways and the external rooms, but that is not entirely effective, because when the winter comes and these people need the air they are apt to nail these windows up in order to keep the warmth in. A great many improvements were made under the old law in this respect, and the tenement houses, as I have said before, are at present a constant subject of supervision. Our inspectors calculate to visit every tenement house, whether there is any complaint in respect to it or not, about four times a year.

SANITARY REGULATIONS.

We require all the poor habitations to be whitewashed twice a year, though that is not always done. Where good care is taken of the

Digitized by Google

property it is considered rather too much to ask, but that is the law and wherever a house is filthy the board of health order it whitewashed.

Q. Did you hear Miss Helen Potter's statement before the committee as to the condition of the tenement houses and the people living in them?—A. No, sir; I did not.

By Mr. CALL:

Q. Does your board regard the covering of 78 per cent. of a lot, and leaving only the remainder open as sufficient for pure air, ventilation, and health?—A. Well, it is regarded as reasonable in this city, where the land is so valuable and the people are so crowded.

Q. Suppose the land was not valuable, would it be sufficient then?—A. Well, we should like every man to have about ten acres about his house if we could.

Q. But ten acres are not necessary for air, are they?—A. No, of course not. Perhaps I ought not to have answered your question in that way. But in this city, situated as we are, if everything else is properly done, covering 78 out of a 100 feet gives proper ventilation.

### NEW YORK CITY—ITS SANITARY LOCATION.

Q. How is it regarded elsewhere, in the sanitary laws of the other large cities of the world, London, for instance?—A. There is no other city so situated in a sanitary aspect as to compare with New York. There is none so well surrounded by water, none having a sewerage system and facilities for sewerage equal to New York, where the sewers flow directly into rivers in which the tide rises and falls five or six feet a day.

### THE DEATH RATE OF NEW YORK CITY.

Mr. CALL. We have had the sworn statement here that the death rate of New York as compared with London and Paris was nearly twice as great.

The WITNESS. Well, that is not so; it is only a trifle greater. Whoever made that statement was not well informed.

The CHAIRMAN. I think it was stated that our death rate is thirty-two in one thousand, while that of Paris is only twenty-two and London only nineteen.

The WITNESS. Of course, we have the figures in our department. But there is not a great difference. All that I would account for, if you will allow me. They say New York is so healthfully located that it should be the healthiest city in the world.

Mr. CALL. There is no doubt about its natural advantages.

The WITNESS. In the first place nearly all the immigration that we have to this country comes to this city, and nearly all the shipping. The immigration is very large. The most desirable part of it leaves New York immediately for the Western, Southwestern, or Southern States. They go out to be farmers. The aged, the infirm, the dissipated, and the sickly—everything that is undesirable—remains here in New York. Consequently our almshouses here are filled with the very worst part of the whole immigration. That is one reason why the death rate is greater. In other cities, for instance, Brooklyn, and perhaps some of the foreign cities, all their penitentiaries and almshouses are outside of the city and do not count in their death rate. Then there is another thing: New York is so located, being an island, that no person can be buried without having a permit. No dead man can be passed

Digitized by Google

out of the city of New York without a permit from the board of health, There is no city in the world where they have so complete a record of the deaths. Neither London nor Paris have so complete a record. Again, people come from all over the country to the city of New York for treatment. There is no place perhaps in the world where there are so many sick people who come for treatment and die as New York. Our physicians are celebrated and New York is the great center of the country. There is no place where there is so much of a death rate from that source as there is here.

Mr. CALL. That is not very complimentary to the doctors.

The WITNESS. Well, these people come here after they are really past cure.

INFANT MORTALITY IN NEW YORK.

The CHAIRMAN. There has been a statement made by somebody that ten thousand infants die here every year.

The WITNESS. That depends on what you call an infant. We generally call children infants until they become five years of age.

The CHAIRMAN. And the statement was made that more people die here than are born here and that the growth of the city is coming in from outside.

The WITNESS. Well, that only shows how recklessly people make statements. They say that more people die here than are born here. It is not so, however, because in the city of New York we have a perfect record of the people that die, but of the people that are born we do not have a record probably of two-thirds, nor perhaps of much more than one-half. A man as I say cannot be buried without there being a record of the fact, but hundreds and thousands of children may be born and we know nothing of it. They do not report births as they ought to do to the board of health. There is no law by which they are required to report it. There is a penalty of $10 if the doctor or midwife does not report the birth, but they do not report them all. People make statements of that kind because they do not understand these facts.

By the CHAIRMAN:

Q. You think there are a great many births that are not recorded, even where there is no special motive for concealment?—A. It is due principally to the carelessness of the doctors. I will guarantee that if you pick out ten doctors here, and ask them the point blank question if they have reported all the births, in the past year, of which they have had knowledge, there is not one of them who will not say that he has not done so. Unless we had men to send to every house every week, and ascertain about the births, we could not get correct information. Abroad they have laws providing that the children that are not recorded are illegitimate.

Mr. CALL. That would not make them illegitimate.

The CHAIRMAN. It would be so presumptively.

Mr. CALL. That would not do. You cannot make children illegitimate that way.

The CHAIRMAN. You can raise a legal presumption of illegitimacy.

Mr. CALL. Of what value is that?

The CHAIRMAN. It is only of value as regards the burden of proof.

Mr. CALL. No such law would work anywhere in the world.

The WITNESS. In such cases they would have to prove the legitimacy of the child

Digitized by Google

The CHAIRMAN. There is always, of course, a presumption of legitimacy, that is a natural and reasonable presumption.

The WITNESS. Nothing of that kind can be done here; nor can we have a police inspection to go about and inquire into people's business. Our people will not submit to anything of that kind, so that it is impossible in this city to get a proper record of births.

By Mr. CALL:

Q. Why do you not impose a fine on people for not reporting?—A. We do not know when the doctors officiate, nor the midwives either.

Q. How do you find out about a man's death?—A. A man cannot be buried without having a doctor's or a coroner's certificate. If there is anything suspicious about a death the coroner has to give a certificate, and there is not a ferry company or a railroad company that will take a body until some certificate is given either from a doctor or from the coroner.

SEWER-GAS—HOW AVOIDED.

By Mr. PUGH:

Q. Is there any communication from the bed-rooms of these houses to the sewers so that the sewer-gas could find its way into the bed-rooms of tenement houses, say from stationary wash stands?—A. Well, they have in all good houses these wash-stands.

Q. Stationary?—A. Yes.

Q. They let in sewer gas, do they not?—A. No; because we require that they shall be trapped.

Q. But the traps are utterly insufficient to keep out the sewer gas, they say.

The WITNESS. Who says that?

Mr. PUGH. That is the received opinion of physicians—that you cannot exclude sewer gas by a trap.

The WITNESS. That is not the opinion of the sanitary authorities here, nor of all good sanitary authorities. The opinion of the sanitary authorities here, and of the plumbers, is that a trap is a perfect preventive of sewer gas, and the simplest trap—the trap that we use here, and the one that the board of health recommends—is simply one that bends like the letter S, and that simply holds the water.

By Mr. PUGH:

Q. But sewer gas goes through water, does it not?—A. Our best chemists and sanitary men here say differently.

By the CHAIRMAN:

Q. How is the trap arranged; horizontally?—A. It is arranged so that part of it is always filled with water. Then, besides that, there is a waste-pipe leading out through the roof so that no pressure can come on these traps. It was said that the pressure from the tide brought a pressure to bear on these traps, so now we have a main waste-pipe that extends through the roof. We have, therefore, done away with any possibility of a trap being forced.

Mr. CALL. It is certainly a great improvement on the old system.

The WITNESS. Oh, yes.

CROWDED APARTMENTS OF THE POOR.

Mr. CALL. A witness testified here this morning in regard to the condition of the laboring classes, and said that there was a case that had

Digitized by Google

come under her observation, where eight families, taking in some forty people, were living in one room in a subcellar in this city.

The WITNESS. I appreciate entirely the good intentions of people that make such statements, but they have not facts to justify them. There are no facts to justify such a statement.

The CHAIRMAN. I think, probably, this must be very well authenticated, because there were two very intelligent ladies that went through the place and saw it.

The WITNESS. We have our inspectors going through the city.

The CHAIRMAN. This was a basement.

By Mr. CALL:

Q. What I was going to ask was this: Under your present system is it possible that such a thing could be allowed? Would it not come to the notice of the authorities; and are there not some means, by law, by which something could be done to remedy that by removing these people?—A. Yes, sir. In the first place, the board of health prohibits the occupation—it has the authority to prohibit the occupation—of cellars in this city that have not one-third of their height above the sidewalk, and even then, if the cellar is damp or not thoroughly ventilated, they can prohibit its occupation. During the last fifteen years we have emptied every cellar where there was any danger from people living and sleeping in them. And there is not any truth in the stories that there are such cellars occupied as human habitations; that is simply humbug. It is not so.

Q. You have legislation, then, directed to remedy that?—A. Yes, we have been often obliged to call on the police force to force those people out. A cellar cannot be used at all as a means of habitation without a permit from the board of health. In the next place the board of health have from year to year compelled the vacation of those places.

Q. I suppose you could vacate any apartment as well?—A. No; we could not do that unless it is in such a condition from want of repair that it is dangerous or unless it is affected by contagious diseases.

Q. Then, if you were to find forty people in one room there is no power under the law to remedy that?—A. Oh, yes; we can remedy a case of overcrowding. If a place has too many people in it it is our duty to see that part of them are removed, but we cannot say that everything must get out of the house.

Q. It is within your power, then, under the law to have things so arranged as to give enough air and space?—A. Yes. The trouble here is that people are obliged to build high and occupy small apartments. But you do not find any forty people crowded into one room.

## TRAMPS LODGING HOUSES.

To keep a lodging house a permit has to be obtained from the board of health; where tramps go or where people pay 5 cents or so for a night's lodging, in places generally called tramp-houses, they have to have a permit to keep such a house.

Q. Can you describe such a house, where they pay 5 cents or so a night?—A. At this season of the year they do not exist. In the summer season what are called the "tramps" are in the country parts. It is only when the winter comes that they crowd into New York.

The CHAIRMAN. I wish you would state to the committee in a systematic way the sanitary laws that you would prescribe in the building up of a large city. The country is only partially built now, and I would

Digitized by Google

like to get your suggestion so that people may avail themselves of them in other parts of the country.

The WITNESS. I could write them out for you to much more advantage, because I am not much of a talker.

The CHAIRMAN. I think you have entirely disproved that statement this morning.

The WITNESS. I could satisfy myself and you much better if I had an opportunity to write it down. But I desire to be as useful to you as I can, and give you all the information in my power.

The CHAIRMAN. We will take a short recess now, and after recess you may proceed.

After recess the examination of Colonel Clark was continued, as follows:

The CHAIRMAN. You had stated the condition in which the board of health had found the city, and were going on to state the changes that had been accomplished by the board, when a diversion in another direction took place. I should like you now to please go on and state first what improvements you made, and afterwards I will ask you to state what further may be done.

## PLUMBING IN NEW YORK CITY.

The WITNESS. I think I stated that about three years ago there was an act passed by the legislature which placed the plumbing of new buildings in the hands of the board of health; that is, so far as the preliminary approval of the plans was necessary. In a general way the board of health has looked after the plumbing in tenement houses, and also, when complaints have been made, in private houses, during the whole period of its existence.

The interest in that particular subject has been growing for a few years past, until this law was enacted by which, whenever a building is to be erected of any kind, a tenement house, a private building, or a factory, the builder must submit to the board of health a plan or drawing showing the proposed plumbing in every particular, where the pipes are to be laid, where the traps are to be, of what they are to be constructed; the size of drains, pipes, &c., all are to be laid down on the plan and then specifications as to the materials to be used; all those have to be submitted to the board of health. When approved a duplicate is submitted to the builder; and we have inspectors to see that that plan is carried out.

In that way the new houses are being plumbed on correct principles as far as the best engineering and sanitary knowledge has informed us—as far as they have arrived at conclusions and rules on the subject.

I would state, too, that our rules regarding plumbing are being adopted in all the cities of the Union. The reason why they are so adopted is, I suppose, because they are carefully made, and because scientific experts and practical experts in plumbing and draining were consulted before they were adopted.

By the CHAIRMAN:

Q. What changes, if any, have the board been able to accomplish in the tenement houses which existed at the organization of the board?—A. The changes in tenement houses as they existed are not entirely satisfactory. It is impossible to make changes without removing parts of the buildings and building shafts, and doing a great many other things;

Digitized by Google

but by cutting windows to some of the rooms that had no light or ventilation, and by cutting fan lights over doors a great improvement has been made, also by requiring the halls of the buildings to be ventilated and improved.

PRIVIES.

A great improvement has also been accomplished in the matter of these large open privies. When such a privy is now within 15 feet of any window they require it to be removed, and what are called "school sinks" to be substituted in place of them. In many of those large tenement houses there are many objections to the kind of plumbing which you would have in a private house; that is, the habits of the people are such that the water closets would be obstructed and injured. The people are not found careful enough for some of these improvements, therefore the privies in the yards are continued, but they are made upon a different principle.

THE APPROVED PRINCIPLE FOR AN OUT-DOOR PRIVY.

I will explain to you, if you please, what is the approved principle for an out-door privy. It is called a school sink, because that class of sinks were first introduced in the schools of this city. It is a large iron trough with the seats above it. These troughs are kept filled with water. The janitor of the building who has charge of it overnight removes the plug from this trough and lets the water in to fill it, and then the next morning adjusts it. Of course, the fœces dropping into this water, there is no smell from it, and, being removed every day, there is no fermentation and no odor arising from fermentation. So that a school sink between two tenement houses on the same lot, if properly cared for, gives no smell any more than if it did not exist; whereas, with the old privies they were a constant source of trouble, and gave forth odors that are known to be detrimental to health. That has been a great improvement effected in tenement houses.

Connections have also been required to be made with the sewers, so that the waste water—what some people call dish-water or slops—can be carried off into the sewers instead of being thrown into the streets or yards. That is another great improvement that has been made.

Q What improvements have been made with reference to the supply of water, or light, or ventilation, although I believe you have mentioned the matter of ventilation?—A. Yes; ventilation, so far as old houses are concerned, and I think, new houses also, is secured by having air-shafts, &c.

THE WATER SUPPLY OF NEW YORK CITY.

As far as the water supply is concerned, that is an element at the present time of great danger in the city of New York. As the city has increased in population, and on account of the elevated railroads, a deal of water is used, and large manufacturing establishments are constantly growing up so that the water supply which a few years ago was abundant is now short. That is, in many of the houses where it used to reach the third or fourth floor it will now rise only to the second and perhaps only to the first floor, and in some parts of the city, at certain times in the day, you will only be able to turn the water on in the basement.

We attribute much of the disease of the past two or three years to

Digitized by Google

the want of an efficient water supply. You are probably aware, however, that arrangements are being made to add largely to the water supply of the city.

The device of water meters has been introduced with a view to prevent wastage of water, but it has not entirely accomplished the result; there is still a great waste of water. For people have had so large a supply for many years that it is very difficult to teach them not to waste the water; and in the winter season nearly every householder is guilty of an offense against the public interest in letting the water run all night from the faucet in order to prevent the freezing of the pipes, and sometimes the whole storage of water has been nearly exhausted by people allowing the stream to run all night.

The board of health has had this subject under consideration, but see no way of relieving the difficulties under which the city is laboring now, except what is proposed, that is, to have another aqueduct or dam at the Croton, by which the supply can be largely increased.

### TENEMENT HOUSES.

Q. Do you think that the tenements as they existed in 1866 have been so modified that they are as healthy as they ought to be for occupation by human beings?—A. Well, I could hardly say that they are as healthy as they ought to be.

Q. Is there anything further that the board of health could, under the law, accomplish in that direction without the tenements themselves being replaced by new and better structures?—A. Well, in some cases—indeed in many cases—the tenements might be improved by removing the tenants and making very great and expensive changes in the building, but the board of health has not ventured upon that.

Q. You have not the power to direct the tearing down of premises, I suppose?—A. Not except in an extraordinary emergency. In such an emergency they might do it. In many cases we have vacated buildings—had the tenants all removed—but that was only where the building was infected by contagious diseases, or where the building was in such repair as to make it dangerous for people to live in it.

The spirit and tendency of the law under which we act, however, is that we are not to do anything of that kind, but that simply, if a place is dirty or wants repair, to see that that is remedied—not subject the owner to great loss by closing up his building, by tearing it down, or anything of that kind. In fact the law limits us, as I have said, to these two contingencies—where the house is infected by contagious diseases, or where the repair is such that the house is dangerous.

Q. Can you limit the number of persons who shall be permitted to occupy these houses?

### LIMITATION UPON NUMBER OF PERSONS IN LODGING HOUSES.

A. We do limit that. There must be so many cubic feet of air to each person. When an application is made by anybody for a permit to keep lodgers that question comes up for consideration. That is the sort of case in which overcrowding has been very noticeable. In giving the permit we say that in this house there shall be only so many lodgers, perhaps fifty, or twenty, or whatever the number may be. The house is measured by the inspector, when he reports on the application for a permit, and the limitation is made.

Q. Now, practically, how are you able to carry out these regulations?

Digitized by Google

You can make them, but is it possible for you to see that they are enforced?—A. When there is any epidemic or contagious disease prevailing, like small-pox, or typhus fever, we send inspectors at night to go to these houses and to see how many people there are living in them, and if we find that there are more people than are allowed, we take away the permit, and if they take lodgers in spite of that, then we prosecute them.

Q. What becomes of the people who occupied the place—the surplus lodgers?—A. They go elsewhere. If they cannot find accommodation at the cheap rate (at ten cents or so a night) they go to the station-house.

Q. They can go to some other house and overcrowd that, can they not?—A. They can go to another house or to the police station.

Q. And until the other house was complained of you would not be aware of any overcrowding in the other house?—A. Possibly that might be done.

The CHAIRMAN. It seems to me you might be very much embarrassed with such a floating population in the full execution of the duty, however wise the efforts might be.

The WITNESS. That is true with the sanitary laws as well as with all our other laws. We have many good laws but they are not always executed.

### THE CORPS OF SANITARY INSPECTORS.

Q. What number of inspectors do you have at your disposal?—A. We have in the first place fifteen inspectors, all of whom are physicians of good standing and intelligence, and the city is divided into fifteen districts.

Q. Are these inspectors employed exclusively in that capacity?—A. Yes, they are simply sanitary inspectors.

Q. And all their time is at the disposal of the city?—A. Practically. They are doctors and have office hours in the morning, and may do some practice, but they are supposed to give most of their time to the duties of the board.

Q. What salaries do they receive?—A. I think it is $1,600 a year.

Q. And there are fifteen such officers for the whole city?

### VACCINATING CORPS.

A. Yes. Then we have what we call the vaccinating corps or contagious-disease corps, consisting of about ten or twelve doctors, who give their entire time to the work of looking after cases of contagious diseases; that is, they give gratuitous vaccination. They go from house to house and see whether all the children have been vaccinated. They go to the schools and if there are any cases of small-pox or any other contagious disease reported, they visit the houses and see, if they can, where the disease came from, or what was the cause of it.

Take, for example, cases of small-pox. We have in this city a great exemption from small-pox, undoubtedly attributable to the great care exercised in preventing its existence here. If a case of small-pox occurs the doctor reports it to the board of health. We immediately send two physicians—our inspectors—to go to this house and see, in the first place, if it is small-pox. If it is found to be small-pox, and if the person is in a private house or where he can be isolated, the patient is allowed to remain at the house; if in a tenement house, a lodging house, a hotel, or any place where the patient cannot be isolated, then

Digitized by Google

he is sent to the small-pox hospital on Blackwell's Island. We have an ambulance to take him to that hospital, where they have very superior hospital accommodations for a person sick with that disease. As soon as that is done, these doctors, having ascertained where this case came from, follow it up and try to reach everybody who has been exposed. They also vaccinate all the people on that block who have not been vaccinated and on the street opposite. They send two or three or four inspectors to vaccinate the people in that vicinity. We often have cases of small-pox coming here from other parts of the country, and by this means we find them out. For the last ten years there has been less small-pox in New York than, perhaps, any other city in the world—all owing to the system introduced here, and which system is being introduced, more or less, into other cities.

Q. Do the police officers co-operate with you?—A. Yes.

Q. In what way?

SANITARY POLICEMEN.

A. We have thirty policemen who are detailed to do sanitary work in connection with and under the board of health. Besides that the police department co-operates with us in everything. For instance, we use their telegraph to report cases of small-pox or other contagious diseases. There has never been any lack of reasonable co-operation on the part of the police with the board of health in that matter.

Q. I suppose, of course, you are confronted with a natural opposition on the part of property owners to any radical changes that you think ought to be made?—A. Yes; that was quite a common thing in the beginning, but there is less of it now and less every year—less opposition from property owners.

In the first place the powers of the board have been well established by litigation so that property owners know that the board are empowered to do what they propose to do. That, of course, removes a strong objection. Then these large estates here in New York are generally controlled by men of liberal views, and withes tates like the Astors' and the Rhinelanders' and similar large estates, we have never any trouble whatever. In the first place, they find it to their interest to keep their houses in perfect order, and a notice from the board of health is promptly complied with.

The difficulty we have in procuring changes and executing orders is with property that is in litigation—property owned by an estate, and which perhaps may be embarrassed by mortgages, or the owners of which may be abroad living in foreign countries, and having an agent here simply, whose business is merely to collect the rents without much regard to the property. We have a difficulty in enforcing orders sometimes with such property, and in some cases it is almost impossible to find who the owner is. The property may be in litigation and may have been so for years.

Q. In such case as that you must have some peremptory power, of course?—A. Yes; we can go on and do any work that is necessary there and make it a lien on the property. But we have not availed ourselves of that because the law has been somewhat defective, or, at any rate, the rulings of courts have been so that they seem to be very tender here about having personal service on a man, and a good many of these liens that have been made—and in that case of course the city furnishes the money to do the work—the liens have been set aside. We applied on several occasions for a law by which the posting of a notice upon the

Digitized by Google

building would be a service, but we have never been able to secure a law of that character. That is really the weak spot in our health laws.

Q. To what extent are these tenement houses in litigation; or to what extent is there an uncertainty as to their ownership?—A. Well, it is a very small percentage. I would not undertake to say whether it was the one one-hundredth or the one three-hundredth or the one five-hundredth part, but it is a very small part.

The CHAIRMAN. I remember that we went into one tenement house that seemed to have, I should think, four or five hundred people in it, and they all, so far as I saw, seemed to be living in such rooms as you describe. The house must have been built before 1866. It had a front room and back room and a connecting room, a dark apartment, which was a sleeping room, and from this same sleeping room was a room with a stove in it on which stood a kerosene lamp, and a woman was doing the day's cooking on this stove in the center of the room.

The WITNESS. That is a difficulty in New York. No other city is like it because no other has such a large tenement population.

The CHAIRMAN. It requires considerable power to be able to take down such a building. On the exterior, this building that I speak of, looked rather like a comfortable building.

### NO REMEDY FOR CROWDING IN CITIES.

The WITNESS. To gentlemen like you of the committee, who have seen the rooms and the air that people have in the ordinary cities and villages of the country, and then go through our city tenement houses here, it looks, of course, as if they must be very crowded, and so they are. One would hardly think they could exist in such crowds, and yet there seems to be no remedy, no way of giving them more room.

The CHAIRMAN. I suppose you hardly expect to see the time when these tenement buildings will be replaced by new ones.

The WITNESS. All the worst tenement buildings that we have had are being gradually removed. There is a great change every year. These buildings are torn down either for a factory or a storehouse. The manufacturing interests of New York are increasing with great rapidity, and they are taking up many of these poor buildings.

Q. When these buildings are converted into factories do the operatives find any better accommodations so far as ventilation, light, &c., are concerned?—A. Well, the new buildings put up within the past five years are superior, and are sought very much by the better class of the laboring population. These new tenement houses are very much sought by them. I think the tenement-house people are being very much instructed, they receive our inspectors differently. They receive them now with great pleasure, and seem to regard the board of health as a friend who is determined to see that they are taken care of. I noticed in the New York Times this morning something to show what is done each summer by the board of health during the hot weather to bring relief to the sick children of these tenement houses. Besides this regular force I speak of, we put on fifty inspectors or physicians during the hot weather to look after the health of these people. The item in the Times says:

#### WORK OF THE VISITING PHYSICIANS.

Sanitary Superintendent Day presented to the board of health yesterday a summary of the work performed by the summer corps of visiting physicians.

That is these fifty extra men who give their whole time to going from

Digitized by Google

house to house, and who also report anything to the board of health that should be corrected.

During their term of five weeks, service—

That should be two months, because they were on two months—

they visited 43,915 houses, containing 198,932 families; prescribed for 6,601 patients, and distributed 24,631 circulars—

These are circulars that are distributed every summer, as to the care of sick infants, written in plain words, and in different languages, in order to instruct the mothers how to take care of their children when threatened with sickness, or when sick with ordinary summer complaint—

and 5,195 tickets for the excursions of the floating hospital of St. John's Guild. Of the patients treated 3,264 suffered from diarrheal diseases, 986 from diseases of the respiratory organs, 285 from contagious, and 2,086 from miscellaneous diseases. Twenty-eight of the patients died, 10 of them from cholera infantum, 5 from diarrhea and dysentery, 2 from gastro-entritis, 2 from diphtheria, 1 from scarlet fever, 5 from measles, 2 from pulmonary consumption, and 1 from marasmus. The special disinfecting corps in charge of Sanitary Inspector Livermore during the period of their employment from July 9 to September 15, disinfected 41,008 closets, 9,915 yards, 7,212 cellars, 9,932 garbage receptacles, and 801¼ miles of street gutters.

That disinfecting corps is a regular corps. Then during the hot season we put on a special corps that goes about the city and disinfects the street gutters where they are filthy from any cause. They also disinfect the privies where they exist. I happened to see that item in this morning's paper, and cut it out so that you might see what we were doing in the summer time in that special direction.

Q. Is there any attendant who has a special supervision of these tenement houses throughout the day—a general oversight to see that the regulations of the board of health are enforced, and that order in a general way is preserved among the various occupants?

## SANITARY CODE.

A. We have in our sanitary code rules and regulations made by the board of health, which have had the approval of the State legislature. In our sanitary code we require that every tenement house must have a janitor. In some cases where a man owns several tenement houses he will have a competent man to take charge of one or more—generally of three or four in a row, perhaps. It is his business to see that these houses are kept clean, and to see that tenants do not injure them or defile them in any way. But there are other cases where in a single house the owner will get a family or a man as janitor to look after them, and allow this family or man something on account of rent for services; but the law requires that there shall be a janitor.

Q. And as a rule is there one?—A. Yes, either giving his entire time to different houses or one employed and designated in the way I have mentioned and compensated by making an allowance on his rent.

## QUARANTINE REGULATIONS.

Q. What connection has your board with the quarantine regulations of the State or of the port of New York?—A. We have no connection with them. That system is organized under the State law; quarantine is a State institution. The health officer of the port is a member of the board of health and meets with the board regularly every week.

Q. So that you administer the two laws entirely disconnected from one another?—A. Yes; the board of health has power to prevent any

Digitized by Google

vessel from landing here even when it has passed quarantine. In fact, when coming from ports which have had yellow fever, ships must have a permit from our board even after they pass quarantine, but that permit is given upon their presenting the permit of the health officer, ordinarily.

Q. What connection is there between the United States health officers, their quarantine regulations or the board that administers them, and the State quarantine board?—A. I don't think there is any. That is one of the vested rights of the States that has never been yielded, although I understand that it has been discussed that the United States Government should assume general quarantine authority.

Q. Are there no quarantine powers exercised here by the United States authorities at all?—A. I don't think there are any.

Q. All that is in the hands of the State authorities?—A. Yes.

Q. And all regulation regarding the introduction of diseases from foreign ports, is all that with the State?—A. Yes, so far as I understand it. The National Board of Health and other national authority may advise, but practically the power is with the State authorities, and is so exercised.

### SANITARY REGULATIONS FOR A NEW CITY.

Q. If you were going to build a city, what sanitary regulations would you make and enforce if you had it all your own way?—A. In the first place, whatever sanitary authority there is in any city must grow up as the city grows, and be adapted to the peculiar circumstances of the case. I should say it would be a great improvement to the health and prosperity of this country if in every village and city there was a properly authorized health authority. If the village were small it would be a physician who would act as health officer of the place—perhaps without compensation. He would look after the drainage of the town and after contagious diseases that might spring up; and he might do many things. Of course, it is only a large city like New York that could have a large establishment like ours, and it is an establishment that must grow up according to the size of the town, its location, and its needs. But if every town in the country had some recognized health authority, it would undoubtedly be a great improvement, and as the town increased the powers of such health authority might be increased.

### SEWERAGE.

Of course, as to building a city, the drainage would depend upon the location. If we knew that a city was going to be built in a particular place, the first thing to be done would be to secure good sewerage before the houses were even built. But if we did not know—and we do not always know where cities are going to be—we might not be successful in foreseeing the requirements of thorough sewerage. Those things in other systems follow the growth of the cities. Young towns, for example, cannot afford to have such a supply of water as we have here in a great city. Some of the towns around New York that have tried to imitate New York in their streets and sanitary arrangements have been made bankrupt in the attempt.

Q. You would first commence with the drainage or sewerage?—A. Yes; and that is not only important in the towns but equally important in the rural districts. There are certain diseases that are caused by the opening of wells and the malarial influences caused by stagnant

Digitized by Google

water, that prevail far more in the rural districts than here, and probably the country suffers more than New York City does from the want of sanitary knowledge and sanitary care. Many of the cases of typhoid fever that exist here in New York City at the present time have been traced directly to the country where the people of this city have gone for country air, the wells and water that have been used during the summer having been poisoned by slops, &c., leading into the wells.

WELLS—DANGER OF THEIR CORRUPTION.

Q. Have you had any reason to ascertain what contiguity between sinks, barn-yards, and like arrangements in rural situations and the water supply of the wells there is likely to be attended with danger; how far apart ought they to be?—A. Yes; that depends entirely on the soil. Men build houses in the country and do not know what is beneath them. Perhaps the formation of the rock or soil may be such that their dish or dirty water thrown out may leak into the well.

Q. Sometimes the soil is such that the water will leak a great distance?—A. Yes.

Q. What has to be done as to the water supply and these other arrangements before these things can be determined upon?—A. Unless people have abundant means they cannot employ the necessary engineer to determine just what can best be done; the only safety is getting the well as far away from the barn-yard, &c., as they possibly can—at least as far away as may be perfectly safe.

Q. And in a higher location, if possible?—A. Yes; we find here, in the opinion of Professor Chandler, the highest authority on the subject, that there is no water at the present time fit for use, even if you go ever so low.

Q. In this city you mean?—A. Yes; in this city; the formation is such that the liquid filth of the city is passed down so far through these open places in the rocks that really there is no water safe to be used. In some cases where water has been brought to the board of health as extraordinarily clear, having been found at a great distance in the earth, when analyzed it has been found to produce the very poisons which have brought typhoid fever to the rural districts.

Q. You think that in any case, then, the water in connection with farm buildings should be analyzed and its qualities ascertained before utilizing it for domestic use?—A. Yes; if that can be done; but of course all these things are impracticable, because people are not educated.

The CHAIRMAN. I am assuming that the thing is done that ought to be done.

The WITNESS. Oh, yes; that would be right.

Q. Suppose you had the sewerage and the water supply all secure, what would be the next point that you would want to guard against, having in view all the time the health of the people who are to inhabit this place as it grows up?—A. Proper drainage and a proper sewer system would accomplish everything necessary until you commenced your buildings; then you would have to have your connections with the sewer and the plumbing arrangements perfect. It is very desirable, too, that the houses should not be crowded together as they are. In some of our New England villages you will see the houses all separate,

Digitized by Google

### NEW YORK SYSTEM OF APPROVED PLUMBING.

Q. You have spoken of the system of plumbing approved in this city, and of its being adopted in other places in the country. Won't you describe that system?—A. Well, in the first place, it is to be supposed that there is a sewer in the street such as we have here, and such as is also to be found in every other city, of course. To that sewer there should lead from the house a heavy iron pipe 6 to 8 inches in diameter, probably coated with tar, and the joints of the pipe where the lengths come together should be thoroughly secured, either by the screw system that we now have, by which they can be screwed together, or by being caulked with molten lead. When you arrive at the wall of the house there should be a trap. That should prevent the passage of any odors or gases from the sewer into the house.

Next, this pipe I speak of should pass up through the house and out at the roof. After going into the house and after being trapped at the wall it should pass up through the house and out at the top. Into this waste-pipe all the waste water of the house should pass. The wash-basins should connect with this pipe, and under these wash-basins and under every fixture in the house there should be a trap.

### PLUMBING TRAPS.

Q. What is that trap?

A. It is one that we recommend more than any other. It is entirely reliable and has no patent on it, and is perfectly sufficient. It is an S trap, which, in the opinion of experts, entirely secures a house from the gas, particularly if you have this waste-pipe connecting with the roof so that there can be no pressure on the trap. Then all the fixtures for water, water-closets, wash-basins, or bath-tubs should connect with this waste-pipe, and all of them should be trapped near the openings where they come into a room.

Following this there is one great danger, the possibility of the great flow of water from the bath-tub "siphoning" some of these traps. Siphoning was found to be a danger, and that is now relieved by having every trap ventilated by a separate pipe. Every trap is connected with a separate pipe, which runs through the roof also, so that you have, in the first place, no danger of pressure on the water in the trap, and, in the second place, no danger of its being siphoned out by any bath-tub. Again, the water from the roof should not be carried into these waste-pipes at all, but to the sewer by a separate pipe.

Further than that, in order to keep up a circulation through the waste-pipe, and to keep it clear, so that if there are any odors generated they will pass out, we have a fresh-air inlet—a pipe extending from this sewer-trap out to the curbstone, between openings there, by which fresh air can enter, passing down into the sewer-pipe, and as it passes down keeping all the time a current of fresh air, so that there can be no odor generated in this trap. By experiments we have found that, except at the very moment when there is a discharge from these fixtures into the pipe, the circulation is very rapid. It comes in from the street and passes up through the roof. The only exception is when there is actually a mass of water, or when something is emptied into the waste-pipe. Then, for a moment, there will be a puff out into the street.

That is the system we have here, and is the one approved by experts of Boston, Philadelphia, and abroad. This whole system was studied up from what knowledge was derived abroad, but it is fair to say for

Digitized by Google

New York that in respect to the care of contagious diseases, and in respect to our ambulance system, our plumbing system, and every other, New York is far ahead of any foreign city.

Q. Is this system of plumbing susceptible of adaptation in the country as well as in the city?—A. There is nothing about it that is complicated or peculiar. But there is this about it: you must have good plumbing. Suppose you put your pipes into the house and the joints are not thoroughly caulked; or suppose the pipes are thin, worthless things, or suppose they are a fraud—you have all the time got that danger to meet. In every city and town, therefore, where there is any plumbing, there should be a supervision in respect to the plumbing and drainage. That supervision in small towns should be trusted generally, I should say, to the medical men.

When you come to a city like New York you want medical talent and you want practical business talent also; but in smaller towns, where such large sums of money cannot be paid, you have to trust a great deal to the medical profession to secure proper attention to sanitary matters.

Q. But really what difficulty is there, so far as the expense is concerned, of exercising that supervision over the erection, even, of farm-houses or houses in villages? If a man is going to build a house, why should he not get the necessary permit and follow the necessary instructions in the country or village as well as in the city?—A. There is no reason why they should not do so if they have the means.

Q. But what special expense is there in getting, say, the best physician in a town of two thousand people to act as sanitary inspector or superintendent? If he is appointed to do work he will probably be asked to give advice in regard to the erection of whatever number of houses are erected in a year—say twenty-five, for instance. That would not cost much.—A. Well, the twenty-five people who build those houses would not, perhaps, care to pay the doctor for such service, and people of the whole town would not care to pay the doctor for supervising your house or mine.

Q. When it comes to a point of life and death, would it not be desirable to have it so?—A. Oh, yes, if you could educate the people up to it. In many towns the board of health is composed of a committee of aldermen, who may be very talented men in other ways, but never had any experience and never had occasion to give any attention to this subject.

## VENTILATION.

Q. Well, having arranged the sewerage and the plumbing, what about the ventilation of a house?

The WITNESS. In a city?

The CHAIRMAN. In a city or in the country or anywhere—how about the ventilation of bed-rooms, &c.?—A. The ventilation that you must depend upon in human habitations is that derived from windows opening into the external air. Of course there are various devices for securing external air, but until we advance further in civilization, the window is our dependence for fresh air. When you have your window there is, of course, an opportunity for the housewife or any other person to ventilate the room thoroughly.

Q. In other words, you would open the window?—A. That is all; yet they do not do that very often.

Q. In many parts of the country, and in all parts, perhaps, during a portion of the year, that is not a thing that could be done, as in the

Digitized by Google

cold season, for instance?—A. Well, I don't know why it should not be done for five minutes or half an hour.

Q. But I do not have reference to ventilation after the occupants have left the room, but to that sort of ventilation which should be going on during the sleeping-hours; for instance in a bed-room?—A. There is enough air coming in generally through the windows. The windows of a room are not positively tight; at least they are not in city houses, and I suppose they are not in the country. Then, again, the room should be large enough, so that the oxygen could not be exhausted during the night. There should be some supply under the doors or over the doors or under or over the windows; there must be some circulation. I think the people of New York suffer more than the people in the country in that respect.

Q. What regulations do you enforce here in the city?—A. We can hardly say that we enforce any regulation. We provide or try to provide a window so that persons may have fresh air, but we cannot send an inspector there and compel them to open the window. We can give them Croton water here, as we do, but we cannot compel them to use it and to wash themselves.

Q. You think it is like the case of leading a horse up to the water but not being able to get him to drink?—A. Yes. The only thing that the authorities of a city or country place can do is to give the people facilities for fresh air and water, and give them good sewers and insist that the house shall be properly erected, but beyond that, as to making people wash themselves or keep themselves clean or compelling them to open their windows in order to get fresh air—all these things are matters of education rather than of police or public supervision.

Q. Do you not think that the people, when they really understand the importance of these things, will be very likely to use the facilities when they have them?—A. Yes, I do; I think the most humble of our people appreciate that; they are not long in appreciating anything of that kind.

Q. What they need is the knowledge, then?—A. Yes, sir.

### BURIALS IN NEW YORK.

Q. Please state to the committee what the facts are in regard to the burial of deceased persons within the city limits. Is that allowed?—A. No, sir, it is not allowed to bury people within the city limits in this city.

Q. And it does not actually occur?—A. Well, there are exceptional cases where families are allowed to put a body in a vault in our cemeteries. I am speaking now of the built-up portion of the city. I suppose that is what you allude to. Of course the city of New York extends to Yonkers, and there are cemeteries in the upper part of the city where bodies are now buried. But I refer to the built-up portion of the city. Bodies are not allowed to be buried there unless there are reasons why they should be put in a vault of a church, or a vault of one of the old cemeteries, and these are very rare exceptions.

Q. There is nothing affecting the public health in that direction?—A. No, and there has not been for a great many years.

### USE OF DWELLINGS AS WORKSHOPS.

Q. How is it as to the occupation of many of the buildings in the city, both as dwellings and as workshops?—A. In a population like this,

Digitized by Google

and I suppose in all large cities, there will always be some mechanical pursuits carried on in the dwellings of the people. That is characteristic of the whole country. Shoemakers, tailors, and others carry on their pursuits in their dwellings.

Q. To such an extent as to seriously interfere with health?—A. There has never been any evidence brought before the board of health that there has been anything like that done in New York to interfere with the public health.

### CIGAR MANUFACTURE IN TENEMENT HOUSES.

Q. The cigar manufacture in tenement houses is now prohibited by law?—A. Yes. That subject was brought before the board of health several years before it was brought before the legislature. Our most intelligent inspectors—men beyond any question as to their acting from the most proper motives—visited these houses and examined the condition of the people that worked at cigar making and examined the health of the children, and gave the subject a thorough investigation on several occasions, and were compelled to report to the board of health that there was nothing detrimental in it to health, and the board from that time forward, on all occasions, refused to interfere.

In fact the parties that brought the matter to the attention of the board of health were not acting from any desire to improve the health of these people, but it was some trade or labor consideration that I would not attempt to explain. It was considered to be one of the movements not affecting the health of the people, but in the interest of some trade or combination or something of that kind.

Q. Upon what ground was it that the legislature subsequently enacted the law, then?—A. Well, I presume that the statement was brought to the legislature that it was detrimental to health. I presume that was one of the grounds on which the legislature acted.

The board of health did not deem it of sufficient importance to go to the legislature on the subject, although I believe the president of the board did send copies of the reports of the inspectors to the governor of the State before the governor signed the bill, and it is possible that the board may have sent to the committee of the legislature some papers on the subject. I rather think they did, but at any rate it was not material to the public health; it was not looked upon by the board of health as a serious thing; it was not looked upon as at all detrimental to health, and if the legislature chose to pass a law on the subject that was their affair.

Q. You have not been called upon to make these personal inspections yourself very much?—A. No, sir. In all that I have said and say I do not speak from personal observation, because I do not act in the capacity of an inspector, but the inspectors themselves and their reports come under my observation constantly, and from those reports I speak.

Q. If the reports are reliable then your testimony is reliable, because you know the reports?—A. Yes; they are cumulative, coming in from year to year, for on most of these points they come in from year to year.

Q. I supposed it was the easiest way of getting that experience—to get your testimony. Are there any other matters that occur to you to state?—A. Well, I hardly know what would interest you. There are different ramifications of this matter which extend in almost every direction; they extend to the cleaning of the streets and the sewer system of the city, and the removal of offal and dead animals. There are a great variety of ways in which the subject broadens out.

Digitized by Google

Q. Describe your ambulance system—give us the facts with regard to it and also with regard to your system of keeping the city clean and caring for the streets and looking for those who may be suddenly disabled; perhaps, also, you might say something of your hospital system which might be very useful as a suggestion to the country at large.

### STREET CLEANING IN NEW YORK.

A. The cleaning of the streets has always been regarded by the board of health as a matter of very great importance to the public health. In New York, where people are so crowded, you can see that to keep the streets clean is a very difficult matter. It was formerly done by contract, and the board of health had the supervision of the contract—seeing that the streets are kept clean. But, like all public matters that are done by contract, the contractors do as little a possible for the money they receive.

The question of cleanliness is one of comparison, perhaps, or of individual opinion. What one man might call a clean street another might call a filthy one. What one housewife might call a clean apartment another might call a dirty one. So that the attempt to clean the streets in that way was found to be impracticable. Then it was placed in the hands of the police department, and a great improvement was made in the cleaning of the streets.

During the past two years there has been a separate department made here for the cleaning of the streets, and nearly double the sum formerly expended is now expended upon the work. The result is, I think, a very gratifying one. It must be very evident to an old New Yorker that for the past two years the streets have been much cleaner than ever before.

### GARBAGE IN CITIES.

If garbage is thrown into the streets, as has been done in several portions of the city, it is a very serious element of disease. So, while the board of health is not charged with the duty of cleaning the streets, it has the subject constantly under observation. In fact that board is now engaged in a movement to instruct people by circulars against throwing things into the streets—impressing upon the people that if they want to have clean streets they must not throw things into them.

Q. What shall they do with them?—A. They have receptacles for them, and the carts of the street-cleaning department come around every day and take them up.

Q. All those tenement houses have receptacles for these things?—A. They are required by law to have them.

### THE NEW YORK AMBULANCE SYSTEM.

With respect to the ambulance system it is one which has grown up out of the intelligence and ingenuity of our people. It has become a very important and perfect system. If a person is overcome by heat, any one may run to the nearest police-station and telegraph the matter to the nearest hospital. Of course it is the duty of a police officer to do so where he knows of an accident.

Q. How frequent are these stations?—A. Well, they are so frequent that in a very short time a person may reach them. Of course, down town they are more numerous than up town. Where the population is most dense they are more numerous.

In some of our hospitals they now keep two or three ambulances all

Digitized by Google

ready harnessed, as fire-engines are harnessed in the engine-houses, so that in an instant a doctor can be in his ambulance and on the way to the desired place, and when people are injured or overcome by the heat, they are brought, by this system, to the proper hospital in very quick time.

This system that we have introduced here is being introduced in Paris. It is a very strange thing that a city like Paris, so peculiarly given to ingenious devices about hospitals, &c., should not have discovered these beneficent means for the aid of the injured.

PERSONAL EXPENDITURES OF WORKING PEOPLE.

Q. I suppose from your long residence in the city you have become familiar with the working people, their habits, the way in which they live, their expenditures, &c. Without going into the subject of the sufficiency of their wages, I would like to call your attention to the matter of their personal expenditures. Do you think that they are as saving as they ought to be, or could they be more so as a rule—could they make their wages go farther than they do?—A. Well, I really think that whether we have very large or very small incomes, we are all very extravagant in New York, from the highest to the lowest; unnecessarily so.

Q. In what particulars?—A. Take the laboring men of the city, for example. Of course the sum is small, but they all do what I would like to do now, and what I do a good deal of myself—they smoke a great deal; they drink considerable, more or less, and I think their families are extravagant. I speak of these extravagancies from having been brought up in the country—in the rural districts of this State—and knowing what economy was in the families of laboring men and of small farmers. When I look back to the time that I spent in the rural districts, and think of the habits of the people there and their economy, why, I cannot help coming to the conclusion that economy is not known here in New York.

Q You mean even among the wage-working people?—A. Well, I would include mechanics particularly—people that earn three, four, and five dollars per day. But the people that work at a very moderate sum—twelve shillings or two dollars—I suppose you allude particularly to them?

The CHAIRMAN. Yes.

The WITNESS. Well, of that class I cannot speak particularly. But when I speak of economy I speak more especially of those who receive good mechanics' wages and clerks' wages, and so on up to higher positions. When it comes to the laboring men of the lower or the uninstructed class—I do not know exactly what you would call them——

The CHAIRMAN. That is a very good term—the class of unskilled labor you mean?

The WITNESS. Yes; I would say about that class, because the compensation they receive is so small, that if they have families it must be very close work to give them bread and proper clothing, and pay rent for a very humble apartment.

FIVE-CENT AND TEN-CENT LODGING-HOUSES.

By Mr. CALL:

Q. I would like you to tell me something more about those three-cent lodging-houses.—A. There are lodging-houses here during the winter season where the price is anywhere from three cents—I have

Digitized by Google

heard of three-cent places—but there are certainly five-cent and ten-cent lodging-houses. Those are about the prices. The five-cent lodging-houses are of a character that were designed to be charitable, where a man that was down in life or hungry or wanted a place to sleep in would come there and would have a chance to wash himself, and would get a bed for five cents, perhaps for three cents, and they would give him something to do, such as chopping wood or something of that kind; I think that the ordinary lodging-houses of the poorer class are ten cents. Then some of them will have a long room in a house and have bunks ranged along the room, something as they would have them arranged on a ship, or as we used to have them on our canal-boats, where two or three sleep above. These people come along at night and pay five or ten cents and get into this bunk, and in the morning they leave, and perhaps next night may be somewhere else or may sleep in a station-house.

Q. Are these places comfortably well heated and have they good air?—A. Well, I don't think they suffer much from cold in these places. It is more the closeness of the place that is troublesome and the filthiness of the occupants of some of the bunks. That is a very bad thing.

Q. Are these under the supervision of the board of health?—A. Yes; within the past three years, I think, by enactment of the legislature—an amendment to the tenement-house act—the supervision of the lodging-houses was placed in the board of health. Now no one is allowed to keep lodgers until they have the permit of the board of health. If a man wants to keep lodgers, or if we discover a man keeping lodgers, we require him to make an application for a permit, and that is given to a sanitary inspector, who goes and examines the rooms and sees how many people can properly sleep in the apartments, and if the place seems to be a decent place he reports, recommending a permit, and recommending that so many lodgers be allowed. A permit is then granted allowing this party to keep this lodging-house and to keep so many people in it. Those places are visited frequently; nightly, when they have any typhus fever or anything of that kind in the city; they are the places where it would run to. At such periods the inspectors go there in the night-time and have an opportunity of counting the people; and occasionally a permit is revoked when a man is found to crowd his place more than he ought to do, or more than was agreed to when he got the permit.

Q. The inspection is not regular, then?—A. No; not as to that. But the police officers on their beats are informed about these matters, and they assist us a great deal. They often report that such and such a place is too much crowded with lodgers. We get information very often in that way.

Q. The only penalty is revocation of the license?—A. That is the principal penalty, although it is a misdemeanor to do it, punishable by a moderate fine and perhaps a moderate imprisonment besides. I am not a lawyer, but I think there is a distinction here between a crime and a misdemeanor.

Mr. CALL. A misdemeanor is a crime, but a low grade of crime.

The WITNESS. It is a misdemeanor here to throw anything into the street or to commit the most trivial violation of a city ordinance.

Q. Are these houses divided into male and female portions, or is any distinction made in that way?—A. I have never heard of any union of the two sexes in these houses; I have never heard of any abuse in that direction.

Digitized by Google

NEW YORK, *September* 19, 1883.

Dr. ABRAHAM W. LOZIER examined.

By the CHAIRMAN:

Question. You are a physician?—Answer. Yes, sir.

Q. How long have you been practicing as such?—A. Twenty-two years.

Q. Do you reside in this city?—A. Yes; and have resided here ever since I entered on the practice of medicine.

Q. You take an interest, I believe, in educational institutions?—A. Yes; and especially the public-school system, of which I am a graduate. I am a graduate of the College of the City of New York, formerly known as the "Free Academy."

The CHAIRMAN. You may make such suggestions as occur to you, bearing on the subject of education of the masses, especially with reference to the system of ethical training or instruction to which your mother, Mrs. Dr. Lozier, referred in her testimony.

INDUSTRIAL AND ETHICAL INSTRUCTION IN SCHOOLS.

THE WITNESS. I have had quite an opportunity for observation in regard to that subject, and have also been an advocate of political and other reforms in this city. I think I can fully agree with my mother's views in regard to the necessity of industrial education and ethical education in our public-school system as probably adapted to ameliorating the condition of labor. I think that all intelligent persons will agree with me that the question of education in our public schools very intimately and deeply affects the question of labor. And from my observation I have come to the conclusion that the system of instruction carried on both in the common schools and in the College of the City of New York, as well as indeed in the common schools of other States, can be greatly modified so as to favor the interests of labor and of working people. I think, with Rev. Dr. R. Heber Newton, that it is of supreme importance that the educational interests of this country should have grafted upon them, even in the primary schools, and more especially in those schools, some form of ethical instruction more than is now methodically done.

Q. Please explain, in that connection, just what you include under the term "ethical instruction."—A. I mean by "ethical instruction" regular, fixed, and steady attention paid to the development of morals, to the enlightenment of conscience by education, rather than to make education look to a literary result, or to a solely intellectual result. I think education should also reach the manners and morals of children through direct systematic instruction. I think that the educational idea as now carried out is to a certain extent a false one, as I have had an opportunity to observe it. I think it is pernicious to our political institutions and to the interests of labor.

Q. As I understand you, you do not mean that remark to apply solely to this city, but mean it to extend to the country at large.

EDUCATIONAL METHODS NEGLECT MORAL RESPONSIBILITY.

A. I have not had an opportunity, except in Minnesota, where I was for a year or so, of observing outside educational arrangements. With that exception I only know the educational system of the country at

Digitized by Google

large from what I have read, and from general information; but I know the system in New York thoroughly. The great trouble with the whole educational system in the public schools here, through all the grades, even up to the City College, is that the idea of education is too much that of enabling a person to make money and gain wealth, irrespective of moral responsibility. I think it is entirely practicable, without very seriously altering the education of the city or country, to lessen the amount of work required in the schools in many respects, and to engraft upon the system a course of daily instruction in morals and matters of human rights and sociology—political economy, physiology, and kindred topics.

Q. Will you give us your idea as to how it could be done?

COMPETITIVE EXAMINATIONS.

A. I think that in the present school system physicians generally, who are familiar with the system, will agree with me that the pressure upon the young brain, resulting from the large number of studies which children are obliged to follow daily, the long hours of study, and the great amount of memorizing of mere details which are utterly useless, is very pernicious to the health of children, and unfits them for the labors of life through the breaking down of the nervous system, and producing an artificial stimulus of the brain by the system of competitive examinations and, to a certain extent, of "marks."

All this is very injurious to the health of children. I have observed it in my own children. I myself have been a tax-payer to a large extent in this city, before financial reverses came on me. My mother has also been a considerable tax-payer. We feel that we have a right to the use of the public schools for the education of our children.

TOO MUCH MEMORIZING.

I am speaking now of three of my own children, especially. My only girl, a young miss of thirteen, considered quite precocious, was so affected by her studies in the public schools and at the normal college—although the system pursued there is considered admirable, and, in many respects, is admirable—the amount of memorizing and detail work was such that I was obliged to withdraw her from the school and mark out for her a course of study quite different from that usually pursued by such children of her age.

My oldest boy, a promising lad of seventeen, passed his examination in the city college with credit—passed from the sub freshman into the freshman class, and stood very high in his classes; but I found that, in order to carry him to that degree of scholarship, I had myself to "coach" him in Latin and mathematics, and I found that his nervous system was becoming so wrecked that he would have an attack of hysteria if something were not done. He was very desirous of pursuing his studies, and I was very desirous that he should, but I had to put him into business. I know myself a number of lads studying in the city college who have been injured in health from over-study. I think the pressure is very hard. My boy had to get six or seven pages committed to memory, almost word for word, at one recitation, in order to stand well in his class, besides his exercises in quadratics, and equations of high degree, and I had myself to assist him in a good many of his examples, which were taken from books that were not text books. He had to study day after day in these two departments, and had to continue these studies to late

Digitized by Google

into the night; then he was up early in the morning, and I found that he had no opportunity for physical exercise. I protested against this. I went to the college myself; I am, as I have said, a graduate of it, and protested against it, both to the tutors and to the principal professors. They all seemed to regret it; they all seemed to think that there was too much to be done. But they thought they could not help it.

### HARMFUL EFFECTS OF COMPETITION BETWEEN COLLEGES.

This competition between the schools and colleges of this and other cities is ruinous to the health of lads and young misses who go through their courses of instruction. It seems to me perfectly practicable that some simple system of ethics should be introduced into the primary school departments; and, not only in those, but into the grammar school departments of our public schools—something practical and simple, without requiring a great amount of memorizing. As it is now the memory is overtaxed. There are many things in geography, arithmetic, and history, for example, that it would be no disadvantage to omit, and a great deal of good would be done by the introduction of other things in their places that would be practical and should train boys and girls in the direction of the development of character.

My second boy, I forgot to say, was required in his last year's course at the public school—one of the very best schools in the city—under this vicious system of overcrowding the memory, to get by heart the names of from sixty to seventy cities and towns, most of which I had never heard but once or twice, and many of which I was not familiar with; and this thing was repeated day after day. He had to memorize the names of all these cities and the names of the rivers on which they were located, the origin of these rivers, the direction of their courses, and so on. I again protested to the teachers against these severe tasks put upon lads of his age in that school. The principal himself regretted it, but the under-teachers, the assistants, told me that the boys were fitting for college, and they would have to work like all the rest. I think the general feeling among intelligent parents of children attending the public schools here is that the course of study is too severe for young brains, and that many of the children break down in the competitive studies.

This idea that the young brain must be crowded with so many facts in history and geography, which are easily ascertained and retained in after-life, is ruining the health of children and breaking them down with disease. There ought to be time left to them for physical exercise.

### A MANUAL OF ETHICS.

In my opinion a system of ethics should be introduced into the public schools in this city such as is adopted by law in the public schools of Minnesota. Such a system of ethics I hold in my hand. I do not recommend this especially above others, and I only speak of it because I am familiar with it and have somewhat carried it out in my own family, and have recommended it in the family of others. It is a system arranged by Mrs. Matilda Fletcher, of Iowa, who has lectured on the subject in various States and before State legislatures—a lady whose acquaintance I enjoy and with whom I correspond occasionally. It has been somewhat carried out in other States. This little book is a manual upon moral and social science. It contains pictorial teaching. I have here a chart which is to be hung up in a parlor or school-room for study.

Digitized by Google

It is an enlargement of the frontispiece plate of the book. It may be said to be object teaching.

There are represented on this chart fifty different traits of character represented as stars of a group. These groups are central around a main group. The time of one lesson is usually taken up by some one subject as to which familiar illustrations are given—instances in every-day life, it may be, or instances drawn from history, or from the lives of celebrated persons. Discussions are held upon these topics, and the instruction is made interesting and practical.

Q. Mention some of the qualities that are depicted on this chart, and state what the central figure of the chart is. It is a figure of the heart, is it not?—A. The principal figure is the heart. The heart is supposed to represent the human character. The impulses, the motives of character. Around it is a galaxy of stars, each star representing some attribute of the mind or heart.

Q. What is the central figure?—A. Love; and around it are grouped the several traits of character, such as Charity, Sympathy, Mercy, Pity, &c. The eye which you see on the chart represents Conscience. Purity you will observe is surrounded by a number of other stars, such as Magnanimity, Peace, Justice, Chastity, Honesty, Temperance, Truth, Cleanliness, &c. Below this comes Industry, and around that are grouped Ambition, Honesty, Prudence, Self-Denial, &c. Below all is Will. On the left, and grouped about a central star, Hope, you observe Fortitude, Self-reliance, Cheerfulness, Moral Courage, Manly Courage, Physical Courage, Self-possession, Perseverance, and finally, Fidelity. Surrounding Love are Patriotism, Friendship, Parental Love, Filial Love, Conjugal Love, Self-respect, Duty, and Philanthropy. You will observe that the presiding trait or function is Conscience, which is represented as an eye. This is simply given as an arbitrary arrangement, but is perhaps the best possible theoretical arrangement, and will aid children in getting an idea of the moral constitution of man.

I do not mean to say that the public school system of this State has ignored ethical training. In 1867, I think it was, such instruction was ordered in the primary departments of several grades. In the morning exercises some remarks were made upon certain traits, and some references in the way of ethics were made a subject of study in these grades; but it was left to teachers to do about as they pleased, and there has been no regular text book such as this. Moral precepts have been enforced more or less by the teachers, but there has been no definite idea of the development of character.

The idea that labor is disgraceful has been too much of a prevailing idea, not in the educational system of itself, but the idea has grown up from the fact that so little account is taken of the development of character. It is true that some portions of the Bible are read without comment; but this ethical study can be pursued without anything specially sectarian or dogmatic being connected with it. It involves simply morality and right-dealing among men.

Q. Please describe what it is that accompanies this chart; what is the general character of this text-book; it is a catechism, I believe, is it not?—A. It is something of a manual, a catechism. It has, I think, some fifty different chapters. It is written in a very simple way. The intention is to give with each chapter illustrations drawn from history or daily observation from home life, or from any source—anecdotes of the lives of prominent men, or others. The child who is supposed to recite these anecdotes has, for the time being, the floor, so to speak. Every indulgence is shown to it, and

Digitized by Google

when it has recited its anecdotes, some critic, perhaps the head of the family, if it be a family, will explain how the anecdote or illustration is related to the subject under consideration, whether it be relevant or irrelevant, or whether the story has been well told, whether the child's remarks have been entirely logical, and whether the observations and moral to be drawn are in harmony with the anecdote. Take, for example, the question of Justice. If Justice is up, the whole field is a broad one. There will be opportunity for remarking upon the injustice arising, for example, from taxation without representation. That is a point upon which American children may very properly be encouraged to reflect. Also that governments derive their just powers from the consent of the governed, and how far those who are governed have a voice in the Government. If the subject be Courage, opportunity is afforded for remarks upon true as distinguished from false courage; upon false pride; upon politeness, &c. Only one subject is taken up or discussed at a time. But the subjects are taken up in regular order. I could illustrate by an actual example the necessity for such instruction in our public schools. Upon passing on one occasion through one of the streets of this city I saw a cart drawn up in front of one of the public schools, one of the best in the city, at an hour when a great many young lads were pouring out. The driver of the cart threw out into the street a great many rulers such as are used by school-boys, which were advertisements of some business house in the city. Upon one side was printed the advertisement of the house, and upon the other side were marked off divisions, by inches, &c. The article is rather a useful one among school-boys, in drawing and other studies. Immediately, a great competition arose among the boys to get these rulers. The elder boys threw down the smaller boys and in the *mêlée* the clothes of the weaker boys were torn, they were themselves trampled upon and hurt, and the stronger boys got a great number of rulers, but in getting them they acted more like wild beasts in the pursuit of prey than like human beings. The disturbance was so great, and the injuries inflicted upon the little boys were so serious that it seemed like a riot. I felt very much annoyed and grieved that these school-boys were not taught how mean a thing selfishness was, nor how good a thing it was to respect the rights of others. They may have had some talks in a general way on the subject; the teachers may have spoken of it in some instances; but it had not been made a regular topic of study, and I had to tell this driver to drive on or that I would have him arrested for disturbing the peace. It appealed strongly to my sense of sympathy to see these poor little boys hurt in this way, and to see their clothes torn for such a trifling cause. Many of our political problems would be more easily solved if in our early education boys were taught simple principles of honesty and fair dealing.

Q. Do they not get such instruction at home?—A. They do in many homes, and in many homes they do not. They do in Sunday schools, but many of these children do not go to Sunday schools, and when they do the subject is taken up in an amateurish way. At any rate, that would be but once a week, and the subject is not handled in a systematic manner.

### WOMEN IN PUBLIC SCHOOLS.

I think, too, that women are more in sympathy with the life of children, and they ought to have some position in school boards, to determine how far instruction must be pushed in the curriculum of studies. I think women would naturally defend children from the very rigid course

Digitized by Google

of instruction that prevails. Children should from the first have practical objective teaching, as in the kindergarten, and if the public school system cannot adopt some such method as that when the children are young, it certainly ought to be the ambition of churches to take these little ones, as is done in some of the churches in this city, and provide a place for them and see that they are protected in their younger years from the influences of the street.

### THE SUFFRAGE FOR WOMEN.

I think the political questions of this country depend very much on how we bring up our children. The present system is one that degrades women. I entirely agree with my mother and the other ladies who have testified before the committee, that the present condition of women is a degrading one, and that by the proper education of children, in their sense of justice, they should be made to see that universal suffrage does not mean the rule of a minority of the citizens of a country, and that it is only a misnomer when it excludes women. The rule of this Government at present is certainly the rule of a minority, for in many of the States women are in the majority, and many of their rights are denied. I think that true ideas of justice and of the rights of mankind should be taught thoroughly and systematically in our public schools.

---

NEW YORK, *September* 19, 1883.

JEREMIAH MURPHY examined.

By the CHAIRMAN:

Question. I believe you were the leader of the strike of the freight-handlers in New York City about a year ago?—Answer. Yes, sir.

By Mr. CALL:

Q. You may proceed to state to the committee any suggestions which you may have regarding the objects which the resolution of the Senate authorizes us to consider.—A. I was employed on railroads for ten years, handling freight—receiving and delivering it—and in after-years as a clerk.

### WEEKLY PAYMENTS ADVOCATED.

I desire to say to the committee that one of the greatest evils that workingmen have to contend with is monthly payment on railroads. In the first place, men who receive their pay monthly have, as a rule, to deal in groceries on credit from month to month, and if they or their families are afflicted by sickness or death, why, then, between the landlord and the grocer there is nothing left for them at the end of the month. In that way they get into debt, and they can hardly ever get out of it. To my knowledge, a few of them who had saved something from their earnings put the money into savings banks, the banks burst and left them without a cent.

### TENEMENT HOUSES.

The tenement houses that the working classes of this city are obliged to live in are not fit for any human being to occupy. Sewer gas and all the other unhealthy elements that surround these houses destroy the

Digitized by Google

health and lives of the people, as has been proven by statistics in this city, in which 75 per cent. of the deaths that occur in summer time are of children under five years of age, because they have not strength or vitality enough to withstand disease when it comes.

### WANT OF ORGANIZATION AMONG RAILROAD EMPLOYÉS.

Men employed on the Erie Railroad, where I was employed for some time, are obliged to work day and night and Sundays, as they may be required. A system was introduced on that road a short time previous to the freight handlers' strike whereby men were compelled to work on Sunday and remain idle on Monday so as to facilitate the transportation of freight brought in for the railroad on Saturday evening. Then there was no freight on Monday morning, because the stores were all closed on Sunday. When these men see the way they are driven by bulldozing bosses and foremen on the docks, and have nothing for their time, they naturally get a spirit of despair into them which it is very hard to get out. I believe that if the railroad companies had allowed these men to organize, that great strike would never have occurred, simply because the men would have had recourse to arbitration or some other means besides striking. The railroad companies will not allow the men to organize.

Last winter I endeavored to reorganize the freight handlers, and the Erie Railroad Company sent special messengers to those who were sick in their houses to come out to work on Sunday or they need not come the next day to work. The sheriff of Hudson County, New Jersey, and the governor of the State of New Jersey (Governor Ludlow) used their best efforts to defeat us who were working for barely living wages. The governor posted on the dead walls of Jersey City proclamations stating what would be done to us in the event of any trouble arising. There was no trouble. They concentrated all the police force of the city on the docks to protect those who had taken the places of the men who were working for 20 cents an hour, and left the people's houses and property and lives at the mercy of the thieves and vagabonds of the city. The same thing was done to a large extent here in the city of New York around Vanderbilt's property and the property of the other railroads. The Erie Railroad Company were not satisfied even with that, but now I understand, and am swearing positively, that a carpenter in their employ told me that there were weapons made in the carpenter shop of the hardest kind of wood, and then lead put into them, and they were given to these men who were occupying the places of the strikers around the docks. On one occasion when the men who were on strike went for their money—the last pay that they drew during the strike—the men who took their places fired on them, and stabbed them with knives, and those who gave testimony at the trial on that affair could not get employment from that railroad company. I was told myself by a director of one of the city railroads here that I need expect no more work on any of the railroads of the United States -although I did not advise the men to strike; they themselves struck before I did. But I would not remain behind them to teach the "scabs," as they are called, who took their places.

### EVICTIONS IN NEW YORK CITY.

The tenement-house system in this city, and in the surrounding cities, is one of the worst evils that the workingmen have to complain of. It has been proven here during 1882 that 16,000 evictions took place in the city of New York alone. If a workingman earns $10 or $12 a week

Digitized by Google

and meets with any sickness or other disaster, which prevents him from meeting the landlord's demands promptly, out he goes on the street. No doubt there are many cases that may not be attributed to that where evictions took place. I spent part of my life as a workingman in England, and I saw more independence, and I saw workingmen just as well off in England, as I do in the United States. I believe that if this committee were to summon workingmen to-day from the railroads they would not dare to testify according to their conscience through fear of dismissal.

### RAILROAD MEN IN LEGISLATION.

Speaking of the legislation of the country, a prominent railroad official told me at one time that I need not expect much from the Government of the country when sixty United States Senators were railroad men.

By the CHAIRMAN:

Q. Did he give you the names?—A. No, sir.

The CHAIRMAN. Ask him for the names.

Mr. CALL. I will give him my railroad interest for very little.

Mr. PUGH. I will sell him mine for a very small sum—even for a cigar.

The CHAIRMAN. I will give him mine for nothing.

Mr. PUGH. I have no idea that a third of the Senators of the United States have one dollar's interest in any railroad; but there are many there who are large stockholders, and some of them presidents of roads.

The WITNESS. The United State Senator from the State in which I lived for nine or ten years—Senator Sewell, of New Jersey—is a director of a railroad.

Mr. CALL. A man may be a director of a railroad and be a very good man.

The WITNESS. Oh, no doubt of that, sir; I have no fault to find. I believe that high rents and rents generally are another great evil to the working people. I have heard one of the witnesses, who testified before I did, speak about the luxuries that a workingman can have. A man who receives $10 a week and pays $15 a month rent, and keeps a family of five or six, cannot have many luxuries.

### COMPENSATION OF FREIGHT HANDLERS.

Q. What is the pay of the freight handlers? You have not stated that, I think.—A. They get 17½ cents an hour.

Q. How much does a man make on that?—A. He must be content with every hour that the railroad company thinks fit to employ him. He may get six hours a day, or he may get seven, or he may get fifteen, just as they require him.

Q. Well, about how much money do they realize as a rule per month?—A. They average about in the neighborhood of $40 a month; they are paid monthly.

Q. At the rate of 17½ cents an hour?—A. Yes, sir.

Q. For how long a time has that been the case?—A. After 1873 they were reduced to 15¾ cents an hour, and it is only recently that they have got 17½ cents.

Q. What is the nature of their work?—A. It is the most laborious kind of work; the loading and unloading freight, grain, bacon, and all kinds of merchandise.

Q. I suppose they are among the most athletic of our working people?—A. They must be so, because there is no room for old or feeble men upon the docks, nor upon railroads generally.

Digitized by Google

NO PROVISION AGAINST ACCIDENTS TO RAILROAD MEN.

When a workingman meets with anything in the shape of an accident the railroad companies have no hospital, and have no arrangement made to help him, and do not even pay a rent for the time that he is hurt or sick. In Jersey City, where I resided last, there was a Sisters' hospital, and the railroad employés were sent in there and kept on charity, as you may say, because the hospital is kept up by voluntary contributions. They paid some expenses towards the maintenance of that hospital at one time, but withdrew it thinking it, was too much.

TAXES CHARGED UP TO RENT.

Whenever any taxation takes place, it is generally put on the rent. For instance, a new improvement in the shape of a boulevard is being built in Jersey City now, and no doubt when the taxes shall be assessed the rents will go up on that account. It has been proven so on many occasions here.

Q. What taxation do you refer to?—A. The city taxation.

NUMBERS OF FREIGHT HANDLERS.

Q. How numerous a body are the freight handlers?—A. The freight handlers on railroads, irrespective of those that work on steamboat lines, number about 3,000 men.

Q. In this city?—A. In this city and Jersey City.

Q. And Brooklyn, I suppose?—A. I am not speaking of Brooklyn, because that is not a railroad town.

Q. Are many of your men men of families?—A. Almost all of them have families.

Q. Have they any organization among them like the trades unions?—A. No, the railroad companies, as I have stated, would not allow them to organize.

Q. That is, you mean they would discharge them all if they did organize?—A. Those who would undertake to create an organization would certainly be discharged. That dread is over the men; at least I will say that of the Erie road, from my knowledge of it; that is the knowledge among the men; but I must say that the Pennsylvania Railroad acted the decentest of any corporation to those men that struck.

Q. How did they do?—A. They took every man back in a body; and others did not. They actually starved them out as long as they could for months after the strike was ended. The Hudson River and the Erie roads did that.

Q. How many of those employés were there of those two railroads?—A. About 2,000 in all that were on strike.

Q. That is, of the Erie and Hudson River?—A. The men from the Erie and the Hudson River who were on strike were perhaps 2,000 out of the 3,000.

Q. What became of those freight handlers that were not taken back?—A. Well, they scattered into other occupations. I myself did, for instance.

Q. What business are you in now?—A. I am in a clothing house on Broadway.

Q. You have probably got a better situation than you had before?—A. I got as good a situation at least. I am employed by the firm of Rogers, Peet & Co., on Broadway.

Digitized by Google

Q. Have the others generally been fortunate in getting good situations, or as good as they had before?—A. Some of them have and others have not, though if they get anything much they will have as good a place as they had. If they get anything much of a place they will be apt to get $10 a week.

Q. They could not get a much poorer situation?—A. No.

Q Have you any further facts that you would like to state to the committee?—A. I would like to say a few words on the labor question generally, because I am interested in it.

The CHAIRMAN. I was going to ask you about that. You may go on.

### CONTRACT LABOR IN PRISONS.

The WITNESS. I think that the convict contract system should be abolished. In England, to my knowledge, they employ their convicts on Government farms and in picking oakum, and any other work that does not compete with honest labor. I believe such a system ought to be adopted in this country. When a lot of convicts are competing with honest labor they are endeavoring to drive the honest labor down to their level, in my opinion.

### CHILD LABOR.

Another great evil is child labor. As a gentleman, who has spoken on the stand previous to me has stated, what is going to become of the country if we bring up the future fathers and mothers of this Republic as they are being brought up now? Take, for instance, the working classes; I suppose they are in the neighborhood of seven-eighths of the people, and in the factories of Massachusetts and the Eastern States some children are obliged to go to work at ten years of age. What can you expect from such people when they grow up to be men and women? They are to-day dwarfed in mind and in body. To look at them you would think they are old people—many of those children.

### TECHNICAL EDUCATION.

As a gentleman stated here to-day, I believe that not alone education as it is given to-day should be taught to those children, but trades should be taught to them, such as carpenters and other trades of that kind, and they should be taught in the public schools. I think it would have a very beneficial effect.

Q. I suppose you do not mean to introduce the trades to any great extent in the schools, but merely the handling of the tools and some of the general principles that might be applied in mechanical work?—A. Yes. I think that when you tie a man or boy to one trade, as is the case now, and give him no knowledge of any other business but that one branch of industry, you tie him down to pretty narrow limits, whereas, if there was a general knowledge of trades taught it would be far better, in my opinion.

Q. How would you provide teachers competent to give the usual instruction and also instruction in the rudiments in the usual trades, or would you have several teachers?—A. I suppose they could be got, but I am hardly prepared to discuss the question in its details.

Q. You think that where there is a will there is a way?—A. Yes, sir; I believe that it could be very easily done.

Digitized by Google

THE LAND QUESTION.

There is another important question bearing on labor, in my opinion, that calls for a solution in this country, and that is the question of the land. As it is to-day, you have a horde of English landlords coming over here and taking up the lands of the United States. Landlordism is getting too hot for them in Ireland and England, and they mean to establish it right here. I believe that Congressman Hendrick B. Wright, of Pennsylvania, introduced a bill at one time into the United States Congress, four or five years ago, to the effect that the industrial surplus population of these large cities should be settled on the lands, the Government of the United States to furnish $500 to buy farming implements and start each man of good moral character and industrious habits on the public lands. I think that was a very beneficial measure. If I am not mistaken, it was Mr. Wright that introduced it, and, as I understand it, there were only twenty-five members of Congress that voted for it.

By Mr. CALL:

Q. Do you favor such a bill as that?—A. Yes, sir.

Q. What would you do with a man who got the $500 if he did not keep on working the land?—A. I believe the bill provided that the land would pay back the money—whoever occupied it.

Q. The land would pay back the $500?—A. The land, yes.

Q. The land could not pay it back. You would have to make the man who got it pay it back; and if the man who had the land had used up the $500, what would you do?—A. Whoever occupies the land afterward would have to pay it.

Q. Whoever occupies the land afterward would have to pay the $500 that the first man spent. Is that it?—A. That was the provision of the bill; that the land should be a lien for the money, as I understand it.

Q. Do you think that would be right? If they gave me $500 on condition that I should work the land and I went out there and instead of working the land I got tired and quit would it be right for another man, who might take that land to have to pay the $500 that I had spent?—A. I am not talking of the right of it now, but I believe it would be a good thing to get the surplus population out of the cities.

By the CHAIRMAN:

Q. This was to be a judicious expenditure, and the land was to be security for the money?—A. Yes, sir.

By Mr. PUGH:

Q. Do you think anybody would go upon farms in the far West under such a provision as that?—A. I know one man that would go and that is myself, and I believe that many others would go.

By Mr. CALL:

Q. Would you stay? That is the question.—A. I am not prepared to answer that question. I am certainly of that disposition that I would rather work for myself than for any other man if it paid me as well.

Mr. CALL. I have no doubt that there are men owning land who would be glad to sell land on terms equivalent to that to men of your ability and judgment and strength. I know I would if I had land to sell.

The WITNESS. Don't you think that if a number of workingmen should

Digitized by Google

form colonies and were to go out into the West the Government might as well furnish them with money in that way as to subsidize railroads and give them enormous land grants?

Mr. CALL. I think it would be a good idea, if other people could be got to consent to it—the people who pay the taxes. So far as I am concerned I would be willing.

The WITNESS. Then why don't the people grumble about the taxes we have to pay on these great railroads that receive such large land grants?

Mr. CALL. We are talking about the appropriation of money. The land grants of course are a different thing.

The WITNESS. But don't they give subsidies also to railroads?

Mr. CALL. None that I ever heard of, except in the times of the war; that is, in the case of the Pacific Railroad.

The WITNESS. Well, I don't know much of their inner workings of these things.

Mr. CALL. In the case of the Pacific Railroad they gave it aid in the shape of a bond, or money, to be returned by the railroad company on certain conditions. That is the only railroad subsidy in money that I know of. But your idea is a first-rate idea, if you could get the working people and all the other people to agree to it; that is, to form colonies and have the Government give them land.

By the CHAIRMAN:

Q. You say you would go yourself. Do you know many others who would go?—A. Well, I believe that every honest industrious man with a will would go rather than bring up his family in this large city.

## THE CONTAMINATION OF CITIES.

The greatest trouble and danger to a workingman here is raising his family in this city with their surroundings, the contamination that children must naturally meet in the streets of large cities; whereas if they get out into the country, and have pure air, and all the other things that have been spoken of here to day, it would be a grand thing.

Q. Do the immigrants that come here—those, for instance, arriving at the Battery—and go out West from here, bring any money with them?—A. Some of them do, and their passages are prepaid to the West. But then I have seen them in the city of Cleveland, and in Cincinnati, Chicago, and other cities of the West, where they were fully as badly off as in New York City. That is not the case in country parts, but is a trouble in the cities. It is a mistake to think that everybody who goes West as an immigrant lives in the country or turns out all right.

Q. Do you think it necessary to go so far west to find the necessary amount of land?—A. I do not think it is. I believe there is plenty of good land nearer home, but it is too dear. In my opinion the land ought to be free to everybody. There should be no charge on it. Land is, or should be, the common property of the people for the use of it, and not for sale, like commodities. As we understand it, Almighty God made land for the whole people; not for any one class.

By Mr. CALL:

Q. Suppose you were to apply that theory, would not everybody in Europe be coming out here to occupy the land?—A. Well, then there would be land vacant over there.

Digitized by Google

Q. It does not follow that because we made land free they would make it free over there. You mean to say that you think all the governments in the world ought at the same time to make land free?—A. Yes, I would like to see it accomplished.

Q. It would hardly do for one of them to do it at a time.—A. I suppose not. If land was free you would not find capitalists and property owners squeezing out of labor everything that it makes, pretty near. William B. Astor owns nearly forty acres of land on this island, and has large buildings erected on these acres, and charges enormous rents; and the other people that own such property manage to get very high rents; and so the people who pay these rents have to press down upon labor in order to pay them; whereas if the land were taken away from those men and they were left with their brick and mortar only they would not be able to do so. As it is, I pay, for instance, $14 a month rent on the fifth floor of a house.

Mr. CALL. I have no doubt there is a good deal of harm done in the matter of these rents, and the question is how you can remedy it.

By the CHAIRMAN:

Q. How many rooms do you occupy?—A. Four rooms.

Q. How large is your family?—A. I have three children, my wife, and myself.

Q. Where is the house?—A. It is located on South Fifth avenue, near Spring street.

SANITARY CONDITIONS.

By Mr. CALL:

Q. Is it in a healthy, comfortable location, having good air?—A. Well, I cannot complain of the air, but living at that height in the city of New York people are obliged to pump all the water they use, as though it came up from the bowels of the earth.

Q. The water does not flow up there?—A. No, and people do not care to travel up and down stairs very often.

By the CHAIRMAN:

Q. There is no elevator in the building?—A. No, sir; no elevator, no water-closets, no nothing.

Q. Where are the water-closets?—A. In the yard.

Q. That building has no water-closets nearer than the ground?—A. No; that is the way with most of the tenements in this city. Take a workingman who does not receive more than $10 a week, and charge him such a rent as that for such accommodations, and how can it be expected that he will be comfortable or save anything?

By Mr. CALL:

Q. Would it not be better to remedy those difficulties by getting a city government that would look properly after the interests of the people, and by having a municipal law requiring a house to have those things in it? Would not that be better than making the land free? How would you be better off in those respects if you had the land all free?—A. Well, I am not discussing that point. It would be all right if the workingman could get those things done by politics; but they have an organized system in politics, so that it cannot be done.

Mr. CALL. That is what government is for. You working people should see to it.

Digitized by Google

By the CHAIRMAN:

Q. Have you any time to do it?—A. No, sir.

Q. If you were to combine, could you do it?—A. A workingman has no time to look after much else but his work.

By Mr. CALL:

Q. You have time to vote?—A. Well, that is about all.

Mr. CALL. The workingmen form a vast majority of the people. I expect you will find that the present city government was elected by the workingmen.

The WITNESS. There is no doubt that if the workingmen were educated they could do a great deal more. Hence it is that I believe in educating the people.

Q. Would it not be better if you could secure the anactment of a State law, for it is a State law that has to deal with these tenement houses, just as you have had a State law prohibiting the making of cigars in tenement houses?—A. Yes, sir.

Q. A State law might regulate this, and it might be made an issue in politics on the same principle as other laws. One requiring tenement houses to have proper accommodations of a sanitary nature could also be enacted and enforced, could it not?—A. I suppose so.

FIRE-ESCAPES NECESSARY.

I don't know how a majority of the inhabitants of these tenement houses could escape in case of fire. They have something on these buildings that they call by the name of fire escape, but it would require a cat to climb it. Women and children could certainly not come down on such things.

Q. They are understood to be sufficient, are they not? Could a man bring his wife and children down by them?—A. Well, a man could bring himself down, perhaps, if he was a good sailor; otherwise he could not.

Q. Then you think the fire-escapes are mere shams, do you?—A. Some of them have steps and hand-rails, and those are good; but others are put up perpendicularly against the wall, and I don't call these fire-escapes at all, because they could be used by very few people in case of fire.

Q. Which are the classes most generally in use?—A. The ones I last spoke of.

Q. You mean the cheap ones?—A. Yes, the cheap ones. In the new buildings going up now they are putting on the best kind, with hand-rails and the like.

By the CHAIRMAN:

Q. There is some exterior protection which prevents people from falling from the fire-escape into the street?—A. No, not that; but there is a place to get out at from a window in each compartment, and then you have to take your chances until you get to the next one, by an upright iron ladder against the wall.

Q. Are those tenement houses easily inflammable, or are they pretty generally protected against fire?—A. They are inflammable enough. In fact the best protected buildings in this city take fire occasionally. There was a fire last night in a great store on Broadway near where I live.

Q. It was not in a tenement house?—A. No; it was a store.

Digitized by Google

### A NATIONAL BUREAU OF LABOR STATISTICS.

Q. Is there anything further that you would like to state to the committee?—A. I would add that it has been proven by statistics that in the cities of New York and Brooklyn there are 250,000 people unemployed, most of whom are so through enforced idleness, as was the case with myself for five months after the termination of our strike. When an advertisement calling for one or two men appears in a morning paper fifty or a hundred applicants will be found looking for the one or two places. This applies to many of the trades as well as to unskilled labor. A national bureau of labor statistics should be established and managed by working men, and not politicians, as is the case in many of the States having such bureaus. Politicians do not understand the wants of labor nor do they care for them.

### LAW ON THE SIDE OF CORPORATIONS.

Workingmen are commencing to look upon legislators generally as having no object in view save that of spoils. When any labor trouble in the shape of a strike is anticipated the whole machinery of the law and all its forces are on the side of the corporations and of the money power; the police force, the State militia, and the Government troops, if necessary, are held in readiness to massacre the people under the slightest pretext.

### NATIONAL AND SAVINGS BANKS SHOULD BE ABOLISHED.

National and savings banks should be abolished, as they are among the many evils that oppress labor. In every city the Government should issue money without interest, and should also establish postal savings banks, where the savings of the poor would be protected. Wall street should be abolished, as it is perhaps the greatest gambling den on the face of the earth; "cornering" in provisions and gambling generally should be made criminal offenses, and any one found engaged in such practices should be severely punished.

### THE TARIFF.

As to the tariff, the workingmen regard the cries of "free trade" and "protection" as those of politicians—not for the welfare of labor, but to serve the political ends of the politicians. In my opinion the motto of the hour for all working people is "organization, education, and agitation."

The committee then adjourned to Thursday, September 20, 1883, at 10 a. m.

Digitized by Google

NEW YORK, *September* 20, 1883.

The committee met at 10 a. m.

ERASTUS D. GOODWIN examined.

By Mr. CALL:

Question. Have you read the resolution of the Senate relating to the work of this committee?—Answer. No, sir; I have not.

Mr. CALL. I will read it to you. [The resolution is read.] We shall be glad to have from you any facts or information in your possession, or any opinions you may entertain, representing the class of industry to which you belong, bearing on the subjects covered by that resolution.

By the CHAIRMAN:

Q. You are a farmer, I believe?—A. Yes, sir.

Q. Where do you reside?—A. At Falls Village, Litchfield County, Connecticut.

## THE FUNCTION OF LEGISLATION.

In the remarks I am about to make I have no other excuse for the latitude I shall take in presenting and discussing the questions before you than to hint that you may as well attempt, governmentwise, to meddle with the mechanism of the universe and direct the course of the planets as to interfere directly with the labor of the country, either to better its condition or to educate it. We are all laborers, or should be, either by head or hand—the body politic *en masse*—and as you can reach us and touch us only through your tariff or internal-revenue levies, what we ask is that you leave us to our natural surroundings, with no extravagant, arbitrary, discriminating, and unjust levies upon our earnings; allot your burthens equitably and impartially, through your revenue functions, and according to the ability of the individual to pay, when that relief most conducive to our prosperity and culture will come; and we will take care of ourselves and our children, and educate them either individually or through our State organizations of government.

## LABOR AND CAPITAL MUTUALLY DEPENDENT.

The labor and capital of a country engaged in production are so intimately connected and interwoven with each other as to become mutually interested and dependent; if one member of the body politic suffers all feel it; hence that condition and relation of individuals and of interests mutually conducive to the prosperity of all is the only legitimate one to be tolerated; while any departure of the Government from its trust of impartial administration, by which one class of producers or of interests become favored, must react on the general prosperity by subordinating and impoverishing the others. So long as we were a new country, struggling for a subsistence with its development—as yet unable to supply ourselves, with consumption constantly in excess of production, in agriculture and manufactures both—this anomaly of condition was but little felt; it is only when your surplus products are dependent upon a market abroad, their value fixed by the condition and ability of consumers there to buy them, that the full force in this disparagement in condition is felt. Even this was light under the old *régime* of an economical administration of government before our civil war, while since, with the enormous demands for revenue and the increased duties to meet it, the exhausting process of levying taxes upon a

Digitized by Google

people only as they consume dutiable products has fallen heavily alike on all labor and with special force upon industries not directly favored by these levies.

### THE FAMILY, THE CHURCH, AND THE STATE REST ON THE INSTITUTION OF PROPERTY.

The activities, the labors of the multitude, are first for living, then a competence, with accumulative wealth. The hope of success animates, inspires, and draws out a man's capacities; and as the family, the church, and the State alike rest upon the institution of property, its healthy acquisition should be open to all, without favoritism from the State. Her province is to protect property, and not divert it from its proper channels; to confine herself strictly to her administrative functions, leaving to individual effort the freest, broadest scope, each to reap the full fruition of his own toil, with no unjust levies to make him subordinate.

### TARIFF FAVORITISM.

The favorable reception by the press of the memoirs of President Buchanan indicates on their part a growing spirit of liberality, while the general commendation and universal sorrow at the loss of Judge Black, his eminent Attorney-General, is more decisive of the cutting loose of the popular mind from the illiberal and fanatical temper of the war era. Perhaps the public will soon bear the intimation that our civil war was a mistake, which a more enlightened and liberal statesmanship should have avoided, while the issue of the greenback and the extreme tariff favoritism of that era were measures as demoralizing to the republic as they were antagonistic to correct principles of political economy and to all sound notions of economical production. We are reaping the fruits of that policy to-day by being excessively taxed to keep up the monopolies of the times, with their watered stocks and enforced dividends, while the ups and downs, the throes and struggles of business are but the legitimate fruits of the body-politic shrinking from and shirking the burdens thus imposed upon it.

### SCALING THE GREENBACK.

It is a question to-day whether it had not been better all around at the close of the civil war to have scaled the greenback one-third and to have recognized the Confederate note in a similar amount. It would have toned down the superficialities of the North, stripped its values of their watered features at once; while to the South, formerly our best customer, it would have given instant recuperation and health, could we have avoided all attempts at that political transition our patent statesmen so long and vainly strove to accomplish. Time is eventful, with its retributive arm; its forces are silent, yet sure. If the base the foundation of our business prosperity is deficient the sooner we realize it the better all around, for health can come only through a proper diagnosis of our disease.

### NATIONAL DEVELOPMENT.

It is an hundred years since the close of our Revolutionary war, with the acknowledgment of the independence of our infant States by the mother country. With a population of only 3,000,000 at its close,

Digitized by Google

sparsely scattered, and occupying only the more accessible areas of our Atlantic slope, exhausted in resources and held together only by the frail bond of the Federal compact, our condition and prospects were such as to excite the grave apprehension of the heroes and statesmen of that eventful era. The adoption of the Constitution in 1787, consolidating the States and making them a unit of power for all national purposes, leaving to the individual States all local jurisdiction not essential to the functions granted to the General Government—an achievment toward human betterment unsurpassed in the annals of mankind—inspired our young Republic with renewed hopes and increased vigor of life; while our vast strides since in population, in development, and wealth is a marvel to the astonished nations. The addition of 50,000,000 to our numbers; our system of internal communication, by which this vast population has been enabled to spread over and fill up this vast territory; our development in industrial resources, and in science and the arts, brings us to the front rank among the nations, and but for our deficiency in commercial resources our position would be one surpassingly commanding.

### COMPARISON OF UNITED STATES AND EUROPEAN NATIONS.

We exceed Great Britain, France, and Germany, each, more than one-fourth in population. They are our natural rivals in industrial resources among the nations; and, but for our want of a correct appreciation or realization of the conditions of economical production, we should surpass them in a contest for the trade and commerce of the world.

It is with nations as with individuals, success depends upon their ability to supply the wants and necessities of others, through capital, commodities, and commerce; and as dear markets drive the world's custom from you, you must produce and fabricate as low as other nations, or the merchant princes of the earth will shun you.

We are no longer an infant nation; in numbers we surpass all our legitimate competitors for the trade and commerce of the world, with a population largely concentrated in towns and cities. Hitherto our vast territories have opened up to labor a broad field of enterprise; while its high price in this country has stimulated mechanical invention, so that in labor-saving devices we surpass all other nations, largely compensating our employers for the competition of lower priced labor in Europe.

The prosperity of a nation depends upon its ability to keep its people fully and profitably employed; hence economical production becomes the corner-stone to that prosperity.

### DEVELOPMENT OF MANUFACTURES.

The close of the first century to our national existence is an era in our history in several aspects. Our manufacturing interests, shielded by the financial necessities of the Government for an hundred years, have reached that state in art, in development and resources, when, with the natural and inevitable influx of foreign commodities, they can produce more than we can consume, and the tendency is to look more and more for external markets. Especially is this so of our iron, our cotton, and our woolen products. Their surplus, like our corn and cotton and provisions, must find an outlet elsewhere, or they must curtail production and leave their operatives idle. Now, the idle man, as a

Digitized by Google

rule, is not as conservative and safe as the industrious; and I think in the long run it will be found that constancy of employment is not secondary to rate of wages.

Concentrated as our population is in towns and cities, it is apparent that hereafter we are to have a surplus of manufacturing and mechanical labor, and the problem of their employment must be met.

## CHEAP CAPITAL.

Not only have we hitherto had high-priced labor but dear capital; the transition has come when we have a surfeit of either, and the problem is to find a full field for the employment of both. Capital has come down to European rates, and to-day scarcely commands two-thirds, if one-half, its former value. Labor has the advantage or benefit of this cheap capital in its tendencies to open up new enterprises; and with our vast territories so accessible to it, and with our superior mechanical labor-saving devices, she need not bemoan her fate or shrink from European competition.

## CHEAP RAW MATERIALS WANTED.

The great need of our labor in the next decade is to place the cheap raw materials of the earth at her command, that it may fabricate for the world at large and ourselves also, while capital, skill, and art stand ready to aid and abet her. The fruit of labor the world over is a living—nine-tenths of us are struggling for this—and it is of secondary importance, the nominal value of your wages, so long as living supplies are in keeping with it.

The national prosperity demands a lower valuation for your merchandise, that our surplus may flow outwardly from us more and more, helping to swell our export trade and revive and reinstate our lost commercial advantages.

The war, with its greenback superficialities and tariff favoritisms, upset all our conservative better ways, leading to extravagance and general demoralization, with expanded values to capital as represented by watered stocks; with all the devious ways of capitalists and politicians to keep up the delusions and insure high interest and extortionate dividends in the face of the fact that capital has come down one-half in interest rates, with a general tendency to lower values to both produce and merchandise the world over.

## MONOPOLIES.

Your banking and manufacturing, your railroad, telegraphic and telephonic interests partake largely of the character of monopolies; they are formidable interests, having had a dominating voice and influence in the Government, State and national, since the early years of our civil war. They are largely championed by the Republican party, but alas! find too many allies among our Democratic friends. Their great struggle is to stay that inevitable decimation to values and incomes resulting from the more skillful and general application of mechanical forces to the economies of human production, aided by cheap capital and a more intelligent class of laborers. In the future the exigencies of business and the necessities of consumers must largely determine their rates; they cannot exceed in the long run what the productive capacities of the country will bear; and as production comes down to a more con-

Digitized by Google

servative and enduring basis values and incomes must yield to this law of equalization and adjustment.

The process of this inevitable scaling is already apparent. Shrewd men foresee this and attempt to realize ere it be too late.

### FOREIGN MARKETS.

England manufactures largely for herself, her colonies, and the outside world. We have one-fourth more laborers, as cheap capital, and surpass her vastly, not only in the infinite variety of our manufactured products, but in the means, the mechanical inventions to produce them cheaply; give us her cheap raw material and we will drive her from the world's markets in many things, without coming down to her scale of wages. This done, commerce will revive with your expanding trade; all may alike flourish, and the millions upon millions among us find full, healthy, and continuous employment. As production becomes cheapened your more undesirable, out-of-style fabrics will more and more find a foreign outlet, without so seriously scaling the more salable better products, thus in a measure removing the incubus of overproduction and giving a more healthy tone to trade.

### THE FARMERS THE BASIS OF NATIONAL PROSPERITY.

As a nation we are but as one family of toilers. There is an equity in the relation of values that should not be discarded. One producer should not be too subordinate to another, and so the great agricultural classes, who furnish 85 per cent. of your exportable products, largely in shape of your cotton and your corn, your provisions and your dairy products, should buy their return supplies at rates in keeping with the value of their own productions. While they furnish 85 per cent. of your exports, nearly 75 per cent. of their whole products is produced by your small land owners, who largely do their own work. They virtually furnish their own capital, perform their own labor, and have to take what its products bring, the exportable value determining the price. Their labor and their lands, their skill and economy, are the basis of their prosperity; they produce without regard to prices, year by year, and continuously, while the tendency of this system of isolated, self-sustained individual production is to materially cheapen the food supplies of the world, so that, whereas thirty years ago the surplus wheat crop of Ohio exceeded the surplus of the whole country, to-day her whole crop might be a total failure without very perceptibly diminishing the national supply or increasing its price.

### COST OF PRODUCTS.

The first cost of a manufactured product is made up by charging cost of raw material, use of capital, and care and labor; but as the latter is so largely supplanted by mechanical appliances, the cost of which goes to capital account, the cost of labor becomes a minor item in the estimate, while your duties are levied on the aggregate value of a similar imported article.

### THE FARMER TAXED 45 PER CENT.

Your agricultural products in their cost estimates are more largely made up of the item of labor—hard, manual, muscular effort, eliminating the sweat of toil, while the labor of this class is dependent for its re-

Digitized by Google

ward largely upon the ability of the foreign operative to consume their surplus at their rate of wages; and you have not been content with this great discrepancy or disadvantage under which the cultivator of the soil labors, having taxed him heretofore an average of 45 per cent., indirectly, on pretense of advancing the very labor he has to draw upon to aid him, giving to that labor in return the merest pittance of this advantage, the lords of the loom and the anvil having hitherto grabbed the lion's share; while our farmers, laboring under all these adverse conditions, have kept up as how of prosperity only by a terrible sacrifice of the virtues of their soil. Their farms are left a barren legacy of exhausted resources, as desolate and unattractive as the desert, from which their sons flee as from the pestilence, lest poverty shall enwrap them in her paralyzing folds.

### THE FARMER AND MANUFACTURER COMPARED.

Your railroads are justified in levying such tribute upon traffic as to enable them to keep them up in safe and serviceable condition, and leave ample resources for all contingences and for dividends, so that their human freight may ride comfortably and safely; yet here is your soil, yielding a subsistence to and carrying all life, vegetable and animal, including the human race, left to contend against such odds in production that its cultivators can only succeed by a process of culture and with a system of products such as to utterly exhaust and ruin it. The acres of the farmer are limited and he can raise but one crop a year, subject to blight, drought, and frost; while the manufacturer not only turns his capital monthly but can multiply his wheels indefinitely, while his products are more certain and sure, a condition of things which, when contrasted with that of the farmer, is the last and least to need the fostering, favoring aid of Government by a levy of extreme duties on an imported product similar to that he makes, and beyond the legitimate financial wants of the Government itself.

I am not a free trader, but recognize the financial necessities of our Government, with her chief practical recourse to meet them at present by a levy of duties on imports.

### APPROACH TO FREE TRADE.

As our agricultural, mineral, and coal areas are continental, so there is no limit, save in climatic influences, to our natural resources in corn, cotton, and wool, or in iron, steel, and other metallic products; while, with our population, now large—soon to become overwhelming in numbers—as we mature in development we must near and gradually come nearer the lines of free trade, compelling the Government to adopt its final constitutional recourse of raising revenue by allotting among the States taxes according to population, when capital must, as it should now, contribute more and more to your treasury resources.

I am but a representative laboring farmer, insisting upon my equality of interest and of opportunity before the law. Justice is a broad shield, ample to protect all, and must intervene when the few attempt self-aggrandizement in antagonism to the rights and interests of the many.

### PLEA FOR THE RIGHTS OF LABOR.

In pleading for the rights and interests of labor I would not be extreme. The radical, agrarian, leveling, revolutionary spirit of the age must be met.

Digitized by Google

He who clears the soil of its primeval forest, or opens it up by building a railroad to it is entitled to his measure of its possession and enjoy the fruit of his culture, while his own blood should inherit and dispose of it. Property is the fruit of labor, capital represents its savings, its accumulations; while the possession of it is a sacred right, to be protected by all the power and wisdom of the state as an encouragement to individual effort.

### THE THEORIES OF FANCY REFORMERS.

The fine spun theories of fancy reformers are at variance with the genius of our people and the spirit of our institutions. I plead for an open field and the broadest scope of human effort, while government must hold the reigns of administration firmly and impartially, with no divergence from justice; for if she yields to the selfish appeals of capital her favoritism why may not labor struggle for a majority and insist upon her turn, and divert the earnings of others to her emolument also. We have a constitutional government, with its powers laid down in the organic chart, and all laws must be within its plain scope and spirit, or they are a nullity. Our form or system of government is a sacred legacy from the fathers, baptized in their blood, and its sacred character should be most jealously shielded, alike from all efforts to divert it to individual or class favoritism and from the radical spirit of the age that would upset and destroy it by supplanting it with its theoretical, agrarian, impractical vagaries. Our sacred edifice must be guarded from the spirit of vandalism from whatever source it may emanate, while our people should be awake to the perils in their own midst, poisoning, festering, and deluding the dependent classes.

We do not want a strong, a military government in the European sense; its natural tendencies are toward a despotism. Our system is predicated upon the interests and affections of all, while our salvation lies in keeping the ship of state intact from all pollution, that our children may love and reverence it both.

### EXPANSION OF VALUES BY THE WAR.

The extreme profits of our manufacturing, railroad, and other corporate interests during and since our civil war era not only led to expanded values, as represented by their watered stock, but resulted in extravagance and a general disregard of all economical principles. Immediately preceding the war we were down to a close basis of production, and our mechanical and manufactured products almost equaled our agricultural in our export trade. During and since its close they have almost shrunken from the exhibit, while the closer production at present tends to their increased export again. High prices of home products not only compels you to consume them yourselves but attracts from abroad similar merchandise; while low prices not only shuts out the similar foreign products but tends to the free outflow of your own.

### THE LAWS OF TRADE IMMUTABLE.

The laws of trade are as immutable as the hills, and cannot be swerved to suit the interests of one or of a few; Government may attempt it, the law of retribution, of equalization, must have its force, and the day of reckoning must come.

The business outlook of to-day results from our departure from correct

Digitized by Google

principles of economical production, while the ups and downs of the past are but the surging of interests and their contention with forces as overwhelming and irresistible as the tides or the laws of gravitation itself.

We must move with natural currents, and not against them; our sailing will be less impetuous, more safe, and more certain in the long run, with a healthy prosperity inuring to all.

### DIVIDENDS ON FICTITIOUS CAPITAL.

It is a question to what extent the legitimate business of the country and consumers can be taxed to sustain the nominal capital of the nation invested in manufacturing, in railroad, and other corporations. Not only is the effort made to keep up their fictitious amount of capital but to perpetuate the old rates of dividends, when capital commanded nearly double its present rates. Our laborers are an intelligent body of men, "worthy of their hire." They realize the tendency of these interests to make them a sacrifice to their grasping, heartless purposes, and tax the whole productive industry of the country to keep up their enforced profits.

### GRADUAL REDUCTION OF TARIFF.

Reduce these fictitious valuations to their proper plane and level by a gradual reduction of your tariff; content yourself with dividends in keeping with the value of capital; come down to the more efficient and economical application of forces, and the price of labor need not be scaled, but its purchasing power so enhanced as to infinitely better their condition, widen their consumption of products, increase their travel and recreation without diminishing their surplus earnings. Relief in this direction would react on the whole body-politic, by making the masses not only contented but liberal patrons and consumers all along the line of life, infusing increased activity to all interests, and swelling immensely the productive industry of the country by producing and fabricating at less rates, increasing the volume of our outward trade, as also that coming in; regaining your lost commercial ascendency, thereby making other and the more subordinate nations tributary to your prosperity and renown.

### AGRICULTURE UNCERTAIN.

Your agricultural products are uncertain; they are at the mercy of climatic extremes, to say nothing of the constant deterioration of your soils. Your mechanical and manufactured products are certain and reliable resources; hence, as our population increases, we must depend less upon the former and more and more upon the latter for our exportable resources, and it needs no great sagacity to see that hereafter the national prosperity is to be conserved by this line of policy.

### WEALTH DEPENDENT ON PRODUCTION.

The wealth of a nation depends largely upon the productive capacity of its workers—the more laborers the more wages; and it is important to a community that its individual members should be infused with the spirit of industry, economy, and thrift.

While the nominal wages of our people exceed that of most others, it is a question whether their average production of wealth surpasses those others, from the fact that we have more idlers. It is estimated that the annual production of wealth among us from all sources, from

Digitized by Google

labor and capital combined, averages less than 50 cents to the individual per day for each working day; while the earnings of those actually in the harness of care and toil cannot exceed a dollar.

Our subsistence must come from the resultant forces of labor and capital applied to production. Hence economy in the application of these forces and in the distribution of their fruits is of cardinal importance to all. The individual may be extravagant, or the nation and the State, while the extreme draft upon these resources, either in extravagant living or in costly and complex administrations, is equally a drawback upon the general fund applicable to the living of all.

## TOO MANY NON-PRODUCERS.

And here is the rock upon which we may be cast.

We earn too little in proportion to what we spend. We have too many non-producers. The daze of sudden wealth is dangerous. We come to look upon it as a matter of inheritance rather than that of an annual reproduction, and suffer a constant diminution to the ranks of our toilers without curtailment of expenditures.

We need to look to the rising generation, and more and more supplant our nominal system of education for one more real and practical.

The great struggle of life is for a competence. Poverty is a great break upon a man's aspirations; while disease, perhaps, more completely fetters his activities.

## THE FUNCTION OF WEALTH.

The active, the laborious, producing masses must support all; and the great secret of success to the State lies in drawing out and making more efficient the productive energies of each individual. Hence our early training should be more practical—a preparatory step to the work of life at maturity. The acquirement of knowledge, the culture of the mind, should go hand in hand with the practice of the arts of life; its real work should never be crowded out, that we may keep sight of its practical realities. Wealth should be looked upon more as an instrumentality to assist and promote the activities of life rather than as a shield from them; while its more general distribution should be encouraged by an effort not only to draw out the energies and promote the efficiency of each individual member of a community, but by allotting every producer the equitable fruit of his own toil. This cannot be done as long as government, by her partial favoritisms, breaks in upon the relation of values and their equities. If your tariff levies were merely for compensating for the increased cost of our labor they would not cover twice or thrice that difference, as they now do.

## CHEAP FOOD.

Cheap food and reasonable merchandise are great national blessings and should go hand in hand, while that man or that nation only can command and monopolize the market who produces these most cheaply; hence he who so combines labor and mechanical forces as to effect this must be regarded as the world's benefactor to whom merchants bow and make their annual pilgrimage.

The active, impelling principles of our character are based upon our physical necessities; we labor for a subsistence; we acquire and accumulate to increase our privileges and enjoyment, and give us the means

Digitized by Google

of self elevation; hence acquisitiveness, or the love of property, becomes the fundamental, pivotal, active force within us, around which all others cluster; and as individuals and nations excel in the development and manifestations of this propelling force, so they surpass and outstrip other individuals and nations around them. Hence, climatic conditions adverse to securing too readily a livelihood are best calculated to draw out this principle of character, and the more dominant nations are found in temperate or wintry latitudes.

### FREEDOM BEST ADAPTED TO DEVELOPMENT.

Freedom of effort is the condition best calculated to draw it out; while a race subject for ages, and one surrounded by climatic conditions such as to yield a spontaneous subsistence to it, both alike belittle and dwarf this more active principle of character from the want of favorable surroundings for drawing it out. Hence, the importance of its development in the individual by removing all obstructions to freedom of action and of effort.

Our people have sprung from all nationalities and all classes; and when adopted into the national family become American citizens, each alike on a footing of equality as to rights, interests, and opportunities. We do not recognize the class distinctions of trans-Atlantic countries; while all inquiries on the part of the General Government as to the condition of labor and its relation to capital becomes pertinent only as your revenue allotments affect it unjustly.

### OVER-PRODUCTION.

The American citizen is very properly jealous of his rights and opportunities. He is the sovereign; the Government his servant. He believes in self-government, and will recognize the exercise of no other authority but that plainly delegated in the organic law. Hence, an elaborate, complex, inquisitorial system, with its tendencies to enlist one-half of the people to govern the other half, is as impractical as it is repugnant to our American system. Man's divergence from rectitude brings with it evils and results self-curative in their nature. Action and reaction must be equal, while the forces of nature must in time largely react on all excesses and exactions to assuage and cure them. Extreme tariff favoritism so stimulates production and development as to hasten the period of over-supply, when relief to the consumer must come. We must adapt ourselves to our institutions as our fathers left them to us, and not remodel them to suit the caprices and interests of the day.

### DISCRIMINATIONS AGAINST AGRICULTURE.

I am here as an agriculturalist, to plead against your discriminations in favor of our manufacturing interests beyond your financial needs under a careful and economical administration of the Government; even your wants under such a *régime* are against us and our natural rights, and in their favor, while any and all assessments beyond these needs are but little short of robbery.

Human nature will out; she must have her defaults. Some succeed where others fail, while the law of awards, of retribution, must have its sway. We reap what we sow, and in accord with our capacities, our care, and our culture; and Government itself is above all reproach and responsibility only by preserving an impartial and just attitude in her administrations to all classes and all interests.

Digitized by Google

### EDUCATION.

Our capacites and forces are based upon our physical organization; they are implanted by nature, and it is for us to develop and draw them out by use, as we do our physical powers. Observation is the foundation of all knowledge. We learn first by seeing, feeling, and hearing, while first principles are substantiated by a careful analysis of facts. The power of inference, of abstraction, is intuitive, the distinguishing, the commanding force of the soul, the divine essence within us; and while observation or intuition is not at all dependent upon education these powers are greatly facilitated by discipline and culture, while the accumulation of knowledge and the elimination of principles by the generations preceding us are opened up to us by our printed records. Education is but the key unlocking these treasures alike to all, yet it must spring innately from the soul itself. Man must nerve himself up to his acquisitions and culture; they cannot be pumped into him. Hence our systems of education should be made attractive; and as practical pursuits are to engage and absorb the energies of the masses all acquirements and discipline should lead to and be connected with these, never losing sight of the natural bias or taste of the individual himself.

### CHOICE OF A BUSINESS.

A pursuit or business should attract the individual as a rule, rather than that he should be coerced to it. The love of acquisition is healthy and inspiriting, while the want of it in the individual enwraps him in indolence, with its tendencies to poverty, vice, and crime. The attrations of a competence lightens the burdens and allures the hopes of the toiler, and you can do nothing for him more healthy and elevating than to encourage him to industry and thrift by allotting to him the legitimate fruits of his labor, and relieve him from the unjust levies of our tariff impositions.

### THE STATE AND NATIONAL GOVERNMENTS.

In our complex system of government it is important that the functions of the State and National Government each remain intact, and no usurpation of the one by the other be tolerated.

The sovereignty of the State is unimpared save to the extent she has parted with it in the bestowment of powers upon the General Government. The intellectual, moral, and physical welfare of the people is still a subject-matter for the State to care for through the promotion of education, the encouragement of agriculture, and the fostering care of industries. All efforts on the part of the General Government to usurp the functions of the State in these directions makes a double system as costly and unwieldy as it is uncalled for.

### AMERICANS ARE NATURAL REFORMERS.

Our countrymen are natural-born reformers. Their zeal, their intensity of character leads them to make a hobby of every matter, and they ride it, as a rule, to death and destruction. Freesoilism led to civil war, with a condition of things making possible our extreme protective system. We barely escaped disintegration and ruin in our intestine struggle; surviving its perils, we have persisted in the extreme protective system of that era until over production bids fair to neutralize its favoritisms and bring relief to our long subordinate interests. Providence is with us in the long run, in spite of both parties.

Digitized by Google

## SMALL ANNUAL SURPLUS.

There is comparatively but little of the living, subsisting resource of one year carried over into the next, and were the living products of the earth blasted wholly for one season one-half of our population would starve out. Hence production and consumption must go hand in hand, while the annual accumulative resources of the more mature nations, called increased capital, must be largely represented by a balance of trade in their favor with other nations.

Your capital invested in a railroad should not return you a dividend while its transportation levies are spent in wasteful expenditures, extravagant salaries, and reckless smash-ups. And so of all other kind of business.

We must depend more upon actual net earnings and less upon borrowed bonded resources—but another name for drafts upon those who are to come after us. The greenback was delusive. It was issued largely for the expanded values of labor, produce, merchandise, and war material in the later stages of our civil war, when gold averaged 200. Government utilized or made permanent these superficial valuations by converting the greenback into Government bonds predicated upon the faith and resources of the North and South alike, while virtually annulling and confiscating the confederate note.

## THE SOUTH.

The law of conquest is harsh and unchristian, as in the days of Joshua. Our brethren of the South were not only swept of their substance, but of their capital also; left with bare hands, yet stout hearts, to make good our wild financiering, our expanded valuations; while in thus perpetuating this demoralization, adverse to all productive industry, the South may yet have the vantage-ground by planting her industrial resources upon a more economical and enduring basis.

Where capital is scarce it cannot be enticed into watered stocks; it is your greenback inheritance here at the North that has supplied capital to ours.

We already find the South, with her plain cotton goods, supplanting ours in our more remote home markets; while the reduced cost of her iron, from more favorable surroundings to its production, already tells upon the price of ours.

The pride and arrogance of the North may yet bow to and recognize the silent and unassuming forces of our Southern brethren. Providence is retributive in her forces and allotments, while the self-sacrificing virtues of her children may yet find their reward. The greenback added nothing to the wealth of the nation; it represented largely the wastes of war. Government merely charged its face value over to the people, to be paid for by the sweat and toil of future generations.

## PROTECTION.

The protecting, exempting forces of the tariff are felt only so long as home consumption exceeds production; as the latter overtakes and outstrips the former its compensating forces in increased price to products cease, while the manufacturer must gradually come down to a lower basis of cost, like the farmer.

This era is already upon us, long ago foretold and promised by Greeley —the centennial of our industrial hopes—and henceforth the transmis-

Digitized by Google

sions, the inheritances of our civil war, with its burdens, must be more equitably borne by all, and that producer only who husbands his resources and judiciously applies them can expect to succeed. The world's competition is virtually opened up to us, while no decree of embargo or Chinese wall of protection can shut it out.

### THE OBJECT OF A TARIFF.

The objective purpose of the manufacturer in seeking an extreme duty on a foreign import similar to that he is making is to so increase its cost as to shut it out in a measure, and give him the home market. This worked well for him and his interest in the infancy of our production. It did not shut out the foreign product, however; it merely brought up the price of his fabric to the cost of that imported, with the duties added, compelling our consumers to pay the enhanced price for both until the increased flow of merchandise from both sources became extreme, and the reaction from over-supply set in, bringing depreciation and disaster in its train. Hence, under this system we have always had our periods of excitement and prosperity in trade and manufacturing, followed by the inevitable reaction of depression and disaster, like the rise and fall of the tides. The lucky voyager who ventured his fortune upon the rising tides of our periods of seeming prosperity, and retired in due time, succeeded in obtaining a competence; while he who persisted in a continuous voyage upon this sea of ever-varying fortunes, ran the risk of finally succumbing to its business squalls, and might go down.

These periods are always hastened through the tendencies of this system to exhaust and impoverish the masses, the consumers; yet so fertile were we in natural resources, so active and unyielding in our go-aheadativeness, with our natural stimulus to business resulting from the enormous influx of labor and capital, both, from European countries, that we scarcely heeded these reactions, or appreciated the real causes back of them.

### CHANGE OF CONDITIONS.

This condition of things is all changed now, as we reach the line of productive development in manufacturing, enabling us largely to supply ourselves; and we need to canvass our surroundings and sailing with increased caution and care.

The shock to business and to values incident to this transition stage in our activities is already upon us, while all watered values must gradually yield. The great struggle of stock manipulators is to keep them up to their old rates until they can unload them to an unsuspecting, over-confiding public.

### WHISTLING, TO KEEP UP COURAGE.

The increased number of failures, the diminished activity in most branches of manufacturing industry, and the more conservative ways of business men, are but the indices to this condition of things; while it cannot but be amusing to witness the efforts of the more partisan press of the country to whistle and keep up courage, and flatter the business outlook, as though they could command the tides and keep back the ocean's sweep; and the country must prosper, and the farmers of the great West get rich by exhausting their soil by raising wheat at 80 cents and corn at 40 cents for export to Europe, while the millenium of

Digitized by Google

our prosperity only awaits the more elaborate reorganization of our agricultural with a labor and educational supervising bureau, having a voice in the executive councils, telling them how to do it.

Among the press there is a conspicuous and honorable exception to this rule, one whose voice ever indicated the true path to national greatness, though once hushed by the howling mob in the early years of our civil war, the true representative, the ever-faithful Journal of Commerce.

## FOREIGN TRADE.

As a people we are liberal consumers of the products of other climes, as also of their works of art, and of their infinite devices to captivate the taste and decorate our dwellings; hence we have a vast foreign trade to provide for in the varied productions of other lands from our own resources, and unless these can be increased and varied and made more certain we are constantly open to apprehension lest the balance shall become disastrously against us. The production of the precious metals has reached its maximum, while the drafts upon its volume for other purposes than that of a circulation medium is constantly on the increase; while if our population continues to multiply in the next decade as it has in the past we shall do well to be able on the average to subsist and feed ourselves.

The happy medium of sunshine and of shower, most favorable to the earth's production, is not at our command. Providence blesses us with his genial forces in one section, while in other regions he blasts our hopes through either extreme; and it is a question of time, perhaps, when a more general failure of our agricultural resources shall bring us to grief. It is wise to husband our resources and increase them both, that we may be fortified for the possible if not probable contingences of the future.

Wanted! The statesmenship to grasp our present condition, appreciate our legislative needs and realize them; to cut loose from all your superficialities, statewise and individually, both; inaugurate the new era of economy and of integrity in your legislative and business administrations, from the nation down to State, municipal, and individual interests; reducing taxation all around, whether levied through import duties or more directly by State and municipal organizations; multiplying the field of labor by the encouragement of cheap raw material, resulting in a more general healthy prosperity to all, with Government herself more paternal to her children from her impartial attitude to all interests and to all classes.

Reduce the army of officials at Washington and all over the land by simplifying your organizations and confining your functions within clear Constitutional limits; let your ambition be not to enlarge your administrative powers, but to execute better, and with honest, efficient officials, those clearly well defined, instead of constant efforts to enlarge your powers by organizing agricultural, educational, and other similar collateral departments to preside over interests better looked after by the States; confining yourselves to statistical information touching these subject-matters; and especially leave tea culture and seed distribution to private enterprise.

## WANTED TO TAX CAPITAL MORE; LABOR LESS.

In thus hauling in sail you will need less and spend less; and import duties can come down to the relief of all, resulting in cheaper living

Digitized by Google

supplies. The nominal rate of wages may eventually fall, but its purchasable power will be increased, while, if you are in earnest in your sympathies for the laborer, you should try to make capital contribute more to your Treasury resources and labor less, that the poor man with a large family shall not pay more, possibly, than the man of wealth.

There is a more just allotment of your burdens than by taxing the individual only as he consumes dutiable products.

Wealth can be eliminated and made available only through the toil of man. Your large estates in this country have come largely through the appreciation of values incident to the growth and development of a new country—the fruition of the labor and travail of all; and justice and policy alike demand that capital so heaped up should contribute vastly more to the burdens of government, and the labor of the land less.

If we can but approximate to these reforms, and open the way to their ultimate realization, the ideal of our hopes is near at hand, for we have no standing army, as in Europe, to eat out our substance and constantly menace us with the horrors of war.

Government is paternal in her relations to the people, subject to the restraints of the organic law; and as she regains her ancient, impartial relations to them, ceasing to exact more than she needs, the old latent fires of patriotism will revive, renewing the old love—a bond of union needing no standing army to enforce her decrees nor a needless crew of Government officials to rob and eat out the substance of the toilers.

---

NEW YORK, *September* 20, 1883.

Dr. A. DOUAI affirmed and examined

By the CHAIRMAN:

Question. Please state your residence.—Answer. My residence is in Williamsburg, or what is called "Brooklyn, E. D."

Q. In what capacity do you appear before the committee?—A. I appear in the capacity of representative of the Socialistic Labor Party of the United States.

Q. You are deputed by them to represent them here?—A. Yes; I am deputed by them to represent their interests and demands here.

The CHAIRMAN. You may proceed in your own way, and say to the committee what you think to be pertinent, as the representative of your body and as instructed, to the committee under this resolution of the Senate, which, I suppose, you have seen.

The WITNESS. I have seen the resolution.

### SPREAD OF SOCIALISM.

The Socialistic Labor Party is not spread over the United States solely, but also all over Europe. It consists in Germany, for instance, where it took its origin, of perhaps a million voters. In France the number cannot be much less. It is little spread in England, but it is well represented there. It is well represented in the south of Europe—in Spain, Italy, Switzerland, even in the Balkan Peninsula. It is largely spread in Russia and Poland. It has adherents in Denmark and Sweden.

Digitized by Google

### THE SOCIALISTIC LABOR PARTY: WHAT IT IS.

The party is two things; that is, it is a scientific propaganda society and has existed as such for about twenty years. It was founded by two remarkable writers and agitators, whose merits are acknowledged by all scientific men who know anything about political economy and political science—Karl Marx, the author of the celebrated work "Das Kapital," or capital, and Ferdinand Lassalle, a pupil of Marx—and several more fellow-writers and agitators.

On the other hand, the party is an evolutionary and revolutionary society. It is evolutionary as long as it can be so, as it is left to itself, and as it has liberty of speech and action; revolutionary—like all natural laws—when it can no longer act freely, but is forced into action. Then it will respond to that call. The political economy which Karl Marx teaches is contrary to all present political economy, or what is called such. I shall, perhaps, need more than an hour to explain it.

The CHAIRMAN. You may have what time you please.

The WITNESS. I will try to make it as clear and concise as possible, and I hope it will interest every one of you gentlemen, since it is a party (and a science at the same time) so very largely represented in Europe and growing in the United States.

### POLITICAL ECONOMY NOT ALWAYS THE SAME.

Present political economy takes it for granted that its laws, or what it so calls, have existed at all times in the same way; have been the same laws under all forms of civilization and culture.

### KARL MARX'S VIEWS.

Karl Marx is the first man that says that this is a total error. There have been at varying periods of time different kinds or systems of production. But we may, for the sake of convenience, classify these different periods into three.

### THE THREE HISTORIC PERIODS OF PRODUCTION.

#### I. THE SLAVE PERIOD.

The earliest of these was the period of Slavery, when all production was carried on by slaves, in a way well known to every one of our contemporaries in the United States. At that time very few riches could exist in the world; production was small, and men were working only for the daily wants of life. There was but little commerce in the world.

#### II. THE FEUDAL PERIOD.

The second period was the Feudal period of production, in which the laborer was no longer enslaved, but was bound to the soil—bound to a certain vocation or calling—bound to a certain market, wherein to sell his merchandise and wherein to buy his merchandise, but otherwise provided for by law; nobody could be entirely helpless. There was provision made for any class of society. The means of labor did not belong at that time, as private property, to anybody, or only very exceptionally so. The land belonged to all the members of a community, or to all the communes within a state or nation. Just so the moneyed capital of the nation belonged more or less, or was, at least, applicable

Digitized by Google

to all the wants of all the people. There was provision made, in short, for everybody within the community. But there was no freedom of movement or of action for the laborer, while, of course, it was always existing for the ruling classes. This period had an end about the time of the Reformation and of the discovery of America.

### III. THE CAPITALISTIC PERIOD.

The third is called the Capitalistic period, or kind of production. It began in different countries at different times, but is now spread all over the civilized world.

### THE TERM CAPITAL.

I must premise here that Karl Marx understands by the term "capital" quite a different thing from what other writers understand. In fact, common writers in political economy use the term in four or five different senses—now in the one and then in the other, and thereby create a confusion of ideas of which it may be said that it is startling that it has not sooner been criticised. The world had to wait for Karl Marx to direct its attention to this very strange proceeding. Capital is, in the sense of Karl Marx (as later on I shall prove), that portion of the proceeds of labor, which is robbed by the employer of labor under the forms of law, and by the aid of which new production is carried on. I break off here on this point because the evidence will come afterward.

### HISTORICAL NECESSITY FOR EACH PERIOD.

So Karl Marx, by teaching that there are or have been three different kinds of production in the world, and that they may co-exist in the world here and there in remnants of old periods—by teaching this, he exhibits first his whole system as a system of natural laws of evolution.

In the opinion of Karl Marx there is a natural, a historical necessity for each of these developments. They are created by the progress of science and of technical inventions and discoveries, and they are made possible by certain kinds of political forms which are consequences of the kind of production. In fact all ideal forms of society, religion, jurisprudence—technical institutions—education, every ideal interest in society depends upon the kind of production. Each will create its own forms of evolution. It will sometimes create them by revolution, just as forces of nature work usually, slowly and easily, but, at times, will work revolutionarily. And so there has never been a progress from one form of production in society to the other without a forcible revolution. As Karl Marx expresses it, "force has always been the midwife of new forms of society and institutions."

### REFORMS NOT THE WORK OF SINGLE MINDS.

It is a consequence of this view that a revolution cannot be made or that the world cannot be reformed by the whims and ideas of single discoverers or inventors, or "improvers of the world," as he calls them. You know now-a-days everybody has his own *recipe* for reforming the world—for improving society. We call those, after the precedents of Karl Marx, Utopias. The world cannot be reformed in that way. It must reform itself, it must bide its time, and then it will come forth by its very inborn, inherent necessities by the wants of the people, by the progress of the times in general.

Digitized by Google

## THE CONSERVATIVES ARE THE REAL REVOLUTIONISTS.

When it comes in a revolutionary form then it is always conjured up not by the progressive part of society, but by their adversaries—by the conservative part of society. It is they who become the first revolutionists.

In order to make that clear by an example, I will refer to the United States war about slavery. All gentlemen of your ages must recollect how it came about. It came about by Mr. Stephen A. Douglas's Kansas and Nebraska bill. The Abolitionists would never have made a revolution—in fact they despaired of seeing slavery abolished during their lives—say within thirty or forty years. When I was part of the Abolitionist party in Texas—in the den of the lion—thirty years ago, I despaired of seeing the days of the abolition of slavery. But Stephen A. Douglas's Kansas and Nebraska bill, which was a revolutionary act on the part of the South or in its behalf (for it was taken to mean a revolution in favor of the South), brought about the reaction not only of the Abolitionist party, but of the whole North. You see, an evolution was going on for thirty years, but the revolution was introduced and set into action by the Conservative party; and it was a necessity which excited, which forced, the North to respond by a war, which, however, was brought upon the country by the South itself. By this example you will understand the position in which the socialistic labor party and Karl Marx stand with regard to evolution and revolution. I will now continue my elucidation:

Karl Marx calls it a very strange one-sidedness of the Anglo-Saxon character—that it cannot analyze well, cannot trace facts backward into their constituent elements, so as to derive the law underlying them, and draw correct conclusions inductively, although "induction" was invented in England. This is necessary before all things in a new science like political economy. You must first understand the facts before you can draw conclusions from them and evolve laws that hold good or are to hold good for future production.

## WHAT IS WEALTH.

Karl Marx begins then with asking: What is wealth? Well, now a days, he says, wealth consists of merchandise; all things are merchandise, even the labor of man. The laborer himself is a piece of merchandise under the present form of production. The elementary form of wealth then is a single form of merchandise.

## TWO KINDS OF VALUE.

You may now ask how comes value to exist—value of which, of course, political economy has to explain all the origin and all the consequences. He says, that looking at a merchandise, you cannot see how it gets a value. One merchandise appears at a first glance of as great a value as another. But we distinguish two kinds of value. We distinguish the value which every merchandise must have, the value of *use*—only useful things that administer to the wants of *every* man can be merchandise. But there is another kind of value—that is, the value of *exchange*.

How does it come about that there is such a value which can be measured, so that one merchandise may be exchanged for any other

Digitized by Google

one? It is not in the merchandise itself that we find it. (You see the analysis of this; step by step is made very cautiously—he proves what he says.) Then he goes on to say it must be in the mind of man that the idea of value exists—in the minds of those men who carry on exchange. And the value is not in the things themselves that are exchanged, but it is in the ideas of man, of the general usefulness of those things and of the measure of usefulness for the individual wants. A and B begin to exchange. A will give a merchandise for which he has no use, but for which B may have use. And he desires instead from B a merchandise which A will find useful to himself. The exchange comes about if A is able, in a given time, to produce more of that kind of merchandise than B would produce, and if B is at the same time able to produce more of his kind of merchandise than A would produce. So the two can agree very well, and with profit to each other to exchange.

### TIME THE MEASURE OF VALUE.

The common measure, then, of value in exchange consists in time. Time is the measure of value. You see all political economists before Marx could not find that out—could not establish that. This was done by analysis of all the processes. I give the matter only in the shortest outline. I cannot give all the details of his conclusion.

Now, he goes on to ask himself, "Is, then, an equivalent always given if merchandise is exchanged?" Why, certainly there is, or the exchange would not come to pass, as a rule at least. Then, if there is always an equivalent given in exchange, or at least is meant to be given, how is it that we find cases in the world where there are no equivalents given? As, for instance, when labor is engaged, everybody knows, from his own experience, that labor produces more than it gets wages for. No political economist before Marx ever explained that. Marx goes on to analyze the several constituents which make merchandise.

### ANALYSIS OF MERCHANDISE.

You have, first, the raw material, together with auxiliary materials, that are transformed into new merchandise. That is one element. The second is labor, which transforms the material. The third is capital, pre-existing, which sets labor into motion and which buys the materials and which takes care of all the means of production. Now, he analyzes: "Is all the value refunded in the merchandise that was before in the raw material and in the auxiliary materials?" He finds that it is refunded. No new value is added to the raw materials themselves; that is, it is not added except it be added by labor.

### THE PORTION OF LABOR.

Labor, does it get its equivalent? Well, political economists tell us that it does, and every employer nowadays believes that he gives an equivalent for labor. It is the common impression of our age. *Labor gets just that which is necessary to produce new labor*, to sustain the laborer and his family according to the contemporary wants of a laborer of that nation and of that kind of laborer. So, political economy declares that because labor is always reproduced at its real cost, like any merchandise (for in the ultimate everything comes down in price to its lowest possible cost) that because labor comes down to its lowest possible cost, it *is* paid its equivalent.

Digitized by Google

### THE PORTION OF CAPITAL.

On the other hand, capital always takes care to have its equivalent by means of interest. So, after analyzing these elements, Marx finds yet no explanation of how it comes that labor is not really paid an equivalent; that more is produced than was before in existence; that here the only exchange takes place which makes of less more, which creates from nothing *something*.

### THE APPEAL TO FACTS.

Well, he says we must look to experience; we must look to the facts; we must go to the shop and examine what is going on there. And, having done so, we find that after six hours of labor the laborer has produced just enough, by creating new merchandise, to refund all that which his labor costs to the employer. Well, does the employer then send him home? No, gentlemen, he keeps him in for twelve hours, if he can—it used to be fourteen or sixteen hours. Our bakers nowadays work seventeen hours as a rule. Our conductors work as many hours as that, as a rule. Capital keeps him just as long as it can.

Well, then, what does capital do with the balance of the merchandise which labor has produced in the length of the day? It appropriates it. So says Marx. And *there* is the discovery of the secret of what capital is.

### THE APPEAL TO HISTORY.

First, however, he looks back into history. Whenever he analyzes, mathematically and philosophically, any notion, any subject, he then looks back into history to see whether of old time it was the same way, or whether it was different. At the period when feudal labor, which was provided for, and which never could be helpless, was changed gradually into capitalistic labor, no new foundation of society was provided for. All the soil had been appropriated. All the moneyed capital had been appropriated. Education had become private property, and was, even so to say, a secret art. All the means of production then belonged to a class, or to several classes—of course the ruling classes—the learned, the powerful classes. What was left for the workingman? Well, nothing but his working force—the force existing in him, and the possibility of procreating children to continue the possibility of labor. He had to sell that from day to day to procure his wants, because he had not the means of labor. The means of labor consist in land, in moneyed capital, and all other such things, as machines, tools, houses, &c.; and that is what a laborer had not left to him.

### FREE LABOR.

This disinherited labor was declared to be free labor. You see the term "free" was here remarkable. That labor was free—yes, to starve! It was free to kill itself—free to overwork itself—free to sell even its freedom away—to enslave itself. But it was not free to do with its powers mentally and bodily as it pleased. It had to take such labor as came to hand. The laborer was entirely at the mercy of that part of his own labor which was before created by him but appropriated by capital—robbed under the form of law. "It that so, or not so?" Marx asks. Well, he has never been refuted. It stands out boldly as a fact

Digitized by Google

that only one man dared to criticise him; but for the most part he had to acknowledge the truths which he found analyzed, and took exception only to two or three points in Marx's book, which, however, the critic misunderstood. After having been corrected about his mistake, he became still, and never said anything more against Karl Marx.

Political economy thus, like the ostrich, hides it head under its wings and feigns not to see its enemy, or to notice that there is danger ahead.

But our laborers study this book of Marx, let me tell you, thousands and thousands of them, and understand it, although it is very deep and sometimes contains foreign expressions; they study it by reading it over and over again, and they understand it, I assure you, even if they cannot explain it as I am able to do. Professor Schaeffle, of Vienna, was the only man that attacked it, the same man who had been state minister of Austria.

## SUPPLY AND DEMAND CONSIDERED.

Mr. Schaeffle says there is another element in the production of wealth besides labor, that one which Adam Smith had already taught us to understand. It is the relation between demand and supply that adjusts values, and creates prices, and rewards labor, always according to its merit, and rewards capital according to its merit. Remark well: Adam Smith, in the introduction of his work, had said that "labor creates all wealth," but afterwards breaks off from that topic and says it is the law of supply and demand. Marx does not even deign to refute Smith, except occasionally in some hints. From his standpoint, however, it is not true. Mankind has always falsified supply and demand by laws—artificial human laws. Who proves that there is not enough wheat in the country if the harvest should fail? Who proves that this is the fault of the weather alone? In every circumstance in which a failure of crops may harm society, human laws are coworking with nature, and increasingly so. And the laws create circumstances—create states of things through which the laws of nature become dangerous, which they are not in themselves. Nature is more productive of merchandise, of its own free gifts, under the hand of human labor than is wanted for the sustenance of human society.

## THE DIRECTING FUNCTION OF CAPITAL CONSIDERED.

Another objection is made, the objection that capital adds something to value by intelligently directing blind labor. Of course it does; but it does not employ its own intelligence, since no one ever knew that capital had an intelligence. It employs scientific men, technical men, skillful laborers of all kinds; and in many cases it has refrained from doing so, and has suppressed useful inventions and discoveries; the discoverers and inventors rarely got the chief portion of the proceeds of the new inventions and applications. Capital always got the lion's share, and the discoverer, as a rule, little or nothing. But, even if there were some very intelligent capitalists, and even if they paid the inventors and the leaders of their technical institutions very liberally, not even these inventors, not even these scientific men are the possessors, the only owners of their science and their advantages. The human mind has invented them all in a long, long course of development, and every new scientist and inventor adds only a very little on the top of all that which preceding mankind has invented for the benefit of all mankind.

Digitized by Google

And it is robbing all mankind, not only the present labor, but all mankind for the present and the future time, to appropriate that not to the scientific man, but to capital, which has no merit of itself.

### REWARD OF CAPITAL FOR NON-CONSUMPTION.

Another objection was made, and that is that capital must have something as a reward for not using up—for not consuming—the wealth created by new merchandise; it must be rewarded for employing it for new production. Mr. Vanderbilt might at any time go and spend his hundred millions according to his own pleasure, and not produce any thing, simply waste it; and the world would be worse for that. To this Karl Marx and his school object, that it would be better if all the present capitalists and all their wealth in money and all their landed titles and all that may be called in any way capital, were taken away—were exiled from the country. Labor would procreate, within a few years, every vestige of it, and increase it; double it; make it tenfold larger, and would be free thenceforth.

I must break off here with the theory. The applications of it which are made in the agitations of our party are in some respects different from the views which common labor organizations are in the habit of taking. But there are so many points on which our party takes a slightly different view, that I should prefer to be asked questions how from our standpoint all the topics of labor may be justified.

### THE DEVELOPMENT OF HISTORY TENDING TO MAKE CAPITAL COMMON PROPERTY.

I will, in general, only say now, about the practical agitation of our party, what follows: Labor, we think, is always in the right, because it was originally defrauded of its human inheritance. Capital has expropriated it, and is every day expropriating other capital; accumulating the capital of others. Capital has expropriated so much that it takes a long time to do to labor what is right. Our party, furthermore, insists upon it that only in the future state of society, in which capital shall be no longer private property, but common property, can all wrongs be redressed; a state of society which will be brought about not by our individual efforts so much as by the development of history, but which seems not to be far off. In the mean time, however, millions of laborers would go down, utterly down, and would be unable to see the better times coming, or to do something toward emancipating labor itself, if there were none of present demands fulfilled which they make at the hands of the state and of society.

### THE DEMANDS OF THE SOCIALISTIC LABOR PARTY.

All these present demands you know quite well, I suppose.

One of these is that the right of suffrage shall be in nowise abridged. Political equality before the law for all citizens, without regard to creed, race, or sex, is insisted upon.

The establishment of a national ministry of labor is insisted upon.

All conspiracy laws operating against the rights of workingmen must be repealed. Of course, our party approves Senator Blair's bill for the incorporation of labor societies, of trades unions, heartily supports it.

Congress should provide for the immediate creation of a national bureau of labor statistics.

Digitized by Google

The rigid enforcement of the eight-hour law of Congress in all national public works is demanded.

We also demand an amendment to the Constitution of the United States declaring eight hours to be a legal day's work in all industrial employments. What is not yet in the platform is the application of this same eight-hour law to all work which States and communities have now performed for them by means of contracts. They ought to be performed either under the eight-hour law or given to trade societies to perform under contract.

All uncultivated land should be taxed equally with cultivated land in the same locality.

The Government alone should issue all money, and such right should not be delegated to any bank or private corporation.

The socialistic labor party is struggling to secure the following measures in those States in which they are not now the law, namely:

State bureaus of labor statistics.

Eight hours as a legal working day, and strict punishment of all violators of the same.

The abolishment of the system of hiring out the labor of convicts in prisons and reformatory institutions.

Strict laws making employers liable for all accidents resulting from their negligence to the injury of their employés. And it ought to be added, and will be added, that the burden of proof as to who is in fault ought not to be imposed on the injured laborer, but on the employer.

Another legal restriction is demanded, that of the labor of children under fourteen years of age. You know that this has been secured in the State of New Jersey, chiefly through the action of our party.

They demand universal compulsory education, and all schooling material to be furnished at public expense.

They demand factory, mine, and workshop inspection and sanitary supervision of all these places, and of dwellings.

They demand that all wages be paid in the legal tender of the land, and that all violations of this law shall be punished.

All ballots to be printed by town and city governments, and ballots containing the names of all public officers to be sent to all voters two days before the election.

All election days to be declared legal holidays.

All property, whether used for religious or secular purposes, to bear its just proportion of taxation.

And last, but not least, entire revision of the United States Constitution, so as to institute entirely popular legislation and enable the people to propose or reject any law at their will, thus absolutely securing self-government.

### REPRESENTATIVE GOVERNMENT NOT SELF-GOVERNMENT.

Our party maintains that we have not popular self-government. We have only representative government, and the representatives do not represent the will of the people, but of the ruling classes, and this cannot be otherwise if representation is to prevail. At all times those possessing the power of the State possess and use it for their own benefit, and make laws to benefit them exclusively, or almost exclusively.

### THE LAW OF REFERENDUM.

In Switzerland direct popular legislation has been introduced to some extent during the last ten years. They have a law there called the "Law

Digitized by Google

of *Referendum*," and they have another law called the "Law of Popular Initiative." By the *Referendum*, any important law that is before the national legislature (and the same holds good of cantonal legislatures) must, on the demand of a certain number of citizens, be brought before the people to be by them either ratified or rejected.

### THE LAW OF POPULAR INITIATIVE.

By the law of Initiative the voters themselves, to a certain number—50,000 in Switzerland—may demand the enactment of a certain law, not that it shall be passed entirely in the form in which the people may have put it—the legislature has the right to modify it so as to be in harmony with all the other laws, and not come in conflict with them—but the legislature is obliged to lay it, when finally formulated, again before the people for ratification or rejection. Several times already, I think four or five times, the whole people of Switzerland have given their ratification of or have rejected such general laws. In some of the cantons the institution exists from time immemorial. In others it has been, or is being, introduced. The most beneficial results have came from that.

### OBJECTIONS TO THE "REFERENDUM" AND "INITIATIVE" CONSIDERED.

It might be objected that the people of the United States are not prepared for such a very great change. I maintain that it would not need a revision of the whole Constitution to introduce this reform. Our Constitution is already broken. It is now in some respects a "dead letter." It is no longer a guidance in all our political actions. It has been overridden by the war of slavery, both by the North and the South, and it is a document which is not up to the times. In the one hundred years, or nearly so, since it came into existence, the world has marched a great way, and it is time that it should be revised; yet, an amendment might for the present satisfy all the more pressing demands.

Give the people the power to ratify by Referendum, or to call forth by the Initiative, the more important laws. Then you will know what is really the will of the people. Then the people may be educated to understand the laws and take care of their own interests, to discuss them in their town meetings and in their ward meetings, to form new opinions, and study the new political economy and the new political science which our party tenders them. Thus our agitation might have a peaceable effect. To discuss the way in which that may be introduced before Congress or before the single States is not material here.

By Mr. CALL:

Q. Let me ask you the question right here. Would you allow the right of free speech in those assemblies to discuss the laws?—A. Certainly.

Q. Would you allow everybody the right to advocate or oppose those laws and decide upon their validity?—A. Yes; certainly.

Q. Then you would have to limit the time by a constitutional amendment, or you would never find time to work the things all out.—A. Well, the president of every debating society takes care of the time of debate under well prescribed rules.

Mr. CALL. We can hardly get along in Congress now.

The WITNESS. I want to have that great mass of present legislation rescinded. Most of our laws are utterly useless. But I cannot go into that subject now. There is a good deal of it.

Digitized by Google

Q. You would have to have a good deal of discussion before every popular assembly, would you not?—A. Yes, sir; that is so as things stand. But I think every conscientious lawyer will say that I am right in this respect. People will thenceforth endeavor to curtail their laws, because they must make them themselves. In fact there is no other means of reformation. Otherwise whatever you can do for the benefit of labor will be a "dead letter."

MANY LAWS IN THE INTEREST OF LABOR BECOME DEAD LETTERS.

We have carried a great many laws in several of these State legislatures, and, as you know, we have carried a law in Congress, the eight-hour law, which has been made ineffective. We have, by the legislature of New York, enacted seven or eight laws, and they are now nearly all "dead letters." We have done it in New Jersey, in Massachusetts, in Missouri, and in Ohio. I might quote quite a number of instances. For some time, if the workingmen are very watchful, these laws will be observed, but it takes a great deal of money to do it. It takes constant watchfulness, and it is simply for the reason that our law givers are capitalists or are in the interest of capitalists. As soon as the people ask a right to take part in legislation themselves they will be practical enough to curtail all useless discussion after having carried it on, say, for several weeks, before voting on the proposed law.

RELATION OF THOSE LAWS TO PUBLIC OPINION.

By the CHAIRMAN:

Q. I gather that you have carried these various measures somewhat in advance of public sentiment, by pressure upon the legislatures. If that is not so, why is it that the laws, being enacted as you wanted them, have failed of execution? Why are those laws dead letters?—A. Because it takes a great deal of money and of time for workingmen who are engaged all day long to be so watchful—to take means to have the laws executed in every case.

Q. But the community is made up, not of the workingmen alone, but of all the elements that make society; and in order to enforce a law it is necessary to have a majority of all those influences?—A. So it is now.

Q. It is the majority of public opinion that enforces the law.—A. Yes, sir.

Q. Now, is not the real difficulty this: that as yet the people are not convinced as a whole—the majority of the people are not convinced—that these measures which you have obtained from legislatures and from Congress are the best for the common good, and therefore public opinion fails to come up even to the legislation?—A. Then do you not see that just for that very reason it is the first necessity of successful reform to have a great common agitation through all the country? As soon as you can by agitation set a people thinking hard on the faults and short comings of their constitution and laws, and tell them some better things that you would put in their place, and make them willing to revise the constitution in the sense of the Referendum and Initiative, as they exist in Switzerland—as soon as you do that you have no more to care for the monopolists, for the capitalists. As long as these are in their good right labor will not harm them; but, if otherwise, the majority would have to rule.

The CHAIRMAN. Yes, we all agree that the majority or major opinion would have to rule.

Digitized by Google

APPLICATION OF THE REFERENDUM AND INITIATIVE.

The question is whether the Referendum or the Initiative will be any better methods of convincing the public mind creating public opinion than the existing method. Now, as bearing upon that, let us say that you have, as you state, already, under our existing methods of enacting laws, secured the enactment of variou smeasures which are in advance of public sentiment, and yet all the time you have had this power of appealing to the people through the press—of disseminating information, of convincing the private judgment of people; you have had all this just as much, it seems to me, as you could have that power if you had this principle of the Initiative for a new law, or of the Referendum in the case of a law already adopted. You could then, it would seem, do nothing only appeal to the people in favor of a certain measure, and show that just so many people wanted it—just as you can now show it by voting for the same doctrine in the platform of a party. I do not see why your new system of reaching public opinion would be any better than the existing system through which you have already secured laws in advance of public opinion. If you have any such reasons I would like to hear them.

The WITNESS. You see, what is my representative's interest may not be my own interest. If he has the legal power to vote not as I want him to vote I may be cheated out of my rights. This is the view of the working people generally, and they are tired of this kind of legislation. They cease to interest themselves in the ward meetings and town meetings, or to think about the laws, or read them through or discuss them, because they see that it is all in vain. There is no opening where they can get through to carry out their own will. You must begin by interesting the people.

Q. Is not that because they are in a minority?—A. No, sir.

Q. Is it not because the doctrine set forth in the law is not really embraced in a majority of public opinion?—A. You can know whether they are in the minority by the plan which I suggest. You know people do not stir until they are compelled to stir, and then it is often found that what was apparently the idea of a minority is really the idea of a majority.

You cannot in our present *status* ascertain whether a certain thing is the will of the majority or not. The votes as given for representatives do not indicate all the wishes of the people. The two parties represent the interests of the people so little that nowadays the party platforms are nearly identical—in fact I should like to see any difference that exists between the party platforms. The politicians are all very "good" men of course—all very "learned" men—have all "studied political economy" and they "understand the interests of every branch of labor in the land." You must know that they are made Representatives because they are lawyers—not because they understand anything of political economy or political philosophy. There are exceptions of course; I grant that.

By Mr. CALL:

Q. What is your profession, doctor?—A. I am a teacher, sir, by profession. Now I am a writer since I am too old to be a teacher. It is time now to have a great agitation among the people as to how they can realize their own will; and if they see that in Switzerland the Referendum and the Initiative have done excellent service, then they will, perhaps, imitate them. They will not be too proud to learn from a republic that is a thousand years older than theirs.

EFFECTS OF THE REFERENDUM AND INITIATIVE IN SWITZERLAND.

By the CHAIRMAN:

Q. What laws have been adopted by the people of Switzerland under these methods?—A. Laws in favor of labor. Children's labor has been almost entirely forbidden, and women's labor very much restricted before and at times of confinement; the hours of labor for all are regulated, and it is made the duty of the employers to pay damages for those who are hurt in their service.

By Mr. CALL:

Q. How do they enforce the law prohibiting women from working before and after confinement?—A. Oh, I can assure you that laws in Europe are enforced.

Q. Laws are generally enforced by being made punitive on the individual committing the offense. Now, take a woman who is working before or after confinement; it would not do to enforce the law by punishing her for so working.—A. Well, we can leave that to the circumstances of the case and of the time. We need not lose ourselves now in the consideration of single instances. The fact that the law is not yet perfect may be conceded; but the very good will of the Swiss people has been demonstrated by the majorities under which this law was adopted.

Q. How many people are there in Switzerland?—A. Two and a half millions.

Q. How large a territory do they occupy?—A. Well, sir, it is a small territory and a poor territory; but, after all, the surrounding despots fear very much to despoil the Swiss people and appropriate their soil because they fear to get into their confines two and a half millions of free-born men. It is a very important country, not only as an example for other peoples who want to be free, but also by keeping, so to say, the "watch of freedom" in Europe—offering a refuge for the fugitives from political persecution in all other parts of the continent.

Q. The point I wanted to suggest here is whether a law that might be practicable for a people of two and a half millions, occupying a very small territory, would be equally practicable for a population of fifty or one hundred millions of people, occupying a continent?—A. Well, this is an inducement for the fifty or one hundred millions of people to be very sparing about making new laws, and to be very liberal in cutting down the old laws to what is absolutely necessary. This would make, not lawyers, but the people themselves to legislate for themselves, and to legislate for their real wants. You have no other means that can be so effectual.

POPULAR AGITATION IN THE UNITED STATES CONTRASTED WITH THE REFERENDUM AND INITIATIVE OF SWITZERLAND.

The CHAIRMAN. But in some of our States these laws that you speak of as having been enacted in Switzerland, under this power of the Referendum and Initiative, have been enacted under the existing political forms. I refer to the laws limiting the hours of labor, and regulating the employment of women and children. Such laws have been enacted in several of our States, and so far as concerns the law regulating the hours of labor under the Government, that has been enacted also under our existing constitutional forms. The point I am aiming at is to get you to elucidate in full the reasons which you have for thinking that, in order to obtain the reforms and specific measures you men-

Digitized by Google

tion as having been secured in Switzerland, it is necessary to amend all our constitutions; it would require such large majorities. The same laws which have been passed by virtue of these provisions of the federal and cantonal legislatures in Switzerland have been already obtained in this country by agitation, and it seems to me the rest might be also obtained without the difficult measure of first amending our State and national constitutions.

The WITNESS. Well, suppose that we do not wait for a revision of the Constitution here. If some of these demands are fulfilled we shall, of course, have to be very watchful; our party and all the other labor organizations will be watchful to prevent their becoming dead letters.

Q. But, you know, after the law has been enacted, whether under the forms you suggest or those now existing, the execution of the laws would still remain.—A. Yes.

Q. Have you any suggestion to offer as to securing a more efficient execution of the law, after it has been once established, by whatever method?—A. The next thing is to do what the Swiss do, namely, to elect all their officers themselves. No civil-service law will be as good as that. You know, at present, competition is very much furthered by our mode of representation and legislation. As the majority of voters cannot be so easily bought as individual legislators, just so through direct legislation the people may become interested in looking for good representatives—for those who shall represent really their views, and they ought to have the power to recall their representatives if a majority of the voters insist upon it.

### SOCIALISM DISCUSSED.

By Mr. CALL:

Q. Under your system of government, would the people have any time to work at all; would they not be engaged all the time in matters of State, and electing officers and recalling them, and discussing the laws?—A. I suppose that when this system is in course of action, once a week in a town meeting, or a ward meeting, would suffice to do those things which belong to the town, or to the ward, respectively, and to attend to their share of the State matters and matters of Congress.

Q. What do you want with a State under that system? Why not have it all in one? Let one answer for all purposes. Wherein is the use of preserving the State and municipal distinctions?—A. Well, you must make a beginning, and must trust that the people will come up to your expectations. It is useless, of course, to enter into the details of so great a subject here. There are a great many other matters which can be more profitably discussed.

Q. Does your theory ever contemplate a state of war, or is there to be constant peace?—A. Our theory is, that the world will be at peace whenever the capitalistic production is carried over and converted into communistic production; that is to say, production in which there will be individual property in what is earned by labor only, while that which is necessary to carry on production, or, as we call it, capital, is owned in common by the State, and is given out—hired out, as it were—for a certain consideration from time to time to trade societies, working societies, &c.

### HOW, UNDER SOCIALISM, EACH MAN'S SHARE WOULD BE REGULATED.

Q. How, under your communistic system, are you going to regulate the share which each man is to get for his production; how could you, as an

Digitized by Google

intellectual laborer—for you would not be an industrial laborer—get your share?—A. Our teachers, those to whom I belong, know quite well what I am worth as a teacher, and they will not value me at less than my worth. I can trust to them. So you can trust to the virtue of laborers, that they will of themselves justly estimate the value of every man's work.

Q. That is precisely what I want to know, by what system of distribution; what authority is there. You say that the people who employ you as a teacher, will know.—A. No; not the people that employ me, but other teachers, I say.

Q. Well, of course, we are speaking of you only as an example. How are they to do that—by some common form of action, as a public meeting?—A. Certainly; in their monthly or yearly meetings.

Q. And so as to every other man?—A. And so as to every other man, and every other employment.

Q. Then you would not have any capitalists—you would have no difference between one man and another?—A. Oh, certainly. We acknowledge gradations in work—inferior work, simple work, average work, and superior work, or "qualified" work, as it is called in political economy. And I think laborers, as a rule, will be apt to think more highly of mental labor than what it is really worth.

### COMPENSATION OF "DIRECTORS OF LABOR," UNDER SOCIALISM.

Q. What do you call a man that is a director of labor and not a laborer himself; a man directing the exchanges of labor?—A. He will, of course, be made a director only because he is more than a common laborer, and he can perform more.

Q. Would you propose to give him a high salary?—A. Either a higher salary or higher "earnings," as we would call it then.

Q. Would you have that arranged by a vote of the people, also?—A. Certainly.

Mr. CALL. It appears to me that you would have a good deal to do.

The WITNESS. That is self-government, and nothing else is.

Q. If you were to regulate the salaries of everybody employed in the country, do you not think it would amount to a great mass of legislation?—A. Well, is not that kind of legislation already carried on in society? Not publicly, but it is carried on in the way of every day business.

Q. But it is done now by individual employers; it would be done, under your plan, by the community.—A. It may come up once a year, perhaps, when the prices of every kind of work and merchandise are regulated, not only of one branch, but of all branches, by common agreement and compromise. Of course nothing would be perfect at the outset.

Q. Once a year you would have a meeting of these different societies to regulate what each man could get?—A. Yes.

Q. And do you think every man would be satisfied with that?—A. Why, certainly; how otherwise would he be? He has no means of helping himself. Every one else is treated just the same way as himself.

Q. That may be your idea; but that is not exactly a free government, is it?—A. It is exactly a free government, and a self-governing government; and it is no longer a corrupt government. Corruption is only possible through representation. It is no longer possible when the people make their own laws and really elect their own officers.

Digitized by Google

By the CHAIRMAN:

Q. You ignore the potent fact, or at least something that you hear a good deal about—the possibility of corruption of the ballot itself, do you?—A. Oh, I know there are now corrupt voters, depraved men.

Q. Do you think that under the new conditions there would be any less of them?—A. Why, my dear sir, there would be no motive to corruption. How is there to be corruption if capital is not any longer private property? How could it tempt to corrupt? It is impossible.

By Mr. CALL:

Q. What difference does it make about private property when one man wants more than another? Suppose the capital all belongs to the community, and I want more of it, and you less, how would you satisfy the difference?—A. Suppose the difference between the highest and lowest wages will be as one to ten—that will perhaps be the most that will occur—would not that be better than it is now? Now-a-days a poor sewing woman earns from 9 to 11 cents a day if she is very diligent and works all her hours, while Jay Gould, who does not work at all, properly speaking (for he produces nothing), gets paid for every hour of the day, say, $10,000.

Q. Why could you not give the sewing woman more than 10 cents a day—say, $2 a day—without interfering with Jay Gould?—A. I do not object, but I took that only as an example; that while now-a-days the most enormous differences in the reward are allowed and are legal, there will then be only a very narrow limit, but still limit enough to warrant the individual activity of each in his own way.

Q. Suppose all that to be so. Why not correct that without going into these tremendous changes that you speak of? Why not get to some practical way of rewarding labor?—A. Simply because it is impossible; you have not the power.

Mr. CALL. It strikes me that if those people who pay these sewing people only 10 cents a day would get together and agree to pay them more, that would be sufficient.

TRADE SOCIETIES SHOULD HAVE POWER TO INFLUENCE THE LABOR MARKET.

The WITNESS. Well, now, I must add something more to the proposals—though this is an idea of my own. I am entirely alone in it, so far as I know. During the times when feudal labor existed and everybody was provided for, to some extent at least, the trade societies which then existed had certain rights through which they were secured against poverty. If trade societies now are to be really effective it is not sufficient that they be incorporated by the Government. When they are made to interest themselves in their own welfare generally, to spread bills before the legislatures and so on, to carry out their own ideas, that will be an improvement, but is that sufficient, if they have not the power to ordain, or if the law which incorporates them does not at the same time ordain that no laborer or workingman who is not a member of a trades union should be employed by anybody? That is the complement to the first law which allows the incorporation of the workingmen. Must workingmen have no rights to influence the market of labor? They will not fully realize all the benefits of incorporation otherwise.

Q. What would you do with those people that have no connection with any labor organization?—A. They will hurry up and connect themselves with trade societies.

Digitized by Google

Q. Do you call that a free country?—A. That is freedom. Nowadays we have none.

Q. Do you call it a free country where a man is obliged to starve if he does not join an association?—A. We have already the liberty to starve, but not the liberty to work ourselves up in wealth. Liberty nowadays is only for the few, not for the laboring men.

Q. You propose that no laboring man shall be allowed to live unless he joins an organization, and you call that freedom?—A. So I do, because it secures him from want; but that is my individual opinion; it is not the belief of my party.

Q. And you think that is a free government?—A. It is a freer government than we have now.

Mr. CALL. Well, that is not the question.

The WITNESS. You would not then have to pay more for labor than is just. It would not be a certain raising of wages, but it would at least preserve people from starvation. People would work perhaps four or six hours a day when work is scarce, but everybody would be employed; and leisure is of itself liberty.

Q. Might it not be that these theories of yours would starve everybody in the country without any delay?—A. It is impossible to do that under my theory. Everybody would be a member of a trades union.

### THE COMPETITIVE SYSTEM CONTRASTED WITH THE SOCIALISTIC.

By the CHAIRMAN:

Q. Do you think that the mass of people would produce as much under that system; would they have the inducement?—A. Why, we produce too much now.

Q. That is not answering my question. Do you think that under that system which you advocate people would produce as much as they do now under the competitive system?—A. If they are left to do it; but I think there is too much production. We have crises now every five or ten years.

Q. If you produced too much the evil might be as great then as now, so far as overproduction is concerned?—A. No, sir; provision would be made then, and will be made certainly in the future state, to equalize production and consumption; to have, by statistical information, an exact knowledge of the present demands, say for the current year, in every kind of consumption, and to produce just as much of that as is necessary, and no more, excepting a little store that may serve to fill up gaps in the coming years, if there should be a dearth.

### OVERPRODUCTION.

By Mr. CALL:

Q. What is there that is produced too much, now, that is consumed by men?—A. We produce now a great deal too much wheat in the United States, and export the richest products of our soil, and a great deal of our working force for much too little pay.

Q. Do we produce more than enough wheat to feed all the people of the world?—A. We have not to feed all the people of the world.

Q. By what standard do you say that there is a greater production than is required for the wants of mankind now?—A. As soon as you produce so much as to leave so much to export, you must see that this is a wrong kind of political economy, because the first object of production ought to be production for one's own country.

Digitized by Google

Q. Why?—A. Because otherwise you export the fruitfulness of your soil, little by little; you export your working force, a great deal of it. Why can't you keep that in the country to make it richer?

By the CHAIRMAN:

Q. Would you abolish commerce?—A. Oh, no. This will abolish the unnecessary and wasteful commerce, merely, which exports riches that do not come back. In this matter of export we are treated somewhat like Ireland is treated by England. It exports in pounds sterling seventeen millions to England every year that does not come back.

Q. When you export why does it not come back?—A. Well, but in what shape does it come back?

The CHAIRMAN. No matter what shape, if it does come back.

The WITNESS. It comes back in the shape of luxuries that capitalists get in Europe; a hundred millions a year, for instance, in return for our wheat and cotton.

Q. But you want pleasures and luxuries for the working people, and ought they not to have them?—A. Let them have some more luxuries than they have. But the more they have the better they will spend, and that will be a happier time than now. But robbed property will not then be spent.

## WHO ARE LABORERS.

By Mr. CALL:

Q. Where do you limit the line of labor? Who is a laboring man and who is not a laboring man, according to your idea?—A. Useful labor, I have already explained, is the only labor. All the rest is wasteful labor.

Q. What is useful labor?—A. That which produces wealth, directly or indirectly.

Q. Take Mr. Vanderbilt, for instance. I do not know Mr. Vanderbilt, and I merely mention him as an example; nor have I any connection with men of such large wealth; but take him as a representative of his class, does not the man that directs the great influences that control industry become a working man?—A. *He* does not direct anything. He pays directors, who do the work.

Q. Is not his brain worth anything?—A. No, not at all, since it is not exercised for the advantage of the country.

Q. Does he not occupy something of the position that you do—your brain and his brain alike directing these movements in the direction of increasing progress? What is he doing but directing the influences at his command to increase production, and what is the difference between your work and his? You are a laborer in your way, and is not he a laborer in his?—A. It is very strange that that must be answered, since he can himself fix the price of what he calls his labor.

Q. I should like you tell me where is the line of distinction between useful labor and labor that is not useful. Is it in industrial employment—manual labor—or is it in all the exercises of the brain, just such as you have shown us to day?

## LABOR THAT IS NOT USEFUL IS NOT TRUE LABOR.

A. I have not for a moment denied that intellectual labor is labor; but this intellectual labor that is exercised to the damage of the whole society and country is not useful labor. Every labor must be useful in order to be true labor. That is the first distinction of political economy.

Digitized by Google

Q. Then every man who has useful ideas is performing intellectual labor, is he not?—A. Conceding that, yet Mr. Vanderbilt's useful ideas I have never yet seen.

Mr. CALL. Well, he may be a very good man and have some very good ideas.

The WITNESS. Oh, I do not say that he may not be a very good man, after the opinion of the times.

Q. But let us take the question philosophically; you say intellectual labor that is useful is true intellectual labor?—A. Yes.

Q. And the man that you call a capitalist, the man that has got some means and happens to use them, his is not useful labor, but is injurious labor, as I understand you to say?—A. Yes; it is injurious for two reasons: First, because that capital by whose accumulation he spends his mental energy is robbed under legal forms, and he has no right to rob. What he afterwards does with this robbed property is again a detriment to society, because it is meant to accumulate more and more capital; that is to say, to extract from the people (who are, as it were, the soil on which the nation is sustained) more and more of the power to create wealth.

Q. You say that this is "robbed." A gentleman who sat recently in the place where you now sit has some very liberal ideas, and though they do not approach yours they are still very decided in the direction of liberal legislation for the benefit of the people at large, and he has some politico-economic theories like yours. He told us that he knew an instance, indeed several instances, but one special instance, a noted one in New Jersey, where one of those "robbers," as you call them, had acquired very large means by his improvement of the condition of labor in his factories. I suppose you would call that man a very bad man and his labor bad?—A. No.

Q. He testified that this employer had acquired large means by increasing the wages of the laborers, and by providing for them in old age, and administering to their comfort in sickness and showed us a model factory—a kind of paradise on earth. Now, what do you call that?—A. You take the question into an entirely novel department. I am not now talking of morality. I did not speak of morality. I spoke from a politico-economic stand-point.

### PRIVATE CAPITAL IMPOVERISHES.

Q. But that is not merely morality, but political economy also.—A. I ought to have spoken of the theory of Karl Marx, when he shows that private capital must impoverish every country, and the warning signs of this are now observed over the country in the crises, the great crashes that come now and then over all the trading and mercantile communities. They show that we have a very unsound state of society. Marx' theory is this: That capital must ruin and must abolish itself, just as slavery has abolished itself. We cannot do anything against this natural action of economical and historical causes. It is a historical necessity that the kind of production which now prevails will run itself, and that, too, before this century is over.

Q. May it not be that the fault of your theory is simply this: that you assume that capital is a thinking, sentient being, whereas there is no such thing, and capital is nothing but the means by which the workingman, who has developed his brain and capacity for organization, directs the labor of his fellows—nothing but the brain instrumentalities in connection with the opportunity of usefully directing their labor. Now, it

Digitized by Google

that be capital why should it not exist?—A. As soon as you establish a state of society where people are equal and free to compete, as soon as you take away the private property in land, money, and education, as soon as you educate people equally and give them every opportunity in the same manner, according, of course, to the state of their respective gifts, but according to the best development possible for education, as soon as you establish such a society, then you may speak.

Q. Suppose the statistics of this country, and of all other countries, should, in opposition to what you say, show that the great manufacturing and producing interests of the world are in the hands of workingmen who have built up these great businesses themselves, and should show that their power is simply the superior intellectual knowledge of their business by which these workingmen are able to give direction to the combined efforts of their fellows—suppose statistics exhibit this to be a fact in every part of the world, then what becomes of your theory that you must take the land in order to do that which is already done by the workingmen themselves?—A. In former times it might truthfully be said that in the United States every person who was a real workingman and was industrious and diligent, and somewhat parsimonious, might ultimately come to a competency, and among thousands there might perhaps be one or two, or three at most, who might become rich; but the opportunities for this are past. You do not see any such thing now.

Q. Such a thing as what?—A. You must not always interrupt me, my dear sir.

Mr. CALL. I beg your pardon. I only wanted to know what you had said.

ALL BRANCHES OVERCROWDED.

The WITNESS. Nowadays everything is very different; wages have gone down, and the wants of life have gone up in prices. Compare only the thirty last years of which I can bear witness, and it is now less possible than ever before to make savings, and still less possible, if you have some few savings, to employ them so as to make them useful, to make capital out of them. The chances are all now gone. The best and most useful land in the United States has been taken up now, or is in the course of being taken up. You have to travel far out into the West if you wish to find a place for pre-emption. And so it is with all branches of manufacture and industry; they are so over-crowded that superfluous men are to be found in every walk of life. Nowadays it is an impossibility, except under very favorable circumstances, to become a Vanderbilt or a rich man. And we know the means by which these men have become so rich. I only know one man, and that was Peter Cooper, who really could say, "I have earned most of my fortune by honest work." All the rest have earned it by means which, if lawful or legal, have at least not been just.

OPPORTUNITIES FOR ACCUMULATION.

By the CHAIRMAN:

Q. You were speaking of there being no opportunities for accumulation by the middle and working classes of this country. Let me ask you if you do not think that your observation should be confined perhaps most closely to those with whom you have come in contact—as the people of this city and its vicinity. Take our State of New Hampshire, for

Digitized by Google

example, a remote, rural State, where people are not supposed to have much of a chance. They have accumulated, in the last twenty years, about $40,000,000, the most of it being by common laboring people, who have made these savings-bank deposits almost entirely during that time, and that is something that they were not able to do during any previous part of the century. I state that as a fact, and it is not an uncommon one?—A. I must entirely deny, from facts of which I am in possession, that it is workingmen who are owners of this capital found in savings banks. It is not the workingmen, but it is the small traders, small business men, who wish to have some return on the capital which they do not need for the moment. I can prove that by statistics; and, on the whole, I recommend to your honorable committee the last census of the United States and the reports of the labor bureaus of New Jersey, Massachusetts, Ohio, and Missouri as to these facts.

Q. That is a very suggestive reference, because those are public records. My question to you now is whether it is not possible that your criticism should be limited to a smaller class of people than you imagine—to those of the wage workers, who are suffering?—A. No, sir.

Q. I thought perhaps you were confounding the evils to which a smaller class are subjected. Do you not confound their conditions, and the evils which they suffer, with the general condition of the country at large, which may be prosperous?—A. No, sir; I am speaking as well of the general class of agriculturalists and self-working farmers and professional men. I know a great many very worthy teachers—American born, as well as immigrants, in this country—because I am a member of their societies, and I know of no man, either among them or otherwise, who makes a fortune by his own labor. It is so in every walk of life. If formerly you had small savings you could do tenfold more with your savings than you can do now. You cannot now compete with these large capitalists that are working in your line of business. There is a large capital—tenfold larger—needed now to enable you to get a profit upon your capital than there was when I came to this country. Then everybody who was really a moral and thrifty person might be said to be the smith of his own fortune, at least to some extent. This is not so now. My long experience and observation of every walk of life, and in every State in which I have been, tells me that it is not so now. Who asserts the contrary should give his illustrations. They would be exceptions, and I should be glad to publish them in our newspaper. All such exceptions are very agreeable to us, because they confirm the rule. But I know of very few.

### CONDITIONS OF LABOR GROWING WORSE.

Q. Before you go on in the other direction, let me ask you whether you think that the condition of the people as a whole—of the 54,000,000 or 55,000,000 that we have here—is growing worse or better, in a material point of view?—A. It is certainly growing worse. The only contrary action is that of the labor organizations. Wherever you find a good labor organization it is proof against too great oppression. Wherever there is a well organized trades union, or labor society, there is a greater power of resistance against the lowering of wages; there is more possibility to raise wages, to curtail the hours of labor, the working day, and to take care of the laws, and to bring bills before the legislature so as to benefit the state of labor generally. The trades organizations are very beneficial. We know that, from the history of the English trades unions.

Digitized by Google

CONDITIONS OF LABOR IN ENGLAND.

Q. By the way, I should like you to give us, what I suppose you readily can, a pretty full idea of the labor organizations of England, and of Europe generally, as they have been, and as they are, and their effect upon the development of better conditions for the masses of the people there.—A. As regards the English trades unions, I will do what I can. They have existed from the beginning of this century when there was still some recollection of the older kind of trades unions that prevailed all over Europe centuries ago. At that time the working day was from sixteen to eighteen hours a day in the cotton factories, which just then, next to the iron industry, had the greatest number of operatives. At that time their conventions and assemblages and their organizations were forbidden by law as conspiracies. Child labor and woman's labor were employed to a very great extent. Wages were exceedingly low, and you know the corn laws had not yet been abolished. All the necessaries of life were dear. Laborers first tried to help themselves by combinations to destroy factories. In the first twenty years of this century a great many factories were destroyed because they had introduced machinery. In part, the execution of the laws against the malefactors stopped that; but in greater part the intelligence of the working class itself stopped it. They saw that this was not the right sort of remedy, because these machines, if once made the property of the working people, might benefit the working people just as well as they now benefit the employers, and so they gave up of their own free accord burning the factories and destroying machinery, and began to petition Parliament from year to year, and they began especially to interest the landed aristocracy in their behalf, because the manufacturers would not listen to to any petitions. So that it came to pass in 1833, that the conspiracy law was abolished and trades unions were made legal. From that time they began to act as free men. They began to combine in such numbers as you now see them combining. They then began to found benevolent institutions in their own mills. A fund for resistance was created, to be used if strikes should occur, or if a single operative should be dismissed and could find no work elsewhere; a fund for widows and orphans was created, and a fund for the benefit of the families of deceased members, and for the burial of those members was created. Thenceforth they held yearly congresses of all the organized trades unions in England, Scotland, and Wales, and they obtained by degrees one law after another, chiefly through the co-operation of the landed aristocracy, because that interest opposed manufacturing interests just as much as possible. The agitation for the abolition of the corn laws was beginning at that time. So they had friends among the aristocratic class, and they fostered very much the enactment of laws that were favorable to workingmen.

ARBITRATION IN ENGLAND.

Laws in favor of arbitration were passed, and that system has existed for many years; but the workingmen needed not to make use of it since they had private contracts in most cases with their employers, and often employed arbitration when there arose any difference between laborer and employer. Arbitration in England is always going on voluntarily, not particularly according to law—that part of the law is not resorted to—because it is in some respects less easily resorted to than the private method.

Q. Do you think that the existence of the law is essential to the ex-

Digitized by Google

istence of these private organizations?—A. Certainly not, but it is good to have it exist until such time as labor is strong enough to make contracts on equal terms. Other laws were passed, such as the laws against child's labor.

RESTRICTION ON CHILD LABOR AND WOMEN LABOR IN ENGLAND.

It was a great victory this law, against child's labor, and that victory was obtained in 1850. Children must not now be employed more than one-half a day, and the laboring day was limited to 54 hours a week. So that children can only be employed 27 hours a week. Since that time the children of working people can go to school, and the law was established that forced them into the school, which, however, was not the present public school. The public school as it now exists has existed only since 1870. A law was laso passed which exempted women from work in certain kinds of industries. For instance, in collieries, in potteries, and several others.

FACTORY INSPECTION.

The next great step was in 1850, when the Government established factory inspection—appointed a number of labor inspectors. That is something that we ought to have in the United States. We need it very urgently. The only trouble in England is that the number of these inspectors is too small. They cannot inspect the factories often enough. But the Government was so lucky as to find very apt men. To their eternal praise be it said the workingmen owe a great deal of gratitude to the first labor inspectors, factory inspectors, and sanitary inspectors, which about that time were chosen by the Government; and in general these English factory and sanitary inspectors have done a great deal of good to the working people and to the communities at large. These were some of the chief advantages of the organization of the trades unions.

EMPLOYERS' LIABILITY LAW IN ENGLAND.

The last or one of the last laws enacted was that which made the employers liable for damages that were suffered by working people during their service. The law is not quite perfect yet, but in the last workingmen's convention, held a few days ago, the provision was recommended that the proof must be brought by the employer that he is without fault. That amendment, I hope, will be adopted by the Government and by Parliament. Then the laboring class in general began to organize country workingmen, who were worse off than almost any other class. Mr. Arch, one of the founders of the party, was instrumental in doing that.

Q. You mean the agricultural laborers?—A. Yes; organizing the agricultural laborers; and this led to an improvement of their wages from eight or eight and a half shillings to ten shillings a week, and that very speedily. The advantage, however, has in part been lost during the recent hard times.

SUFFRAGE IN ENGLAND.

The workingmen were instrumental in obtaining the manhood-suffrage law, as far as it exists. It is called the household suffrage act. If you have your own door key—not to the house, but to your dwelling—

Digitized by Google

then you are a household voter, and can vote. But it is the intention, I understand, of the Government to confer the suffrage upon every grown person above 21 years of age. All those steps, have by degrees, been obtained by workingmen, sometimes by connecting themselves with the aristocratic class, sometimes by holding with the manufacturing class, and sometimes with the mercantile class.

### CO-OPERATION.

The pioneer societies, which co-operate in production and consumption, have been spoken of a great deal here in the United States, and have been more recommended than they are worth. In fact, the best effects of these societies are obtained by trades unions which carry on at the same time a consumption store. Consumption stores are carried on for the most part by trades unions. There are about 900 consumption stores in Great Britain. In a very few cases they are productive unions. This is the benefit which has come from organization. I know of no case in which the employing class have voluntarily, without being pushed by the working class, made any grant of higher wages or shorter working time, or larger rights in any way within the factory, or of any other benefits for labor. If there is such a more general—not individual—effort to be spoken of, I do not know of it. I know very benevolent individual employers, both in this country and in others. I have often known large capitalists to say "We owe labor more than we pay it. We ought to make it good in some other way." Mr. Poppenhusen, of College Point, L. I., founded an institution, a sort of labor lyceum, with kindergarten, library, debating society, and so on. That was practical philanthrophy. I know other such individual efforts here, and in other countries. But it is not done by the employing class as a class. These cases are exceptional.

It can be proved historically that wherever labor is well organized, wages are high and working hours are short, and that in proportion as labor is badly or not at all organized wages are low and hours are longer. There is hardly a limit to the indignities to which labor may be put if it is not organized.

### WAGES PROPORTIONED TO ORGANIZATION OF LABOR.

You can make a scale of wages, and, on the other hand, a scale of hours of labor, and read off on that scale who has the highest wages. The highest wages in this country are those of the glass makers of New Jersey, Ohio, and Indiana. They have been so well organized that their wages are nearly $1,000, on an average, a year. The next highest in the country are the higher branches of the iron industry. There the wages average about $800 a year to each man; a lower grade about $600; a still lower grade $1 a day. But wherever labor is well organized there need not be a war between capital and labor constantly and always. Mr. Jarrett has told you that that need not be, though there is a general war between labor and capital, and harmony never can be fully realized, yet there is great help in these institutions because there are sure to be benefits from them.

It has been said here before you, if I recollect aright, that if wages are raised by strikes there must result an enhancing of the commodities or necessaries of life; that merchandise must become dear just in the same proportion as wages are raised.

Digitized by Google

Q. It has been claimed that the increase of wages of one class was really paid by the laborers or consumers in another class.—A. That was the proposition. Well, it is one of the strangest mistakes that can be made.

PROPORTION OF JOINT PRODUCT—CAPITAL, 19.7%; LABOR, 17.5%.

In this country labor gets about 17½ per cent. of the proceeds of labor—that is, by the census of 1880. Every former census shows another and a better result. But by the census of 1880 labor gets only 17½ per cent. from the proceeds of labor, while capital gets 19.7 per cent. That is to say, after it has paid for materials, interest, rent, taxes, and all the incidental expenses, the net revenue or benefit to capital is 19.7 per cent., according to the census of 1880. Now, suppose shoemakers raise their wages, say 20 per cent. The shoemaker who now has $300 a year will then have $60 more a year. That is an item for him—a considerable item. How much will that raise the price of the merchandise which he makes? In a pair of shoes, for instance, that costs $3, it raises them at most only a few cents. He may now have to pay more for the shoes which he and his family consume in a year. It may cost him in a year perhaps $3 more. Instead of paying for a year's shoes, say $20, he pays now $23. Yet he has, as we see, got $60 more wages than he had, so that he is still considerably better off. Is not that a clear gain for him? And so with every other kind of merchandise.

Q. You might follow that illustration out a little more, perhaps. The 20 per cent. that you add on the basis of the census to the wages of the workingmen would be only 3 per cent. on the cost of the article. So that, assuming that before he got an average of 17 per cent., that would carry the proportion of production which he would receive up to 20 per cent.; and the same theory, carried on through, would increase the share of labor to 20 per cent. and reduce capital to 17 per cent.—A. No, sir. Now comes the objection to that——

Q. But is not that your illustration?—A. That seems to be. I will now explain. As soon as the workingman gets $60 or more a year he will spend it. This will make a larger profit for the capitalist, and, selling more merchandise, he can afford to have a smaller profit, for the oftener he turns his capital around in a year, if he makes even a small profit, it will amount to just as much profit at the end of the year as if he turned the capital round less frequently and made more profit at each turn.

Q. Your point is that increasing wages does not decrease the profit of capital?—A. It decreases in all cases the profit of capital, but capital can afford to lose it because the market is enlarged.

Q. And the larger aggregate makes up for it?—A. Yes.

Q. Then, assuming the same volume of business, profits would be decreased; but you claim that the volume of business would be increased?—A. Exactly.

Q. Then, if the aggregate of business is increased, an increased amount of labor must be performed, must it not?—A. Certainly; but the amount of the individual's labor need not be increased thereby.

Q. It must be if there is more produced, must it not?—A. The number of laborers is increased, but the single laborer is not more occupied.

Q. You assume that more laborers will be employed?—A. Yes; and that is a great benefit. The more laborers you employ, and at good wages, and the more purchasing power they have, the better will be the market.

Digitized by Google

REDUCTION OF HOURS BRINGS ENHANCEMENT OF LABOR.

Q. It has been thought that the best method of securing the employment of additional laborers would be by reducing the working hours of those that are now engaged. What do you think of that?—A. It comes to the same thing in the end. If you reduce the time more laborers will be employed. In consequence of that the laborer will have more purchasing power; and in consequence of that again, the capitalist can afford to pay higher wages. It always was the fact, and without any exception in the history of labor, that when the working time was reduced wages were, after awhile, enhanced, and when the working time was increased wages were after a time reduced. This may be demonstrated in every single case. Our newspaper, the Volks Zeitung, gathers all these cases, and we have quite a library of reference upon them. Whatever labor gains capital must lose, and *vice versa.*

Q. I do not quite understand your propositions as consistent with each other, perhaps because I have not understood your statement fully. In the illustration you gave a moment ago about the increase of the wages of the laborer by 20 per cent, I assumed that there would be a corresponding reduction of the profits of capital to 16 per cent., so that what labor gained capital would lose, which is the proposition, as I understood, that you then laid down; but now you controvert that.—A. If I said that capital loses 3 per cent. from the 19 without a compensation in the long run I must have mistated or misunderstood the question.

Q. No; you said it in this way: that what labor gains capital must lose, assuming a given volume of business.—A. Yes.

Q. But then I understood that you supplemented that proposition with this, that inevitably as you increase pay to the laborer there would be an increased volume of business or production?—A. Yes.

Q. Then followed the question to you that, if the volume of business is increased, of course there must be more labor performed, and, consequently, there must be more wages paid, and you met that by saying that there would be more labor performed, but not by the individual laborer—other laborers would be called in and employed?—A. Yes, sir.

Q. And thus the volume of business would be increased, but by other laborers; and just how the individual laborer would be any better off I have not been able to see.—A. Because the wages are increased, and there is a larger number of workers who guarantee each other's existence.

The CHAIRMAN. Well, I think I understand your theory, and I will not interrupt you in your narration. You were saying when I interrupted you that whatever labor gained capital must lose.

VICTUALS AND RENT FORM BULK OF LABOR'S EXPENDITURE.

The WITNESS. Yes. Now, it so happens that the largest part of the reward of labor is spent for victuals and for rent—about 70 to 75 per cent. going to those. In many branches that proportion of the value of the product which is expended in raw material alone is very large—say 80 to 85; sometimes even 90 per cent. forms raw material. The butchers who furnish us our meat need a large capital, and spend on the raw material—for the cattle which they kill—perhaps 81 per cent. Labor, profit, and all other expenses share the last remnant. So you see that if wages are raised in all industrial pursuits at the same time by 20 per cent., that makes the purchasing power of the 20 per cent., and of all the wages, a great deal higher—because, there being so little labor comparatively entering into the production of victuals and rent, it

Digitized by Google

is only a small percentage by which the cost of labor is raised, and therefore the purchasing power of the wages which are given has risen. I do not know whether I have expressed myself clearly enough. The matter is a little difficult to express. Since labor spends most of its income for victuals and rent, and the actual production of victuals and rent—houses, dwellings, fuel, &c.—requires but little labor comparatively to the whole amount of money spent in production, therefore when wages are raised in all branches—when butchers and bakers, and when also brewers and house-builders raise their wages, it is a comparatively trifling portion of the whole product which is thereby raised, and therefore the purchasing power of the industrial laborers is not consumed so much by the buying of these victuals and by the buying of that rent.

Q. But the force of your conclusion depends upon your assumption that the raw material in all those businesses amounts to 80 or 90 per cent.?—A. Not in all businesses, but in these chief ones that I have mentioned, in which workmen consume most.

Q. Very well, it depends upon the assumption that labor is a very small element in production. Now, if you go back to the raw material in the case of the butcher, that is the animal which he kills, is it not? He invests his capital by purchasing an animal which he kills. That animal, in its turn, is production to the herdsman, and, in a certain sense, to the middle man, and so on all the way back to the land and to the wild animal from which this animal proceeded originally in the process of domestication of the race. Capital has been invested over and over again in this process of domestication. To get down to the animal which you have killed, it starts as a calf, perhaps, on the plains; there is no capital in that, yet it now costs a good deal; just as with the iron ship which was at one time raw ore in the mine, worth little or nothing, while now it is a finished ship sailing on the ocean, and 90 or 95 per cent. of that ship is labor. So it would seem to follow that the assumption of men like John Roach, who say that nearly everything in production consists of labor, must be correct; and, if that is correct, your argument would be fallacious.

SIX-SEVENTHS OF ALL PRODUCTION GOES FOR BENEFIT OF CAPITAL.

A. I have in many different ways calculated that all the productions that exist, all the receipts that exist, go, six-sevenths of them, to the benefit of capital and only one-seventh to the benefit of labor.

Q. You consider the animal sold to the butcher as capital, do you not?—A. Yes, of course, when sold.

Q. Then production is capital, is it not?—A. Well that would be a misnomer.

Q. If production is capital production is labor?—A. Production cannot be capital.

Q. You sell it, and the moment it is consumed by sale it is capital in the hands of the man who has got the price, is it not?—A. The product, yes.

Q. Well, now, you start with the soil, and nine-tenths of what converts the simplest thing into a salable commodity is the work put upon it. Therefore nine-tenths of whatever profit is received goes to labor. As each stage of progress is reached the article becomes the raw material of the next process in industry, and the same proportion of labor is made use of in that occupation.

Digitized by Google

CAPITAL REWARDED AT EACH STAGE OF MANUFACTURE.

A. Every new process presupposes the anterior process, in which capital has been rewarded already, and it must not be put in the account now.

Q. The capital which has been rewarded is labor.—A. And the labor has been rewarded—I do not deny that—as far as it was not "robbed."

Q. Then labor all the way through is 90 or 95 per cent. of that?—A. But its reward on each stage of proceedings is less than that of capital. The New York Volks Zeitung has proven this in the case of a number of industries. It may be proven from the figures of the census in the case of every industry, and I regret not being prepared to do it just now, at least in some instances. I am ready to prove it at any time.

The CHAIRMAN. I understand you.

The WITNESS. We are speaking of industrial associations and their effect on wages.

Q. But is it not possible that there may be there a grievous fallacy? Can you segregate one process in the great series of processes which ends with the printing press, or with the ship, or (in the case of food) with the stomach—can you segregate one thing from out of these processes and leave all the rest out of consideration?—A. No; I do not propose to do so. I had to consider, according to what you wanted me to tell you, how trades unions or societies have benefited workers, and I am speaking now from the standpoint of the experience of trades unions. I say that when their wages are raised the merchandise which they need most of all for their livelihood will not be essentially, will only be triflingly raised, if at all, by the raising of wages, which is a matter of experience with trades unions.

The CHAIRMAN. I agree with that perfectly, and I think your illustration proves that.

The WITNESS. If, now, I have to consider agricultural labor, and all that, I shall have to begin afresh.

WHAT CAPITAL GAINS LABOR LOSES.

All my topic is that whatever labor gains by raising wages or curtailing time will ultimately redound to the damage of profit; it will curtail profit; and whatever profit, or capital, gains, labor must lose.

Q. But, in order to make it equitable, must you not increase wages in a corresponding proportion among all classes of labor that contribute to the thing as finally produced at the point of consumption?—A. Oh, yes; but at the same time all the producing power of these laborers increases, and thereby the body of consumption increases, and thereby capital can afford to lose a little of its profits. It is now so, and in future societies there would be no profits; profits would be entirely abolished through the workings of the trades unions in all branches and dividing the net profits.

Q. You say profits are to be entirely abolished. Profits are the accumulations which are made the basis of future enterprises or production?—A. Not always; they may be consumed.

Q. Yes; they may be consumed or may be wasted; but we have been speaking of capital and labor and raw material—which, I suppose, you would say was one form of capital—being combined to produce the next commodity. They enter into combination to produce new commodities. Now, if you distribute the entire result or price of the commodity immediately, and there be no accumulation, what will be left to commence enterprise anew for future investment in future production?

Digitized by Google

THE NEW STATE OF SOCIETY.

A. Do you mean when the new state of society shall come?

Q. Well, yes, you may put it in that way. I suppose that you would not entirely abolish profits until you introduce the new state of society.—A. I think it impossible to do it before that time. I do not know of any means by which it could be done.

Q. Then the introduction of the new state of society results in the gradual reduction of profit by increasing distribution to labor. Is that it?—A. Well, it may be so, and it may be different. It depends entirely on the way in which it is introduced—the transition state.

Q. In what other way is there a peaceable way out of that?—A. Profits may be done entirely away with, or entirely abolished in different ways. For instance, the present capitalists might be willing (I am supposing this to be the case, though it is improbable) to enter into combination with the trade society of each kind, and serve them as bookkeepers or directing persons, foremen, &c.; and the trade societies might be satisfied with the service of these men at a very high figure, perhaps, until a certain time. That might be a very gradual plan of introducing that new system.

Q. Is there any other way—you speak of an immediate introduction of it—how can that be accomplished otherwise than by revolution?

PREPARATION NECESSARY FOR IT.

A. If revolution does introduce it suddenly now it is not our fault. We are not prepared for it. We would prefer to have enough working time to agitate, so as to have a clear conception of what is to be done the day after the revolution, to "spread the light" among the working people, and even among our adversaries, that they may see that we are not going to bring things to ruin. And then if it does come, it will not come so forcibly as in other ways. But if it is forced upon us, as all revolutions are forced upon the working people, through the reactionary or conservative party, we are at a loss to know the immediate results. It has always been so. So much is this the case that a revolution once begun in one country comes to another country also, and then we may have a convention of all the different countries, and we may arrange the production and consumption of each among ourselves. We may then say that this country shall produce this kind of merchandise, and that country another kind, and each country so much of each commodity, we compensating the others for their merchandise with our kind of merchandise. The trades unions then may be able to so equalize production and consumption as to be entirely just, and yet every year afresh, so as to do away with all the faults or defects of distribution, for defects must of course from the beginning exist. There ought to be every year a fresh distribution.

REPRESENTATION SHOULD BE DUAL—POLITICAL AND ECONOMIC.

Furthermore, since that topic has been touched upon, let me say that my own idea is, and it is an idea shared in by many persons, though not in the party creed, that there should be two kinds of representation of the people—a political one and an economic one; the political representatives to have to do simply and solely with matters of law, morality, and education; the economic representatives to have to do with the economic representatives of all the nations that are combined, they to compromise and agree about a contract of production and consumption

Digitized by Google

through which no profit is allowed to any single person or to any nation. Exploitation should be forbidden, even as regards colonies; every nation to do her share in producing such articles as are adapted to her capacity and the mutual wants of all, and all the others to produce what they can can most advantageously produce, and every nation to have a store left for future wants so as to supply gaps in production when they come.

That is a private idea of my own. I do not, however, suppose that we know all things, or that I individually should know everything that can be done. There is enough wisdom in the world to arrange all these matters if it is left free to act for the benefit of all the community. Nowadays that is impossible.

### BRAINS SUBJECT TO CAPITAL.

Nowadays all learned men, all scientific, all technical inventors and directors, are at the service of the ruling class. They are not left free to do what they can do, and therefore they work to the detriment of all the other classes. It is even doubtful whether they work for the ultimate benefit of capital, since they impoverish, through exploitation, the working people of all countries, so that ultimately there must be a revolution to make an end of it. But there is science and wisdom enough in the world, so that as soon as knowledge and wisdom are put to the work of reforming, they will find ways to accomplish their end. Therefore we need not now puzzle ourselves with special details of the new society. We need only now agree upon principles, and these principles are the fixing, as far as experts can determine, what everybody's work is worth to society, in the case of the workingman by experts from the workingmen's own ranks, and in the case of the learned man by experts from the learned man's own ranks, this principle to be carried through between all the nations; production to be equalized to consumption (with a little surplus); laws to be reduced to the smallest possible amount, because they will have nothing more to do with economic matters; absolute free trade, without any duties at all; and a curtailment of the working time of every individual to, say, four or five or six hours, according as the necessity may demand it, so that every man and woman may really be free.

### FREEDOM: WHAT IT IS.

My freedom consists in having as much of my time as possible at my own disposal. I must be at the service of society for some hours of the day. Society has a right to demand that at my hands in return for the benefits it confers upon me; but such freedom should be had for everybody as that he should be free for, say, five-sixths of the time of the day. And labor should only be expected of people for a certain number of years. There ought to be a kind of pension fund, or insurance association—the State itself to be such an association—which should allow labor to retire at a certain age, to enjoy life, and to add its wisdom, acquired by ripe experience, to the councils of the nation, to serving voluntarily and without pay in all kinds of offices. In olden times the old folks were considered the best folks to consider the welfare of the nation, and did not get any pay for that. Those were the so-called senates; why should not they be so henceforth? Profits, however, should be abolished entirely, and the value of services and merchandise should be rearranged from year to year through conventions of the economic representatives of all nations.

Digitized by Google

### WARS TO BE ABOLISHED.

Wars, of course, with their standing armies, &c., should and would be entirely abolished.

Q. What method would you substitute for war, in the adjustment of such difficulties and disagreements as might arise?—A. All wars, nowadays, are undertaken for economic reasons, for the sake of exploitation of nations and similar reasons. If the motive is taken away, war will be taken away. And, by the way, our education in the future will be a far better thing than it is now; and I would like to direct your attention to some points under that head.

The CHAIRMAN. The committee will be glad to hear you after recess.

The committee then took a recess of half on hour, after which Dr. Douai's examination was continued, as follows:

### EDUCATION.

The WITNESS. Education is my real profession, and in that I have had alarge experience—perhaps more than any other living man—in many countries. Of course, I expect great things from an improvement of education for the future state of society, and for the present as well.

The CHAIRMAN. Before you go on, as bearing upon your experience as a teacher and your right to speak for education, let me say that I am told you have been identified with the Kindergärten system of schools, and have done as much as anybody living, and perhaps more, to introduce and foster them. What have been your connections in that regard?

The WITNESS. I shall touch upon that.

The CHAIRMAN. Then, without interrupting you again, I shall just ask you to give us your views upon education, and the connection between education and labor, speaking at such length and to such points as you choose.

### THE SCHOOL SUBSERVIENT TO OTHER VESTED INTERESTS.

The WITNESS. Educational reforms are very difficult, because the school was at all times considered the servant of other vested interests—of the church chiefly—of the State as a despotic State, and of society. There is no profession so unfortunate as the teaching profession, because it can almost never execute what it considers necessary by the behests of science and the teachings of experience. The teacher's efforts to improve schooling are always hampered by the fears entertained by the church, by the State, and by society that the children to be educated may not be educated according to their own wishes. I premise that simply to show why it is almost impossible to expect that in our present society much could be done for educational reform. I shall afterward mention what may be done.

### NEW STATE OF SOCIETY NECESSARY FOR EDUCATION.

It is clear to my mind that we need another state of society for the best interests of humanity and of education. All the improvement of mankind—the inauguration of a high degree of freedom and development—depend upon a new state of society in which capital shall no more exist in private possession—when alone it will be possible to ward off the sinister influences of these powers of which I speak and to give

Digitized by Google

back to education, that is to say to the teaching fraternity in combination with the parents of the children, and the representatives of science and religion—to give back to these the rights they ought to have to reform education and the school. I think there are more reformers of society among teachers than among any other class of professional men, because they have the sore experience in their hearts of how much they might do if they had the privilege left to them, and how little they can do nowadays, even with their best efforts and their best knowledge. Therefore I think teachers will, in the reorganization of society, play one of the first parts.

When that shall be the case then the real business of the political part of the State will be to further all the interests of education, and to devote as much of the proceeds of labor—let us say as much money—as possible to the purposes of education. The lack of means which prevails nowadays to carry out educational reforms is so considerable that the best will can do but little. But then when it is possible to devote all the necessary means to this great reform—the giving all that can be imagined—then it would be possible to do a great many things that are now impossible.

### THE KINDERGARTEN—ITS EDUCATIONAL ADVANTAGES.

It is, however, very useful to have models, even now, established by such means as are now at our command, by which it may be shown what could be effected in the end if the means were larger. In this respect I have always tried to introduce kindergarten as a general education—not as it is now, an education of the earliest age for the wealthy classes. I have, of course, no objection to that, but as an exclusive means it is just the opposite of what I should wish. All the youths, all the children of the age of from three and a half or four years, when they can take care of their own cleanliness and do not involve too much trouble to the teachers outside of the real purposes of the schools, all these children ought to be seen in the same school, so as to form an early association of all classes; to render sympathetic their sentiments; to morally educate them and to make them take interest in each other's well-being; to teach them to behave in an orderly manner, and to associate themselves willingly with every kind of child; at the same time to learn a great many things which are necessary for citizens of the state to learn who are to live together; for instance, to govern themselves in a body. Children ought to learn that in the kindergarten, and not in later schools.

### SELF-GOVERNMENT BY CHILDREN IN SCHOOLS.

This self-government has been already carried on and practically tested, as all educational innovations have been practically tested, long, long ago. In Switzerland, at the end of the last century and the beginning of this century, first in the Reichenbach canton of Grisen, there was a school in which Louis Phillippe, afterward king of France, was a teacher, and one of our great German writers was also a teacher. They introduced into that school self-government among the children. The children had a right to elect their own officers and law-givers. The teachers had only to modify such measures as were too severe. The experience had with that kind of self-government among the children was glorious. That same kind of self-government was also tried by Pestalozzi and by Fellenberg, also in Switzerland, and they are unanimous in its praise. That might be instituted in the kindergarten, but the kindergarten has far higher purposes yet.

Digitized by Google

YEARS OF GROWTH—THEIR RELATIVE EDUCATIONAL IMPORTANCE.

If you consider that the first year of life exhibits a larger growth of body and mind than the second—perhaps double as large—and the growth of the second year is more than that of the third, and so on through every subsequent year, the growth becoming slower and less intense, except perhaps during the years of development—from fourteen to sixteen—in the two sexes, when there is a very large increase of growth, mentally and bodily, you see that just in these important years it is most necessary that the early growth should not be stunted. It is nowadays stunted because there is not the attention paid to it which might be paid.

WHY MEN ARE CLASSIFIED AS STUPID AND AS INTELLIGENT.

Many talents simply fall asleep or die because they need, but do not receive, fitting nourishment, which is occupation—occupation with the objects that attract the mind, that are adapted to the special wants of every child and to the wants of all the children. This negligence of the educators of early childhood results in the fact that only a minority of children seem to have real gifts, real talents, or genius. That is the reason, and the only reason, why men are classified as stupid and as intelligent, why the prejudice prevails that there must be always a stupid class which must be ruled, and an intelligent class which may rule. Every common man seems to have an experience of that kind. "Some children," they say, "are intelligent and some are geniuses, and it is all the gift of nature!" Well, all the old teachers of large experience with whom I have conferred about that say it is wrong; it is not true; all real teachers' experience contradicts it. The more opportunities you give children at an early age to satisfy their hunger for that kind of instruction which is adapted to their special talents and to the common talent of mankind—in other words, the better the food you give them, and the more correctly it is proportioned to the natural craving of the mental appetite, the more their powers develop. And it is so in every child.

Why, sir, when I was a young man it was believed that among one hundred children in the schools there might be perhaps 5 per cent. who might be good drawers and designers, and it was said that all the rest would never learn it. It is not so. In our kindergartens we have the example that every child may become a drawer and designer, if you begin at an early age and work gradually.

It used to be said in my time that to become a good mathematician one must be a very stupid fellow. That was the prevailing prejudice among my comrades in the higher schools. In our kindergartens we develop the talents for mathematics and geometry at a very early age by gradual exercises, and we find that no child is entirely devoid of talents for this kind of science. And so you could go along the whole list of human achievements, and you may, in every child, develop a considerable aptitude for acquiring more and more, during lifetime, of this particular skill or science adapted to the particular talent, while in general, by this practice, all the talents are developed in every child.

GOETHE'S KEY TO MENTAL DEVELOPMENT.

Our greatest poet, Goethe, in his romance, *Wilhelm Meister*, develops the idea at great length that you need only become acquainted with the special talent of a man or a child, and develop that, in order to see all

Digitized by Google

his other talents—the general talents that are common to all mankind—rising a step, or several steps, higher. If you give the individual child that particular food which it craves most, this will give it courage to attempt every improvement in its other mental powers. It was this dictum of Goethe which prompted me during all my life as a teacher to try to see if it was true, and I have made a great number of experiments to test it—so large a number as to show me that it is true.

### THE FUNCTION OF THE KINDERGARTEN.

The kindergarten is the school which has been invented by Friedrich Frœbel for the purpose of developing all the talents of childhood at a time when they have not yet fallen asleep through neglect. So that, you see, if afterwards your elementary or your higher school builds on this basis, you can rear citizens that are equal to all the tasks that you can impose upon them. Of course the whole school would then assume a very different aspect from what it now bears. Our elementary school would begin with well prepared children. They would not only understand every word the teacher says, but they would, from their course of kindergartening, have learned the meaning of language, and even of two languages. In all the kindergartens which I directed two languages were taught at the same time—spoken and practiced and well understood.

### NUMBER OF WORDS UNDERSTOOD BY CHILDREN.

The number of words which an average child here in New York and its surrounding neighborhood understands in the English language is not more than from 300 to 500.

By the CHAIRMAN:

Q. At what age?—A. At the age when they begin to go to school—even in the first year of school. German children know, perhaps, in addition, some three hundred to five hundred German words. Their vocabulary is so limited that a teacher cannot express himself intelligently to the children. Then one or more years of that time of life when talents are yet to some degree fresh and apt to grow rapidly, are wasted by the efforts of the teacher to first discipline a little his class of sixty or eighty pupils to make them sit still, not to move their bodies, but to rise when bidden, to sit down when bidden, not to turn their heads around, not to wink, and all the rest of it. And the children must be taught to understand what the teacher means.

### DEFECTS OF PRESENT SCHOOL SYSTEM.

Again, all the exercises in the public schools are too abstract for children; they have never in their lives known anything that was like those exercises. But children that come from the kindergarten, if you have them in a separate class, so that no other pupil can get between them and their studies, advance so rapidly that there is no comparison possible between them and the other children. I have in my practice found that if you begin the elementary school with children of seven—at the full seventh year of age—you begin timely enough, and, if they have come from the kindergarten well prepared you will find them, two years afterward (then in their ninth year) as far advanced as any other children are at ten. This is the effect of such preparation.

Digitized by Google

But even then, according to my experience, the elementary school should not be a sedentary school for all the hours of attendance (which should be about five hours for all except the high school). Children should not be forced to sit down and study in that position for at the outside more than one-half of this proper time. The other half of the time should be spent in a continuation of the kindergarten exercises on a higher scale. Then you can teach all those branches which they had in the kindergarten in such a way as to develop the arts and the sciences, as far as they can be taught at that age, in a playful manner, and so as never to overwork the mind, much less the body.

A great deal of those exercises in the second half of the time ought to be gymnastics, so as to give a relief to the body, which has been tired out by sitting a long time, and at the same time to develop all the beauty of which the body is capable, and all the muscular strength and all the health that is possible. That is the very first object. If you have your children well prepared, from the kindergarten up, you may be sure that at eleven or twelve years of age they will be as far advanced as other children are at thirteen or fourteen. This is not saying too much. I might quote examples if it were proper for me to do so, seeing that it is my own experience of which I should have to speak. The fact, however, is that you can teach double as much in half the time if you have begun in time to do the right thing—to give the child the proper nourishment for all its faculties. That is as to the general idea.

### THE HIGH SCHOOL: WHAT IT SHOULD BE.

Now, when we come to the higher school—that school which should begin after the fourteenth or fifteenth year of age, just when the body and mind begin to have their "second-step" year, as we call it—the great development year—when manhood and womanhood are beginning to ripen—just then the high school should commence. The high school might be carried on a great deal like the present high school but always connected with practical exercises for one-half of the time. And here professional, mechanical, and technical education might be taken care of. So that every school ought to be connected with workshops in which every kind of work should be taught, not only theoretically, but at the same time practically, by means of actual work. And not one kind of labor only, but several. Every youth ought to be able to make an easy transition from one kind of calling to another. This is indispensable in our time when so many professions and callings are likely to become superseded and to be entirely dispensed with. It is but natural that at a period when inventions and division of labor and production on a large scale are carried on as they are nowadays many professions will by and by become superfluous. The reason why we have so many superfluous people nowadays is because they cannot afford, or have not the courage of mind or of body to go over from one profession or occupation to another which pays well enough.

### WHAT THE SCHOOLS SHOULD DO TOWARD MEN'S OCCUPATIONS.

Our schools ought to impart this facility. They ought to provide for contingencies in which whole populations may be deprived of their livelihood by the progress of the times. If society and the state do everything possible to advance the professions and industries of life, they should bear the consequences, on the other hand, of so arranging and adjusting things that the followers or practitioners of any particular

Digitized by Google

profession may not, through the progress of the times, be made the sufferers, be made the victims of that very progress. There is no right in men, whether singly or in combination, whether in the state, in society, or whatever you choose to call it, to make the individual man atone for the general progress of society and suffer the consequences thereof. To prevent that, there ought to be diversity of callings taught and practiced by and for the pupils. This, of course, ought to be done by the masters in every science and art. It ought to be taught on theoretical grounds, and the teaching applied for practical purposes. When, for instance, the art of glass-blowing is taught, the scientific principles which underlie the whole production of glass ought to be explained. As much chemistry as possible ought to be taught to make the occupation intelligible to those who are employed in it. They ought to see and understand how glass comes to exist, and the different kinds of glass that may be produced by the different mixtures of elements, and so with each mechanical art and profession; it ought to be taught on scientific principles as well as with the greatest practical perfection, so that no person can ever be in life without the means to support himself. In a properly adjusted system, four or six hours a day would enable a man to produce as much as society wants him to produce. So that he could dispose of the rest of his time as freely as possible, and then be indeed a free man.

### VALUE OF CLASSICAL EDUCATION.

I ought here to state my opinion of education in the old or classical languages. Of course, those languages are indispensable for such men and women as want to be historians, investigators of antiquity, or naturalists in the line of prehistoric mankind, or prehistoric animal kind. Such persons need the old languages—not Latin and Greek only, but a great many more. When I was a youth, it was thought a great achievement to understand Latin and Greek, and, at most, Hebrew, for those who wanted to study theology. Nowadays, to be philologists, as we ought to be, means to understand and almost to be able to speak reasonably well from ten to twenty languages, so great are the demands made in the sciences, as they are nowadays advancing. Of course, it would not be possible to deny to philologists the knowledge of Latin and Greek, and of all other foreign languages; but to all those who do not intend to become philologists and pedagogues of the highest kind, of what earthly use are Latin and Greek? I cannot see that they are of any use to such people.

Of course, I have studied Latin and Greek, and I think I know something of them. But whatever I may have learned, and whatever I may have done of good in this world, has not been the result of my knowledge of Latin and Greek. I know many men as old as I am who say the same thing. If it were not for the thousands of philologists who are employed in our colleges, and who of course would bear ill having instruction in these languages abolished in colleges, we would have a great many more advocates of my idea.

If you want Latin and Greek terms for any science, you have your dictionaries; you can find the terms there by looking for them. If you want choice sayings from the great poets, or the great writers of Greek or Roman literature, you will find collections of those saying published in books and alphabetically arranged so that you can look them up whenever you need them. Do you want to read the old poets? Well, I advise you not to do it in Latin and Greek, if it can be helped. There were very few among my fellow students at the university who

Digitized by Google

could really enjoy the Greek and Latin poets as they ought to enjoy them. Among the twenty with whom I was passed to the university there were but three who could do it, who could really get the benefit of the old poets and philosophers from the originals. The others had to study very hard, and yet they could not in after years use their study of Greek and Latin for their amusement or for their moral or ideal improvement, because they did not know the languages well enough.

The study of these classical languages is a waste of time, sir, which was invented in old Europe, at a time when there was no other means of general culture of the mind, and it has been continued to our day, because in Europe, government, and the church, and society are prone to hold up old-time distinctions of classes. A learned class may be most easily distinguished from an unlearned class, either by being able to use a few Latin and Greek terms for technical purposes, or by being able to quote a few of the famous sayings of the poets, and thereby be distinguished from the common people. This is not as it ought to be in a free republic, such as the United States. It is not being done in Switzerland, where they could have it if they wanted it. I wonder, therefore, that the idea of Latin and Greek, as necessary for all the higher professions, should be advocated to such an extent as it is in this country.

## SANITARY SCIENCE IN SCHOOLS.

But a great many other things ought to be introduced into the higher schools. It is, in these times, almost barbarous not to have a full course of sanitary science introduced into all our higher schools. I have in my schools begun to teach hygiene in a simple way to children of ten years of age; they understand quite well what preparation they must make to preserve them in good health, and what it is necessary to do for the development of their limbs and their bodies. They understand a good deal of it at ten years of age; but a good deal of hygiene and sanitary science ought to be gone over with every man, and especially with every woman.

Speaking of women here, I would insist that every young girl, when she has reached her maturity, should become an auxiliary kindergartner for a year at least, where she would be instructed how to educate very young children according to the ideas which Frœbal has given. It is an excellent thing. I have trained more than thirty kindergartners. I regret to say that very few of them are yet in the profession. Most of them are married; but they are happily married, I assure you; they are good wives and good mothers, and know how to educate their children in the way that they ought to be educated. I think I have done more good in that line than in many others that seem of greater magnitude. I can testify to the fact that such a course of instruction would be of great benefit, not only for the female sex, but for mankind at large. If mothers know how to deal with the tenderest child, how to appreciate the time when they must begin these exercises, which develop the health and mind of a child, it helps to develop, not only the child, but the mother.

## NATURAL AND APPLIED SCIENCE IN SCHOOLS.

I come now to another point: I would mention as something to be introduced into the high school, namely, natural science, in all its principles and bearings, in connection with a certain amount of applied or practical exercise. It is almost impossible nowadays for a man to be

Digitized by Google

educated unless he understands the general laws of nature for a great many practical technical arts and sciences—a basis which cannot be replaced by anything else. If you learn all these things by the book, you do not know them. The only way to learn natural science is to practice it, to analyze, to experiment, to synthesize, to try every kind of inquisition with all bodies and all forms of matter, and to reduce everything down to mathematical certainty and calculation. I would devote a good deal of time, therefore, to natural science, practically taught, so that every child at sixteen or seventeen years of age would be a real scientist—not "crammed" or overcrowded with useless knowledge, as is now the practice of the schools, but with a practical understanding of the effects of each law, and with the practical possibility of evolving principles in their mathematical relation—in other words, to make *constructors* of men and women—to make them more than mere seers—to make them thinkers and builders. It can be done in a few years if the children have been brought up as I have described from the kindergarten by the use of all the faculties of the mind and of the body, by training the eye and the hand and all the senses through object lessons, through acquaintance with living things, through practices continued in the elementary school and in all kinds of work. This is a continuation of the kindergarten work on a higher scale, and later, in a scientific and practical manner in the higher schools. That is my idea as to a school in the later and better development of society when the means are at hand for its introduction and proper development.

### MODEL WORKING SCHOOL—DR. FELIX ADLER'S.

But the question is, "How far can we go now?" I will preface my consideration of that question with the remark that we have here in New York a model school to which I may refer without being obliged to speak of myself. Dr. Felix Adler has continued kindergarten work in a working school in which only poor children are received, and they gratuitously. The gratuitous feature of the institution has a double purpose. It wards off the objections of parents as to having their children educated in a form to suit their own ideas, which may be the worst form for the children, and which, in any case, is nonsensical, because a teacher in a school composed of more than ten or twenty students cannot individualize so much as to have special care of any one child all the time.

The other purpose of this feature is that children who come there to be taught gratuitously are willing to stay through the full course of teaching, which is eight years. They are taken in upon that condition. American children are generally so educated that they are independent before their time. They say to their parents, "I do not want to go to this or that school;" "I want to learn this or that thing"; and "I do not want to learn this or that other thing." The parents acquiesce in this fancy of the child, and they let them run their own course in education. In this way there is no real education possible. Felix Adler, therefore, properly insisted upon it that only the children of poor parents would be received, because those parents would be grateful for the benefit which the children would obtain, and they would be governed by this requirement, and would not be governed by the children, because, of course, they would be very glad to see their children well educated.

These are conditions necessary for success, otherwise success would be impossible. He has been carrying this idea beyond the kindergarten for four years past. All his children who have come to the working school have gone through the kindergarten for two years, and then the

Digitized by Google

kindergarten exercises are continued in the working school. One-half of the time they learn by book, but more by object teaching than by book; the other half of the time they practice what they learn. They are taught, of course, to read, write, and cipher; but all this in a very different manner from the conventional manner. It is all objective. The children have to find their own rules for their practice. Arithmetic, for instance, is taught not in the common fashion, but in the earliest stages, in the kindergarten; is taught objectively by getting the children to count the corners and angles of all geometrical bodies which they have at hand. They must see what they count. They are enabled to reckon in fractions simply from seeing bodies divided into fractional parts.

All this is done in such a way as not to burden the memory but to be a natural result of sight and feeling.

### THE MEMORY OVER-BURDENED; THE THINKING FACULTY STARVED.

The want of success in our present method of education is that memory is burdened too much, and the thinking faculty is neglected almost entirely. This is ruining the minds of children. The food, not being palatable, is not digested. It is with the mind as with the body, that which is put into it will be digested, if taken in reasonable quantities, and if taken at the time when there is a natural appetite for it, provided no more is given until that has been digested and the appetite has returned. That which has been taken in must not be rendered useless by giving too much at a time. It must be worked out, as it were, by muscular exercise so as to create new cells. That which you acquire by heart is as much ballast as the ballast you have in a ship—you throw it out again when you can load in money or other valuable things. You have not learned it really by heart. You have learned it from necessity, because you wanted to meet the requirements of an examination with its marks and its record kept by the teacher, and these marks and this record are made more account of than the knowledge and science involved. This is a mere mechanical training, and since the education of the thinking faculty is neglected, it cannot conduce to the making of real scientists; it does not make real self-thinkers or self-governors.

### EFFECTS OF NEWSPAPER READING.

If it be true, and it certainly is true, that the American people consist to a very great extent of intelligent people, it comes rather from the steady and continued habit of newspaper reading and the reading of books outside of school, than anything that is gained in the schools. And it is one of the best and most instructive customs which the Americans have, to have intercourse with even small children, but especially with youths. Whatever children learn, of self-thinking, is a real acquisition, and in the practical business of life, when the children are obliged to leave the paternal home, as many of them are obliged to do in order to earn a livelihood for themselves, their minds are sharpened by conversation and contact with others, it is in such conversation and contact that they really learn to exercise the faculty of thinking.

### KINDERGARTENS ATTACHED TO PUBLIC SCHOOLS.

If you ask me what might be done now, I would say that there might be done here what has been done in the city of Saint Louis. Mr. William T. Harris, who was at one time superintendent of the public schools

Digitized by Google

of Saint Louis, being a man much inclined to German ways of teaching, had a letter addressed to me requesting that I should give him my experience as to kindergartening for all classes of children—to make it a common education. I detailed my plan, and he has, in four years' reports, gratefully acknowledged what had been performed in pursuance of that plan in the public schools of Saint Louis. They had a very excellent lady at the head of the kindergarten institution of that city—Miss Blow, a daughter of one of the Senators of the State of Missouri. She was an educated kindergartener, having studied the system in Germany. There were enough kindergartens established in Saint Louis to enable every child to be educated in that system preparatory to going to the public school.

Q. The kindergarten system of Saint Louis, then, is the plan which you recommend?—A. Yes; but I have not seen much of it of late. Miss Blow is not any longer at the head of it. Mr. Harris is no longer there, and I can, therefore, only speak of what I know of its achievements in former years. Great changes take place in educational matters here in a short time.

### POLITICAL INTERFERENCE WITH TEACHERS.

During the period that I have been a member of the American Teachers' Association I have seen more than six of the best educators of the country ousted by political nobodies—by school boards who did not understand anything of that with which they were charged to deal, in a public capacity. There was Mr. Rickoff, of Cleveland, who first reformed all the schools of Cincinnati, where he was occupied for seventeen years, and later for seven years, or more, in Cleveland. He was obliged to leave, and is now superintendent of public schools in the city of Yonkers, in this State. There was Mr. Wickersham, the State school superintendent of Pennsylvania; he had to go; I do not know why. There was Mr. Northrup, superintendent of public schools of Connecticut. I do not know whether he is yet in office, but whatever the politicians could do to oust him, they have been doing. So it was with Mr. William T. Harris himself, who was superintendent of public schools of Saint Louis; he has preferred to go. I do not know whether Mr. Edmund Ruffner, of Virginia, the State superintendent of public schools, is yet in office. I have not heard of him for some time. But the politicians have fastened upon this public school system as a means of promoting their personal ends, and they very well understand how to get rid of real reforming educators. An illustration of this was given in Boston a short time ago. So you see how difficult it is in our days, before a new state of society is introduced, to reform schooling.

### NATIONAL AID TO EDUCATION.

I fully agree with the idea that the National Congress should give national aid to education. I approve of a law which would devote a number of million dollars every year to the education of the children of the South, and in all States where education is now neglected, and in proportion to the population of the State, for such length of time as shall be necessary—say, for ten years. I have always been in favor of such a law, and have always voted for it in the educational assemblies of this country. It has been before Congress now for, I think, twelve years. It has been so little favored, however, that it is still before Congress, and I think that it is not any farther advanced than it was years ago. Now, what else may be done?

Digitized by Google

### TAXATION OF PAROCHIAL SCHOOLS.

It is a very serious question, I admit, to interfere directly with parochial schools. In fact, I consider it nearly impossible. But, sir, why should we let them go free of taxation? If they establish schools that are at enmity with the public schools, why should they not be taxed? They are trying to spoil the public schools by withdrawing the Catholic children from them, and sometimes, also, Protestant children. Why should we favor these religious institutions by remitting taxation in their case? They should be taxed, and that is something which could be done without being open in any way to the criticism of interfering with religion itself.

### A NATIONAL UNIVERSITY FOR THE UNITED STATES.

I now come to a point that I consider of the highest importance. It would be a very great, good thing to have a university of the United States, for reasons which are apparent to every educator, and have often been touched upon by the philological and educational conferences of this country.

We have more than 300 colleges in the United States, and we have not one single university in which everything that may be called science or art may be learned from the best of teachers, and with the best means that science and art can command—not one! Even the richest endowed universities—those of Harvard, Yale, Cornell, the University of Michigan, and the State University of California—are not up to the demands of the times. Why should your young men, when twenty-one years old, go to Europe and spend a great deal of money for what they might have here for nothing at first hands and from the very best of teachers? You could have here the most brilliant professors of Germany, England, or France, to teach in a university of the United States. They would answer such a call with delight, and you would, of course, give them a proper salary. It would be an honor to be a professor in such a university. You would have the very best men in their several specialties in the world, and could make it a condition that no pupil should be admitted who, upon examination, was found not to be up to the demands of the university. You could require that merit should be the test of admission. The great difficulty now is, that each one of the 300 colleges that we have in the United States demands students for the sake of keeping up their own lives and meeting the necessary expenses of the institutions. The consequence is that they admit a majority of unripe pupils. They take them because they must get the money. Their funds are not sufficient to enable them to pay proper salaries to the professors or to pay for the instruments and apparatus necessary in a proper or complete course of instruction. Concentrate these 300 colleges into one for each State, and a great one for the United States, and you will have the means at once to make of each of these institutions as much as any German university is worth; and with the additional privilege that there will be free teaching for the first time in the history of the world, except, indeed, in Switzerland; real freedom of speech for the professors, real independence of mind, so that they can teach what is really science, and not what is approved or permitted "by authority"—a compromise between science and religion, with a little politics thrown in.

A university of the United States is a great desideratum. The teachers know how useful it would be, and so do the philologists. But the

Digitized by Google

idea is hooted down by the majority of the people. Yet what better thing could the United States do than to establish an institution which should be a representative of the highest development in every branch of science and art, and thus show what mankind can do in a really free state. It is a grand idea. It is a pity that it must be postponed for, perhaps, decades of years, in order to prepare the public mind for it. Political parties, as at present organized, are opposed to granting means for such an institution—at least one of the old parties is; the other sometimes talks of it; but whether it is in earnest about it I do not know.

I think I have said all that I had desired to say to the committee; but shall be glad to answer any questions which may be put to me, whether in connection with the political, economic, or educational views which I have presented.

The CHAIRMAN. I think we may be satisfied with the presentation of your views. Your comprehensive and valuable statement in reference to education is so plain as to hardly need further elucidation. If, however, there are any further observations which you would like to offer, the committee will be glad to hear them. Have you stated all that occurs to you?

The WITNESS. I have touched upon each of the propositions I had in mind. Of course, it would be impossible to exhaust the subjects.

Adjourned.

---

NEW YORK, *September* 21, 1883.

The committee met at 10 a. m.

FRANCIS B. THURBER sworn and examined.

By Mr. PUGH:

Question. You reside in this city?—Answer. Yes, sir.

Q. What business do you follow, and what have been your pursuits to enable you to give us information upon the subject of the relations of labor and capital, and the general subjects embraced in the resolution authorizing us to make the examination upon which we are engaged?—A. I do not think that I have any special qualifications, but I am engaged in the wholesale grocery and provision business, and have been so engaged for the last twenty years in this city; also in the importing and manufacturing of food products to some considerable extent.

Q. What do you consider have been your opportunities to inform yourself upon these questions?—A. I have taken some little interest in the politico-economic questions which have come before the public, and have studied them somewhat.

Mr. PUGH. Please proceed to give us, as you think proper, any information or opinions which you may have upon these subjects.

The WITNESS. I have some diffidence in appearing before your committee in response to your request or subpœna, feeling my incompetency to treat in a thorough manner the important subjects under consideration. A man who is subject to pressing business cares necessarily observes only those phases of the subject which come under his notice, and this observation is naturally somewhat superficial and only of value when compared with that of other persons who have had opportunities to view this great question from other points of view.

### INDUSTRIAL CHANGES WROUGHT BY STEAM AND ELECTRICITY.

Before touching upon the points specially mentioned in your subpœna, I will state in a general way that I believe the unsatisfactory state of the relations existing between labor and capital which prevails to a considerable extent in our country is due to the enormous changes consequent upon the discovery and utilization of the forces of steam and electricity, which, within comparatively few years, have revolutionized all departments of production and commerce and to a great extent the affairs of society in general. It is but natural that laws made for the government of society before these great forces became known should not now be adequate for the protection of all classes. The great problem with our forefathers, who established our Government, was a more equitable distribution of wealth than existed in the older countries which they had left in consequence of class tyranny. They sought, by abolishing the laws of primogeniture and entail, to secure the distribution of wealth, and through simple, honest, and economical government the welfare and happiness of the whole people. The measures taken to secure this were deemed very radical by the conservative people of that time, and accomplished for the time being the result intended; but within the last fifty years new forces have arisen, for the regulation of which the old laws are entirely inadequate, and these forces have been allowed to be monopolized and now inure in a great and unequal degree to the benefit of the few. With these forces have come a tremendous development of machinery and corporate organization, all of which have conferred great benefits upon humanity as a whole, but the development has taken place without proper control and regulation, and a crop of attendant evils has grown up which are now crying loudly for remedy.

### EFFECTS OF MONOPOLIES.

I do not attribute all the ills to which society is heir to the effects of monopoly, but I do claim that the great problem which the statesmen of our day have to solve is the equitable distribution of wealth, which, under existing conditions, is heaped up in the hands of the few, to the detriment alike of those who possess or control it and those who have nothing.

Many minor causes have a bearing upon this effect; land monopoly, currency monopoly, transportation monopoly, tariff monopoly, patent monopoly, combination in trade monopoly, taxation, intemperance, ignorance, and immorality all have a greater or less bearing I do not think him the wisest counselor who would attribute all our existing evils to any one cause, for they all have an influence upon the common result, but it is surprising what an influence transportation monopoly has upon the aggregation of wealth in the hands of the few.

### RAILROAD MONOPOLY.

With the advent of steam the whole world became travelers and shippers. The carrier, always an important factor in the world's commerce, advanced at once to a controlling position, and when uncontrolled by competition wields a taxing power such as the world has never seen. On the water, which was everybody's highway and could not be monopolized, the exactions of the carrier have been kept in check by competition; but on the land, with the advent of our iron highways, combination and consolidation has been permitted to take

Digitized by Google

the place of competition, and under the form of popular government corporate power now rules the nation. A majority of our law-makers in both political parties are now interested directly or indirectly in corporate enterprises, and naturally our laws are to a great extent made in that interest. While many of the men interested in corporate enterprises are upright and conscientious men, the moment their individuality becomes merged into corporate organization there is an absence of that personal responsibility which attaches to the individual, no matter how extensive his operations may be, and corporations habitually indulge in practices which society would not for a moment tolerate in the individual. The use of money by corporations to control elections and legislation, although done covertly, is so common as to be frequently discovered, but so powerful has the influence of corporations become that the grossest bribery when discovered cannot be punished. The Anti-Monopoly League, of which I am a member, has grouped a few recent instances of this and other manifestations of corporate power in the little collection of undisputed facts which I append to this statement. The political view of this question seems to me even more important than the economic one, or, in other words, that the control exercised by corporate power over our elections, legislatures, and courts is more important than the taxing power which it holds over the productions of the people, although this latter is doubtless the cause to the other effect. Many people in considering this question reason that the benefits of railroads are far greater than the evils which are now commanding public attention, and, therefore, no attempt should be made to remedy the evils, and they are disposed to look upon anti-monopolists as unreasonable people who would not be satisfied with anything. It should be remembered, however, that the primary duty of the State is to provide public highways; that steam roads are simply improved highways; that the people are indebted to the men who *inrented* them, and not to the corporations who now control them, because they would have been constructed by the people if this function had not been delegated to corporations, and the benefits of the invention would have been distributed in a far more equitable manner than they have been under corporate management.

### RELATION OF RAILROADS TO THE STATE.

The following, from the joint letter of the president of the New York Central and the president of the Erie Railroad to the Hepburn committee, defines the relation of railroads to the public, as it appears from a railroad standpoint:

That it is the primary duty of the State to furnish "highways," whether they be the road, the canal, the turnpike, or the railroad, the State alone having the right of "eminent domain."

That this duty has been complied with by the State in most of these ways.

That, for prudential and other reasons, the State of New York preferred to engage the services and capital of her citizens to do what was her duty to do, granting them certain powers under certain limitations and restrictions, which are made part of the contract between these "citizens" and the State.

The State places such "citizens" in her place to perform her duties, and for th s purpose clothes them with the imperial right of "eminent domain," so far as may be required to perform the duty devolving upon them.

Such "citizens" so placed have a right to the fullest protection of the State, and to be protected against any laws that the State would not pass if such property of "citizens" had been built by the State itself, and further, such "citizens" should be protected against any legislation that would lessen the value of property so obtained by its "citizens" by reason of their contract with and their willingness to take the place of the State in the performance of one of its highest duties.

Digitized by Google

The railway company thus holds, in its relation to the State:

1st. Its position as a substitute for the State under the powers and limitations of the law; and

2d. The right of pecuniary recompense, and of ample protection of property.

The writers of the address—

This "address" was an address to the legislature by a committee of the New York Chamber of Commerce and the Board of Trade and Transportation, of which committee I was a member—

look upon the railway company as for pecuniary profit only, and ignore their position as created to perform the duty of the State, taking the risks of investments, on management, &c., upon themselves. The railway companies thus have a higher claim than the ordinary corporation can have upon the State.

The ordinary corporation is organized for the special pecuniary profit of its shareholders, the profit of the public being secondary. The railway corporation is organized primarily for the benefit of the people of the State, and the pecuniary consideration is secondary, but necessary to induce the citizens of the State to assume the performance of the duty of the State. This assertion is true, and is in the essence of the grant by the State of its powers.

I embody that in my remarks as an interesting statement, from high railroad authority, of what they understood the duties of railroad corporations to be toward the people. I may say, *en passant*, that this exposition of their duties is very different from their practice.

### WATERED RAILROAD STOCKS.

Would the State, if if it had constructed these highways, have watered stocks, discriminated against persons and places, corrupted elections and legislatures, debauched courts, and created enormous wealth for the few at the expense of the many?

It is an old axiom that "it is a poor rule which does not work both ways;" and while it is true that corporations should be protected in their rights, they should be obliged to perform their duties. The trouble is that they have always claimed their rights, but have neglected their duties; and now, through chicanery, fraud, and corruption, seek to establish a continuous evasion.

If, indeed, corporations had been held to the original theory upon which they were chartered, namely, that the construction of a railroad was a partnership between the people and the corporations, in which after capital actually invested had received a fair return the rest of the benefits should accrue to the people in the shape of reduced charges for transportation, then the result might have been different. Many of the original charters stipulate that when capital has been compensated to the extent of 10 per cent. upon the amount actually invested, rates can be reduced, but this has been evaded through the medium of "construction companies" and other forms of stock-watering, and, under the assumption that railroads have the right to charge "what the traffic will bear," enormous sums are unjustly exacted from the people. In many cases railroads have been extended and improved out of surplus earnings, and these very earnings have been capitalized and made the pretext for further taxing the people. The committee of the legislature of New York which investigated the coal combination some three years ago describes this practice in the following words:

During the receipt of these enormous profits many of the coal corporations, as was the case with railroads not engaged in the coal-carrying trade, unable under their charters, or for other reasons, to declare dividends upon their stock that would absorb their unexpended surplus, issued additional stock to the stockholders, for which they paid nothing. Inaugurated what is commonly known as stock-watering, or a capitalization of surplus earnings, which is in substance exacting money from the people, creating an indebtedness representing the same, and making this the basis for forever asking the public to pay interest upon their own money so exacted.

## NEW YORK CENTRAL RAILROAD STOCK-WATERING.

The New York Central Railroad is a prominent illustration of this practice. In 1867–'68 the stock of this road was watered to the extent of some $47,000,000. Rates for transportation have been imposed which have yielded regularly 8 per cent. dividends upon this watered stock, amounting each year to $3,760,000, and these dividends in fourteen years, with interest compounded annually, already amounts, as will be seen by the following tabular statement, to upwards of $83,000,000.

*Watered stock issued in* 1867 *and* 1868 *by the New York Central and Hudson River Railroad* ($47,000,000) *upon which* 8 *per cent. dividends have been regularly paid.*

| | | | | |
|---|---|---|---|---|
| Dividend, 1869, on this watered stock at 8 per cent | | | | $3,760,000 |
| Interest on $3,760,000 at 7 per cent., | $263,000; | with 1870 dividend, | $3,760,000 | 7,783,000 |
| Interest on 7,783,000 at 7 per cent., | 544,000; | with 1871 dividend, | 3,760,000 | 12,087,000 |
| Interest on 12,087,000 at 7 per cent., | 846,000; | with 1872 dividend, | 3,760,000 | 16,693,000 |
| Interest on 16,693,000 at 7 per cent., | 1,168,000; | with 1873 dividend, | 3,760,000 | 21,621,000 |
| Interest on 21,621,000 at 7 per cent., | 1,513,000; | with 1874 dividend, | 3,760,000 | 26,894,000 |
| Interest on 26,894,000 at 7 per cent., | 1,882,000; | with 1875 dividend, | 3,760,000 | 32,536,000 |
| Interest on 32,536,000 at 7 per cent., | 2,277,000; | with 1876 dividend, | 3,760,000 | 38,573,000 |
| Interest on 38,573,000 at 7 per cent, | 2,700,000; | with 1877 dividend, | 3,760,000 | 45,033,000 |
| Interest on 45,033,000 at 7 per cent., | 3,152,000; | with 1878 dividend, | 3,760,000 | 51,945,000 |
| Interest on 51,945,000 at 7 per cent., | 3,636,000; | with 1879 dividend, | 3,760,000 | 59,340,000 |
| Interest on 59,340,000 at 7 per cent., | 4,153,000; | with 1880 dividend, | 3,760,000 | 67,254,000 |
| Interest on 67,254,000 at 6 per cent., | 4,035,000; | with 1881 dividend, | 3,760,000 | 75,049,000 |
| Interest on 75,049,000 at 6 per cent., | 4,502,000; | with 1882 dividend, | 3,760,000 | 83,311,940 |

Making $83,311,940 in fourteen years.

Suppose that Mr. Vanderbilt, instead of watering his stock in 1868, had kept it at the volume then outstanding and had paid dividends on that amount, the people would have been $83,000,000 richer, and $47,000,000 of watered stock, which cost nothing but the paper on which it was printed, would not now be in existence and furnish a pretext for further taxing the people to pay dividends upon it.

## FICTITIOUS CAPITAL IN RAILROADS.

Poor's Manual for 1883 (p. iii) says:

> It is safe to estimate that the actual cash expenditure upon all the railroads of the United States within the past three years did not exceed $1,050,000,000, a sum $973,646,452 less than the increase in the period named of capital and indebtedness of the several companies Of course such an enormous increase of liabilities over actual cash outlay is greatly to be regretted, and is well calculated to create a distrust of all securities, good and bad.

The object, of course, is to spread out an enormous fictitious capital which may be made the pretext, as the country develops, to tax the public unnecessarily high rates for transportation service, just as they are now charged double or treble the rates for telegraphing which they would have to pay if the telegraphs were owned by the people and operated by the Postal Department.

The apologists for these practices attempt to meet these figures by statements showing the large decrease in transportation rates during the last few years. That this is true no one disputes, but no fair-minded man who examines into the question of corporate and public rights will, I think, come to the conclusion that rates have been reduced as much as they should have been in justice to the public. On the through traffic of the great trunk lines there is not so much cause for complaint, but local rates in many cases are excessive, and certain classes of traffic are taxed out of all proportion to others. The anthracite coal traffic is a case in point.

Digitized by Google

### RAILROAD OVERCHARGES ON COAL TRAFFIC.

For considerable periods during 1878 and 1879 coal sold at an average of $2.25 per ton of 2,240 pounds at tide water, or say, $3.25 per ton of 2,000 pounds delivered to the consumer in New York. The coal roads formed a pool and prices were nearly doubled, or say, $6.00 to the average consumer. The legislature ordered an investigation. The evidence showed that $3.25 to $3.50 was a fair price for coal, and that the coal roads had watered their stocks so that it was not reasonable to expect that ordinary dividends could, with justice to the public, be paid upon the enormous mass of obligations outstanding.

It is safe to say that the public now pay an unjust tax to the railroad companies which constitute the coal monopoly of from $1.50 to $2.00 per ton on every ton of anthracite coal consumed.

### ON MILK TRAFFIC.

The milk traffic in this State is another case in point. The recent investigation by the railroad commissioners have shown that this article of farm production is charged upon the principle of "what the traffic will bear," sixteen times as high as other articles of similar weight and value and more than 200 per cent. higher than is charged by railroads leading to other principal cities of the country.

### OVERCHARGES ON DRY-GOODS TRAFFIC.

Another striking illustration of the arbitrary discrimination by carriers is found in the case presented by the dry-goods trade of this city to the pooled lines recently. Cotton goods are arbitrarily charged the first-class rate on west-bound freight, which is 75 cents per 100 pounds, from New York to Chicago, the same rate which is charged upon silks and other goods of from ten to twenty times the value of cottons. Railroad men gloss over such glaring injustices by selecting items favorable to their side of the question and placing them before the public as illustrations of the reasonableness of railroad charges.

### ON FOOD PRODUCTS.

The literary bureau of the railroads in this city is now circulating a statement and paying for its insertion in papers throughout the country, as follows:

A barrel of the best flour, worth in New York $7, will make 180 loaves of bread; cost of making is $3; whole cost, $10; retailer's price for the 180 loaves, at 10 cents a loaf, $18; profit, $8. The total freight-charge on a barrel of flour from Minneapolis to New York is $1, or about one-half cent for the flour of the loaf.

A hindquarter of beef weighing 200 pounds, cost in New York, at 9 cents per pound, $18; retails at 16 cents per pound, or $32 for the whole quarter; profit, $14. The railroads carry dressed beef from Chicago to New York for 40 cents per 100 pounds, or 4 mills per pound. Hams and bacon, on which the consumer pays a profit of 4 or 5 cents per pound, are carried by the railroads from Saint Louis, Cincinnati, and Chicago, to New York, for one-fourth of a cent per pound.

These figures are incorrect in essential particulars as well as sophistical in argument. What kind of an argument is the statement that a barrel of flour is worth $7 and will make 180 loaves of bread, which at 10 cents each, makes $18 for the barrel? That the railroad charges $1, and the middleman and the baker absorb all the rest. The real question

Digitized by Google

is, *does the railroad perform its charter obligations to the public, and give the people the value to which they are entitled*, and the answer is found in the relative accumulations of the carrier, the middleman, and the baker.

## IMPROVEMENTS IN TRANSPORTATION.

The improvements which have been made in railroad transportation during the last few years have been enormous, and have naturally resulted in decreased charges for transportation. Steel rails which last three times as long as iron rails, locomotives which haul double their former load, freight cars which carry two tons of load for each ton of dead weight in rolling stock, as against the former rule of ton for ton; improved signals, cheaper methods of handling freight, and other causes, have operated to greatly reduce the cost of transportation, and it is safe to say that the public have not shared to the extent they should have shared in these great savings. Poor's Manual for 1882, in commenting upon the decreased charges for transportation, says, "It is certain that each year the railroads charged freight traffic over them all it would bear," and the great question would seem to be, is it fair that the decision of this important matter should be left entirely to corporations which seek only their own advantages? The report of the Hepburn committee, page 69, says:

Now, as to the necessity for some regulation to protect the public, see testimony of Mr. Rutter, pp. 453,454, where he testifies that he serves the stockholders only, and only regards the public interest to make it tributary to the interest of the stockholders.

Mr. Vilas (testimony, p. 415) testifies to the same controlling motives. Mr. Blanchard, after describing a railway officer as subject to three practical tribunals—first, the president of the road; second, the law as laid down affecting transportation; and third, the unwritten law of commerce—says:

"It has been our policy in this matter, while keeping within the statute law, as far as I knew it, or had occasion to know it, that wherever this public unwritten law came into contact with the interests of the shareholders, I believed it to be my conscientious duty to decide in favor of the shareholders; I knew of no claim that the non-shareholding interests had upon me as a railroad officer, so long as I was within the written law, to concede its views in the matter of rates, and in the management of our traffic."

In the joint letter (testimony, p. 47) Messrs. Vanderbilt and Jewett say:

"That the managers of a railway company desire to make all the money they can for their clients, and to do this they have before them the question what rate *within their chartered limits* will an article bear that will yield the largest profit and at the same time stimulate its production."

The marked importance which is here attached to keeping within the law emphasizes the necessity for governmental control.

## RELATIVE INTERESTS OF SHIPPERS AND CARRIERS.

It seems to me that as there are two parties in interest, the shipper and the carrier, the interest of the shipper far exceeds in magnitude that of the carrier, and it is manifestly unjust that the lesser should dictate to the greater so absolutely as it now does. Pooling, even, is not an unmixed evil, for it does insure a certain degree of uniformity and stability, but pooling, *when there is no power above the pool to decide what is a reasonable charge*, is apt to be arbitrary, tyrannical, and exacting. Once let it be conceded that the requirement of the old charters that rates should be "reasonable," based upon the cost of the service, be supplanted by the new theory enunciated by the railroads that charges should be adjusted upon the principle of "what the traffic will bear," and, with corporate managers sole judges of that question, we might as well concede the ownership of the country in fee to a few cor-

Digitized by Google

porations. Indeed, they would exercise a more valuable privilege than ownership, for, with the liberty to decide what portion of the profits of production and commerce they will take, it is better than to have the trouble and expense of ownership.

### THE INFLUENCE OF MACHINERY.

At the beginning of this century the man who owned a thousand slaves, or the man who employed a thousand men, was a wonder. To-day those who own machines, driven by steam, producing equivalent to the labor of a thousand men, are so plentiful that they no longer occasion remark. Twenty-five years ago Cutter wrote "The Song of Steam," which said:

I blow the bellows, I forge the steel,
  And in all the ships of trade
I hammer the ore and turn the wheel
  Where my arms of strength are made.

I manage the furnace, the mill, the mint,
  I carry, I spin, I weave,
And all my doings are put in print
  On every Saturday eve.

I've no muscle to weary, no breast to decay,
  No bones to be laid on the shelf;
And soon I intend you may go and play,
  While I manage the world myself.

This was considered then a poet's dream, but only twenty-five years have substantially proved its reality. Necessity is still, perhaps, the mother of invention, but surely steam has proved itself the father.

In the Guide to the United States Patent Office there is the following commentary upon machinery for the manufacture of paper:

The old hand-press process produced about 100 pounds a day; a machine will turn out 2,000 pounds in the same time. A machine will convert a stream of fluid pulp into paper, dry and polish it, and cut it into sheets; the time consumed in converting the pulp is two minutes; the old process was eight days.

A recent advertisement of a cocoa manufacturer recommends his wares for cleanliness, by saying: "not touched by human hand."

A recent description of a manufactory of food products, says:

On this floor is located a marvelous box-making and packing machine, one of the most striking illustrations of the triumph of mind over matter ever embodied in machinery, and which will cut from the card-board, shape, fold, gum, dry, and fill paper boxes with any material, carefully weighed or measured, at the rate of 1,500 per hour, or about 25 each minute. Nothing in the way of machinery can be more wonderful; not even the Yankee pin machine, which will cut, from a roll of wire, pieces of the right length, head them, point them, polish them, sort them out with their points all one way, and stick them into papers, just twenty pins in a row, faster than one can count. With such deft, reliable, and rapid workers as these steel automatons, no hand work can compare in putting up packages. The trouble, delay, uncertainties, and waste of the grocer's business are largely done away with by this machine, for it is positively cheaper to have packages done up tastefully, uniformly, and reliably, than by hand labor, which is sometimes neither neat nor correct.

### THE RELATIVE SHARES OF CAPITAL AND LABOR.

What do these mean to the man who earns his bread by the sweat of his brow? What to the capitalist who controls these great forces? Answer these questions from these extreme different points of view, and you get widely divergent conclusions: the laborer will say that labor is

Digitized by Google

being ground into the dust by the iron heel of capital; the capitalist will say that the chief benefits of these wonderful forces remain with labor; that no man gets more than a living, and that the laborer lives vastly better than he formerly lived, has more comforts, and should be satisfied. As with all extremes, justice must be sought somewhere between them. All humanity has unquestionably benefited from these inventions; but the real question is, What has been the *relative* benefit? Has labor shared to a proper degree in the comforts which steam and machinery have conferred upon the human race?

Human nature is such that we may start with the assumption that this is not probable. Capital alone had the means to utilize these great powers, and, as a rule, it gave to labor only what it was forced to give by the laws of competition. The laborer obtained but a living in any event; the driver of the locomotive may obtain a somewhat better living than the old coach driver did, but the locomotive earns enormous returns to the capital invested as compared with the horses and driver of the coach. Mill operatives earn a better living than the old hand weavers did, but the mill owner accumulates wealth beyond the dreams of avarice in the olden time. Unquestionably, however, the middle classes benefit to a greater degree than does the laborer; the middle classes are proportionately the largest consumers of manufactured goods and the lower cost of these enables the middle class to live more luxuriously than before. This, however, does not help the relations of the capitalist and the laborer; the tendency of machinery is to concentrate all manufacturing into few hands; large corporations are less amenable to personal influences—considerations of humanity; it is their interest, and they have the power to crowd down the laborer to the lowest possible limit; in many cases they are compelled by competition to pay barely starvation wages. This has in turn forced labor to organize, and trades unions do what they can to protect the laborer's interest. It is, however, an unequal fight at best; capital and machinery can be idle and not starve. The land owner, with accumulations, can let it lie fallow; but labor, even with the closest economy, can accumulate but slender stores, and these are soon exhausted.

## EDUCATION.

During the time steam and machinery have been making themselves felt, education has been looked upon, and justly, as a safety-valve for the passions of ignorance. Statesmen, political economists, everybody, in fact, has prescribed education as the universal panacea; but they have forgotten that education has its wants as well as its uses. The intelligent laborer has the same wants as the capitalist, and appreciates the same pleasures; it would be strange, indeed, if he did not endeavor to secure a fair division of the comforts and luxuries of the age. An instructive debate took place year before last in the Italian Parliament over the abolition of the grist tax, which has long pressed heavily upon the people. Signor Giovagnoli, a new deputy, remarked:

> The economists and financiers in the chamber paid too little attention to the actual world outside; they had forgotten the existence of eighteen millions of the working classes who contributed largely to the charges of the state, and upon whom, indeed, the grist tax pressed most heavily. In past times, said the speaker, religious belief helped to mitigate the sufferings of the poorer classes. But now that science had done away with the religious delusion, even the poor aspired in this world to their share of happiness, of bread, of meat, and of wine; and unless science could also do away with the delusion of these necessities, social violence would make short work of legislation and legislators.

Digitized by Google

Dynamite can be refined to a point which renders it exceedingly liable to explosion, and it seems to me that higher education for the masses, while our laws permit the wealth of the country to be gathered into the hands of the few, is like refining dynamite to the explosive point. Where ignorance exists it should be dispelled by education, and especially I believe that technical education—education which gives the people knowledge how to earn a comfortable livelihood—should be encouraged, but the people are far more in need of laws which will insure a fair division of the products of their labor than they are of higher education.

### THE LAND QUESTION.

As regards the monopoly of land which has attracted so much attention during the last few years, while it is important, it seems to me that it is not so pressing a question in this country as in some others. It is well, however, to apply "the ounce of prevention" here rather than wait for a time when "the pound of cure" will become necessary—as it now seems to be in regard to transportation monopoly.

### THE CURRENCY QUESTION.

As regards the currency question, it seems to me that its importance is overrated by those who advocate an increase in the circulating medium. These men overlook the fact that the great bulk of exchanges are performed by checks and drafts, and that both the paper and metallic money issued by the Government do but a comparatively small amount of service in this way. All the paper and metallic currency in the country would not be sufficient to do the business which is transacted between the banks of this city by the aid of the checks and drafts which, through the clearing house, are exchanged between them. Commercial credits also, to a considerable extent, assist in moving and exchanging the great staples of commerce. While, of course, it is possible to make the currency so scarce that there will not be enough to effect the smaller exchanges which are done in a retail way, and the scarcity may be so great that it may occasion considerable inconvenience to the public, yet I do not think that this is the case at the present time to any great extent in this country.

All persons admit that our present national-bank currency is a great improvement upon the old system of State-bank currency, and the only question is, are we not paying too high a price for this currency, and should not the Government issue all currency, whether metallic or paper, thus gaining for the people the interest on the circulating mediums and leaving the banks to pursue their legitimate and useful business of deposit and account?

### THE TARIFF.

As regards the tariff there is doubtless an element of monopoly here which demands careful consideration at the hands of our statesmen. No one desires to see our manufacturing industries broken down by a precipitate return to free trade, but if it is left entirely to the manufacturers to say what degree of protection is necessary for their prosperity, they will doubtless decide this question as the railroads do the question of "what the traffic will bear." *It seems to me that there must be a power above all these special interests which will care for the public interest.* Constant and prolonged agitation of the tariff, however, is very detrimental to the public interest. Among the troubles

Digitized by Google

which the commercial classes experience in this country, are the frequent proposals for change in the policy of administrations and of political parties. Especially is this true of Presidential elections, of which the excitement and turmoil of one is no sooner over than the agitation for another is begun. The Presidential term should be lengthened to at least six years, which I believe would be a step in the interest of both capital and labor.

INTEMPERANCE.

As regards the evils of intemperance, they are no doubt very great, and particularly so among the laboring classes. I believe that legislation may do something in the way of taxing heavily all spirituous liquors, but I think more may be done by substituting a lighter class of stimulants for those heretofore so largely used, and by creating a public sentiment in favor of temperance in its truest sense.

REMEDIES.

That remedies for existing evils must be found all thinking men admit; and these remedies must come through legislation or violence. The aggressions of corruptly-acquired corporate wealth are already endangering legitimate property rights, and intelligent self interest on the part of honest capitalists would seem to dictate that they should combine against "the wealthy criminal classes" to secure justice for all classes.

Just what legislation can do remains to be seen. It can do something, but not everything. How much it can do depends greatly upon the force of intelligent public opinion behind it. With such a public opinion practices which have been made illegal can be abolished, but without it laws are often a dead letter. When our fathers abolished the laws of primogeniture and entail there was a great outcry from the conservative classes, but public opinion sustained that measure, and its wisdom soon became apparent to all.

NEW SAFEGUARDS AGAINST UNDUE ACCUMULATION OF WEALTH.

It is evident that we have reached a time when new safeguards must be imposed to prevent the undue accumulation of wealth in the hands of the few. The *laissez faire* policy has had its day; the positive aggressive forces which are now encroaching upon public rights, must be actively resisted, or there will soon be no rights left worth preserving. The centrifugal or centralizing force of corporations must be met with the centripetal force of a people's government. What these safeguards shall be should be determined by your committee after a full hearing of all parties interested; but the law-making power should then act promptly and thoroughly.

I believe that the following measures are worthy of your careful consideration: Stringent laws against fictitious values in all works of a public nature; insist that charges shall be reasonable, based upon cost; prohibit unjust discriminations; provide railroad commissions (State and National) to see that these laws are enforced—and be careful to see that these commissions are not packed against the people; punish bribery with disfranchisement; prohibit free passes; make political contributions and expenditures public; prohibit lawyers who are legislators from accepting retainers to influence legislation; make gambling in the necessaries of life, or pools and corners, by which the legitimate laws of

Digitized by Google

trade are annulled, a conspiracy by statute as it now is by common law, also prohibit officers of public companies from speculating in their own securities, and give minority stockholders some representation; carefully revise the patent laws with the view of preventing oppressive monopolies, while retaining the stimulus to the inventor; establish a postal telegraph and telephone, also postal savings banks and a parcel post, such as are giving such general satisfaction in England at the present time; reclaim the public lands from corporations which have not earned them; prohibit the acquirement or tax the ownership of large tracts of land, so as to make such investments unprofitable; adjust all tax laws so that the tendency will be, as far as possible, to make capital rather than labor bear the burdens of Government, and thus narrow the gap which has been so rapidly widening under the unrestrained development of the forces before mentioned; limit the life of corporate charters in future to thirty years, and, so far as can constitutionally be done, re-enact existing ones, so that the people of each generation can revise in a just and proper manner the powers of these organizations which have such an important bearing upon the public welfare. Develop our public service upon the basis of honest and capable service and not upon partisan favor.

I have made these suggestions hurriedly and at random, simply for your consideration. Some are probably fit subjects for State and others for National legislation. With careful study and full investigation I might myself modify some of the opinions I now entertain. Most of the testimony which you gather here is, I fancy, somewhat crude and ill-digested; but it serves, nevertheless, like straws, to indicate the current of public thought, and I shall be glad if you find some grains of wheat among my chaff.

I may also say that the statement of "undisputed facts," to which I have alluded, I have here with me, and it might be of interest to have those facts read.

Mr. PUGH. We shall be glad to hear them.

The WITNESS. I may state that this was presented at a banquet given to Hon. Darwin R. James, secretary of the New York Board of Trade and Transportation, and member of Congress elect from one of our New York districts. The "undisputed facts" were taken from a report compiled by the National Anti-Monopoly League.

### BENEFIT OF TRADE ASSOCIATIONS.

The spirit of association has in all ages induced men to join together for either pleasure or protection, and the merchant citizen has from the earliest period played an important part in regulating the affairs of society. The merchants' associations, or guilds of the middle ages, have been called the bulwarks of liberty, because they withstood alike the assults of barbarism and despotism.

The frith or peace guilds were a feature of English life from the seventh to the tenth century, and in the eleventh and twelfth centuries they extended over the continent. One of the most important was founded at Roeskild, under King Canute, for the suppression of the piracy of the vikings. Others, as in Schleswig, Artois, Fleisburg, &c., joined "for the protection of right and the preservation of liberty, the hindering of violence, and maintaining of peace by all means that law and custom allow, even against kings."

The guilds became of such importance that their laws grew to be that of the commune or city, and to them we are largely indebted for many of the principles of the common law which have withstood both the open assaults of power, the covert stabs of codifiers, and are still the bulwark of individual right as against corporate aggression.

Some may think that there is no longer any need for merchant citizens to associate for the protection of their own and others' rights. We have not to be sure the robber barons of the middle ages who took toll with the strong hand from the caravans which

Digitized by Google

passed through their defiles, but the ingenuity of the nineteenth century has largely monopolized the forces of the age and devised a system by which the production and commerce of a continent has been directed into a few narrow channels, not to say defiles, and, through the device of rendering a public service and under the forms of law, is tolled at will by our brainy barons upon the same principle the barons of the strong hand in the middle ages took toll—what the traffic will bear.

When and where has the world ever seen such aggregations of wealth as have been suddenly accumulated by the carrier taxing the producer and merchant?

And this result is not the worst feature; the means to the end are, it seems to me, the most to be deprecated. The corruption of our elections, legislatures, and courts, the undermining of the very foundations upon which our forefathers based our free institutions, the spectacle exhibited to the young, of chicanery and fraud conferring the highest prizes of society upon its most unscrupulous and unworthy members. These are features of our modern life which suggest in the strongest manner a future, if not a present, for our country, "Where wealth accumulates and men decay."

That was my statement as a preliminary to those facts, and it was made at this banquet to which I have referred.

By the CHAIRMAN:

Q. Do some illustrations occur to you now, some specific facts illustrating what you say as to the highest "prizes of society" having been conferred as a result of fraud, chicanery, and the like?—A. I think that they will suggest themselves to any citizen who will look at the development of our great corporations. I do not wish to mention names, but they are really too common for mention. They can be indicated from the "facts" which I will now read:

UNDISPUTED FACTS PUBLISHED BY THE ANTI-MONOPOLY LEAGUE OF THE UNITED STATES.

It is not disputed—

That Gould, Vanderbilt, Huntington, Stanford, Sage, Field, &c., twenty years ago were comparatively poor men, and to-day these five men are worth probably $500,000,000, and through the corporations they control wield the power of $3,000,000,000.

That they control, absolutely, the legislatures of a majority of the States in the Union; make and unmake governors, United State Senators and Congressmen, and, under the forms of popular Government, are practical dictators of the governmental policy of the United States.

That within twenty years two hundred millions of acres of the public lands have been given to corporations, equal to about four acres for every man, woman, and child in the United States.

That this wealth and power has been acquired largely through bribery and corruption. Mr. Gould testified in 1873 that he contributed money to control legislation in four States, and it was proven that the Erie road, in a single year under his management, disbursed more than $1,000,000 for this purpose. His interference with the administration of our courts of justice is illustrated by his telegraphing United States Senator Plumb, asking him to support Stanley Matthews for the United States Supreme Court. And the striking spectacle was presented of Whitelaw Reid, editor of one of the leading Republican journals of the country, and Henry Watterson, editor of one of the leading Democratic journals of the country, lobbying on the floor of the United States Senate to secure Mr. Matthews' confirmation as judge of the Supreme Court of the United States.

That a judge of the supreme court of the State of New York recently held court in a stock gambler's office, and wrote his attorneys that he would "go to the very verge of judicial discretion" to oblige them, and yet the legislature refused to impeach him.

That other judges and many legislators in this State exhibit a strong bias in favor of corporations, accept their "courtesies," and openly "speculate" in corporate securities on "points" furnished by corporate magnates.

That our great boards of trade and commercial exchanges are fast passing from the domain of legitimate business to that of gambling speculation, and the spectacle is exhibited to the young of the highest prizes of commerce and society being conferred upon its most unscrupulous and unworthy members.

That men who defraud the public, and even their friends, by selling under false pretenses, stocks for which no money was expended, and accumulate enormous fortunes through professional misrepresentation, are called "financiers," and by doling out a little of their ill-gotten gains for religious or charitable objects, are able to

Digitized by Google

purchase the commendation, or at least the toleration of good men, and an influential portion of the pulpit and the press.

That because Senator Thurman was active in compelling the Pacific railroads, in which Mr. Gould was interested, to fulfill their contracts with the Government, that honest man and able statesman could not return to the United States Senate.

That E. D. Worcester, treasurer of the New York Central Railroad, testified before the late constitutional convention of the State of New York that that road paid $205,000 one year and $60,000 another to obtain legislation, and that it was obtained.

That in the last United States senatorial contest in the State of New York, a member of the legislature stated that he had been given $2,000 to vote for a railroad candidate for the United States Senate; that he had given the money to the speaker, and asked for an investigation. An investigation was ordered, and a State senator and two lobbyists were indicted; but they have not been tried, and it is stated that corporation influence will prevent their trial, or, if tried, secure their acquittal.

Q. What became of that case?—A. It is still pending in the court, sir.

That, in 1877, the railroad rioters in Pittsburgh destroyed a large amount of property. The railroads refused to indemnify shippers, but endeavored to make the people of the State liable to the railroads. They tried to buy a bill through the legislature, saddling several millions of dollars upon the public. Their usual method of bribery was employed, but was detected, and E. J. Petroff, a member of the legislature, with several accomplices, were tried and found guilty; but here political influence was brought to bear, United States Senator Don Cameron leaving his seat in the Senate and going home to look after things, and they were pardoned.

That, in 1881, the railroads of New Jersey united in an effort to secure the entire water front of Jersey City under the specious guise of confirming the boundaries of a map. This infamous bill was such a flagrant disregard of public rights that the governor, although elected by railroad votes, vetoed it. The senate again passed it over the veto, but the assembly hesitated, and bribery, the usual monopoly weapon in such cases, was resorted to. An investigation was ordered, and the committee reported that the bribery was fully proven, and that John J. Cromer was the man who did it. He has not yet been tried, and it remains to be seen whether Jersey justice is equal to the task of punishing a corporation briber.

That in March, 1882, two members of the Ohio legislature were arrested for bribing others in the interest of a railroad company.

That the Congressional investigation of the Credit Mobilier bribery showed that $47,261,000 profit was made by a syndicate of Congressmen and other public men; and it is a well known fact that many of our public men have become very wealthy, without any visible means of doing so.

That both our national and State legislatures are packed with corporation lawyers and other representatives of monopoly interests; measures in the interest of the people are retarded, smothered, or throttled, while those in the interest of corporations are consummated without the slightest difficulty.

That a large portion of the election expenses of political parties are derived from corporate sources, and that even where party leaders are not personally interested in monopolies they are afraid to voice the public sentiment upon that subject.

That votes are habitually and largely purchased at the polls under the pretense of paying a day's wages to "work for the ticket," and sometimes without even this transparent pretext.

That public sentiment has for several years demanded the enactment of an adequate law for the regulation of interstate commerce, but it has been postponed and throttled without the slightest consideration.

That the last Congress not only refused to restore to the public domain the lands which had been foreited by the Northern Pacific Railroad, but on motion of Congressman Reed, of Maine, gag law was enforced, and Congressman Caswell, of Wisconsin, tried to prevent the vote going on record.

That vote was simply that this question should be considered. You are probably aware that either the Judiciary Committee of the House, or the Committee on Commerce, I am not certain which, voted on the question of whether they would permit the discussion of the question affecting the lands of the Northern Pacific Railroad. Eight members of the Committee reported that no action was necessary; seven of them reported in favor of a resolution restoring to the national domain these unearned lands at that time, and placing that thing upon the Calendar.

Digitized by Google

Speaker Keifer ruled that a majority of the committee reporting that no action was necessary a minority report could not be considered. Mr. S. S. Cox appealed from the decision of the Chair, and Mr. Reed, of Maine, moved to lay it on the table. That motion was carried, and the largest number of "dodges" that, I think, has ever been seen upon any measure in the House of Representatives occurred on that occasion. It was carried, however, and, as stated here, Congressman Caswell, of Wisconsin, made a motion to prevent its going on record, and, but for the objection of Mr. Murch, of Maine, it would have succeeded.

That a large portion of the public travel on free passes, at the expense of the rest of the community, and a free pass issued by the New York Central Railroad is in the possession of the Anti-Monopoly League, which specifies that it was issued on account of the Supreme Court.

That a committee of the New York legislature, Hon. A. B. Hepburn chairman, after investigating the management of railroads in this State, used the following language: "Abuses in railroad management exist so glaring in their proportions as to savor of fiction rather than actual history."

If you have not read the report of the Hepburn committee you would find it most excellent reading.

That to perpetuate these abuses the perpetrators thereof are now seeking to control the thought of the nation. Leading journals are purchased with illgotten gains, and the ablest editors in the country are engaged to preach "peace on earth, and good will to men" in one column, while misleading innocent investors and villifying patriotic citizens in the others.

In view of these facts is it not time that merchant citizens were again associating in guilds to uphold right and put down wrong; to sustain the Constitution and the old laws which were adopted to secure freedom and equality for all men?

Never has there been a time during the past thousand years when there was more need of the services of the merchant citizen than at present. Financial freebooters, sailing under the flag of law, have pillaged the people until they are almost ready to take up arms, and when that kind of a fight is once begun who can tell where it will stop? The merchant citizen is the true conservator of property rights; he resists alike the assaults of the idle and vicious and the aggressions of the unscrupulous and powerful. It is from the latter that the worst is to be feared at the present time, and our guilds must arrest the financial freebooters who are preying upon our industries and threatening our free institutions. Let us, like our honored guest, be citizens in the truest sense, and while diligent in business not forget our duties to our country; show that we are—

"Men who their duties know,
But know their rights, and knowing dare maintain."

Q. When was this paper prepared?—A. About twelve months ago. These facts are now about eighteen months to two years old.

Q. What has become of all these cases that you mention—can you tell us whether they are still pending, or what has been done with them?—A. They are still pending. Nothing has been done with them since this paper was prepared.

Q. So that in that regard the paper has the same force to-day as it had at the time it was written?—A. Yes, sir.

## LEGISLATORS INTERESTED IN CORPORATIONS.

By Mr. CALL:

Q. In your observations you state that a majority of the legislators are directly or indirectly interested in corporations. What do you precisely mean by that?—A. I mean, sir, that they are interested either as stockholders, officers, or attorneys.

Q. Do you mean that a majority of the legislators of all the States, and of the two Houses of Congress, are so?—A. It was shown that, I think, some two hundred and twenty-four, or two hundred and eighty-

Digitized by Google

four, I am not certain which, of the members of the last House of Representatives of Congress were lawyers, and a friend of mine who is a member of Congress, and has been in Washington a good deal, assured me that, as far as his knowledge extended, which he claimed was very extensive, a large majority of those gentlemen were in some capacity retained by these monopoly interests, corporate interests, bank interests, and others.

Q. Do you mean regularly retained; retained by the year?—A. As I understand it, retained by the year. They are counsel for the companies, and are constantly pushed forward in our political system, and naturally make their way to the law-making halls.

Q. So that your impression is, that about two hundred members of that Congress were in the regular pay of some outside corporation, to influence them in their Congressional action; is that the idea?—A. My impression is that they were in the pay of corporations. I do not say that because a lawyer is counsel for a client he would in all cases allow himself to be influenced in his official acts; but I do say that the tendency is strongly in that direction, and that when a lawyer goes to a legislative hall, he has been, to a certain extent, educated in those views—he has been educated to see things through corporate spectacles, and even where he is perfectly honest, as honest a man as exists, he will inevitably be biased, and in questions where public rights conflict with corporate rights, he is very apt to give the benefit of the doubt to corporations.

Mr. CALL. Well, now let me tell you: I do not know a single instance, personally, of a lawyer who is a member of Congress who is interested in any corporation, directly or indirectly. I do not believe that Senator Pugh is; I know that I am not.

Mr. PUGH. I am not the lawyer of any corporation. I have no interest whatever in any corporation. But, at the same time, I cannot undertake to dispute the correctness of the gentleman's statement; not, perhaps, that it would cover a majority, but a very large number of the members of Congress.

Mr. CALL. Well, I do not know any. Senator Pugh may be right; but I say that I do not believe that there is an honorable man on the face of the earth who would be a member of Congress and yet be the regularly retained representative of any corporation that had any possible interest in legislation to come up before him. I have not a doubt, Mr. Thurber, that that statement misrepresents the character, for honesty and integrity, of the public men of the country.

Mr. PUGH. I do not understand Mr. Thurber to say that a majority were attorneys, but that the number that he supposes to be interested covers the stockholders, the railroad officers, *and* attorneys.

The WITNESS. Yes, sir.

Mr. PUGH. And all persons identified in any way with these corporations. I do not pretend to say that these parties are influenced or corrupted at all by their relation to these roads.

Mr. CALL. The implication is of corruption. It is as well to meet it positively.

The WITNESS. I do not know that it is of corruption, sir.

The CHAIRMAN. As confession on the part of the committee seems to be in order, I want to confess, too, that I have never had any interest in corporations while in public life. I have invariably declined retainers, and passes, and all manner of connection with any corporation, since I have been in any sense a public servant; and, so far as this general connection of legislators with the corporations of the country is con-

Digitized by Google

cerned, I have no personal knowledge of its existence. I do believe that there are men in Congress who are retained in the way that you speak of, but I do not think that there are men there who understand that they are so retained as to influence their official action; they have regular retainers, and I think they ought to dispense with them. I do not believe that any man in public life has a right to be retained for, or have an interest as counsel for, or in the reception of fees from, any private party who is liable or likely to have interests that may come in conflict with those of the general public in the enactment of legislation. I think your general position is quite correct. I do not think that the evil extends to the length that you apprehend, or to the length that a great many people, who read these general assertions, imagine that it does.

The WITNESS. I hope that I am mistaken, Senator; and I want to say here that the drift of my impressions in that respect is simply this: that owing to so large a number of influential men becoming interested in these dominant forces, legislation naturally takes the direction of being in the interest of the few rather than of the many. I disclaim any intention of imputing corrupt motives, and I think, Senator Call, you go too far when you say that.

Mr. CALL. Of course it is no personal statement of yours, but the question is whether your friend tells the truth. I again affirm that I have not the slightest idea that it is true in any part or parcel. I disagree with these two gentlemen, our chairman here and Mr. Pugh. I do not believe there are ten men in the United States Congress, including both Houses (and I challenge the truth of the statement you have read), who have any interest, direct or indirect, in corporations by a legal retainer. I question very much whether there are twenty in the whole number that own a dollar's worth of stock in any corporation, because the majority of the members of Congress, contrary to what is said and thought by some people, are poor men; they are men from the people. The idea that these men are elected by corporate influences is a mistake. Throughout the South corporate influences are unknown, and in many of the rural districts of the country corporations have no influence.

The WITNESS. I think that you are quite correct, sir, that in the South these influences have not made themselves felt as in other parts of the country. Take Georgia, for instance; in the new constitution of that State the people have imposed safeguards which have put the public interest above these special interests. They have created a railroad commission there which, without doing injustice to the railroads, has insured full justice to the people. In most of the States, however, which have railroad commissions they are of little use to the people.

Mr. PUGH. Both the Senators from Georgia are railroad presidents.

The WITNESS. Yes, sir; I am aware of that.

Mr. PUGH. But I have no idea that they are influenced, or that their acts as representatives of the people, are influenced at all by their individual interests. I do not make any such charge, or have any such suspicion; but I recognize the fact which you state that there is a large number—approaching, as *you* say, a majority—or, as *I* say, a large number (I would not undertake to estimate the number), who are identified in their personal relations and interests with corporations, and mostly with railroads.

Mr. CALL. Well, if I believed any such thing I would not serve in Congress with such a body of men as that.

Digitized by Google

Mr. PUGH. Well, I am not so scrupulous as that; and I do not believe at all that the existence of that fact makes Congress a corrupt body.

Mr. CALL. If these men are interested in corporations and legislate against the public interests they are undoubtedly unworthy to be in those places.

Mr. PUGH. I do not say that they have done it themselves.

Mr. CALL. In the cases of the two Georgia Senators, their railroad connection can have no possible connection with any legislation whatever. It cannot touch the question.

Mr. PUGH. I do not say that it does. I have not intimated that those men are subject to suspicion or criticism, or that any member of Congress in the position stated by Mr. Thurber is not above suspicion in his personal and representative identity. I do not intimate that there is any ground whatever in their acts as members of Congress for a suspicion or a criticism of their representative acts.

Mr. CALL. What other members of Congress are there that you know of that are even stockholders?

Mr. PUGH. I do not think that it follows, because a man has personal interests in legislation, that he is influenced by it or corrupted by it.

Mr. CALL. Well, I do.

Mr. PUGH. I have a large personal interest in all the legislation of Congress, because I am a citizen, and as a citizen I have an interest in it.

Mr. CALL. I am not talking about that general interest in legislation, but about pecuniary interest.

Mr. PUGH. Well, every man's pecuniary interests are affected by general laws.

Mr. CALL. If a man has no other pecuniary interest in legislation than that which belongs to a citizen, of course, there is nothing in the point, and one might as well be a railroad man as not; but I wish to say that I disagree entirely with the impression that any considerable number of the members of Congress are interested either as stockholders, or as retained attorneys of any corporation whatever. I do not believe there are twenty such men; and I do not think, outside of the gentlemen you name and three or four others, that you can name any such man in either body.

Mr. PUGH. I do not undertake to state any number at all, because I do not know the number, but I know that the number exceeds your impression of what it is.

Mr. CALL. The two Kentucky Senators I know are not; the two Tennessee Senators are not; the Senators from Mississippi, I know, are not; the Arkansas Senators are not; the Missouri Senators are not; and I can go over the whole list of Southern Senators and say, here, that none of them are interested as the regular attorneys of any corporation, or as the stockholders or officers of any large corporation or railroad company.

The WITNESS. Do you not think, Senator, that a man may be interested in a certain direction and feel that he is perfectly right in adopting a certain line of policy, simply because he has learned to think that those things are right?

Mr. CALL. No, sir; I do not, any more than a man can think that he is right in stealing. The line between right and wrong is clearly marked. No man can exercise an official function, and at the same time be interested pecuniarily in the exercise of that function properly; it is his business to abstain from the exercise of that function when his personal interest comes in to influence his personal action. That is a

Digitized by Google

principle of action so old as to have been recognized ever since there was anything like civilization—there can be no doubt upon that subject; even under the old Roman laws it was so.

The WITNESS. Judges sometimes have been elevated to the bench who have had a large corporate practice, and it has been noticed that they seemed in some cases to look at the thing differently from others.

Mr. PUGH. Why, I can mention, here, what is a public fact: there is Senator Edmunds, and there was Senator Conkling, and other Senators of great distinction—men of undoubted personal integrity—who, while Senators, have argued cases for large fees before the Supreme Court of the United States, and no one ever supposed that they were influenced in their legislative action by the fact that they were the paid attorneys of any corporation.

Mr. CALL. That has nothing in the world to do with the statement made by Mr. Thurber.

Mr. PUGH. That is your opinion.

Mr. CALL. That is not only my opinion, but that is the fact in regard to it. The difference is this, that the statement made here is that some two hundred members of one House of Congress were the retained attorneys of great corporations, and that being such, it influenced the legislation of the Federal Government. That was the statement.

The WITNESS. That was not exactly the statement, sir.

Mr. PUGH. I do not believe that that is correct. I do not think that anybody who has any knowledge on the subject believes it.

The WITNESS. The statement was this: "That Congress is packed with corporation lawyers and other representatives of monopoly interests; measures in the interest of the people are retarded, smothered, or throttled, while these in the interest of corporations are consummated without the slightest difficulty."

Mr. CALL. Precisely. You could not make it clearer than that. If that be true, they are a gang of outrageous thieves and ought to be turned out.

The WITNESS. We must judge somewhat by the results of railroads obtaining legislation.

Mr. CALL. State some one result of legislation which justifies that enunciation. Give us one.

The WITNESS. I think that the difficulty which Mr. Reagan has had year after year in getting his bill discussed and out of committee might be cited. If you will consult him as regards this matter, I think you will find that the committees have been generally hostile to any fair regulation of the transportation interests of the country, and that it has been with the utmost difficulty that those measures could be discussed or reported in any form.

Mr. CALL. Well, now let us see. Because Mr. Reagan's bill regarding transportation has not had fair and full opportunity for discussion, therefore it is reasonable to believe that more than two hundred members of that Congress are the packed servants of those corporations. I do not think that that is any kind of a proposition; there is no logic in it. I have been a member of Congress, in the Senate, during the time that Mr. Reagan's bill has been up for discussion; I know Mr. Reagan personally, very well—perhaps better than most persons do. I have some sympathy with his ideas, but yet, for my life, and upon my oath, I could not say that that bill is exactly what it ought to be and would answer the purpose.

The WITNESS. I do not say that.

Digitized by Google

Mr. CALL. Then, truly, there should be no inference drawn from the action of those men.

The WITNESS. It is the retarding of all efforts in that direction that I refer to.

Mr. CALL. May it not be that men may not see as clearly as you do, and perhaps have different opinions as to the propriety of that legislation?

The WITNESS. It is not legislation that I am interested in any more than any other citizen, but I am informed that more petitions have been received by Congress upon that subject than upon any other that has come before it.

Mr. CALL. I am not advised of any such pressure as that. I know that Mr. Reagan is a very earnest, and, like yourself, a somewhat enthusiastic advocate of his own ideas on that subject, and I believe that there is a very considerable feeling in the country as to the regulation of interstate commerce, railroad commerce, and transportation.

By Mr. CALL:

Q. You are a merchant, I believe.—A. Yes, sir.

Q. Very largely engaged in trade.—A. Yes, sir; somewhat largely.

THE POWER OF COMBINATION.

Q. I understand you to say that one of the great public evils of the day is the combination of capital in trades which are in themselves a monopoly. I think you enumerated that as one of the classes of monoply.—A. Yes, sir; trade combinations.

Q. Will you please give me some illustration or instance of it?—A. Well, we see it in the grain corners which take place; we see it in the cornering of petroleum by the Standard Oil Company; we see it in the coal combination that I have mentioned; we see it occasionally in almost every one of the great staples; where a few men get together and control large capital and create corners, disarranging trade and commerce by doing so.

Q. What would you call the enterprises of the late Mr. A. T. Stewart; would not they amount to something in the shape of a monopoly themselves from their very gigantic nature?—A. I have no knowledge that such was the case.

Q. Well, this was the idea that I wished to express: What is the power that comes from combination? You spoke of trade combinations creating corners in wheat; what is that power precisely? In what way does it become exercised? Suppose you and I should agree to make a combination now and create a corner in wheat, whence would come our power to do it?—A. I suppose the large capital is what you would say it was.

DIFFERENCE BETWEEN CAPITAL OF ONE INDIVIDUAL AND OF COMBINATIONS.

Q. Well, now, what is the difference between Mr. Stewart or any other gentleman doing a large trade and controlling a vast capital, and two or three other men doing it, they doing it as a combination, while he would do a large amount of trade for himself?—A. There would be no difference in the effect, providing the action was the same. For instance, if I should buy up all that there was of an article and unduly increase the cost of it, I think that would create room for legislation the same as if it was done by two or three other persons.

Digitized by Google

Q. You do a large business, do you not?—A. Yes.

Q. And you do buy as cheaply as you can?—A. Yes; but we are distributers, sir; we are not speculators.

Q. And if this should amount to a vast sum, perhaps you would not quarrel with the principle you speak of.—A. Perhaps not; perhaps my human nature is no better than anybody else's.

Mr. CALL. I am not speaking of you as an individual. I only refer to the type.

The WITNESS. I understand; you are speaking of the type; but if it all operates against the general welfare, it would not matter whether it was my interest or the interest of a combination; it should be regulated.

Mr. CALL. There is no question about that. The only question is what is the difference between a man and a combination acquiring immense capital and doing an immense trade. Of course the matter of "corners" in wheat and the necessaries of life, if all that is represented is true, all men agree should be prevented. But I am not speaking of the trade combinations that you refer to.

The WITNESS. You spoke of Mr. Stewart as a type.

Mr. CALL. I mentioned him because he is dead.

The WITNESS. Yes. I never heard of his acts reaching the effects that I have stated; nor the acts of any other single merchant. They could do so, I think, in the way you have indicated. But it seems to me we have to deal with evils as they press themselves upon us, and we have to endeavor to find remedies for them.

Mr. CALL. The effect I was speaking of was accumulation. I understood you in your testimony to refer to that.

The WITNESS. Yes, sir. You will find, for instance, a case which is before the public mind at the present time as to the manufacture of matches by the Diamond Match Company, which was simply such another as the Standard Oil Company. It combined all the match manufactories into one concern, and it was only thrown down when the gate was opened and the law of competition allowed to work with European matches.

Q. Now, following up that idea, what other instances of legislation, or of the want of legislation, occur to you as matters in which the Federal Government has been or is derelict? You mentioned the Northern Pacific Railroad grants as one.—A. I do not know that I have in my mind for the moment any specific cases. We have been so busy trying to regulate our New York legislature that we have not had the chance to pay much attention to the specific shortcomings of Congress.

## NATIONAL RAILROAD COMMISSION.

Q. You propose to have a State commission, I understand, to regulate these railroads. Do you think legislation in that direction would cure the evil?—A. I think we need positive, specific laws defining public and corporate rights, and then we need a public executive force in the shape of railroad commissions for State roads in each State; and we need another commission for those railroads that are interstate in their character, and that operate in and through the Territories—for those we need a national commission.

Q. Do you think you could properly vest a national commission with absolute authority to prescribe the rates of transportation and of freight on the different lines of transportation throughout the United States?—A. I do not think I would at first. It is an intricate subject, and one

Digitized by Google

which requires a good deal of study, and it would seem to me to be necessary to have the case thoroughly diagnosed before prescribing specific remedies. But the principle ought to be set forth in the statutes that unjust discrimination should be punishable by certain penalties; and then there should be an executive in the shape of a commission to see that those laws are executed.

POWER OF CONGRESS OVER INTERSTATE COMMERCE.

Q. Do you think it would be in the power of the Congress of the United States—are you clear upon that point—without any amendment to the Constitution, to pass a law making it criminal on the part of railroad authorities in any one State to discriminate against the through freights?—A. Of course I am not a lawyer, and am not as well qualified as yourself and other lawyers are to judge upon such a point. I take, however, the judgment of men who have expressed themselves on that point. One of the ablest committees, perhaps, that was ever appointed by the United States Senate was that on the transportation routes to the seaboard—the committee under the chairmanship of Senator Windom, of Minnesota. That committee made an examination of the subject in 1874, I think. The summary of their conclusions as to constitutional power of Congress is a most interesting one, and they say that such power does exist. In conversation with the late Judge Black I discussed that matter very fully, also; and he was strongly of opinion that Congress had the constitutional power.

Q. That the power to regulate commerce extended to the prescription of the rates of travel and transportation—that must be the theory?—A. No, sir; I don't know that I would put it in that way; but that Congress possessed full power to regulate interstate commerce.

Q. Well, of course, what you mean by interstate commerce is regulating it in respect to the rates of fare and transportation—that is what we are talking about—the preventing of discrimination means, of course, that they shall not have a better rate in one place than in another, that the through rate should be uniform, or something of that kind.—A. Well, my interpretation of that point would be that the greatest possible freedom should be allowed to transportation companies, consistent with the public welfare, and that so far as fixing the rate is concerned I would certainly at first simply insist that the principle of equal rates for equal service should be preserved, and that there should be no unjust discrimination. There may be a discrimination which is a perfectly just discrimination

Q. That is, you would enact a law which would affirm in terms that there should be equal rates for equal service in the interstate commerce of the United States?—A. Yes, sir; and I would provide a commission to enforce that principle.

Q. Then you would have a court to decide, would you not?—A. Every railroad commission is a court to a certain extent; that is, it hears opposing interests.

Q. Yes; but it could not under our form of government authoritatively decide anything.—A. No, sir; but it reaches the object by reporting to the legislative branch of the Government, and the legislative branch affords the remedy.

Q. You are inclined to think that that would be an efficacious remedy, are you?—A. It has not been so in the past, but we hope that in the future there will be some improvement.

Mr. CALL. I do not see how you are going to remedy that if all the

Digitized by Google

members of legislatures and of Congress are retained attorneys of the corporations.

The WITNESS. When public opinion is thoroughly agitated and brought to bear upon a subject it is apt to have some influence, and I think that in the future we may reasonably look forward to some improvement in that respect.

WHAT IS CAPITAL?

Q. You spoke a good deal about capital as contrasted with labor, and the resolution of the Senate authorizes and requires us to take evidence in regard to the relations of capital and labor. Will you please give me your idea of what capital is? We have had a great deal of economic definition here on this subject. Yesterday we had a very learned gentleman here telling us what capital was, and the idea of some great economic discoverer who had appeared as a new light in the world; and I would like to have your idea as a practical business man in connection with this statement which you have made to the committee.—A. Well, my general idea is that capital is simply accumulated and stored up labor. Everything is the result of labor.

Q. "Stored up labor." Well, that is rather a difficult thing to store up, it seems to me. Are you quite sure that that analysis or antithesis which you have made. in your remarks, of the contradistinction between the interests of capital and labor has any real tangible existence? In other words, can you contradistinguish capital from labor under any economic system?—A. I think that capital as a rule has certain antagonisms with labor. You may say that it also has certain things in common. They are independent to a very great extent.

Q. You say "certain antagonisms with labor." What antagonisms?—A. Well, the capitalist will get all out of the laborer that he can.

Q. But the capitalist and the capital are two distinct things, as I understand it. Is not that your understanding?—A. Then you may say that capitalists will get all out of labor that they can, and in that sense they have opposing interests. On the other hand, they have the common interest, that by association both of them profit, and if one receive an undue share of the benefits of production which is the result of their co-operation, of course the other is not justly treated, and the great problem is how to secure to each an equitable share of those profits. It is just so in the case of a railroad company. A railroad company will insist that their interests are identical with those of the shipper. That is, it has been time and time again asserted that the interests of the trunk lines leading into New York are the interests of New York. In one sense that is true; but on the other hand, the railroads are interested in charging New York commerce with all that it can bear, according to their view of the case. Of course New York cannot get along without railroads, nor could the New York railroads get along without New York; and in that sense their interests are identical. It is the same with labor and capital. But the question is, how shall the share be divided? It is neither right nor just that either should dictate to the other, because, if that is right, human nature, which is essentially the same in both cases, will commit injustice.

Q. Suppose I were a broker, and I were employed to sell you two or three hundred tubs of butter in your grocery business. I have got no butter, nor have I any capital, but I have a right to sell butter to somebody else. It is to your interest to make all out of me that you can, and mine to make all out of you that I can, in that transaction, is it not?—A. Yes, sir.

Digitized by Google

Q. But yet in that case I am merely directing the means and production of others, and you are merely buying for the purpose of distribution, and we may neither of us have any "stored up labor," as you express it. We may be in so far acting entirely on the current necessities and economic distribution, the distributive means of the day, but there is the same competition that you say exists between capital and labor in that case as in the other.—A. Would not that depend upon whether you were working for the seller or for the buyer? I admit that there would be an antagonism between the buyer and the seller, one trying to purchase as cheaply as he could, and the other to sell as high as he could, but the broker should be an impartial man between the two.

Q. At all events, whether representatively or directly, he wants to make out of you all that he can, and he wants to get the highest price, and you perhaps want to get out of him all that you can. In that respect there is an antagonism between you. What I mean to say is that the antagonism which you speak of between capital and labor, labor "stored up" and labor not "stored up," exists in every other transaction in life?—A. Yes, I think so, to a great extent.

### IS CAPITAL ACCUMULATED WEALTH?

Q. It is no peculiar antagonism, and therefore cannot, as a definition, contradistinguish the two things. The point of my remark was a simple suggestion whether this that is so often termed the antagonistic interest of capital or "accumulated wealth," as some people term it, as contradistinguished from labor, does not simply mean the directing power which enables you and your associates to combine and conduct that vast business of which you are the head, and whether the antagonism is not simply between the brains, the superior economy, the better associations and opportunities of credit which come to the poor man as well as to the rich man, instead of to a separate, particular class that you call capitalists? I mean to say that you as a directing head, or any workingman who becomes the head of a factory, simply directs the combined efforts of his fellow workmen, and that, as between you and others, neither of you have any capital except the credit and energies that are in you, and the same antagonism exists in that case between you and the laborer you employ as does between what you call labor and "stored-up" labor.—A. I think that in all trades and in all commerce there are those antagonisms of interest, and they are regulated by competition, excepting where combinations come in to shut off competition, and the public interest is protected in the ordinary lines of commerce by that principle of competition. Wherever that principle of competition is abrogated then comes in the danger of monopoly and of injustice.

Q. Yes; the antagonism is between the directing power which you have and which enables you to amass the vast business that you have—whether because of your brain or of somebody else's brain—and all other people who have an antagonism that you should not succeed.—A. All competitors, as you choose to put it.

Q. Yes, of course; all competitors, and the men you employ are dependent entirely on your sagacity and what you shall give them; and their interest, if it be an opposing interest at all, is to get from you as much as they can for the least amount of work?—A. Yes; I think in my business that would hold true.

Q. And your interest, as an economic force, is to get from them the greatest amount, in reason, of consideration that you can for what

Digitized by Google

you pay them?—A. Yes; you may say that in my business it is my interest to get the largest amount of service for a given amount of pay. And while, of course, those things are modified in various ways, there still remains that antagonism; and I think that whenever you find a divergence of interest the great question is how the joint product of labor and capital can be equitably divided; if capital has the best of labor, if capital gets the long end of it, so to speak, it is greatly to the detriment of society; if labor gets the long end of it, so as to do injustice to capital, that very soon reacts.

IS INJUSTICE DONE BY THE ACCUMULATION OF FORTUNES?

Q. Well, how is it to the detriment of society that you should make a million of dollars, or five or ten million dollars, if you please, out of your transactions as a merchant—transactions which are scattered all over this country? Of course, if you make $10,000,000 according to the propositions you lay down, somebody has had injustice done to him. You have got more from some of your employés than you ought to have got?—A. No, not necessarily; it depends on whether an injustice has been done.

Q. But is not the fact that you have got $10,000,000, and they have got only a subsistence, a proof that injustice has been done?—A. No sir, not necessarily. It comes up in a thousand different ways, and there may have been a full equivalent given in every case.

Q. Then that is what you would call an equitable distribution of the capital and labor—that one should get, say, $10,000,000 and the other nothing but a subsistence?—A. No sir; I do not say that, by any means.

Q. How much of that $10,000,000 then ought they to have?—A. I say that I may or may not accumulate unjustly. If I do it unjustly it ought to be taken away from me.

Q. But we concede that all your transactions are perfectly honest and fair and legitimate, and that you have got no intention originally of coming out with this $10,000,000. You want to have a little something more than these laborers have, but yet you do come out after all with $10,000,000, and they have nothing but a bare living, even if you do pay them more liberal wages than other people do. Now how is it that that is an equitable distribution of the profits of the general product of labor, that you should have $10,000,000, and they nothing but their support?—A. Well, in the first place, you are presuming what has not happened, and we are dealing with facts.

Q. It has happened with some people—it happened with A. T. Stewart, for instance.—A. Well, perhaps he did, and perhaps he did not proceed with due regard to the laborers that he employed, and I think that the thing to decide is where injustice exists in that distribution.

Q. That is just what I want to know. How much of that $10,000,000 (supposing there was any such case, whether with you or anybody else) would be the equitable part of what you would call labor? According to my idea everybody works and everybody is a laborer and therefore you would be entitled to your proportion of labor in the $10,000,000, but we will call it "stored-up" labor as distinguished from labor.

THE OFFICE OF LEGISLATION.

A. In the first place, that state of things does not exist; but if it did exist I would get at it this way—that any state of things which continually made men poor and did not give them their share of this accu-

Digitized by Google

mulation, ought to be so regulated that they would have a fair show. I do not see that you can make all men alike; all men are not born with equal ability, health, physique, energy, and all those things that go to make up men; but they are all born with the same natural rights—the same right to earn a living and a competence, if they possess it, and where I draw a line is where legislation or a controlling interest in the affairs of a country so shape themselves as to oppress any one class for the benefit of others. There I say the duty of the statesman is to come in and remedy those laws where they discriminate in favor of any class; and I am of opinion that our legislation, for the last twenty-five years especially, has been more largely in the interest of capital than in the interest of labor, and that one of the main factors has been the compact force of corporate organization acting constantly upon our legislation. It has naturally resulted in such a state of things, and it seems to me that the time has come when just the inquiry which you gentlemen are making here should be made, and that, based upon the results of that inquiry, remedies ought to be proposed. I believe that unless you do something in that line there will come a time when there will be a social explosion.

Q. Well, now, we will take the instance that I was at, because the old logicians say that error always lurks in general propositions, and truth is always to be found in particulars. We are supposing a case that sometimes happens, when a man comes out as a merchant with one million or two or three million dollars, which we have always regarded as an evidence of his directing power and economic capacity of his opportunities of credit; all these we have been supposing to combine in a merchant who has come out of business with one, two, or ten million dollars. That sometimes happens. Now, how is it that corporate power would have enabled you or any other man to have had a million dollars of profit while your laborers have had nothing but a living?

### CORPORATE ORGANIZATIONS A LAW UNTO THEMSELVES.

A. The difference between corporate and private operations, as a rule, is this, as I observe them: that we have not experienced as many evils from private persons as from corporate organizations, because the law of private competition with individuals and factories is allowed to work. Corporate organizations, being on a larger scale, have practically become a law unto themselves. The law of competition does not work with them, or at least only works occasionally, or not to the same extent. It does not work with the same regularity and thoroughness as it does with ordinary business, and therefore we have experienced more evils from those corporate organizations than we have from private persons.

### NO PERSONAL RESPONSIBILITY IN CORPORATIONS.

Again, as I touched upon the subject in my first statement, in corporate organizations there is an absence of that degree of personal responsibility—conscience, if you may so term it—that you find to a great extent among private individuals.

Q. Yes; but I do not think you caught my point. All that, no doubt, is very correct and forcible, and I appreciate it entirely, the evils of corporate existence, and the necessity of a legal restraint upon it; but how is it in the instance I gave? Supposing you come out of your business with one, two, or ten million dollars; and the laborers whom you have

Digitized by Google

been employing, either you or your partners, come out with nothing except, at the best, a good living during the time they have been engaged in it. They will be fortunate if they have got homes and clothes during the time they have been engaged, and if they have been able to send their children to school, and to pay for some life insurance. But we will say that they have had all that, and that is a very good condition for the man, whether a corporate lawyer or a briefless one, a tradesman, or a striker, or one who does not strike, that condition of things will describe a man who is very fortunate in the general average of the better part of mankind. Now, you come out with one or two or ten million dollars, while such a man as I have described comes out with nothing but what he eats and wears and what his family eats and wears. How would corporate power have aided in producing that result—to have given you $10,000,000, and have allowed your employés to have nothing but what they got all along and have now?—A. Well, I should say that corporate power would tend to enable the business to be done on a larger scale, and it would bring about this element of lack of personal responsibility which I have mentioned.

THE OFFICE OF PERSONAL RESPONSIBILITY.

Q. The lack of personal responsibility on your part?—A. Yes; and if the result did occur and could occur in private business—in my own business, for instance—as you have described it, I think that it would imply that there was something wrong in the conditions which would permit me to accumulate $10,000,000, while the men who worked for me only get a bare living.

Q. Could you, or the imaginary man, remedy that by giving your employés more—giving them an interest in the business?—A. Probably so.

Q. Is there any other way in which you could remedy that—either by your giving, or the law compelling you to give, these laborers a portion of your net profits?—A. I do not know whether there could be or not. As I said awhile ago, I think that every business man is regulated to a greater or less extent by competition. There is nothing to prevent me, if I am worth $10,000,000 from giving away any part of it to my men. But, in the first place, you do not see those accumulations in private hands, simply because competition regulates it, and in the other case you do see the accumulation, because competition does not regulate it.

WHO OWN RAILROAD STOCKS?

Q. Do not the merchants generally own these railroads, by owning the stock?—A. No, sir.

Q. Is not the stock pretty well distributed among them? The farmers do not own them, I fancy.—A. The stock of the railroad companies is not owned to any great extent by the merchants who are the shippers. You may occasionally find a merchant who has perhaps accumulated enough capital to enable him to afford to divert a portion of it into railroad investments, and you will find that sometimes a merchant will graduate from a merchant into a banker or a railroad man.

Q. Do you not call a banker a merchant?—A. Yes; to some extent he is; but his interest may change and he may become interested in taxing the very commerce that he was previously identified with.

Q. Then you merchants want a law to protect yourselves against each other?—A. Not necessarily. We want laws that will insure a fair

Digitized by Google

chance for everybody. We think, for instance, as between merchants and railroads that there are two parties in interest, and it would not be just for the merchants to dictate entirely to the railroads any more than it would for the railroads to dictate entirely to the merchants. As I have already stated, there ought to be a power above these special interests, whether of railroads or any other, which would act as a sort of arbiter to prevent either side getting an undue advantage.

Q. Are you, as a grocery merchant, willing to trust me, as a farmer or lawyer, to prescribe the rates for your business and how you shall conduct it?—A. There you are changing the ground again.

Q. Am I?—A. Yes. I must keep to the fact that there is a great deal of difference between a private institution regulated by competition and a semi-public body like a corporation which these same laws do not affect to the same extent.

### "REASONABLE CHARGE" ON RAILROADS.

Q. Admitting that distinction, does it go so far as to relate to a difference as to what shall or what shall not be a profit? Does it go so far as to say that a man not familiar with the business shall say what constitutes a reasonable charge? That is the reason why I put my question to you, whether you should allow me, either as a farmer or as a lawyer, to prescribe the rates for your business. Is there any difference in respect to the necessity of accurate knowledge and experience to determine what price your goods should sell at or what price the railroads should charge for them?—A. I, as a merchant, would say that it is simply a question of how far the two functions are subject to abuse. If I possess the power to abrogate the laws of competition—to gain control, for instance, of all the wheat in the country and put up the rate to any price I choose—taxing the people for that commodity such price as I thought they would stand—"what the traffic would bear"; what I could squeeze out of them—I say the law should and could come in and prosecute me, even though I have no public charter.

Q. And the evil would be the same?—A. Yes, sir.

Q. Now, let me know what sort of law you would have by which to step in and regulate that. You said that, with regard to the railroads, we should have a law prescribing equal pay for equal service, and if the railroad commission prescribed what that proper rate was, if the railroads differed from it, then they should go back to the courts or to the State legislature and have them decide what was right. Would not that be a pretty cumbersome and tedious process?—A. Well, you and I are now wandering off into some hypothetical considerations.

Mr. CALL. I do not think so.

The WITNESS. Well, let us get down to the question of the wisdom of regulating rates.

Mr. CALL. I mean as to the mode of regulating them. I concede the wisdom of having proper rates; charging no man too much nor too little, and to charge exactly enough, though I do not just see how the public are much hurt by giving a poor man a free pass occasionally to ride on the railroad—but I concede that it is wise to have the right rate charged, neither too much nor too little.

### STATE RAILROAD COMMISSIONS.

The WITNESS. Well, I will give you a case in point. About three years ago the State of Georgia organized a railroad commission. It was given power to fix rates. They studied up the subject about a year

Digitized by Google

and then they fixed rates for the railroads of Georgia, to the very great benefit of the people of that State, and yet they fixed them in a reasonable manner so that it has not injured the railroads greatly, because a more equitable adjustment of rates resulted in a large increase of traffic, which in turn yielded a profit, and I do not believe you would find the people of the State of Georgia voting to-day to have that power taken away from the railroad commission. Of course, it is possible that if that commission had gone ahead without studying their subject and without becoming fully informed, they might have done much damage and treated the railroads unjustly and injured the people indirectly in that way; but they were endowed with that power, and they had the discretion to go ahead, and they have done great good. What then is to hinder that same principle from being applied to public corporations like railroads in other States, or, so far as it constitutionally may, to interstate commerce?

Q. The law of Georgia, I understand, applies the three-cent fare in regard to passengers?—A. Not only that, but it prescribes the rate for every article carried. Now, take for instance our "pool" trunk lines. The shipper is not at all consulted as to rates. They fix an arbitrary rate, and say that the shipper shall pay such an amount. In Germany the Government authorities, before making a change, send out circulars to the leading shippers and persons interested in transportation asking their opinions as to the wisdom of the changes. They take the sum of these opinions and come to a decision which is equitable alike to the shippers and to the administration of the railways—the railways being now under the Government control. What I claim is, not that the interests of the railroads should be made subservient to those of the shippers, although perhaps they might equitably be made so, because the shipping interest may be as twenty to one—but what I do claim is that there should be somewhere lodged a power above these great organizations, which will have the right to say what is fair and just to all parties in interest.

Mr. PUGH. I will say just there, Mr. Thurber, that in Alabama there is a railroad commission charged with the power of supervising the discharge of the duties of railroad corporations to the public in the regulation of freight rates and all other duties and powers under their State charter. That board is composed of an able and efficient commission, and they have prescribed the rates, have taken jurisdiction of this whole subject and exercised it for two years, and it has given entire satisfaction to the railroads and to the public, so far as my knowledge goes.

Q. Have you not got such a commission already in this State?—A. We have a commission in this State, sir, but not such a commission.

Q. Are the rates of fare prescribed by the Georgia commission satisfactory, and are the rates of transportation less than here? If so, how much less than here?—A. The rates of freight, of course, depend largely upon the volume of business.

Q. But what is the fact in the State of Georgia in regard to their rates?—A. I think the rates both of fare and of freight are generally higher in the State of Georgia than in this State, because they cannot afford to carry as cheaply on the traffic which they have there as our roads can afford with the heavy traffic that they have.

Q. That is what I supposed, and I supposed you were referring to some law which would prescribe the proportion of profit which the railroads should have. That is your idea, is it, that as the bulk of transportation increases and the net profits of railroads over and above the

Digitized by Google

cost, &c., decrease, there should be a decrease of cost to the public. That is your idea, is it not?—A. Yes, sir.

Q. I want to know what sort of law you would have in order to get at that. There is already a commission law in your State, and in Georgia and elsewhere?—A. I would give to our New York commissioners similar powers to those exercised by the railroad commissions in Georgia and Alabama, and if our commissioners were true to their duties they would see that when the charges for transportation resulted in more than a given per cent., say 10 per. cent. (which was the limit fixed in our original charters), then the rates should be reduced.

### A RAILROAD CHARTER A PARTNERSHIP.

I look upon a railroad charter somewhat in the nature of a partnership between the people and the men who build and operate the railroads.

Mr. CALL. It is a public franchise undoubtedly. There is no question about that.

### FREE PASSES: THEIR INFLUENCE ON LEGISLATION.

The WITNESS. And in regard to free passes, it seems to me that as railroads are chartered by the votes of all, all persons should have equal rights on them. It seems to me that a free pass to one man is a discrimination against the whole, and especially as we have seen very bad results from it. We see in our State legislatures men more or less influenced by the courtesy of free passes.

Q. Do you think your average legislator is for sale for the mere pittance of a free pass?—A. No, sir; I do not think the average legislator can be bought with a free pass; but I do say that it is a courtesy which is an entering wedge to railroad influence dominating in our legislatures. Why should the parties desire to give away so much money? We had the example here last winter in our legislature of representatives of railroads coming there and actually arguing that they should have the privilege of presenting to people these gratuities. One would think that if they were actuated by a desire to increase their revenues, they would not give free passes.

Mr. CALL. Well, I have always supposed that a pass was regarded as a mere compliment, in certain cases, and it certainly would be a very poor man that could be bought by a pass.

The WITNESS. The gradations of purchase and influence are varied.

Mr. CALL. Is hould be prepared to believe almost anything of your people here in New York if they can buy a man with a railroad pass.

The WITNESS. I do not say they can buy men with a railroad pass; but I say it is a step in the wrong direction, and it might just as well be stopped.

Q. Now, with regard to the railroad commission—which seems to be getting to be the law, generally, over this country, you want some amendments, I understand you to say, in your law appointing a commission; but, with those amendments all passed, how would you have that affect this great accumulation of money which you say results from the corporate franchises of railroads?

The WITNESS. The accumulations already made?

Mr. CALL. Accumulations in the future as well as those already made.

The WITNESS. I think that the tendency of these remedial measures would be to prevent the same ratio of increase in the future that has happened in the past.

Digitized by Google

REGULATION OF RAILROAD CHARGES.

Q. How would you remedy that? I do not see anything in your statement that would seem to regulate the profits of railroads, excepting the termination of the charters in thirty years.—A. I would regulate the charges on the cost and risk of service. The railroads have been operating on the principle of "what the traffic will bear," they being the sole judges of that question. If, for instance, you get honest and independent railroad commissioners, men not under the influence of railroad companies, and they apply that principle—that they should be compensated on the basis of the cost and risk of service, and no more—why you would tend greatly to limit these great accumulations in the future. I do not know that you could do anything so far as the past is concerned.

Q. You would not distribute the whole net proceeds of the railroad's income in a reduction of freights, would you; you would leave something—you would leave 10 per cent.?—A. Yes, I would.

Q. And then you would leave something for building up and keeping the road in repair?—A. Of course, there are certain fixed expenses—operating expenses and keeping up the plant—and then come your charges. From those, dividends of 10 per cent.—if that be deemed a fair return—would be allowed. I myself would give to men who invest money in railroads a liberal return on the actual money invested.

Q. How much would you give them?—A. Well, that would depend somewhat on the time and circumstances. I do not know that I could specify at this time; but I think they are entitled to a liberal return. What I object to is the evasion of their duties.

Q. That is all right. But I am looking at your proposition, that here is an institution that acquires these accumulations and disturbs the natural course of affairs in such a way as to be injurious or destructive to the public interest. It is a means of accumulation so great that you consider it dangerous to the public welfare. That is the proposal you have stated; is it not?—A. Yes.

Q. Can you fix a rate of interest that would not accumulate almost incalculable sums of money in a progressive country? You say that it is a vast power in individuals—and no doubt it is—to tax the community, but can you prescribe any rate of interest by which accumulations would not finally come to be a vast amount?—A. Well, sir, I should say that you certainly could prescribe rates for a service to the public, which would limit the amount which they would accumulate. It would be larger or smaller, and in proportion to the business done, and the capital invested, &c.

Q. But, I say, if you allow them the cost of repairs and running expenses, and then fix 10 per cent., or 6 per cent., or 5 per cent., or any other per cent. that you please, for the shareholders to get, would not that in time amount to the same vast accumulation that it now does?—A. No, sir; I do not think it would upon actual values.

Q. You think the evil would be remedied, then, by prohibiting them from watering their stock?—A. That is one phase of the evil.

Q. And making exaggerated charges?—A. There is no one remedy that will do for half a dozen different phases of a disease, and I do not pretend to have a specific for all the ills that society is heir to. I feel my utter inadequacy to enlighten you on such a variety of important considerations as are involved in this whole controversy.

Mr. CALL. You are too modest entirely, sir. I think you are the most proper man to tell us a great deal that we do not know about this mat-

Digitized by Google

ter, as you have a large and profitable business, and are therefore the very kind of man that does know about these things. You may be a little too enthusiastic about anti-monopoly matters. It has occurred to me that possibly some amendment of the law in regard to railroad transportation, in which the shipping and mercantile interests, as contra-distinguished from the transportation interest, should be represented, might be a practical form of State legislation.

STATE RAILROAD COMMISSIONERS CONTROLLED BY RAILROADS.

The WITNESS. I think that there could be a representation of the public; it is not alone the shipping interest that is involved; the entire public are interested, more or less. I think that railroad commissions not controlled by the railroads would be a very great advantage. But that is one of the troubles. Two-thirds of the railroad commissions in the United States to-day are controlled in the railroad interest.

Mr. CALL. Of course that is a trouble, and always will be a trouble.

The WITNESS. That is one great thing to guard against. Many of the commissioners are perfectly honorable men, but they have been educated to view things from a railroad stand-point, and they naturally look at things from that stand-point. But there are certainly two parties in interest—the shipping and carrying public—as well as the consuming and producing public; they are all interested, more or less. I think that when you get public opinion up to the point where railroad influence does not control in our legislation and politics, you have accomplished a great deal. When you create a commission and have a majority of commissioners not inclined to give it a fair trial, it then acts as a sort of buffer between the railroads and public opinion. Our railroad commission law in this State left it to the governor to nominate, and the senate to confirm, the commissioners in the usual manner of nominations and confirmations. The clashing between the political interests of the Republicans and the Democrats defeated the thing; that is, the railroads carefully fostered that rivalry and defeated us for two or three years; indeed, it has defeated us for several years—eight or nine, I may say; but when the Hepburn committee recommended a railroad commission, the railroads, by fostering political rivalries, succeeded in postponing action. Finally we got a place where the Republicans and Democrats alike said, in their respective platforms, "We shall have a railroad commission," and the law was introduced. The Democrats were afraid that the Republicans would get a majority of the commissioners, and the Republicans were afraid that the Democrats would get a majority; so, as a sort of compromise measure, it was decided that the anti-monopolists, acting with the commercial bodies of the city, should nominate one of the commissioners, and that the other two should be taken one from the Republicans and one from the Democrats. Finally the bill went through in that way. The present administration of the State is Democratic, but two years ago it was Republican, and largely the change has been effected because the Republicans had not been true to their duties in reference to this and other matters. The governor appointed two men, a majority of the commissioners, who are upright and honest men, but who are also recognized as men whose sympathies and affiliations are against it.

By the CHAIRMAN:

Q. The governor appointed two such men?—A. Yes, sir. It is too soon to judge how they will do—too soon to do anything but diagnose—

Digitized by Google

but the public are interested to see whether their action will exhibit bias in favor of the railroads, or whether they will carry out the law in its proper spirit.

Q. They have power under that law to prescribe rates and fares?—A. No, sir; they have simply the power of representation to the legislature and to the attorney-general. If it should prove that they are men above any influence, and have not been educated so as to see the thing from only one side, the commission will undoubtedly be productive of great good. We have had several illustrations of its usefulness already, but it has not been in operation long enough—only since the 1st of January—to illustrate its full usefulness.

Q. The third man was suggested by the anti-monopoly party, was he?—A. Yes, sir.

Q. And nominated by the governor on their selection?—A. Yes.

Q. What are the names of those commissioners?—A. John D. Kernan is one.

Q. Is that a son of ex-United States Senator Kernan?—A. Yes. Another is W. C. Rogers (son-in-law of Hon. Hamilton Fish), and the third is ex-State Senator John O'Donnell, of this State.

## THE CURRENCY.

By Mr. CALL:

Q. You said something in your statement about banks, expressing approval of them in some respects in regard to the currency, but expressing doubt whether the people did not pay too much for the service, as I understood your remark.—A. Yes, sir.

Q. And that it would be better for the Government to issue the currency direct, without the intervention of banks. Was that the idea that I gathered from your statement?—A. Well, I raised that thought. My own view of the question has been that that has not been so pressing as many others that exist at the present time. At the same time, I can see no difference between the purchasing power and usefulness of a ten-dollar greenback and a ten-dollar national-bank note. In one, the people make the interest, and also save that large percentage which results from the loss of money and its never being presented for redemption; and in the other the banks make that. The banks have done good service, and are entitled to great credit for giving us a currency that was a great improvement upon the old style of currency; but my impression is that they have been pretty largely rewarded. They have made this interest, and their term is now extended for twenty years longer—their right to issue currency. It seems to me that when that term comes round, it would be for the public interest that the Government should issue all the currency, both metallic and paper, instead of delegating that function to the banks. The late John E. Williams, president of the Metropolitan National Bank in this city, took that view, and I have heard several men largely interested in banking circles say that they thought they could get along on the function of deposit and discount which the banks have. The probabilities are that banking would be more profitable even than it has been, with the taxes removed as by the last Congress.

Q. You do not regard that as an important factor for the present in your remedial measures?—A. Well, sir, I have not given as much attention to that subject as I have to some other fields of these politico-economic questions; and I think that that is a subject which will come up when the time comes round—when the present term for which that is authorized expires; and it is time enough to deal with it then.

Digitized by Google

Q. You have no suggestions to make for the present, then, in relation to it?—A. No, sir; I cannot say that I have.

By the CHAIRMAN:

Q. In what way would the people make the interest if the Government issued the money?—A. The interest on the circulating medium—I am speaking of the nation at large—not of individuals.

Q. Well, in what way would the nation at large make it?—A. When the banks now loan money, of course, the use of money is worth its interest, and at the same time the banks are getting interest on the bonds upon which the currency is based. They receive interest on their bonds.

Q. How would the Government first part with the currency—of course, it would not give it away to people—how would it issue it?—A. It would pay it out for its liabilities—which are very large.

Q. But you would not pay it out every time you had a liability—you would not make more money to pay that liability?—A. No, sir; I think it should be limited.

Q. How would you regulate it?—A. I would regulate that by a *per capita* law governing the issse.

Q. Not by the wants of trade, but by a *per capita* provision governing the amount of business?—A. It seems to me that one is the same as the other. It seems to me that as population increases trade increases.

Q. In the same ratio?—A. I think so, substantially.

Q. Does property increase in this country in the same ratio as population?—A. I am not sufficiently conversant with the subject to answer that, nor have I thought much on it; but it has seemed that as population increases, naturally, somewhat more currency is required. I think a comparison of our own wants with those of other countries where different conditions exist, and making allowance for these differences, would enable, for instance, the Committee on Banking and Currency of both Houses of Congress to say how much currency is needed. I have always been willing to trust the people on these subjects, and I think the people and their representatives are as well able to judge as any other agency would be.

By Mr. CALL:

Q. How would you get it out from the Government?—A. I would, as I have said, pay it out for its liabilities and debts. The Government is always buying a good deal.

Q. Do you think that that would be a sufficient method—$300,000,000 a year might be either too much or too little?—A. It might; I do not know how that would be, but I think Congress is as capable of regulating that as wisely as it does the question of the tariff or any other.

Q. But the Government pays out $300,000,000 a year and takes back that much money, and that might be an equal factor in the varying amounts paid out and paid in, and in the times of paying it?—A. Yes, sir; we have seen the effects of that; we have seen that when the Government revenues were very large, absorbing large amounts of money for taxes, &c., it created stringencies in the money market.

Mr. CALL. Yes; I understand that that is why the governments of the world have had some advantage in financial agencies—in order to meet these necessities and to guard against the unequal recurrence of those stringencies that might happen at the very time when a great deal of money was wanted for business and could not be got.

The WITNESS. Do you not think it would be possible for our law-

Digitized by Google

makers, or the Department which was charged with that duty, to regulate that quite as well as our bankers and others regulate it who have an actual pecuniary interest in it?

Mr. CALL. That may be; I am only presenting the question to you as it is presented philosophically by those who have considered it. I wanted to know what a practical business man like yourself would think of it. I have very great confidence in you merchants.

By the CHAIRMAN:

Q. Banking is free now, and regulated only by the broad laws of trade, is it not?—A. Yes, sir; that is one thing that has made me feel that there was not the same fear of monopoly there that there has been in other departments of commerce. [To Mr. Call:] I am afraid the average merchant would not be able to help you as much as you think in coming to your conclusion. You may be able to dig out a fact here and there that would be of some use to you, but the merchants are just as selfish as the rest of the community.

Mr. CALL. If you carry out that anti-monopoly movement I do not know but what we will have to get a law passed to wipe out the merchants, because you have a monopoly of the money here.

The WITNESS. If the principle of competition did not affect them, I think something would have to be done, because I do not think their human nature is any different from any other human nature.

### WHAT ARE REASONABLE DIVIDENDS ON RAILROADS?

Q. I want to ask you a question bearing on your remarks in regard to railroad-stock watering and the payment of an income taken from the people beyond what you think is just to the road. Upon what basis would you regulate the amount of interest or dividend that a railroad corporation may justly distribute to its stockholders?—A. Our primary railroad laws in this State started out with the idea that capital invested in railroad enterprises ought to be entitled to a return to the extent of 10 per cent. upon the capital invested. I do not know that I would limit it to 10 per cent. in all cases, because in some cases there are conditions and reasons for permitting a higher remuneration than in others. Where the people contribute considerable sums for the construction of these roads, as they do in many instances, not only giving the right of way, but subscribing either through individuals or by towns, municipalities, or counties, as they frequently have done, that would alter in some degree the conditions.

Q. I do not wish to take a case where a railroad has become bankrupt, or has been going on for a number of years without fair compensation; but take a case where a railroad has built its roads and made money, and had returns more or less satisfactory, and is now doing and will henceforth do a reasonably prosperous business. What do you think is the rule or principle upon which, as a basis, dividends should be limited?—A. You have got to fix some arbitrary amount, of course, and I would think 10 per cent. a sufficient limit, as originally fixed in the charters of the New York railroads.

### HOW SHALL THEY BE COMPUTED?

Q. Ten per cent. upon what?—A. Upon the actual cost of these roads.

Q. The actual cost in times past, do you mean; or the actual cost of

Digitized by Google

replacing the road at the time the dividend was declared, or the money earned?—A. I think it would be fair to take the actual cost of the road from the beginning.

Q. But I am assuming a case where a road has paid a good dividend from the beginning. Now upon what basis would you say that the New York Central, or the Erie, or the Pennsylvania road would be entitled to a dividend; upon the actual value of the road to-day, or what?—A. No, sir; I should say upon its cost; that is to say, I do not think a railroad corporation for forming a public function is entitled to such increase of value as the owner of private property is; but that seems to be a great point at issue between the railroad men and the public. The railroad men claim that they are entitled to the legitimate increase of value, as they term it, the same as on any other investment; but I think there are reasons why they are not. In the first place, they are in partnership with the State—they get their return first. Another thing, the motive in building railroads is not to start out now and build a railroad for the purpose of getting 10 per cent. on the money invested, but there are always collateral motives.

Q. You assume that the railroad is taking fare enough up to this date to make only a just and reasonable return; that there is nothing beyond; that the rest has either been left with the people by means of low rates of fare, or, having been collected, it is paid over to the State in accordance with the law; and to-day we are commencing to establish some rule by which the dividends of a railroad should be paid. We will assume that it is all, even between the railroad and the State up to this date, because the past is past, and we cannot do much about it; but, upon what basis, if we are to commence to regulate the dividends of railroads to-day, are we to do it fairly?—A. My impression is that you should take as a basis the original cost, separating construction accounts from the operating accounts, making allowances for betterments, and so on.

Q. That will give you the actual value to-day, will it not?

SURPLUS EARNINGS: HOW SHALL THEY BE TREATED?

A. If they have put their own money in they are entitled to a return on all their own money; they are not entitled to a return on money that they have exacted from the public in the shape of surplus earnings.

Q. Why are they not entitled to it?—A. Because these surplus earnings really belong to the public. Here are two cases in point, the New York Central and the Baltimore and Ohio roads——

Q. [Interposing.] I understand the point, and, if you will excuse me now, you can illustrate a little later. Wherein does it make any difference to the public whether, on the one hand, these surplus earnings are taken and fairly invested by improvements in the road, and then the public pay a fair dividend upon that investment, or, on the other hand, the road hires the money, but will not have any money beyond its fair return, if everything is given to the people in the form of cheap fares, or some is returned if more is earned—if, I say, more being required, they hire the money, and take from the public enough to day for this money which they get from individuals—why does it make to the public any difference which of these two courses is pursued, the honest investment of the money or the hiring of the money with which to make the improvements?—A. My view would be this: that in one case it is arbitra-

Digitized by Google

rily taken from the public at large, and in the other case the revenue is derived from persons who have legitimately acquired it, if you please, and who choose to lend that money to the railroad company on such securities as the railroad company give for it.

Q. How can that be, if everything has been all this while left in the hands of the people—never collected from them? It is left in the hands of those who have had occasion to get service from the railroad, either as passengers or shippers, is it not?—A. Yes.

Q. It is left in the hands of those two classes—passengers and shippers—and they are not the public at large.—A. Yes, precisely. There is a distinction there I admit; but why should the shippers and travelers be obliged to contribute this thing from their pockets?

Q. Why does it make any difference, I say, whether these men contribute it originally and it is invested and then an income paid upon it, or whether the money is hired from other parties and those parties are paid for the hire of the money?—A. It makes this difference: Suppose you are a shipper and I am a person whose money is let. It makes a great deal of difference to you whether the railroad compels you to contribute the amount for these betterments, or whether the railroad borrows it from me, who am a money lender.

Q. And then tax me to repay it to you? It will have the right to tax me as a shipper or passenger, to repay it to you; it is only a question whether it is the shipper of the present or the shipper of the future.—A. I know; but you are taxed for the regular interest on these amounts; you not only have to pay the interest, but to put in the principal.

Q. It is just so in either case, is it not?—A. No, not as between classes of citizens.

The CHAIRMAN. Very well, I will not dwell on that point; but where there is an undue watering of stock, and it is not representing an actual investment, I think your criticism is very correct.

### NEW YORK CENTRAL AND BALTIMORE AND OHIO RAILROADS.—APPLICATION OF SURPLUS.

The WITNESS. I was going to illustrate by a comparison of two great trunk lines of railroad, the New York Central and the Baltimore and Ohio. Both have had large business, and large surplus earnings have been invested in betterments extending and increasing roads. In the one case the New York Central capitalized that surplus in 1867 and 1868, as I have illustrated in my first statement, and has maintained its rates so that they have paid regularly 8 per cent. dividends on the forty-seven millions of water which they put in in 1867 and 1868, and this $3,760,000 per annum, with interest, already amounts to $83,000,000. On the other hand, the Baltimore and Ohio invested its surplus, but did not capitalize it. They made the people contribute in the shape of surplus earnings enough to extend its road, and they have now a surplus of some $38,000,000 or $40,000,000, but have not issued stock to represent it.

Q. They have a surplus, but not invested, you mean?—A. It is invested but not capitalized. There is no stock issued to represent it, and no dividends are declared on it.

Q. That only adds to the value of the stock?—A. That is all. It has paid 10 per cent. dividends instead of 8 per cent., as the New York Central has paid. At the same time the Baltimore and Ohio road could

Digitized by Google

carry a great deal cheaper than it does if it did not keep up its constant adding to its surplus. It is adding all the time to its surplus.

Q. That is, to the value of its property?—A. Yes.

## SHOULD THE PATRONS OF A RAILROAD CONTRIBUTE TO SURPLUS EARNINGS?

Q. It does not accumulate this interest anywhere, but puts it into the form of a better railway?—A. Yes; and a longer railway, and all that sort of thing. It is increasing immensely. Charles Francis Adams, in one of his reports as railroad commissioner of the State of Massachusetts, takes the ground that it is unjust to the public to compel it to contribute in the shape of surplus earnings for the expansion and improvement of railroads; that railroads should borrow that capital, or that the men who own these railroads should put their own capital into them, rather than take from the class of people who use the railroad the necessary capital.

Q. Supposing the money is advanced, how is it to be repaid?—A. It is to be repaid by the interest on the bonds—or whatever it may be—and sinking funds are gradually accumulated for that purpose.

Q. And it all comes out of the people in the form of fares and freights, does it not? There is no other way in which a railroad can get money.—A. Well, yes; I think it would operate that way.

Q. It comes to the same thing in the end?—A. When it is honestly stocked.

Q. Yes. If it is watered your point is well taken; but if it is honest, I do not see that there is anything to the criticism.

The WITNESS. There is this in it, though, is there not (I have not thought that point out very clearly): The propetry which the money borrowed represents still remains at the time of the repayment of the loan by means of a sinking fund. To whom should that property belong, the State or the railroad company?

The CHAIRMAN. Well, you cannot contemplate the abolition or destruction of a great line of traffic. It must either exist in the State or somebody. When it dies the State or nation dies.

The WITNESS. Is there not an element of value there that belongs to some one? There is an increased earning power. The point I have in my mind is this: That after the capital actually invested by the corporation, or the individuals who constitute the corporation, has been fairly compensated, the rest of the enormous advantages resulting from steam roads, and from the discovery of steam, belongs to the people.

The CHAIRMAN. I think so, too; I believe that. The difficulty is to settle just where the line is that separates the amount which the corporation is entitled to take and beyond which the public shall receive its share in distribution and retention.

The WITNESS. Yes, sir. I will think out that point which you raised as to the difference between the borrowing of capital and the accumulation of it in the way of surplus earnings; and perhaps I may give in something in writing hereafter which may deal with that. I should like to see what Mr. Adams has to say on the subject. I have only a dim recollection of it.

The CHAIRMAN. Very well. Bear in mind that I am only speaking of a perfectly honest investment of money in a road—nothing in the way of "water."

Digitized by Google

The WITNESS. Yes.

After reading your letter I thought perhaps you might desire a comparative statement of retail prices which consumers on the average have paid at different times for the principal articles of family consumption. When Mr. Hewitt was investigating this general subject some years ago I compiled such a statement for him; and, with same modifications in bringing it down to the present date, it would perhaps be a useful exhibit for your record.

The CHAIRMAN. Your suggestion of bringing it down to the present date is an important one. I had contemplated that the committee would avail itself of that same list, which I had observed in your former testimony. But if you will give it to us with the alterations you suggest we shall be glad to have it.

The WITNESS. I will do so. There is one period which to me was a very interesting one and which I have been trying to work up, but have not yet got all the data. That is the period from 1860 to 1866. With these six years filled in it covers periods six years apart. It is five years now since Mr. Hewitt's table was made up. It began at 1860, and leaped to 1872, probably.

## EFFECTS OF PRODUCE EXCHANGES.

The CHAIRMAN. I would like a statement of your views as to the manner in which the operations of the Produce Exchange affect the prices of the necessaries of life to the consumer; but there does not seem to be time to go into that matter to-day. We may do so later.

The WITNESS. I will state so far as a proper and legitimate use of exchanges is concerned I believe they are beneficial; but, so far as the "cornering" and "pooling" arrangements exist, they are of course a harm.

Q. Do they exist to the extent of doing very serious harm?—A. Yes, sir; very serious harm.

The CHAIRMAN. Then we may want to hear from you at another time on that subject.

The WITNESS. I think what would be better for you would be the result of the investigation that took place last winter by a committee of the New York legislature.

The CHAIRMAN. Well, that is in two large volumes of perhaps a thousand pages, and I did not notice that it came to any conclusion—at least it was a very much mixed conclusion.

The WITNESS. The probability is that the monopoly influences got control of a majority of the committee and operated upon its conclusions.

Here the committee took a recess for half an hour.

A few days after the completion of his oral examination Mr. Thurber submitted, in writing, the following remarks, to be added to his statement:

## CAPITALIZATION OF SURPLUS EARNINGS.

Referring to the chairman's question regarding the complaint of stock-watering on railroads by the capitalization of surplus earnings, &c., and the inquiry as to what is the difference to the public whether the additional capital required for railroad development is derived from surplus earnings or by borrowing it, as long as transportation charges must be

Digitized by Google

high enough for maintenance and to pay interest on the investment, I desire now to say:

In the first case the public using the roads are required both to furnish the capital and pay interest upon it, while if the required amount was borrowed (say from either foreign or domestic capitalists) the public would only have to pay the interest alone and keep the property up to its original condition.

I cannot better illustrate what I think right than by quoting from the report of the Massachusetts railway commission for 1875, of which Mr. Charles Francis Adams, jr., was at that time chairman. The report (pages 12 and 13) says:

Under a more logical and intelligent system of public accounts, a course wholly different from that described would be pursued. A rigid and uniform method of keeping accounts would be adopted, and an adherence to it by all corporations strictly enforced. Out of the earnings all operating expenses would first be paid, and that on a system which would insure a regular, though not excessive, improvement in the condition of all the properties, or at least every reasonable safeguard should be maintained against depreciation. This done, the entire balance should be credited to net income, and from it as a fund, should it be sufficient for that purpose, dividends should be paid to the full amount authorized by the original contract between the corporation and the public. Any surplus remaining after these claims were satisfied should be applied neither to the new development nor to additional construction, but to the extinguishment of all indebtedness, and after that to a reduction of rates. It should go towards relieving the public of its burdens. The necessities of development should be provided for, as the original construction was provided for, by the investment of fresh capital. Upon the capital required for it that development should pay a fair profit; if it could not do so it should not be ventured upon; but the community ought not to be called upon, as it now is, to pay in that capital itself under the disguise of surplus earnings; these surplus earnings should be left in the pockets of the people. Instead of paying interest on an increased railroad system built by private capital, the community is itself furnishing the capital to develop roads which are the property of the private corporations. Under the system called "stock watering," a similar practice is pursued, but in that case the surplus earnings are represented in the increased value of the property, and are from time to time capitalized and divided in the form of new securities among the stockholders. Thus the community not only itself pays in the capital required for the development of its railroad system, but it afterwards is taxed, through necessarily heavy rates, to pay the dividends on the very capital thus paid in. In the other case it continually pays in new capital, which, however, only improves the original property of the corporations, as on it new dividends are not paid. Unless railroads are in no respect public corporations, both systems are false, though the last is a much less flagrant abuse than the first.

Mr. Thurber later submitted the following:

[H. K. & F. B. Thurber & Co., Food products. Manufacturers, importers, exporters. West Broadway, Reade and Hudson streets.)

NEW YORK, *December* 7, 1883.

DEAR SIR: Messrs. E. J. Denning & Co., the successors of A. T. Stewart & Co., delayed for a considerable time furnishing the prices on staple dry goods, and owing to absence and other engagements I only now am able to transmit same to you with a schedule of groceries. I trust these will reach you safely and prove satisfactory.

Very truly, yours,

F. B. THURBER.

Hon. W. H. BLAIR.

NEW YORK, *September* 21, 1883.

JOHN M. GREGORY examined.

By the CHAIRMAN:

Question. I believe your residence is in Illinois.—Answer. My home is in Chicago.

Q. You are a member of the Civil Service Commission?—A. I am sir.

Q. Will you state to the committee, if you please, your occupations hitherto, your connection with the educational interests of the country, and your study of economic questions and questions pertaining to the public welfare?—A. I have been for the past thirty years actively engaged in the work of education; for six years as superintendent of public instruction of the State of Michigan, and for sixteen or seventeen years as president of a college, or for the last thirteen and a half years of that time, until my resignation two years ago as president of the Illinois State Industrial University. I have also been a writer for the educational press, editor of educational periodicals, &c. My economic studies have been carried on while lecturing on the subject to the senior class of the university for the thirteen years preceding my resignation. I have also written and published somewhat upon that subject, including a volume this last year.

Q. Have you seen the resolution under which the committee is acting?—A. I have read it, sir; but I do not now recall all the points in it.

The CHAIRMAN. [After reading the resolution.] We should be glad if you would make a statement of your views and present such facts as may seem to you pertinent to be offered to the committee within the scope of the resolution.

The WITNESS. I can easily state what views I have under two heads of Economics and Education. That is, I can speak as an economist and as an educator on those points from a somewhat wide observation, an observation on this continent and repeatedly in European countries.

### ANTAGONISM BETWEEN CAPITAL AND LABOR LARGELY A SOCIAL QUESTION.

I will speak first briefly of the controversy or antagonism that is supposed to exist, and does practically exist at times, between capital and labor. I believe that this antagonism and the controversies that grow out of it, are not purely economic, that it is not simply a question of distribution of products, nor a question really of the power of labor or capital, or the proportion that capital or labor should take; but that

Digitized by Google

the question is largely a question belonging to what I should call social economics, a branch in which every problem really has two sets of factors, one set of which is economic and the other socialistic; that the trouble arises out of the social distinctions and classes that are produced by the unusual prevalence in modern times of large masses of wealth. It is the man behind the capital and the man behind the labor, if I may so speak, who are at variance. The variance between them is doubtless intensified by the economic conditions of each; but it does not depend entirely upon that, although they themselves would perhaps, in nine cases out of ten, ascribe it to economic differences. It grows rather out of social differences.

### INFLUENCE OF SOCIAL DIFFERENCES ON CAPITAL AND LABOR.

If the capitalists and laborers belonged to the same social class, if they stood upon the same social plane, we should hear but very little of the differences between them. Whenever in any period of the history of the country, or of the world, by reason of the prevalence of the religious sentiment, or any other conditions that unite them virtually on the same platform, outside of and independent of their business and their positions, there has been little difference between them. We are often cited to the fact that in the early days of New England the laborer on the farm and in the shop was the peer, socially—a member of the same church probably, possibly an officer in it—of the man that employed him, and that the relations between them were full of good will on both sides. It was simply the fact that the positions, socially, were not disturbed by their positions, economically, or rather that there were other conditions that controlled and overshadowed the economic conditions, so as to keep them on a plane of equality. I should judge, therefore, that everything that tends to lift the laborer towards the same social plane occupied by the capitalist or the employer, and tends, therefore, to lessen the social differences, the disparity between them will tend also to abate the controversies and antagonisms between them.

### LABOR AND CAPITAL NOT ENEMIES.

We all agree, I think, that labor and capital are not naturally antagonistic, that they are mutual helpers, that they are the result of the same causes, the labor of to-day employing itself on the products of the labor of yesterday, or of days gone by; and that capital is, as has been said here this morning, preserved, conserved, labor. Labor is largely indebted to capital for its means and facilities of work, and for its support in work, and for its being able to undertake larger enterprises; and capital is wholly dependent upon labor to carry out its enterprises. So that the antagonisms existing between capital and labor, if we would account them as such, are wholly unnatural, and we cannot look for them in labor and capital themselves as economic forces; but we shall find them in the laborers and capitalists themselves, and not with them in their economic, but in their social, relations. This is the more evident from the fact, that whenever labor reformers have attempted to formulate their doctrines, as they have done in the great national conventions held in Europe, more than half of their statements have related to the equality, and rights, and privileges, of the classes—very little, indeed, related to the economic distinctions between them. I think the distinction is important, however, when we deal with the question at all of the

Digitized by Google

controversies between these two classes—the laborers and their employers— because to miss the point is to miss the remedy. We do not understand the differences.

### THE LABORER'S CONDITION IMPROVING AS CIVILIZATION ADVANCES.

I wish to state also what is an obvious fact to all readers of history, that the laborer's condition has steadily improved as civilization has advanced. He is better fed, better clothed, and better housed in general in the nineteenth century than he was in the eighteenth century, and much better than he was in either the sixteenth or the seventeenth centuries; that all the advancement in the productive power of labor by the improvements of machinery and the discoveries and applications of motor forces have steadily inured to the benefit of labor; that it is better off than it ever was before, notwithstanding that sometimes it has happened that the discovery of a new method, or a new machine, has for the time injured a particular class of laborers, as it did in the case of the Spitalfields weavers who, before the discovery of the power-loom and the spinning-jenny, furnished the British army its most able-bodied recruits; but subsequent to the discovery and introduction of these measures widely in England these weavers deteriorated through their privations physically to such an extent that it is stated by a high authority that only one in forty of their men could pass the surgical examination for service, showing here a case where a discovery produced widespread and continuous distress. But while a few cases like this exist, and perhaps always follow in the immediate wake of an invention or discovery, the facts of history show that in the long run the wages of labor have increased, and the condition of the laboring classes generally are largely improved in all material respects. I think that we may affirm that. But this increase of productive power has inured also to the benefit of capital. The capitalist is bettered in his condition in proportion to his capital, and the disparity between the laborer and the capitalist is all the while on the increase. For example, take a man who can make $500 a year and a man who can make $5,000 a year from his capital; if you double the income of both each is benefited proportionately we would say; that is, the laborer gets $1,000 a year and the capitalist now gets $10,000 a year. But the difference between $500 and $5,000 was really only half as great as the difference between $1,000 and $10,000. The evident disparity, therefore, has tended to produce discontent on the part of the laborer, notwithstanding his own improved condition. I account for the discontent, notwithstanding the improved condition, on the ground of the disparity; and this again confirms what I have said, that the real source of controversy and discontent is social differences, and not economic differences, between them. It is true that the laborer attributes frequently his lower relative condition to the fact that he does not get, as he thinks, his share of the increased production.

If my view is right it is evident that no remedy to the labor troubles can be successful that does not take the social element also into account. I do not mean to say that there are not economic difficulties in this such as have been frequently alluded to before us, such as the great increase of wealth and the large power that it gives; but that this is not the only remedy, and that a more economic remedy, therefore, would not cure the difficulty. I think that that has been the reason that the many attempted practical remedies in Europe for the laboring classes have never brought content and have never quieted the disturbances or the controversies.

## INFLUENCE OF EDUCATION ON THE PROBLEM OF CAPITAL AND LABOR.

Without discussing further the principle of the relations of labor and capital, or rather of the laborers and the capitalists (or employers) as classes, I will ask to be permitted to speak simply of the influence of education on this problem and on its solution, and the part that education must be looked to to play, as one of the ingredients, at least, or factors, in the true remedy. It is an old and settled belief that education helps labor and the laborer. It is stated over and over again every day—it has been claimed indeed as one of the strong arguments for the support of the American common school and educational system that education, besides its political importance and significance as making an intelligent people for an intelligence-requiring Government, is a vast benefit to the laboring classes; that it helps labor and the laborer. Perhaps it would be truer to say, and the better way, as avoiding one of the objections to this view, that *intelligence* helps labor and the laborer, and that education helps both in proportion as it promotes intelligence.

## SCHOOLING NOT EQUIVALENT TO EDUCATION.

Education as a process does not, unfortunately, always produce intelligence as a result. Schooling is not equivalent to true education. Schools are often complained of. The American school system has frequently been berated on the ground that it does not always produce intelligence. And sometimes the argument for the advantages of education has been answered by a certainly illogical answer, because a very irrelevant one, that schools do not produce education always, or intelligence. That, of course, does not prove that intelligence itself is not advantageous and important. It is a general truth that cannot be denied, because it is proved by all human experience, that man has lifted himself from a savage state along the line of advancing civilization by virtue of intelligence, and by means of his intelligence; that he has advanced in proportion as he has become intelligent, and he has advanced by the fact of his intelligence, and by the means that his intelligence has revealed to him; that is, the pathway and the facilities for these. So that, if all human advancement has been, as we claim, by means of man's intelligence, certainly it follows that the increase of intelligence is always a necessary condition to the betterment of human relations, and the increase of human civilization. I think it follows naturally and necessarily from that. We will drop the word "education" then, since so many confound education with its processes—the result not always following the processes. I need not stop to say why it does not always follow.

Passing the general argument of intelligence and its power to elevate, I wish to call your attention to a few particulars not ordinarily perhaps discriminated—not analytically stated, at any rate—in which education, or intelligence, which I shall use as synonymous with true education, or an educated result——

Q. [Interposing.] You do not really consider that to be an education which does not amount to intelligence?—A. No.

## TECHNICAL EDUCATION.

First, then, technical or industrial education—the education in the principles and processes of the arts—increases the power of labor, because, to the laborer larger helps enable him to substitute for simple hard-hand labor, labor which is more elevating and, perhaps, in general, more easy

Digitized by Google

to him; gives to him a wider range, also, of labor activity, enabling himself to employ his labor power, not within the narrow line of some acquired trade, but in the larger line of all the trades in which the same intelligence or processes would be involved. Technically, labor also aids the laborer in increasing the productiveness of his labor, increasing his share of the products, and, of course, the absolute, not the relative, amount of products that come to him. I will not say at present anything of the relative shares. That is a question outside, and belongs to economics, and I may, if I have a moment to spare, return to it; but at present I want to speak simply of the laborer's absolute increase of products, and of comfort from those products, which I say depends upon his improvement very largely by technical education, whether this technical education is gained in the schools (as is the cheapest way always to gain intelligence), or whether it is gained by study in the manufactories, by lectures, &c. (which is the longest way to gain technical knowledge and intelligence). The claim of the technical schools on the other hand, I will say, is that they do more rapidly, more directly, and more cheaply, this work of technical teaching and technical education than it can be done in shops.

### GENERAL EDUCATION HELPS THE LABORER'S PERSONAL CHARACTER.

General education, by which I mean the education that increases the general intelligence, and develops the general powers of intelligence, promotes the condition of the laboring classes also in various ways.

In the first place it gives to the laborer himself higher personal character, and hence, higher social standing. We have on record cases of those who have been employed in the lowest and most menial labor, but who by virtue of their studies and their acquisitions in science, have come to be recognized among their neighbors, and sometimes throughout the whole country, as persons of such intelligence as to make them the peers of the best men of the land. I know an instance in point, of a man who was but a porter in England, carried packages from trains on his shoulder, who attained such eminence as an entomologist in one of the branches of that science that he was visited by men from all over the world who were referred to him as the only authority in England from whom they could get the fullest statement of truth in his special department of entomology. And of course, although he continued his labor as a means of livelihood, his acquisitions made him the peer of the Fellows of the Royal Society and of the British Association for the Advancement of Science. This is an extraordinary case, but all education that increases the intelligence of a man tends in the same direction, and lifts him to be the peer of his fellow-men, and goes very far to remove the difficulties and discordonces between the laborer and the capitalist.

### IT INDUCES ECONOMY.

Second, it increases both his motive and ability to save money and to accumulate property. It was stated properly here this morning that education aroused new wants. It brings not only power, but it brings wants; but human wants are not to be treated as misfortunes, for it is by virtue of his wants that man rises really above lower conditions to higher conditions. The man who wants nothing is on a par perhaps with the clam on the sea-shore and would make no motion, would give no sign, would make no effort. Education, then, increases the wants and elevates the character and opens, not only new motives for industrial

Digitized by Google

activity, but new and higher sources of enjoyment to man. But the point I make now is that, other things being equal, the most intelligent laborer will earn most and save most, or be most likely to accumulate property. It tends to remove him, as you know, from the labor class to the capital class, to the class of employers.

### IT ELEVATES THE TASTES.

Thirdly, education elevates and refines his tastes and enjoyments; increasing thus his motives to temperance, in the indulgence of the lower appetites in order that he may have the means for the gratification of the higher appetites; tending, of course, to his peace and contentment, because he finds in them a source of enjoyment. The discontented class of laborers are not generally the intelligent class of laborers, and the discontent of the ignorant class of laborers grows out of the fact that they have so few sources of enjoyment which they can gratify, and those are all gratification of lower appetites, that call for and waste a good deal of money and of time in their gratification. But I will not dwell upon this.

### IT AIDS IN THE DISCUSSION OF LABOR PROBLEMS.

It gives to the laborer, fourthly, great advantages in the occasional and unavoidable struggles which must arise between the employer and laborer. I do not hold that any remedy can ever be found, legal, moral, or economical, that will prevent the occasional differences that arise from the simple advancing wealth and advancing conditions of life and labor. These necessarily arise from time to time. I need not stop to define them, because they are sufficiently obvious. In all the occasional differences or controversies between the employer class and the laborer class, as to wages, as to rights, &c., the educated laborer has this advantage, that his demands are much more reasonable; they are rational; they are intelligently conceived; and, therefore, he is much more likely to state them well, and, as a consequence, to secure his rights in the premises.

The great difficulty that has come from the labor struggles has come from the difficulty of making clear to both classes their absolute rights and interests in the case, and it has grown, very frequently, out of the ignorance of the laborers. To cite a fact: During the great railroad strike of 1877, if I remember, I was asked to address a large body of striking railroad laborers at a railroad center in the West. I undertook to state before them, in the kindliest spirit, and with most careful statement and limitations of it, the real relations between labor and capital, their mutual dependence, and their common interest, and to show to them that when there arose, unfortunately, misunderstandings between them, the remedy—the possible remedy, the best remedy, at any rate—did not lie in the direction that they were employing. They listened to me with great attention. It was in a large crowded hall, and some thousands of the laborers were present. Some of these very same auditors within ten days from that date found themselves in the penitentiary for their share in the subsequent operations. A large committee of them came to me at the close of the lecture and extended to me very cordial and, I have no doubt, very sincere thanks for the statement which I had made to them, which they said they agreed with, but that, unfortunately, I had left off where they wanted me to begin.

Digitized by Google

THE SOCIAL QUESTION AMONG LABORERS.

When I inquired as to where they wanted me to begin in the discussion, I found that they wanted me to begin with the statement of the social question; of their social rights, influences, privileges, and standing in the community, and that so long as they were in this condition they were not content with what they had.

Q. Did they comprehend what, in your judgment, was necessary in order that their social condition might be changed?—A. I think not.

Q. They did not comprehend this necessity of education or increased intelligence?—A. No, sir; and I do not think they comprehended really the economic facts on which they were acting and which I attempted to state to them. I think that the lack of intelligence is a very grave factor in this matter. I was about to say that in that section of the country almost the entire body of striking railroad operators were foreign citizens, of very limited education, generally ignorant, with scarcely an American citizen among them.

By Mr. CALL:

Q. What did they mean by their social condition?—A. The advantages for themselves, their wives and their children—that they were not occupying and holding the rank, position, and privileges that they were entitled to; they were "lorded" over by those railroad kings and others, and they were striking, as the fathers of the country struck, for their liberty and their rights.

Q. Because they were not invited to the houses of these people?—A. I do not know what they meant, sir. I did not go far with them. Having spoken an hour and a half I was weary enough to stop much further discussion. I found also that while they were not very intelligent, yet, as a child might ask a question that a wise man may not answer, they were ready to ask questions which they were not able to solve and which they were not even able to understand if solved for them.

Q. But did you understand that they were quitting the railroad positions because they had not sufficient social recognition?—A. Well, yes.

Q. Not because they were not getting enough pay?—A. Well, it narrowed itself down to the fact, in their comprehension, that they were not getting enough pay, and they thought that if they got enough pay they would get all right; but it would not come right.

INFLUENCE OF WAGES IN ELEVATING THE SOCIAL STATUS OF LABORERS.

By Mr. PUGH:

Q. I do not want to divert your thought from the line of your statement; but the question suggests itself to my mind, whether this social improvement—this social condition that you think is involved in this problem—can be reached without wages enough to enable them to do so. Do not wages, at least, lie at the foundation of the effort that they are to make to elevate their social condition and their social relations? Is not compensation sufficient to enable them to do so an indispensable element in that problem?—A. It would be indispensable if it were not that the country generally provides free education—indeed up to the highest grade. There is no grade of education in this country, nor in any of the public institutions of education that are not open and accessible to the poorest citizen and the child of the poorest citizen.

### WHO PAYS THE TAXES?

Q. Have you ever had occasion to consider or to make an estimate of the proportion of the revenue collected from the people which is paid by these workingmen, and out of which the appropriations are made to support public schools?—A. As all wealth comes as the direct product of labor, all taxation must come from the products of labor.

Q. It must fall on the products of the laboring classes?—A. On the laboring classes—the labor of the past and the present—the laboring classes are taxed in proportion, however, only to their property, and in most States with considerable exemption of, sometimes, homesteads, sometimes their necessary tools and various things; and yet, after all, as all taxes come at last upon consumers, the laboring class, being the most numerous, will ultimately pay the largest proportion of the taxes.

### ADVANTAGES OF CAPITAL IN ALL DISCUSSIONS WITH LABOR.

Q. Have the laboring classes the same power to protect themselves as the owners of these overgrown fortunes, that you speak of against the burdens of taxation necessary to support public schools. The owners of real estate, for instance, charge the rental with the taxes upon their property. Have the laboring class the same power to protect themselves against this burden as the large property holders have?—A. Allow me, in answering that question, to say that in my line of thought I am not just now dealing with the conditions of the controversy, or as to which side has the greater advantage in it; but, diverging, in order to answer your question, I would say the employer class—which is usually the capitalist class—has doubtless a very large advantage over the laboring classes, both in relieving themselves from taxation and in any controversy as to rights between them; because labor cannot subsist more than a very little time without employment, while capital can live upon itself for some time and outlast the laborer in the struggle. That is evidently true.

I am speaking now, however, of the advantages that the laboring class would obtain from an improvement of their education. And I shall speak at the close, of the remedy therefor, the way in which this remedy of education may be applied by the public; which, indeed, will be quite obvious.

### BEARING OF EDUCATION ON CHANGE OF EMPLOYMENT.

I think my fifth statement (if I have kept my numbers aright) is as to the advantage to the laborer that comes from the fact that intelligence through education widens his capacity and enables him to turn more readily to other employments when there is an actual glut in the market of labor in his trade. In the course of the industrial history of any community there will come revolutions in industry, new demands for things that are newly discovered, and the diminution of old demands—the demands for new kinds of labor, or the diminished demands for old kinds of labor, which, as in the case of the Spitalfields weavers, I have referred to, may be very disastrous to the laboring class. But an educated laborer, I mean the man whose intelligence and powers of thought have been increased, will much more readily turn away from that labor in which there is a glut and accept new employments and devote himself to new means of livelihood.

Digitized by Google

### IMMOBILITY OF LABORERS.

One of the old mistakes of the economists, and one perhaps that is held by a good many economists yet, is as to the mobility of labor; that it may be easily moved from one employment to another, from one locality to another, so that if it is left free it will flow naturally to the localities and to the employments where it can do best. As a matter of fact there is very little of that mobility. Men, ignorant men, especially ignorant laborers, find it exceedingly difficult after they have grown up to go from an employment in which they have acquired a certain amount of hand skill to another and better employment, and so they suffer great privations by adhering to employments that have ceased, perhaps forever. It has been found in England that a shilling a week difference in wages between one parish and the parish adjoining it could not tempt laborers who were in an almost suffering condition out of the old parish into the other.

### IGNORANT MEN NATURALLY TIMID.

The ignorant man is naturally timid and suspicious, and he does not move naturally from one place to another. He does not know what would happen to him. What he wants is employment; he does not want to take risks. The intelligent laborer, on the contrary, has that large capacity and intelligence that will enable him to pass from one employment to another kindred employment, or from one community to another community, and thus he gets an advantage. I am only enumerating some of the advantages that accrue to the laborer by education.

The CHAIRMAN. I think that your suggestion—one that we have not heard from any other witness—is one of very great force, and laborers in large cities are very apt to be unjustly blamed because they do not go outside upon the land. It is almost impossible for these men to do so. It is like asking them to go to the moon or to the stars. Unless help comes from outside they cannot do it.

The WITNESS. Yes; that is an instance of the immobility, as I would term it, of labor.

### LABOR UNIONS BENEFICIAL IF LABOR BE INTELLIGENT.

I would say that, in the sixth place, labor unions—which in some form or other are traceable in history from the time of the Pyramids to the present time—would be not only harmless but useful among a body of well-educated men. It is among the ignorant and vicious, the ignorant if not the vicious (vice perhaps follows ignorance very frequently)—it is among these, the laborers of no trade, that labor demagogues get their following. I do not mean to speak disparagingly of men who are seeking to promote their own advantage in the conditions of labor; but we all know that there are among the laborers those who trade upon their sympathies; that these demagogues get their following from those who are ignorant, and it is among them that they propogate their destructive doctrines. Doctrines that would not be entertained for a moment by intelligent workingmen are received and fed upon and become the means of excitement to the ignorant laborer. His ignorance makes him subject to this.

### OTHERWISE INJURIOUS.

The labor unions, therefore, become tyrannical over an ignorant class. In the nature of things brains will govern bodies, and the best brains

Digitized by Google

will govern most; and in any circumstances a brainy man put into the leadership of very ignorant men, unless he has the benevolence and the justice of a saint, is strongly tempted to use his brain-power over their ignorance for selfish purposes, or, at any rate, for fanatical purposes. And it makes it, therefore, exceedingly dangerous to the laborers themselves to form unions, since their unions may have only the effect to cripple or fetter themselves and bind them convenient to the hand of the man that governs them. The unions also in their controversies with their employers, or the employing class, are constantly being thrown into a disadvantage by the fact of the ignorance of very large numbers of the laborers themselves. I do not think that labor unions have flourished much among native-born and native-educated American citizens; but they have flourished, and flourished most in the countries where the laboring classes are most ignorant.

### STRIKES.

And it is in those countries that the laboring classes have been thrown most frequently into strikes. I remember that only some two or three years ago a very eminent economist, writing in the columns of the Revue des Deux Mondes, the leading periodical of France (if not of the world), stated as a fact that *grèves*, as the French call them, or strikes, were epidemic in France, and showed that this epidemic character of the strikes, as he said, grew out of this depressed and debased intellectual condition of the French laborers who were made to believe the most preposterous statements as to their rights and privileges, and as to the motives and actions of the employer classes.

As I have said before, labor unions would not only be harmless, but they would be an actual benefit, because they would be organizations for mutual advancement in social and in industrial or economic conditions of intelligent men, and they would be powerful always in the settlements that might arise in the revolutions of industry between the employing class and the laboring class.

### CO-OPERATION.

Most modern economists have felt that one of the great reliefs to come to us in regard to this antagonism between labor and capital must come ultimately in the matter of co-operation. Co-operation has been tried in a good many ways—both productive co-operation and distributive co-operation—that is, co-operation as laborers, as partners in a common enterprise of production, and co-operation of the classes in the mutual sharing or distribution of products, as in the mercantile co-operation. Many of them, however, have failed—so many as to have largely discouraged co-operative enterprise. I have very largely studied the history of many of the co-operative enterprises of the country, and of the world, and I think that their failure, in almost all cases, can be traced directly to the lack of intelligence on the part of the great body of the co-operators. Co-operation cannot take place without common sympathy and common understanding. The ignorant man is too timid and too suspicious to make a good co-operator either in production or in distribution; co-operation, therefore, has never had a fair trial, because it has been practiced (when practiced at all) among many of those who were too ignorant to understand what the methods of the operation were, and what results were reasonably to be expected from it. Therefore, I hold that the progress, and the large progress, of

Digitized by Google

the laboring classes, lies in co-operation. The principle of co-operation is opposed to competition—these two being the only known forms of the labor struggle, so to speak.

Those are the statements that I would make at large; they are not exhaustive by any means, of the good that would come to the laboring classes by the increase of intelligence. Can the remedy be applied? It is not enough to say that if you "bell the cat" you can always hear the bell. But you must first find somebody to bell the cat. It is not enough to find that a remedy would cure the disease, if you find that the remedy cannot be taken by the parties for whom it is intended—that the stomach of the patient will not hold the medicine.

### EDUCATION: OFFICE OF THE GOVERNMENT IN IT.

Shutting out the economic view for the present, without ignoring it, (without denying it, certainly), I wish to say that the educational remedy is not in the hands of the people themselves. If it were, it would be too costly, and too difficult to apply. It is at this point that the Government can do most, in my judgment, for the remedy of the great difficulties that the nineteenth century is bringing about between the labor classes and the employer classes.

### POPULATION OF THE GLOBE ENORMOUSLY INCREASING.

To understand this difficulty, and the extent of it, I may be allowed to make this further remark: There are two facts in regard to the condition of humanity at this hour, on this earth, that never before existed. The globe has a larger population by one-half than was probably ever living at one time on its surface, and a population that is increasing more rapidly than it was ever before known to be increasing. I think that in my boyhood it was stated by the statisticians of the day that, in round numbers, the population of this globe was between 800,000,000 and 1,000,000,000; accurately it could not be obtained. The German statisticians, who publish an annual statement of the population of the globe, count the present population of the globe at nearly 1,500,000,000, or nearly twice as much as it was within the memory of living man.

By the CHAIRMAN:

Q. Do you not think that a part of that may be accounted for by the fact that we have a more correct census in these later times, and that the number of people who lived fifty years ago may perhaps have been larger than was estimated?—A. Possibly, but taking Europe into consideration, and leaving out our own country, as abnormal, because of the increase by immigration—Europe had a population in the Roman Empire its palmiest days of not over 180,000,000. It was reduced by the wars at the time of the invasion of the barbarian hordes to less than 80,000,000. It increased slowly during the middle ages, and within the memory of living men has a good deal more than doubled—has increased indeed until to-day on the soil that was occupied by not more than 180,000,000, in Roman times in its best days, there is now a population of 350,000,000, in countries in which the census has been taken with a good deal of accuracy for half a century, at least. And more than that: The census of British India is taken with almost equal accuracy, and shows there a very large increase—40,000,000 at least within the last twenty years. An eminent English statistician, I think the president

Digitized by Google

of the London Statistical Society—has so stated in a recent article. But in general I think we may affirm safely that to-day there are 500,000,000 of people on the globe more than there ever were at any one time before. We have supposed, in our land, that the growth of cities was wonderful. The growth of cities in Europe has been almost as wonderful. Anyone who has had occasion to visit Europe after ten years' absence, will find that any city with which he had become familiar in Western Europe, will have grown out of his knowledge by the increase of its suburbs. The increase at Brussels and Antwerp has been so large as to really be entitled to rank them with American cities in their growth.

### IMMENSE INCREASE OF WEALTH PER CAPITA.

The second fact that I had to notice was the immense increase of wealth *per capita* growing out of the vastly increased facilities and means of production of wealth. It is probable that to-day on the American continent, within these United States, there is machinery driven by steam power, requiring only easy supervision, that does every day between sun and sun more labor than the entire population of the globe could do if this population could be turned into skilled workers and work from sun to sun. The power, therefore, to produce wealth is vastly greater. There are those here that remember when in the country towns of this State a fortune of $25,000 was counted as very remarkable. You have more millionaires to-day than you had then people of a fortune of $100,000, or of $50,000, simply because there has been a vast accumulation of wealth. This accumulation of wealth has itself facilitated, and has at the same time been produced by (it is both a cause and an effect of) this gigantic growth of corporations which were impossible fifty years ago, and will grow, with the steady increasing productive power that science and invention are giving, to a point to which no man can look. Now, evidently, the difficulty that to-day exists is only to be intensified if the population of the world remains in the same condition as to intelligence and civilization, because the disparity between the laboring class and the employer class is going on to increase more rapidly in the next quarter of a century than in the last quarter of a century. It was a law announced by Turgot, the great French statesman and economist, that in the long run the wages of labor will be at the living point of the laborer. That in the competition of laborers the wages will always go to the living point. Of course that living point rises or falls with the intelligence of the laborer. There will come an advancement, therefore, in the laborer's condition, so that as he to-day wears better clothes, sleeps in a better house, eats a greater variety of and better food than was given to the nobles of the time of Henry VIII or Elizabeth, he will go on increasing in the material points. Yet the disparity of which I have been speaking between him and the employing class is becoming all the time larger, more conspicuous, and therefore more galling.

### DIFFERING RELATIONS OF INTELLIGENCE AND OF IGNORANCE TO WEALTH.

You may never destroy the employer nor the laborer class. You can never merge them absolutely into each other. The only thing that you can do is to lessen the disparity between them. But that disparity cannot be lessened as a simple economic fact. It will have to be lessened, if at all, as an intellectual fact—a fact of civilization and morals.

Digitized by Google

And you can rely upon an intelligent population ultimately to come to an understanding of these interests; but you cannot rely upon an ignorant population. In the presence of an ignorant population wealth stands as a menace and as a bribe. Wealth threatens them with overthrow and oppression; it attracts them to spoliation. You cannot prevent that ultimately; they will revolt against it as an oppressive power, or that they will fling themselves upon it as upon a spike, if things go on—at least that is the tendency. I do not believe that they will come to that. I believe that mankind, as a whole, is competent to the care of mankind, as a whole; that the thoughts of the millions are always more wise and more intelligent than the thoughts of any one man of the millions—that the millions will ultimately solve a problem that no one man, however wise, can solve; and that, therefore, they will ultimately be solved in the direction I indicate.

EDUCATION SHOULD INCLUDE TRAINING OF THE MORAL POWERS.

I ought to add this much to my statement about education; that is, that education should include the moral nature, especially in the formation of proper moral sentiments—sentiments of patriotism, philanthropy, and justice among men. And I think that the education of the country needs to be advanced in that respect, perhaps more than in any other, that which shall bring to the knowledge of the children of the people these great facts of human relationship—the simple elements of political economy—of the true connection and mutual interdependence and mutual helpfulness of labor and capital; the fact that these two classes must exist, and that the balance of enjoyment between them is not as great as they themselves are disposed to think, and that they have no reason to feel any very great envy or jealousy.

I do not think of anything else at the moment. I have confined myself, as I supposed that was my proper sphere, to treating education as an economic force, and as involved in the economic remedies of the economic difficulties.

Q. And in that connection are there any practical recommendations that in your judgment this committee could make to Congress promotive of the interests of the people in the way of education; what can we do, or what would you suggest?

NATIONAL AID TO EDUCATION.

A. Well, it is a very obvious suggestion that in those sections of the country in which the census shows that illiteracy prevails Congress should give aid to overcome this illiteracy, which of itself is a very large political menace, but a very much larger economic, and social menace, as it seems to me. And it is the common opinion among practical educators, and those that have dealt most largely with the education of the country, that it is the duty of Congress to intervene with national aid to secure the education of the illiterates, whoever they are and wherever they are, especially in large sections of the country. And it is the more so that illiteracy has this one very baneful symptom—the illiterate man never appreciates the disadvantage of his position. He cannot appreciate the advantages of those things of which he knows nothing. It is, therefore, to the interest and safety of the country to raise him out of his illiteracy. I think that no good citizen would deny that whatever is necessary for that purpose should be appropriated without hesitation and without delay.

THE VIEWS OF EDUCATORS WITH REGARD TO IT.

Q. What have been your opportunities of learning the sentiments of educator throughout the country upon this subject?—A. Thirty years' association with the guild, and frequent conferences with them in the educational conventions of the country, with which I have been associated many years, have given me opportunities to hear expressions of their opinions—expressions not made simply in debate or conversation, but in well formulated and almost universally adopted resolutions to this effect.

Q. Have you come in contact with this same class of men in all sections of the country?—A. To some extent. I believe I have been in every State of the Union, except Florida, which I hope some day to visit. And in every State of the Union, I may say, I have visited institutions of learning, higher or lower; and in almost every State of the Union I have made educational addresses and met educational audiences, so that I have had occasion to make more or less acquaintance throughout the Union in educational circles. I have found little or no difference of opinion in lines of latitude or longitude in the educational sentiment on this point. I think that the few exceptions I have met of those who dissent from it are of the class of men that have adopted the notions once promulgated by Henry Barnard, of Connecticut, as against free education, namely, that that which costs little or nothing will be valued at little or nothing—a principle that does not apply in education, simply because the education cannot be appreciated by him who knows little or nothing of it; and by the time he is educated to appreciate it, he has already partaken of the benefits of it, and it is past the time when the question could be raised. Then, I answer further, from the obvious fact that no educational system within reach of the wealthiest people can do the work of the education of the people. There is not an institution in this country, I venture to say, above the grade of the common school, or even of the little primary school, that could support its force and do its work from any income that it is likely to get from the pay of its pupils. There are institutions that make money out of boarding scholars, but I do not know of any one which could live and pay its bills on the fees for tuition as paid by the people, or such as the people could pay.

By Mr. CALL:

Q. I appreciate very highly your views on the subject of the education of labor. You said you thought the world would always be able to take care of mankind?—A. In the long run.

WISDOM INHERING IN THE MASS OF MANKIND.

Q. And that there was more wisdom in the millions than in any one man?—A. Yes.

Q. Upon what logical idea do you base the proposition that a multitude of ignorant men or of less intelligent men will have more wisdom than the minority of more intelligent men?—A. I regard it as a simple fact of history that all the leading discoveries have been but a single step in advance of the moving convictions and intelligence of the age. The man who first gets upon the top of the hill and so first sees the sun rise did not create the sunrise. If he had not discovered it just as he had, why, within an hour afterwards somebody else going in the same direction would have discovered it.

Digitized by Google

Q. Somebody else would have seen it who should have come to the same place?—A. Yes; because of the simple fact of advancement. I may seem to be exceedingly metaphysical in this matter, though I do not think I am. I think that there is a steady progress in the main intelligence of the masses of humanity going on in certain directions produced by the circumstances that are overcoming their thoughts in some direction—one man adding a little and another a little to the store of thought. What one man adds becomes common to all men, and speedily the body of thought grows and the body of intelligence grows, and the last discovery of the man who formulates has simply expressed what the millions were thinking, but could not speak.

Q. Well, you manifestly do not think they have arrived at that claim of equality yet, or at any time in the past, do you?—A. No.

Q. Otherwise this educational scheme would not be necessary?—A. If the solution of the economic problem of the antagonism of labor and capital has to wait until you can produce economic equality, or property equality, then it is never to be solved.

Q. Or equality in intelligence, either?—A. Or equality in intelligence.

## SOCIAL ECONOMY DISTINGUISHED FROM POLITICAL ECONOMY.

Q. You must have some other factors, then, that are not based upon bringing everybody up to the same level exactly?—A. Yes; it is as I said at the outset. I, as an economist, discriminate between pure economics, in which there are questions simply of productive forces—production and distribution under natural laws—and social-economics, which really is a segment, or section, of social science—that segment in which wealth comes in as a social factor. The social problems will always be problems of "two unknown quantities," as a mathematician would say—two sets of unknown quantities. And the problem will never be solved by a single or simple equation that should state the conditions of one unknown quantity. There must be always a combination of equations, each one of which states the fact as to that unknown problem. Every social problem has two sets of factors—the social and the economic factor, and it can never be settled as a simple economic question any more than it can be settled as a simple social question. I hold, therefore, that your tariff question cannot be settled as a pure economic question—it is a question of social economy—and the question of labor and capital can never be settled as a mere economic question—it is a question of social economics.

## EFFECTS OF EQUAL AND UNIVERSAL INTELLIGENCE.

Q. Suppose you were to give to everybody the same degree of intelligence—the same conditions of the unknown quantities—the same degree of *belles lettres*, intelligence, and of philosophical intelligence, and even of wealth—how would it be?—A. They would be different before night.

Q. Would the social status be changed?—A. No, sir; they would not have time to become really equal in intelligence.

Q. But, assuming that that could be done, would they consort together and have the same tastes; would they dress alike, and like one another's looks equally well—as contradistinguished from what they do now?—A. No, sir.

Digitized by Google

Q. Some other causes then would operate besides?—A. Society will have its cleavages by many lines of affiliation.

Q. People would still continue to like one man better than another, and one woman better than another?—A. Yes.

Q. Although they may be of exactly the same intelligence?—A. Yes.

SOCIETY NOT INJURED BY ITS GRADES OF DIFFERENCE.

And I do not think it either an advantage or a disadvantage to society to have either its horizontal or its vertical "cleavages," as I would say. That is, society advances by mutual resistances as well as by mutual co-operations by the contributions of opposites and differences, as well as by the agreement of those that are in accord. Therefore, I never expect to see human society, even in the better land, on a level.

Q. That is the unknown quantity, then, that you cannot realize?—A. I do not ever expect to see human society reduced to the dead level of any one class. Nor do I think that it is needful either to the happiness of men or the advantage of society.

SOURCES OF WISDOM IN GOVERNMENT.

By Mr. PUGH:

Q. If it be not true that a greater and a higher degree of wisdom exists in and must be evolved from the masses of our people than is to be found in one man, does it not follow that our system and experiment of Government ought to be displaced, and a one-man government substituted for it? In other words, if one man has more wisdom than is to be found in the masses, does it not follow that our people are not capable of self-government?—A. I think so, sir.

By Mr. CALL:

Q. Do you not give any place to the qualities of heart in the matter of wisdom of government? You must have wisdom and goodness together.—A. I am very much of the opinion of old Socrates, who counted wisdom and goodness as one; they are so nearly alike at any rate that they are not for any length of time separable; and, if I did not think that virtue was logical and vice illogical, I should have no faith in humanity.

Q. Do you not think that a very wise man may be a great rascal?—A. Certainly. The divorce may take place.

Q. And has taken place not unfrequently?—A. Yes; but I think that the moment he becomes a great rascal he becomes a great fool.

Q. Intellectually?—A. Well, wisdom is not simply intellectual power, but the application of it.

Q. You do not think the first Napoleon was a fool, do you?—A. He verged on towards a folly that ultimately ruined him.

Q. But still in intellectual capacity he was as sound a man as you would be apt to find?—A. Yes.

Mr. PUGH. Mr. Gladstone agrees with you, Doctor, although he is a monarchist, that a higher degree of wisdom is to be found in the mass of the people than in any one man that ever lived. He differs with my brother Call.

Mr. CALL. I am not expresssing my opinion on it, but only asking

Digitized by Google

the witness how he arrives at the result that a man more intelligent than all the others has not more knowledge than all the others, whether that is not a contradiction in terms.

The WITNESS. The statement, of course, has to be taken with the strict limitation that I put upon it; that in the advancement of the human mind in intelligence and towards the solution of the problems that meet us in civilization, it is the experience, the thought, the intelligence of the masses, of the millions, that contribute the ultimate solution. Although some one man may interpret that solution finally, he does not create it.

Mr. CALL. Oh, no; the aggregate wisdom promotes intelligence, and the highest intelligence, in the minority; and the single man or discoverer is not a discoverer by virtue of any inherent power in himself, but has gathered it from the concensus of the past and present of mankind.

By the CHAIRMAN:

Q. Do you think that it is a supposable case that any one man should know as much as all other men?—A. No, I do not.

Q. Then the whole discussion proceeds upon an impossibility?—A. Yes; taking it in that view. I would, however, beg to have my statement restricted to the exact conditions.

The CHAIRMAN. I did not understand your statement to involve the assumption of an impossibility; but I thought you were being questioned upon that assumption.

Mr. CALL. Let us see. Your proposition is that no one man knows more than all the rest of mankind.

The CHAIRMAN. I offer no proposition; but I am not averse to doing so, if you wish to discuss the matter.

By Mr. CALL:

Q. With regard to your proposition, Doctor, I merely asked the ground on which you assumed that ninety-nine men would possess more intelligence than the most intelligent of these men, and whether that man might not for the occasion and the time being be the wisest man, not for the whole past of the human race but for the time being. Take Julius Cæsar, for example; we will suppose that he was superior, intellectually, to the mass of the men that he commanded—the men constituting the great armies that he controlled. I suppose there is no doubt about that. By what logic do you demonstrate that his men in the aggregate were wiser than he was? What force is there in that proposition? It leads up to the proposition that I was asking you about; whether a plane of perfect equality could be found by any measures, economical or otherwise, which you repudiate. You say that you do not contemplate a state of society where every man should be on the same place, or be as wise as every other man.—A. There are certain spheres of knowledge in which the mass of mankind do not intrude, and the man who, by virtue of his opportunities and knowledge, does enter these spheres knows what the masses probably never will know.

Mr. CALL. Undoubtedly that is the practical application.

The WITNESS. Sir Isaac Newton, in the discussion of his *Principia*, went into the realm of the higher mathematics, where the experience of mankind does not go at all. Such cases as that would lie outside of my proposition entirely.

Digitized by Google

By Mr. CALL:

Q. So you might say of the abstract applications of the great principles of mechanics. Of course it is manifestly impossible for the mass of mankind to engage in the applications of electricity, to which Edison and other men are now addressing themselves.

IS CAPITAL "CONSERVED LABOR?"

I should like to ask you another question. You speak of "conserved" labor, and with a great deal of force. As an economist, I should be glad if you would give me an instance of conserved labor.—A. Suppose a woodman goes into the forest to-day and chops down a tree, trims it up and produces a saw-log. To-morrow he sells that saw-log to his neighbor, who wants it. What is it that he sells to him—suppose the forest to be free? That other man can go in and get what he pleases. And the man of to-day might go in if he chose and chop down a tree and produce his saw-log and do with it what he pleased. But there was so much of the labor of producing the lumber or boards which he wants that was done yesterday—which is conserved in this product—that he prefers to pay for it already done. That is the only sense in which I used that term "conserved labor." He buys that conserved labor, and that is what he really buys in buying that saw-log, because it lessens his labor by so much labor as was expended upon it by the other man. He must either buy to-day's labor or yesterday's labor. That saw-log represents capital.

Q. Then the duration of that capital is only for the time that the saw-log exists. When it is gone what becomes of the capital then?—A. The profitable consumption of one form of value gives rise to the existence of the value in another form.

Q. Well, we will take the saw-log. It is put in a house and continues to be capital. After awhile it decays and is taken out; where is the capital then, or where is the conserved labor, when the plank that was made out of the saw-log is destroyed, or has perished in the natural course of things?—A. The ultimate form of value is force.

Q. But tell me about that log. Does it still remain in the world as conserved labor, or has it gone?—A. The house, so long as it remains, is a representative of it.

Q. But suppose that plank decays and you have to take it off and put another one in its place?—A. Well, the log united with other capital has produced a house.

Q. But we must stick to the log.—A. I stick to the log so long as it is in the house.

Q. Well, I want to know what becomes of it, or of the "conserved labor," when this log has perished. Where is the capital or "conserved labor" then?—A. The house——

Q. [Interposing.] But I want you to hold onto that log.—A. I did not mean that the capital exists in its conserved form in the same way.

Q. Suppose the log is sawed up. In the course of time it will decay. It may be in one generation or it may be in two. It certainly will not last forever. Now, what has become of the conserved labor when the log has perished? Has it disappeared entirely from the world, or is it still a living factor in the shape of capital?—A. It may be there. It may have been consumed in the use of the house without producing anything of value. It may have been consumed in giving shelter to a

Digitized by Google

laborer, conserving his vital heat and energy which he having thus conserved puts into new products, just as a manufacturer finds it profitable to buy a machine, and in the course of time steadily, year by year, the machine wears out. Has he lost the value of that machine? No.

Mr. CALL. I think so. According to my idea, he has.

The WITNESS. No. If he did, then buying a machine is a losing business; it is a losing business, unless the machine wearing out has produced new values not necessarily of the same material but of some new material on which it has worked.

Q. The point of my suggestion is whether or not this great question of labor and capital, and the measures by which labor is to be relieved and benefited, is not a question of the direction of the energies of society, of man, and of labor, and whether the definition is not a false one that capital is "stored up labor," that it is "accumulated wealth," as contradistinguished from the intelligent direction of the vital forces of life, the economies of business, and of the world?—A. Well, I should consent that, taken in its largest extent—taken not as a figure of speech or a statement of one aspect, but as a statement of the whole question, it is not true that capital is conserved labor, for labor is labor and cannot be anything but labor, and it cannot be conserved.

Mr. CALL. Precisely. That is right.

The WITNESS. So that it is in an accommodating sense that we use the words "conserved labor."

Q. It is a question, then, of the energy which shall profitably conserve the forces of life, mechanical and productive?—A. Yes; there is no doubt of that. At the top stands the man, and he interprets all.

Mr. CALL. Precisely; so that the laborer being an operative in the factory, who, by force of character, of will, and of intelligent adaptation to the purposes of life, becomes a director of the labor of his fellow-men in the manner most advantageous to them, is in fact a capitalist by employing and directing successfully the energies and labor of those around him.

The WITNESS. Yes; doubtless.

Q. And hence the regulations which you want are to adjust the relations of those employing or directing men to those who are employed?—A. Yes. In speaking, too, of classes as likely to be permanent classes, I do not wish to be understood as saying, or desiring it as a fact, that laborers should forever remain laborers and capitalists forever capitalists. I would leave to the laborer the largest liberty to rise from the class of laborers to the class of employers. I think that the natural evolution of industries, and indeed of all mechanical movement, lies in the constant evolution from the lowest to the highest, and that the movement is onward.

Q. Yes; I think that is within the scope of your idea, and that was the reason I put that point. You think that intelligence and education develop that capacity to merge from one into the other, and bring the laborer up from one into the other?—A. Yes.

By the CHAIRMAN:

Q. But without diminishing, I suppose, the number of laborers?—A. Yes.

Q. That is to say, that the same man combines both capacities more and more?—A. Yes.

Adjourned.

NEW YORK, *September* 22, 1883.

The committee met at 10 a. m.

GEORGE STORM sworn and examined.

By Mr. CALL:

Question. Please state your residence and occupation.—Answer. My residence is 125 East Thirty-ninth street. I am a manufacturer of cigars, and one of the members of the firm of Straiton & Storm, of this city.

Q. You are engaged in the manufacture of cigars in New York City?—A. Yes, sir.

Q. Are you very large manufacturers?—A. Yes, sir; in all probability the largest in this country.

Q. Probably the largest in the world, are you not?—A. I should think so, excepting the Government factories of France, Italy, or some of the other European governments.

Q. Will you give us some idea of the extent of your business, if it is agreeable to you—if there is no reason why you do not wish to make it public?—A. We employ in the prosecution of our business about 2,200 operatives, of which I should say about 60 per cent. were males and 40 per cent. females. These people are engaged in the various branches appertaining to our trade, and produce about 250,000 cigars per day, the result of whose labor we dispose of throughout the United States, and have at various times exported some to England, the coast of Africa, and to Australia, and in one instance to Germany.

Q. We should be very glad to hear from you a statement, in your own way, in regard to the relations which you sustain to your laborers, the compensation you pay them, your manner of adjusting differences in regard to compensation, and your general economies in that respect—anything touching the question of the relations of labor and capital in your own business?—A. I have furnished myself with a few figures which I suppose it would not be remiss to refer to, would it?

Mr. CALL. Not at all. We should be very glad to hear anything you have to say on the subject.

### THE QUESTION OF CAPITAL AND LABOR WORTHY OF SERIOUS ATTENTION.

The WITNESS. In the first place, gentlemen, I believe that the question of capital and labor is worthy of our most serious consideration. I think that especially true in this country, where the Government rests so directly on the will of the people, and where those coming under the head of wage-workers have the same political rights that are accorded to people who are supposed to be capitalists. And, in speaking of this subject, I do not propose to inquire as to the origin of capital—why some people are capitalists and others laborers. So far as I am concerned, I am quite willing to leave that to those who can find profit in such matters; they tend to befog me in coming to any rational conclusion on the subject. But, it is quite sufficient to know, in treating the subject at all, that there is a large proportion of our population who depend upon their labor for the maintenance of themselves and families. They seek, in their own way, to ameliorate their condition—to solve the great problem that we are all trying to solve for ourselves in this world—to gain all that we can in the shortest possible space of time.

Digitized by Google

### STRIKES: HARD FEELING ENGENDERED BY THEM.

Now, then, to accomplish this end, the only method that is apparent to them, or at all possible, is to organize. Once being organized and feeling their strength, either real or imaginary, a demand is made upon capital, and the organization is used to enforce this demand. In making this demand, there is either something in the manner of its making, or in the fact of the time being inopportune—at any rate, quite frequently, capital refuses to yield to these demands—a strike follows; and, before this war terminates, both sides suffer, serious losses are incurred by both sides—those on the side of the workman, generally speaking, being irreparable; while capital, if it triumphs absolutely, may recover its losses. The great misfortune in such a strike, however—far greater, in my estimation, than the pecuniary loss that is suffered at the time—is the hard feeling that is left at the time that the strike terminates. The strife has, doubtless, been embittered (at least that has been my experience) by the employment of falsehoods and calumnies on both sides. And when the strike ends, the vanquished will reserve to themselves the right to renew it at a more opportune time. It is, therefore, not a peace, but a truce.

### STRIKES NOT THE WAY TO SETTLE DIFFICULTIES.

I am of the opinion that that is not the proper manner in which the relations of capital and labor should be adjusted. A strike, as I understand it, is the employment of force, in which reason and justice play but a very small part. And when a strike is once inaugurated, those among the work-people who are the most unreasonable and loud-mouthed, are looked upon as the leaders. It is a marvel to me how people, who have so much at stake as the work-people have, sacrificing all that they have to depend upon for their livelihood, can so blindly follow the leadership of such men.

### LOCK-OUTS.

"Lock-outs" are another species of strikes, and an illustration of the employment of force, that becomes a question of endurance as to who shall be the victor and who the vanquished. And the only excuse, in my opinion, that employers have for resorting to a lock-out will be found in the fact that one wrong begets another. People claim sometimes that the interests of the workman and the employer are so closely interwoven as to become almost identical. Does it not occur to their minds that if this is so the differences that arise between them ought to be a subject for calm and dispassionate deliberation, and force should only be resorted to when all other methods have failed? The principle, as understood by trades unions, and, I am sorry to say, by employers, quite frequently is to knock one another down first and argue afterwards. Now, I do not believe that to be the correct manner of beginning. I think I would like to argue first, and take my chances of a knock-down afterwards. Of course the two elements believe that they are naturally at enmity—that there is nothing that can come from the one which can benefit the other. They believe that; in fact, that is their catechism.

### EMPLOYERS NOT BLAMELESS.

The employer is not blameless in this matter. We will assume, however, that he is willing to accord to those whom he employs the rights

Digitized by Google

that justly belong to them. Now, in approaching the subject from that stand point, he must disabuse his mind of many old theories. The notion of master and servant has no place with him. He ought to remember that these people are members of the human family, with certain claims upon society, and certain rights under the Government, which neither he, as an individual, nor the people at large ought to ignore; and he must not accept as strictly correct the principle that a workman or laborer is an article of merchandise, or occupies precisely the same position as an article of merchandise, which, having been bargained for and secured at a price satisfactory to the buyer, he may then take such means as seem to him best to dispose of the article at its highest value and profit to himself without giving the article any further consideration. It would be well to bear in mind in the employment of human labor that that which we employ or bargain for is a living, thinking being, and though we may secure its labor and its skill for a certain consideration, we may have left its mind in rebellion and ready to break forth at any moment against the task that has been imposed upon it. My experience has been that such labor is neither profitable nor satisfactory in the long run.

### THE LABORER'S VIEW OF CAPITAL.

The laborer, on his part, looks upon capital with a great deal of suspicion. He does not believe that the employer will ever yield anything that he is able to retain; and, in fact, he does not think that anything good will ever come either out of his employer or out of Israel. He cannot understand it; and he takes the concessions that at times are made to him rather as an evidence of weakness than a desire on the part of his employer to be just. And I have often thought that these people value that which they obtain rather by the difficulty of its procurement than by any other standard. That which they secure from a strike seems to afford them more satisfaction than that same thing, or one like it, yielded without the employment of force, or the incurring of any loss on their part.

### ARBITRATION.

I believe that arbitration, as a means of adjusting the differences that occur from time to time between labor and capital, can be made serviceable and beneficial to all parties concerned. But, at the outset, each side must approach the subject in a spirit of fairness, prepared to yield when they find themselves in error. And, in fact, that very point, in my estimation, is one of the most unfortunate features in a strike. There may have been an error committed, ruination may stare them in the face, but, having taken their stand, they propose to fight it out to the bitter end. Now, in arbitration, where calm judgment is supposed to prevail, where the questions in issue are argued over and weighed as to their correctness, &c., such false and extreme positions are not likely to be assumed. The employer must necessarily play the more prominent part in an effort to adjust, by arbitration, the difficulties that may arise. His experience as a merchant, and his intercourse with men of a different stamp, probably—more intelligent than the work people usually are, or can well be—will enable him to bring to bear upon the subject more experience and more intelligence, and he must necessarily be forbearing with his work people. He cannot expect that a man that sits at his bench eight or nine or ten hours a day, with his thoughts engrossed with his occupation, should be as familiar with the effects and

Digitized by Google

causes of various things in their relation to commerce as he who is in daily communication with the people who are engaged in commerce and sees its workings and effects. He will encounter, and must be prepared to overcome, considerable ignorance among his work people. There are some who will be unwilling to understand it; others again that probably could not if they tried. His reliance must be rather upon those men—and they will always be found, and found, I think, in majorities among the work people—who have an interest in their occupation, and in the stability and continuance of it; and though they want to get all that they possibly can, which is quite natural, for their labor, they are unwilling to enter into a strike for its procurement. They are quite content to receive it in a feasible manner if it can be so obtained. These I find, as I said before, in spite of all the difficulties that we have with the unruly spirits among our work people, to constitute the majority among them; that is, so far as my experience goes.

### DIFFICULTIES IN APPLYING ARBITRATION.

Now, in the effort to establish arbitration, as I said before, the employer will doubtless find many things that are disagreeable. He must expect to be abused roundly by those who are unwilling, for reasons of their own, that that should be the method by which difficulties should be adjusted. He will find not only that by manufacturers in the same line of business who either are unwilling to attempt the experiment, or, for reasons of their own, will sneer at it. But if he will but persevere, and convince his work people that he is determined to be just, and to give all questions arising his fair and just consideration, with a determination to yield all that belongs to them, he will succeed. There must in this be a certain amount of firmness, coupled with a desire to be just. If the work people, on their part, can be made to understand that, all things being equal, they will receive just as much compensation, and just as fair treatment by the tribunal that he and they have established for the adjustment of these difficulties as they could possibly obtain by the employment of force and resorting to strikes (which would cause them losses), they will hold fast to the plan of arbitration with a determination not to allow these loud-mouthed agitators that usually control work people to get the upper hand of them, or to upset that which they find beneficial. It would astonish you to see with what tenacity these men hold on to arbitration through all trouble, and there has been much of it, but the employer, as I said before, sometimes fails to give these matters impartial consideration. He is not always actuated by the purest motives.

### EMPLOYERS WHO CANNOT ARBITRATE.

I have had employers come to me to inquire about this method of arbitration, and how it worked, and, after taking all the trouble to explain it to them, they would say in a sly manner, "Well, I suppose you have it all your own way, don't you?" These people are unfit to have arbitration—they are tricksters. In speaking of arbitration, we must, therefore, leave all such people out of account.

### CIGAR-MAKERS' BOARD OF ARBITRATION: HOW CONSTITUTED.

Now, as to our experience with arbitration. I think it was in 1879 that this board of arbitration was organized. I will here remark, that

Digitized by Google

its organization was undertaken at a time when labor was very much depressed; when there was no immedate prospects of an advance in wages. Without going into the details of its organization, or the obstacles which we encountered, which I have already outlined, excepting to show how we tried to get the better element into the board, I will state that the entire body of our work people, divided into departments, elected from their number, annually, fifteen delegates. These fifteen delegates organized and elected from among their number five. Four of these five constituted the workmen's portion of the board of arbitration. The firm named three foremen, and these, with one member of the firm, constituted the four that represented the interests of the firm. We had another department that had its separate board of arbitration, elected on about the same principle as this—and when I say another department, I mean a different branch of our work—a branch that is entirely distinct, although those engaged in it are quite familiar with either. Now, in order to get a working majority we took the ninth member in this board from the "packers," as we call them. You will observe I told you there were five elected delegates originally, of which four went to the board of arbitration. Now, then, the fifth one elected acted in the same capacity in the packers' board of arbitration. So that there was really in each of those boards so constituted one individual that was not directly interested in either the work people or the firm, only so far as they were fellow-workmen. But that was neutralized by this, again in our estimation that the stoppage of the one (because of a non-agreement, if you please) would have thrown the other out of employment. Hence, there was a motive on the part of those to bring an adjustment about if possible.

By the CHAIRMAN:

Q. At the time of the organization of these two boards, was there a strike or suspension of work?—A. No; nothing of the kind.

Q. Was it with reference to a future arrangement of prices?—A. Yes.

Q. And to prevent difficulties arising?—A. Yes; there was no trouble that we could then see in the future. Prices at that time were low. In fact, there has been almost a steady advance from that time forward until now.

Q. Was it at a time of any special dissatisfaction on the part of working people, or uneasiness because their wages were not raised?—A. No, sir; it was rather the result of what had happened shortly before that time, the great strike that had lasted, I believe, for three months in New York, in which all the cigar-makers, packers, &c., were engaged.

Q. This led you to provide some method of security against their future occurrence?—A. Yes, against the recurrence of such things in the future.

Q. I do not quite understand (though you may have stated) whether there were more than these two boards, or do you mean to have it understood that you organized a board for each department of the business?—A. No; there were two boards, one for the packers and one for the cigar-makers, but the organization—the principle of it was about the same.

Q. Are there any other departments in the business besides these two?—A. Well, all other things, excepting packing, will come under the head of cigar-making. Now, then, this cigar-makers' (or "bunch" makers') board of arbitration adjusts all other things excepting things connected with the packers.

Q So that these two boards cover the entire mass of your working people?—A. Yes.

Digitized by Google

By Mr. PUGH:

Q. How is it as to the number engaged in packing and the number engaged in manufacturing cigars?—A. Well, the number engaged in packing would represent, in our establishment, probably 130 out of 2,200.

Q. One hundred and thirty packers out of 2,200 employés?—A. Yes. The packers are those who put the cigars in boxes; it is looked upon as the higher branch in our occupation, and the pay of those men is considerably more than that of the cigar-makers, and hence there has always been an unwillingness on the part of these people to have anything directly in common with the others. In order to satisfy this feeling it was necessary to create two boards.

By the CHAIRMAN:

Q. Fifteen were chosen, I understand, by the entire mass of working people acting together. Now, how were the fifteen divided between the two classes?—A. Between the two boards.

Q. Well, there were first fifteen chosen; were they selected principally from the cigar-makers, or were they divided in proportion to the relative number of the two classes?—A. It was in this way: the packers elected their delegates——

Q. They were how many—they were a portion of the fifteen, were they?—A. No. I will try to explain that. The cigar-makers, rollers, &c., and everything that did not constitute the packers—they, again, are divided, for convenience sake, in working them, into departments. They do the same work, only they are divided into departments, and under different supervision. These people, irrespective of their kind of work, or of their sex, elect fifteen delegates from among their number. The fifteen delegates so elected assemble a week after their election and elect five from among their number.

Q. Are any of these fifteen persons packers?—A. No; none of them. I wanted to cut my narrative short, and hence I omitted that point. The packers proceed in a like manner and elect from among their number seven delegates. These seven meet and they elect three. The three are to act with the board of arbitration.

Q. Three of their own number?—A. Three of their own number. Now, mark you, how they are put together. We have got five elected by the cigar-makers, to constitute the board of arbitration, and three by the packers. Now, then, we are going to form two boards of arbitration, one for the packers and one for the cigar-makers. Four of these cigar-makers constitute themselves the cigar-makers portion of the board of arbitration, to which we add three foremen and one of the members of the firm, that makes eight. These eight assemble and they elect one of the three packers that have been chosen to act with the cigar-makers' board—making nine. The packers' board, then, is reduced to two, to which we add a foreman and one of the firm; that makes four. You see it is a similar board and their interests are similar also. These four then elect one of the cigar-makers.

Q. One of the five?—A. One of the five. That takes that one away. He constitutes the odd member in the packers' board, and one of the packers constituted the odd member in the cigar-makers' board. That is the way that is put together.

The CHAIRMAN. I understand.

CHARACTER OF DELEGATES TO ARBITRATION BOARD.

By Mr. PUGH:

Q. What has been the character of the men selected for those positions by the cigar-makers and packers heretofore?—A. Well, they have,

Digitized by Google

I think, tried to select their best men. Of course, there may have been exceptions to this. But I will say this, that in the selection of their men, and even after they have been elected, the work-people display considerable watchfulness as to them.

One circumstance comes to my mind now that will illustrate. We had, for example, some one who was on the board of arbitration, and I looked upon him as a very violent socialist. He was one of those men who, I think, are agitators by profession, and I think that he was rather thrust upon us as a fire-brand by this particular element which exists among our people. And after his election it came to the knowledge of our people that, while, I think, in Bremen, he had absconded with the funds of a benevolent association.

Well, the work-people who had elected him sent a committee to the foreman and asked that the man be discharged; and the foreman inquired into the matter and found that they were quite correct, and got rid of the individual at once. I cite this as an instance to show that they watch carefully, and take into consideration the character of the men that they elect. Now, of course, we have got this to contend with, that men sometimes court the good will of their fellow-men, and we have had individuals in the board of arbitration that have steadily voted one way. No matter how wrong or absurd the motion may have been, so long as it seemed to be in the interest of the workingman, they have voted steadily that way. They, however, are the exception.

By the CHAIRMAN:

Q. Let me ask if in this general action, when, in the one case the original fifteen, and, in the other case, the seven delegates are chosen, all the employés participate and have the opportunity of voting—the females, as well as the males?—A. The females as well as the males; yes.

Q. They actually do participate?—A. Yes. We recognize and admit female suffrage.

Q. Do they ever choose females to represent them on the board?—A. No, sir; they do not.

Q. They do not usurp the offices, but leave the men to their natural rights as leaders, do they?—A. Yes.

Q. And notwithstanding that, they generally select good men?—A. Yes.

By Mr. CALL:

Q. Men are in the majority, however, among the employés?—A. Oh, they decidedly are.

By the CHAIRMAN:

Q. I suppose, however, that sometimes these men are elected by the action of these female voters, are they not?—A. Quite frequently; yes, sir.

Q. Are the men all on one side in the elections, and the females on the other?—Well, they have their preferences, and show them quite plainly occasionally.

Q. Do you think their preferences are based on fitness for the position, or on their feelings, as a rule?—A. I think they are based on their particular preferences.

Q. It would really be better if the ladies could be excluded, would it?—A. Well, I do not think it would.

Q. Do you not think that that difficulty exists among men as well—that their feelings sometimes influence them in the selection of those

Digitized by Google

whom they elect?—A. Well, I will say this, that in their preferences men are generally governed by the views entertained by those whom they elect, and which they have heard them express, whereas I find that the females do not take that into consideration so much as the particular affability of the individual, or something that pleases them.

Q. May not that be for the reason that the candidates are all selected from the male sex? If you made this an even thing all round, and took some of the candidates, as well as voters, from both sexes, may it not be that the males would show the same attention to the lady candidates that the lady candidates do to the men?—A. I should not be surprised.

By Mr. CALL:

Q. How do you think it would be if the majority of the voters were women; would not they elect some women delegates?—A. Possibly. I think they would have a preference for the male sex though.

Q. You think the men would hold their own among them?—A. I think they would.

INTEREST SHOWN BY WORKING PEOPLE IN ELECTION OF DELEGATES.

By Mr. PUGH:

Q. You were speaking of the character of the men who constituted the board of arbitration. When they are elected are the merits of the different persons you have spoken of fully discussed? Do the work-people show great interest in the selection of the board?—A. They do show a very great interest, and discuss the merits of their candidates with as much warmth as probably would be found in a political contest.

Q. And the result of the elections have always been in favor of their best men?—A. Well, I cannot say that it has always been so.

Q. But as a general rule?—A. As a general rule, yes. And the people so elected look upon their position as one of great responsibility, and act accordingly. For example—and things of that description can only be illustrated by examples—when the board is about to meet for the adjustment of any question that has arisen between ourselves and our employés it is customary that each twenty-five of our employés should have a representative to present their case before this board of arbitration when it meets. Between the time of the call of such meeting and the actual meeting of the board the people elected usually refuse to converse, or be conversed with, on the subject that is likely to come before the board, an evidence that they propose to leave their mind unbiased, and meet the question when it is presented, when the board meets, and to render judgment on the evidence there furnished.

The same species of argument that people on strike usually fill themselves with and build up their courage with we had to encounter, namely, they take as evidence something that they have heard from somebody else.

It is the practice of men sometimes in speaking to each other of their wages, to exaggerate the amount that they earn. It took us some time to impress our people with the idea that in order to adjust those things we must have the truth.

I took it on myself on several occasions to call on other manufacturers to furnish me with the information, and found in many cases that our workman, in getting the like information by hearsay from some other workman, had been misinformed. All those things, of course, one has to contend with.

Digitized by Google

RESULTS OF FULL UNDERSTANDING BETWEEN EMPLOYERS AND WORKMEN.

It is gratifying to know that in the questions that have arisen between ourselves and our employés—and they have been both for an advance of wages and for the adjustment of different styles of work and the prices thereon, including reductions of wages—in no instance that I can remember now, has the line been sharply drawn, and the vote been five to four; but in the course of the examination of the subject—of the arguments made there—and by reason of the light brought to bear on the subject, the workmen on this committee have seen the question in a different form that they had imagined it at first, and one or more would usually vote with the firm. Again, on many occasions, those representing the firm—the foremen, and quite frequently myself—(I am on the board of arbitration as representing the firm)—have voted with the men.

By the CHAIRMAN:

Q. You have changed your opinion?—A. Yes. That is, I have had new light thrown on the subject and have had first impressions corrected, and it afforded me pleasure, and always does, to vote with them, because I want to remove the impression that the manufacturers will never yield anything to their men; that they can never see anything good coming from them. And the men, on their part, must necessarily feel towards the manufacturer as though he were willing to accord them that which of right belonged to them.

I think that when the two elements or interests have once learned to respect one another so far as these points go, that is, if they believe it, they will seek to come to a feasible conclusion, and to give to one another all that belongs to them under the circumstances, taking into consideration competition and the state of trade generally, which all enters into discussion; then when the result is officially reached they are satisfied. There is not a murmur.

During this last agitation, consequent upon the reduction of taxes of $3 a thousand on cigars, workmen—whether correctly or not—made up their mind that they must have a portion of that $3 a thousand, and they eagerly waited for the 1st of May to get the advance of a dollar which they claimed as their portion of the reduction. In many instances—and I watched it very carefully, because it was of some interest to me—the workmen of other manufacturers struck. Some as early as the first of April, some the second week in April, some the third week in April. And I purposely wanted to defer as long as possible the question which I knew would come.

In the first place I was anxious to see what other people would do; in the next place I wanted to see what confidence our work-people reposed in their board of arbitration, and whether they felt satisfied that they would obtain, without the loss of a moment, all that would be obtained by their fellow-workmen.

At the end of April, I think almost the last day of the month, a committee waited on me, and stated that in view of the reduction in taxes they thought they were entitled to a dollar advance on cigars, which was about the advance that had been yielded by all the other manufacturers throughout the United States. Well, I knew that something would have to be done in the matter, and I might as well have done it then; but I chose, in order to satisfy myself, to submit this to the board of arbitration. I so stated. I told them, what was a fact, that we were paying the highest wages that were paid, much higher than

Digitized by Google

some of our competitors, and that in any advance that should take place I should take into consideration our ability to compete, and labor constituted, of course, a very important part in the production of cigars, &c.

I deferred the assembling of that board of arbitration until after the first of May. Yet it was a time when everybody was excited. Some of the workmen thought this thing had to be done "right away," and "as soon as possible," and all that sort of thing. I purposely deferred the consideration of the question until after the first of May. Our men calmly awaited the time; evening came; they assembled; I suppose there must have been two hundred or more assembled to hear the proceedings.

By the CHAIRMAN:

Q. Please describe the assembly and how you conducted things. Did you preside?—A. No.

PROCEEDINGS OF AN ARBITRATION MEETING.

Q. Describe the proceeding, please.—A. The evening came; the hour was 8 o'clock. A portion of the factory was cleared out and made as presentable as possible. A table and chairs were fixed for the convenience of the board, and after that other chairs and conveniences for the delegates. I would remark here that those delegates that had remained after selecting the board occupied the position of delegates until the end of the year. This arrangement is made for these delegates so that in case there should be a member of the board absent his place could be filled right then and there. On this occasion that I speak of there were seats for those who represented the work-people—one in every twenty-five; and every interest in our establishment was represented, excepting the packers. Well, they assembled about 8 o'clock, and, after the usual form of reading the minutes of the previous meeting, &c.——

Q. Let me ask, first, why were not the packers represented?—A. Because they had no demand to make; they chose not to make any. The minutes of the previous meeting were read——

Q. Were those minutes in reference to some other subject?—A. In reference to anything that came before it in the way of adjustment.

Q. Adjustment of some other matter?—A. Of some other matter. Then the petition presented originally to the employer was read, setting forth their demands——

Q. Who read it?—A. The secretary of the board.

Q. You organized regularly?—A. Yes; organized regularly, with a presiding officer and secretary. The secretary, of course, reads things that are to be read. Then the nine members, where there are various subjects—for example, different styles of work, or where the demand embraces hand-work, we will say, and mold work, and "bunch" making, and all those things that come in the regular order of our business—the board decides in what order they are to be taken up. Then they are taken up in their regular order. We will say, for example, that the question of one dollar on mold work is in order. The people representing this particular branch of business state their case. They state the reasons why, in their opinion, this advance should be granted, giving facts and figures.

Q. This has all been arranged outside among themselves?—A. It has all been arranged. They have all got their remarks ready. After the

Digitized by Google

case has been stated, if there is anything to be said on the part of the firm why this advance should not be granted or why it should not be as much as they demand, the firm then states its case.

Q. Through some member of the firm—or otherwise?—A. Either way. After the matter has been thoroughly ventilated the board closes all discussion except its own members, and then they take up the merits of the case.

Q. How long did the hearing continue before the board closed the discussion?—A. There is a limit to the time.

Q. Well, I mean in this particular case—how long was it—an hour or so?—A. Yes; an hour and a half or two hours. They have the privilege of presenting their facts either in writing or verbally, confining themselves strictly to the subject. Then the board, among themselves, discuss the merits of the case, taking into consideration the general position of trade, bearing in mind that they do not propose to advance wages to a point where it would be impossible for us to employ them. We put forth our side of the question and make comparisons with the wages of other factories where they make like work. We usually take the earnings of our people and exhibit those when necessary.

Then when the question is fully and finally discussed a vote is taken, "Shall there be an advance recommended?" Well, in this last sitting the question "Shall there be an advance?" was decided unanimously "There shall be an advance." Then, as to what it shall be, there was a division.

I wished to try the temper of our men still further. There are other incidental advances in our business that cannot usually be put on the price of a cigar. We had been paying, as I said, the highest wages paid in the country, and a great deal more than some of our competitors. I explained this to our workmen, and explained that instead of a dollar, which, by the way, had been the general advance throughout the United States, our people should be content with ninety cents. The vote was taken on the question, and I think the result of it was 6 in the affirmative and 3 in the negative.

Then the question turned on hand work. I wanted our work-people to acquire the habit of being just to one another in their dealings, and I tried a rather dangerous experiment in this hand-work question; that is, where a man makes his bunches, wrappers, &c., the entire cigar (for in the mold work he only makes part of it), the pay of a hand-worker is anywhere from $11 to $20 per thousand; or we will say, for argument sake, from $10 to $20 per thousand. Now, they demand a dollar, and from time immemorial it has been the custom, no matter what was paid, that the price should be $1 or $2 advance. Now, the man that makes fifteen hundred of the lower class of cigars will, at the end of the week, find himself a dollar and a half better off by an advance of a dollar a thousand, while the man that makes eight hundred cigars (which is about all he could make) at $20 would find himself in the possession of eighty cents more, if I am not wrong in the figures.

Now, then, it is fair to presume that a man that is able to do the twenty dollar-work is the better workman of the two. And I could not understand why, in advancing a round dollar per thousand the man who made the poorest work, and is unable to make the finest work, should receive a great deal more, by reason of the advance, than the better class of workmen. Well, that was a staggerer to them. Their thought was, "It don't make any difference; we want a dollar." I calculated that by allowing them I think it was 7½ per cent., based on the work that had been made of various kinds, the advance would amount

Digitized by Google

to a dollar and about seven or eight cents. But I preferred to pay this dollar and seven or eight cents, and have the principle, once for all, established that the advance should be in the ratio of their wages, or that in any advance of wages the employé would judge as to how much benefit he had obtained by the additional amount of money that he found in his pocket on Saturday night, and that there was no good reason why the finest workman should in such a matter be at a disadvantage. I made the proposition to them in that way. Well, I think it took two hours warm discussion, and finally I told them that if they would adopt this principle, instead of advancing a dollar a thousand, make the advance on hand work 7½ per cent., for example, and, after two weeks, if they felt dissatisfied with it, I was prepared to take the sense of the board on the question once more. They so accepted it, and they are quite satisfied with it. They have discovered the equity of it.

By the CHAIRMAN:

Q. I suppose that has been matter of very serious argument among them?—A. Very serious, indeed.

Q. They had to comprehend the thing thoroughly first.—A. Exactly.

Q. And I suppose they discussed it all through the 2,200 employés?—A. Oh, yes; it was a firebrand among them, because such a thing was never heard of.

Q. During these two weeks it went right through the entire number, I suppose?—A. Yes; and it is all now working very satisfactorily. They saw the justice of it.

Q. When they saw the justice of it they yielded?—A. They yielded.

Q. Did the women and all consent?—A. They all consented. I will say this, however, that in a strike I would rather remain out of the reach of the women. I think they are a little the worst to deal with.

The CHAIRMAN. That may be because they understand their wrongs the better. You have not had much trouble in the way of strikes, in your own experience, I take it—at least, not of late years?

The WITNESS. Not of late years. The most serious strike we had of late was one that originated with a female. However, I do not believe it would be of any value to go into that matter.

### BENEFIT FUND.

I have to call your attention furthermore to this point. Jointly with the board of arbitration I organized among our employés a fund from which they could derive a certain benefit in case of sickness.

### ARBITRATED DECISIONS ALWAYS ADHERED TO.

Q. Before you go to that, I would like to ask you if, in any instance of any importance, or, perhaps, in any instance whatever, the decision of your board of arbitration has been overruled?—A. No, sir.

Q. Do the firm and workmen alike conform to its decision?—A. It has invariably been conformed to, and not only that, but, seemingly, cheerfully.

Q. And, I believe, you have stated in refutation of the insinuation which employers have sometimes made to you, to the effect that "of course, you have it all your own way;" that as matter of fact you have yourself changed your own views, and you have conformed to the decision of the board?—A. Yes, sir; I have reason to believe that the workingmen have learned—I don't think that they felt so at first—but

Digitized by Google

I think that experience has taught them that we propose to treat them fairly, and take all their wrongs, if any they have, into consideration, and right them if possible. It takes time to bring that about, but I think that they have confidence in our desire to be just to them. I was going to say that jointly, with that board of arbitration, we organized, or, I should rather say, the men organized a benefit fund——

By Mr. PUGH:

Q. Before you go from the board of arbitration, I would like to inquire if you know the extent to which these boards have been organized in the same industry by other persons or companies?—A. I have no means of knowing that, but I know that the inquiries in relation to the workings of the board have been very many by employers in other branches of business.

ARBITRATION A BENEFIT TO EMPLOYERS.

I will say that so far as its results are concerned, as a manufacturer who seeks to benefit (pecuniarily, if you please) by his occupation, I think that I can safely assert that the board of arbitration is a decided benefit to the employer, as well as employé, for this reason: the question of labor—of its continuance or its instability, as the case may be—has always been a serious one, and always will be a serious one, to people who employ large numbers of work-people.

NO FEAR OF STRIKES.

By the method here adopted, and the certainty that any difficulty that arises will be adjusted, and believing that any such difficulty will be settled upon a fair basis, it has enabled us to use all our energies in the natural pursuit of our business, without giving the question of labor half of our time, or being constantly troubled with the nightmare that perhaps there may be a strike to-morrow morning; hence, I believe we have been more prosperous and our business has been more satisfactory than it was prior to the existence of this board.

ARBITRATION INDUCES GOOD WORK.

Again, I think it has a tendency to draw about the employer who employs it a class of work-people that are better than those that are usually found, because the individual that has an interest in his labor, and proposes with it to maintain his family, and who takes it into consideration that if he works for this or that man he will constantly be employed, is usually the safest and most satisfactory workman; and that class of workmen would be quite likely to work towards a concern or establishment where he would be likely to realize benefits (in the continuance and stability of his work) such as he would have in an establishment like ours. Hence, I think we have a better class of workmen than we could get without it, or than could be found in any establishment in the United States. Our dollar, to be sure, is no larger than other people's dollar, but men do appreciate good treatment, and there is no good reason why they should not receive it.

The employer, of course, plumps himself upon a high pedestal. He mentally says to me: "Well, now, what do you do; do you associate with all those men?" I do not, and there are plenty of employers that I do not care to associate with, and there are plenty of men, probably

Digitized by Google

among our employés, that I should have no objection or hesitation to associate with, if necessary; but it is not necessary. Our intercourse consists in our endeavoring to understand one another. And surely, especially in this country, I do not believe that any man has a right to believe that he occupies such an exalted position that even to make himself plainly understood by the people with whom he deals is a degradation. Now, then, if that is to prevail and we permit the workmen to drift wholly into the hands of demagogues—agitators—who live and thrive by the control that they have over those workmen, and we suffer the consequences, whom have we to blame? Certainly, ourselves largely.

TRADES UNIONS.

By the CHAIRMAN:

Q. In your arrangement for the adjustment of difficulties, or preventing them from arising, in what way have you come in contact with the trades unions? I notice that the cigar-makers' union is a powerful organization among the trades unions. Are any of your working people members of that organization?—A. I believe the majority of our working people belong to one trades union or another; I believe there are several in our trade.

Q. Do you have any difficulty with them?—A. Not at all.

Q. So far as you know, they probably favor your adjustment of the difficulties, or do they interfere with it?—A. Well, I do not know that they do. I do not know that the trades unions, or leaders thereof, favor the adjustment as it is made in our establishment. But all men are alike in one respect, they like power, and as we have the largest establishment of its kind, naturally trades unions would like to use it as a lever, and they would like to come and interfere in our business probably if they could.

When I speak of trades unions, I speak of those who have control of trades unions, and I draw a line between the people who belong to those organizations and those who pretend to speak for them. So far as we are concerned, it matters little to me if a man belongs to ten organizations; but those organizations, whatever they may be, can exercise no influence directly in the adjustment of anything that may occur between ourselves and our men. We reserve to ourselves, according to compact with them, and as long as it exists, the right to adjust our difficulties in our own way.

Q. You say you "reserve" it. What do you mean? When you employ a man do you say to him—— —A. We say nothing to him; it is a mental reservation—in other words, we should not permit people who are not in our establishment and who have no knowledge of our business or the interests that enter into it—to dictate to us what we should or should not do.

Q. But there have been numerous strikes among the people who manufacture cigars in this city, this season, and you have not been involved in those, have you? Those have taken place under the direction of the trades unions, have they not?—A. It was a lock-out on the part of the manufacturers who had associated for the purpose of protecting one another against the demands of the trades unions.

Q. You were not involved in it?—A. No.

Q. How does it come about that while your employés belong to a union, just as the employés of other establishments belong to a union, the other establishments have trouble with the union while you do not, they paying about the same wages that you do? You do not lock-out

Digitized by Google

and they do; and the trade unions seem in some way the occasion of, or are connected with, it.—A. As I said before our working people belong to one or other of the unions that exist in our trade. They have, among themselves, independent of any board of arbitration, a committee who take into account at all times the interests of the entire trade, and how much and how far their sympathies and aids, as work people, can ameliorate the condition of others of their fellow-beings.

Now, then, we have not allied ourselves with the manufacturers for the purpose of locking out our work-people in case such or such a thing occurs in the trades union. We hold ourselves aloof from any such alliance. Our work-people occupy a like position. They belong to these trades unions and associate with their fellow-men; but, so far as our establishment is concerned, their trades union has no concern there. When they send money to strikers it is sent by the factory of Straiton & Storm. When they sent money, for example, to aid a strike in Pittsburgh, they always sent it as from the factory of Straiton & Storm; and hence it sometimes appears in the newspapers that Straiton & Storm's men have contributed, and it sometimes seems as though they contributed to all the strikes.

Q. Your people do not admit the control of the trades union over them?—A. No.

Q. They make that reservation?—A. They make that reservation.

Q. And the trades unions sometimes admit workingmen to that modified allegiance to the union—as in your case—they take these men although they do not agree to strike on the order of the managers as against you?—A. They do.

Q. The general obligation, I believe, is to strike when the managers say so, is it not?—A. I do not know how that is, but I can say that, so far as we are concerned, we have never suffered from that since we had this board of arbitration; prior to that, we did.

By Mr. CALL:

Q. Do you pay higher wages than others engaged in the business?—A. Well, I cannot say that we pay higher wages, no; but we demand the very best of work, of its kind; and, I believe, in consequence, pay comparatively the highest wages.

Q. Is there any difference in the hours of labor in your factory and others?—A. No, sir.

By the CHAIRMAN:

Q. With regard to the demand made upon you recently by your employé. They wanted the rise to take effect on the first of May; it generally did, all over the country, I understand you?—A. Yes.

Q. You postponed action till along in the month?—A. Yes.

Q. When the rise was decided upon, did it date back from the first of the month, or take effect subsequently?—A. I forget what day of the month or of the week it was, but I imagine that the meeting took place on Monday at any rate, a day or two after the expiration of the week.

Q. So short a time that it was immaterial?—A. Oh, it was longer. I am glad you mentioned that; I want to speak of it.

The CHAIRMAN. I wanted to see if they had such confidence in you that they were willing to work along at the old rate and take the risk?

CONFIDENCE PRODUCED BY ARBITRATION.

The WITNESS. Yes; the meeting occurred somewhere in the middle of a pay week, and the question, after all adjustments had been made,

Digitized by Google

naturally turned into when this advance should take effect; and I allowed it to drift on until I could get an idea as to what they would prefer. Some wanted it to take place the very next day; others thought it ought to go into the next Saturday, and I think the tendencies were to allow it to go over to the next Saturday. I solved the problem by allowing the wages to date back to the previous Saturday, and that ended the matter; which, of course, was quite satisfactory.

Q. They were willing to allow the action of the board to be deferred until after the time when the increase had generally gone into effect?—A. Oh, yes; during the discussion there was a division as to whether it should take place the following day, this being in the evening, or whether it should take place the following Saturday. Then, after I had allowed it to go on as far as I wanted to, I solved it by dating the wages back to about three days before the meeting.

Q. Do you consider that your board of arbitration is so thoroughly an established part of your business that it enters really and substantially into the contract between you and your laborers, until you should give notice to your laborers that so far as you are concerned, you would not thereafter be bound by its decisions? Do they understand when they go to work for you that you will be bound by the decisions of this board, and that you will be bound by its decisions, so far as you are concerned, until you give notice to the contrary?

### ARBITRATION PREFERRED WHERE TRIED.

A. I think that is thoroughly understood. And I tested it some time ago, to show that this board of arbitration was not necessary to my existence as a manufacturer, and if it had no interest for the work-people the sooner it was got rid of the better. It was during an agitation in our establishment by a portion of the employés, and I put the question to them in this way. I desired that they should vote then whether they wished the continuance of this board of arbitration—this was some eighteen months since—and its continuance was voted by an overwhelming majority, probably two-thirds of the votes cast were in favor of its continuance. And it was at a time when there was an unfortunate occurrence in the place, caused by some of the packers, and the men were more or less excited. In fact, the sum and substance of the thing is this: that the trades unions in our business had looked upon this board of arbitration with great misgivings, and had tried, at various times, to make it odious, either to the work-people or to ourselves. But I think they have abandoned all that; it has taken such a firm hold on the minds of our people that I do not think, at present, anything could shake it.

Q. Of what nativity are those people that work for you?—A. They are principally Germans and Bohemians, with a sprinkling of English and some Americans.

Q. All work harmoniously together and in obedience to the decisions of this board, do they?—A. Yes; we have to conduct our proceedings usually in English, German, and Bohemian, which is sometimes quite difficult, I assure you.

### ARBITRATION APPLICABLE TO ALL TRADES.

By Mr. PUGH:

Q. Are there any special reasons, in your business, that makes arbitration a success that would not make it a success in other industries employing labor and capital? What is your judgment, founded

Digitized by Google

on your experience, as to this kind of board being a remedy for the adjustment of all such antagonisms between labor and capital as cause strikes?—A. I am not prepared to say that the board of arbitration—or arbitration itself, if you please—is the only method; but until one can be found that will answer the purpose better, I believe that if properly applied and fairly understood there is no occupation in which the results would not be beneficial to all parties concerned. So far as I am concerned, I am willing to throw arbitration over to-morrow, if I can find something that will answer the purpose better; but until such a thing is found, this certainly answers the purpose very well. Of course, in the formation of any board of arbitration, in order to have it working at all, either one side or the other must have a majority. You gentlemen must understand that better than I do. Now, the workmen would look upon a board of arbitration in which the employer would have an absolute majority with distrust, and, in fact, he would have no faith in it.

On the other hand, I think that the employer, nine times out of ten, and probably ninety-nine out of a hundred, can trust to give the employés the majority in such a board; but, if possible (and I said there is no branch of industry in which it is not possible), they should take the odd individual from some different branch of the business, so that the continuance of one would be contingent upon the non-stoppage of the other. Then, again, the employer must take into consideration the natural interest which the employé has in the continuance of his work. It is his all. It is everything that he has in the world. Disturb that, and you may get him out on a strike, and then passion may govern him entirely, and he will care very little what will happen. But in calm deliberation, where he sees that he will probably get all that he is justly entitled to, without the employment of force, it is fair to assume that there will be intelligent men enough among the workmen constituting such a board who will see it in that light.

You must naturally assume that the employer will desire nothing but what is just, and that he is willing to show his employés that he is willing to be just; and I think he can rely on some of his workmen finding out his desire to be just; his interest and sense of justice all combine to produce that result. Of course, if he is indifferent to whether they see it that way or not, it is different. But we must assume that a man goes into this thing with his heart in the matter to some extent. I am not prepared to say that many of the strikes we have in this country are not brought about by capital. Labor is not always at fault. It is a Godsend sometimes to have a strike when there is an overproduction.

By the CHAIRMAN:

Q. You think capital may then stimulate the strike?—A. I think it has done so very frequently.

The CHAIRMAN. Some other witnesses have testified to that effect.

By Mr. PUGH:

Q. This board is so organized that there is a checking power against any injustice which may be produced by the majority power of one interest?—A. I think so.

### MUTUAL BENEFIT FUND—HOW ORGANIZED.

Q. I was going to call your attention to another little matter here, and the results that can be produced by a little careful management among a large number of employés; and before proceeding to its work-

Digitized by Google

ing I will say that, generally speaking, I do not believe that it is either beneficial or desirable to bestow charity on the workmen. I think it is rather better to extend to them a helping hand occasionally, and enable them to get into a position where they will not need any charity than it is to bestow charity on them in the hour of their need, or flood them them with tracts. These things used to occur in our establishment; quite frequently, at the death of a member, petitions would go round to be signed by all, for 5, 10, or 25 cents, in order to satisfactorily put their fellow-workman at rest.

By the CHAIRMAN:

Q. You say your "establishment;" these people do not all work in the one building for you, do they?—A. No. But they are all considered one "establishment." It occurred to me that means could be devised to do away with this system of beggary, which is always a means of degradation, to my mind, to work-people.

I entered into consultation with some of the best minds among our work-people, and developed a plan by which, on a contribution of five cents per week of all our work-people, they would derive benefit, in case of sickness to an individual, of $5 per week, and in case of death $100, to be paid to their family. Now, then, this movement was looked upon by the workmen when first inaugurated as an idle dream; they thought it was impossible for it to work; that there was not money enough in it. The firm contributed, in their way, $25 a month for this fund. However, we had many obstacles to overcome at the outset. The question arose among the work-people, "Suppose we are discharged, what then? We have paid in our five cents a week." The five cents a week became, in their minds, a considerable sum when they had to pay it out. Hence, the question arose how their share would be disposed of in case they were discharged or were on a strike.

We made an arrangement by which, in case one of the employés was discharged, not having received any benefit from this fund during his employment, there would be returned to him 50 per cent. of all the money that he had paid in. Of course, he had been guaranteed the $5 per week in case of sickness, and his family $100 in case of death; and besides that, the firm had contributed $25 a month, and we therefore deemed that the return to him of one-half of what he had paid in was a fair and equitable arrangement. Well, then, as to what would happen with this fund in case of a strike; we got over that difficulty in this way: I arranged that in case of a strike, in which two-thirds of the employés should be engaged, if it continued more than three months then the fund should come to an end and be divided among the members that had contributed it. I had a firm belief in the fact that there would never be a strike.

As I stated, the working people had first looked upon this arrangement as a means by which the employer proposed to still further fasten the workmen to himself. I looked upon it, on the other hand, as the means of putting a workman, under certain unfortunate circumstances, positively beyond immediate want. I looked upon it as the means of enabling his or her family, in case of his or her death, to get enough money to get an opportunity of turning around and looking the world fairly in the face, and seeing what the future had for them.

### RESULTS OF THE MUTUAL BENEFIT ASSOCIATION.

Now, let us see what the results have been. This went into effect in 1879, and, without going into details of the moneys that were paid out

Digitized by Google

during that year or subsequent years, I will say that the result of the entire transaction has been that there have been collected from our employés $14,831.49, and there have been paid out in the shape of benefits $9,074.77, leaving a fund to-day of $5,756.72. Now, then, this has been achieved on the small sum of 5 cents a week.

### SANITARY CONDITION OF WORKSHOPS.

Naturally, we give the sanitary condition of our establishment some consideration. I think it is necessary and proper that that should be done. We exercise such care as we can with regard to the healthfulness of our establishment. About a year ago we found it necessary to employ a doctor to make daily visits to our establishment at the time of the prevalence of small-pox in the city of New York. This we paid for.

The result of our efforts altogether show two things—they show what can be accomplished by a large number of people by the accumulation of small amounts, and, again, that the employés must necessarily be healthy, comparatively speaking. Because of their great number they have with the money so collected worked up a surplus fund of $5,756. The result of all this has been that there is a certain amount of pride among our people in their shop and in their work. I have called the attention of manufacturers generally to this fact. I think the majority of our people are proud of the fact that they work for Straiton & Storm. We have in the last few years found no difficulty in getting all the work-people thatwe want, whereas, prior to the organization of this board of arbitration and this benefit fund, we were quite frequently without the necessary number of employés required to do the work. I am stating now some of the secrets of our trade. But I believe it is an absolute benefit to Straiton & Storm to have this system of arbitration and of benefits, though they do cause us a little trouble and thought, of course. Having once established them, however, we have accomplished several things that a manuacturer always wants to accomplish, namely, the procurement of good mechanics, and to get them when he wants them, and the ability to retain them.

By the CHAIRMAN:

Q. Do you have any reason to discharge people in case of fluctuations in business?

A. We do not. We work still on the same principle. We try and do all that we can consistently with our own interests, for our work-people. In a case of that kind—such a period, for example, as that during which the tax agitation was up in Congress, and when manufactured articles had accumulated on our hands, and it would not be safe to increase the manufactured material, then we reduced the working time, but we did not discharge. I do not understand the justice of discharging men in such a case. On looking into the countenances of my men, I could not tell whom it would be wise to discharge. I could not tell that any could afford to be discharged, and, unwilling to inflict injury or hardship upon any one of them, and believing that it was fair and just that such work as we had should be divided among them, so long as the trouble continued, and so we worked for five days a week, and sometimes for four days a week.

Q. And you diminished production in that way?—A. Yes, sir.

Digitized by Google

RESULT OF REDUCTION OF WAGES BY ARBITRATION.

Q. Have you had occasion, in the operation of this board, to reduce wages by its decisions?—A. Yes, sir; we have.

Q. And you have had no difficulty?—A. None whatever.

Q. They acquiesced in the reduction as well as in the advance?—A. Yes.

Q. Although, I suppose, it was hardly done with the same pleasant feeling?—A. Well, I suppose not. That is natural.

Q. Have there been reductions that have been serious for the employés, or have they been trifling?—A. About in the same ratio in which the advances have been made.

Q. When did you say that board went into operation?—A. In 1879.

Q. Then it has been in operation about four years?—A. Yes. I cannot call to mind now but one instance of reduction in that time, but there have been adjustments where the claims of men have been refused entirely, and not only refused entirely, but so refused with the sanction of the board as probably two to one at all times. Our work is piece-work, and if a man imagines that his neighbor gets an advance which he himself does not get and that he ought to have it, whether he is really entitled to it or not, of course we have to make it clear to him why he does not get it. These questions come before us, and I make it my business to show such a man why he ought not to be granted this thing, and, in many instances, such grants have been refused, and the refusal has been acquiesced in, and the work went on without the loss of a moment's time. There has not, at any time during these four years, been the loss of an hour in our establishment because of any question that has arisen between ourselves and our employés.

The CHAIRMAN. If there is anything that suggests itself to you in connection with labor matters we should be glad if you would let us have the benefit of your information on the subject. There must be a great number of points that occur to you which it would be to our advantage to know.

The WITNESS. Then, with your permission, I will take up this question of trades unions. I may get a blessing for it, but I will do it all the same.

Here the committee took a recess of half an hour; after which Mr. Storm continued his testimony as follows:

TOBACCO INDUSTRIES IN FRANCE, AUSTRIA, SPAIN, AND ITALY.

By the CHAIRMAN:

Q. You referred, in the early part of your testimony, to the factories of France, Italy, and other European Governments. Please explain the relations of those Governments to the tobacco industries of their respective countries.—A. The tobacco business, that is, the manufacture of tobacco and cigars, in all their various forms, is a Government institution in France, Italy, Austria, and Spain, excepting in the Spanish colonies. No one is permitted to engage in the tobacco business in those countries. The Governments have their resident buyers in all tobacco-growing countries who supply their factories with the necessary material, and in Havana they have cigars made especially for the Government.

Q. The governed industry is the manufacture, and not the growing,

Digitized by Google

of the tobacco?—A. It is the manufacture and not the growing. Therefore, everything appertaining to the industry of tobacco is in the hands of the Government, from which they derive a large revenue.

STATISTICS OF CIGAR BUSINESS OF THE UNITED STATES.

I would like to offer a few statistics here, which I think are nearly correct. They may be of value. I calculate that the cigars manufactured in the United States number 3,500,000,000, the value of which, in the factory—or the selling price at the factory—would be about $96,000,000 or $97,000,000. The imported cigars number about 50,000,000, valued at about $5,000,000, making a total value of $101,000,000 or $102,000,000. Adding to this the estimated profit of the retailer of the goods, it would seem that the consumer pays $150,000,000 annually for cigars in this country.

DUTY ON CIGARS EXPORTED FROM HAVANA.

There is another fact that I would like to call our law-makers' attention, that probably has escaped their notice in the past, and that is to what extent we have to pay tribute to Spain, or the portion of it represented by the island of Cuba, for the privilege of smoking their cigars and using their tobacco. The export duty levied on cigars in Havana amounts to about $2 per thousand, thus showing that the imported cigars that we smoke in this country pay tribute to Spain to the tune of $100,000 per annum. The export duty on tobacco is about $4.25 per hundred-weight, which would amount, on the quantity annually imported here, to about $300,000. Thus, it will be seen that we pay on tobacco and cigars annually to Spanish authorities about $400,000.

AMERICAN TOBACCOES EXCLUDED FROM CUBA.

In the face of this, our own tobaccoes are excluded from the island of Cuba. I simply call your attention to this as one of the things under which we suffer.

Q. They are excluded under an absolute law, do you mean, or by a high tariff?—A. By law.

Q. Is it illegal to import them under any circumstances?—A. It is; excepting from their own colonies. They import from Porto Rico, for example; and that is the manner in which tobacco finds its way into Cuba. The same law does not apply to the island of Porto Rico. Tobacco is permitted to enter the port of Porto Rico, and Porto Rico, being a sister colony, its tobacco is permitted to go into Cuba. Therefore, much tobacco that is grown in Porto Rico finds its way by that roundabout method to the island of Cuba.

PRODUCTION OF AMERICAN TOBACCO FOR CIGAR MANUFACTURE.

Q. With reference to the profitable production of the quality of tobacco in Florida, you may state, generally, your views on that subject, and then come to the more specific one of the growing qualities, for the purposes of tobacco, of the soil of this country, and of its different localities compared with the capacity of the soil of the West India Islands and other countries, and particularly the southeast portion of the country, as Florida, Alabama, &c.—A. I shall have to confine myself strictly to the tobaccoes that are used for cigar purposes. With that which goes

Digitized by Google

under the general head of tobacco such as is grown in Virginia, Maryland, and Kentucky, I am not familiar, as it is used for an entirely different purpose.

Q. Is it not used for cigars?—A. Not at all.

Q. Where are the tobaccoes grown that are used for cigars in this country?—A. In Pennsylvania (probably in Lancaster County); some in New Jersey, Connecticut, New York, and Massachusetts; some little in Vermont and New Hampshire, though very little. The better portions of Ohio tobacco are also used for cigar purposes. Wisconsin has of late years produced the finest tobacco for wrapper purposes that is grown in the United States.

Q. How about the Carolinas, and Alabama, and Florida, and that vicinity?—A. Florida has raised good tobacco in the past for cigar purposes. In fact, I have reason to believe that prior to the war some of the most valuable tobacco for cigar purposes was raised in the State of Florida, but for some reason or other they have not been successful in the cultivation of tobacco in Florida. I am of the opinion, though, that if a proper effort were made, as good a tobacco could be grown in the State for cigar purposes, or, rather, I should say, as valuable a tobacco could be grown in the State as in any State in the Union.

Q. How would it compare with Havana tobacco?

A. It would resemble it very much in appearance, but I am of the opinion that by the importation of seed from the island of Cuba, which has been largely done in the State of Wisconsin, and to which that State owes its prestige in this particular, we would produce a tobacco, especially for wrapper purposes, that would, in many instances, be superior to the Havana tobacco or that grown in the island of Cuba. The planters in the island of Cuba, in their eagerness to get the greatest results in the shortest possible space of time, have, for many years, used guano on their lands. They have, practically, exhausted them; and, therefore, for the past half dozen years, we have scarcely had a good crop of tobacco from there, and some of the tobaccoes grown in the United States from seeds which had been originally imported from Havana have arrived at such a state of perfection that seeds from this country, grown in the manner described, have been returned to the island of Cuba for the purpose of being planted into their lands, the planters there believing that their seeds had run out, and the fact of their having been planted in this country and receiving the necessary strength that the soil here imparts to them, and being replanted again in the island of Cuba, would bring about beneficial results, I do not know what the result has been.

By Mr. PUGH:

Q. Your partner was telling me of some surprising results as to the cultivation of tobacco in Wisconsin. Have you mentioned that matter?—A. Yes. I have referred to that in my testimony.

Q. Did you state about the results in planting the seed the first year and the second year, and how the best product was made for the second and third year?—A. The result of the planting of the seed for the first year is usually discouraging to the planter, for the reason that the plant is apt to grow very small, and as he sells his tobacco by the pound, and expecting to get, at all times, for that species of tobacco, probably a thousand pounds to the acre; then, owing to the diminution of weight, he feels disappointed; but the natural tendency of tobacco is to grow larger every year, and if the seed is not changed in the course of a few years it will run out and return to the natural species of tobacco that

Digitized by Google

grows in this country, and all its resemblance to Havana tobacco will disappear, and therefore the seed needs to be renewed about every four or five years, I should say.

### TRADES UNIONS.

Mr. PUGH. We should like to hear you now on the subject of trades unions.

The WITNESS. Do you want me to give my views, or would you prefer to put questions to me?

Mr. PUGH. We should be glad to have your views first.

The WITNESS. As I regard the trades unions, they are simply combinations of those engaged in labor for the purpose of accomplishing something which they propose to accomplish by the union of their forces. I do not think that any one will claim that the formation of such societies is wrong, or that they overstep the line of propriety, because, in this country, at the present time, everything seems to be done by combination.

But, aside from that fact, they have a perfect right to associate themselves for the purpose of studying out how best to solve this great problem of wages, and of existence, and of the comforts which they propose to derive from their wages.

### RESULT FROM EUROPEAN CONDITIONS.

As to the mistakes that they make, and I have thought over them repeatedly, I cannot but come to the conclusion that they are largely due to the influence of operators from the other side—from Europe—who come here with notions and ideas based on institutions as they exist there. They fail to shake off that feeling when they come here; they do not recognize that the circumstances here are different, but, applying the same methods and the same rules to bring about the ends that they desire in this country, where, certainly, there is some little difference in the situation of people generally, and especially is this the case where they propose to govern or dictate as to the number of people that should be employed in a particular occupation, it occurs to me that when they undertake to say to an individual, "You shall not acquire the knowledge of this or that trade, because we have enough in that trade already," they ought to determine something to recommend to this individual that he might do in order to acquire a livelihood for himself

### INTERFERENCE WITH MEN'S RIGHTS.

I consider it a species of interference with an individual's rights—with individual labor. Let us say that they are actuated, as they say they are, by the very best motives, namely, that they themselves will want all the work. If they apply the same principles as they would have applied to them, namely, that they are members of the human family, what is to become of those who fail to acquire a knowledge of an occupation? So long as the population will continue to increase, if there is no provision made for their maintenance and they are left to their own resources, it is natural to assume that they must acquire an occupation of some kind, or else become criminals to prey upon society. I consider that to be one of the greatest mistakes that trades unions make. We depend, to-day, in many branches of our industry, solely upon the mechanics that come to us in the shape of immigrants.

Digitized by Google

SELFISHNESS OF TRADES UNIONS.

Now, I recognize the fact that every immigrant who comes here with the determination to work is an acquisition to the country, but I am unwilling to believe that it is just that we should depend upon that supply constantly, and have this particular species of work reserved for them, and that our own youths here should be prohibited from acquiring the knowledge of it; because in that matter, the trades unions certainly exhibit an amount of selfishness that they would not like to have applied to themselves. They drive the surplus population who could acquire a knowledge of a trade into a mass of unskilled labor that floats about the country.

These unskilled laborers are certainly also human beings. And if the trades unions have such a great care over those who are not capitalists, they ought not to ignore this class of unskilled labor, although they do ignore it altogether. That, I think, is all wrong.

For example: If I want to apply to-day for five hundred skilled laborers, at wages ranging anywhere from fourteen to sixteen or twenty dollars per week, I probably would not get one hundred in the ordinary course of events; but if I should apply for one thousand able-bodied men, good accountants, men of good education, and those who could write a good hand, &c., at wages anywhere from six to ten dollars a week, I would probably get that thousand men in a very few days.

Again, I think it is detrimental for the reason that I think they keep the better elements out of the trades. Now, then, a man that acquires a knowledge of an occupation that does not apply to it altogether his brute force, but applies his brains, and has some degree of education, the chances for the elevation of such a man are certainly far greater than they would be for the one who ignorantly puddled along and did his work "good enough," and was satisfied with that.

Therefore, I think that, so far as the trades unions are concerned, when they undertake to regulate that portion of the mechanical arts, they over step the laws of propriety and of common sense, and show an entire disregard for the welfare of their fellow-beings, who are in a like position with themselves, and probably worse.

Then again, I think that when they propose to dictate to an individual of their own class who, in order to be permitted to work, and with the results of his labor to maintain his family, when they say that he must comply with certain requirements of their own, they trespass upon the dearest rights that a man has, and I would blush to know a man that would put up with a thing of that kind.

It is these things that makes trades unions so extremely odious to many minds. People do not even care to touch or come in contact with men that are so unreasonable, and I have reason to believe that the great majority of those who constitute trades unions are not in sympathy with this idea.

Men will naturally say, "If this is so, why should it be tolerated?" For the simple reason that a species of terrorism is exercised to get people into trades unions. Once there, the quiet, hard-headed man who wishes to get along quietly in the world, pays little attention to it. He simply pays his dues. The agitators, who desire to aggrandize themselves at the expense of their fellow-workmen, make themselves popular, they run the machine, they make the laws, and they enforce them.

If the trades unions were to get rid of these nonsensical provisions that grate upon the sensibilities of the community, they could be made to serve a most excellent purpose in the amelioration of the condition of

Digitized by Google

working people of this country. And they do deserve a great deal of consideration.

But it is a great species of tyranny when a corporation or association, or even one man, will demand of working people, as a condition of employment, that they shall pledge themselves not to belong to any association. I consider that that is an unnecessary degradation for the working man or woman, and it is a great pity that there is anybody so poor that necessity compels him to sign such a document. But that is again an application of the same species of force, so to say, as we find in the "lock-out" which follows the strike, or the strike which follows the lock-out.

SUFFERING FROM OVERSUPPLY OF LABOR.

By Mr. PUGH:

Q. These people who come from the Old World have suffered there from an overstock of skilled labor in particular trades. When they come here, they try to limit the supply of skilled labor in the way you have stated. In other words, they want to destroy the power of competition that will necessary result from an overstock of skilled labor. Look at our railroads, how they combine. Mr. Fink stated to us the other day that he represented forty railroads; five main trunk lines, and that they combined for the main purpose of destroying competition and preventing interference with the freight rates. Then, here is the Western Union Telegraph Company, which has absorbed some seventy or eighty corporations of like kind for the purpose of destroying competition. Here are these coal miners, dealing in anthracite coal, in Pennsylvania, combining for the sole purpose of preventing overproduction and an overstock, so as to enable them to dictate the price and limit the supply. Now, these are examples that capital furnishes to laborers for doing what I have no doubt you are right in saying is a great wrong in itself; but, inasmuch as the same thing is done by those who employ labor—the power with which they are competing—it is hardly to be wondered at that labor combines in something like the same way, is it?—A. Well, sir; I am unwilling to admit that two wrongs make a right.

Mr. PUGH. Of course, and so am I; but that is what these people have to contend with.

RAILROAD COMBINATIONS.

The WITNESS. So far as railroads and telegraph companies are concerned, and corporations generally, I hold in the first place that railroads have superseded or taken the place of the ordinary highways of commerce which have been used in the past, and I have yet to learn that from the inception of a railroad or of railroads in this country up to the present time the investment, as a whole, has been so very satisfactory, but I do know, and we all know, that by means best known to themselves, certain of our capitalists have got control of the great railroad properties, and manipulated others, to bring about the greatest amount of revenue, and undoubtedly much injustice has been done to the people at large, in trying to make the railroads all pay a certain dividend, if you please, as their earnings—forcing commerce in a direction in which it would not naturally go.

But I do not know how we can remedy it. These things sometimes remedy themselves. They have in the past twenty years, in many instances brought disaster upon some of the promoters of this system.

Digitized by Google

I do not believe that too much legislation or too much government is at all necessary for us as a nation. I do not think it will promote our well-being. We may from time to time suffer evils, but ultimately they will correct themselves. The same thing holds good with regard to telegraph companies, coal companies, and other companies of that kind.

### LABOR NEGLECTED IN LEGISLATION.

We come back to the original question of the relative position of labor as one of the factors in this nation. I hold—and I want you to pardon the remark, because I believe it to be just, and I shall state it—that labor, in legislation, has not received proper consideration. I hold, sir, that a public sentiment needs to be encouraged in which the rights, to a certain extent, of the laborer, as a factor in our being, as a nation, shall be taken into consideration; and, indeed, I hold it to be necessary as a piece of safety. Because, if you drive fifteen or twenty millions of people all on one side without giving them any consideration simply because you happen to have the power, you will ultimately unite those people; and imagine the legislation which, if united, those people might indulge in as a matter of revenge!

### THE VIOLENT, NOT DANGEROUS, CLASS.

Mark you, I am not an alarmist. I do not believe that those fellows who call for Springfield rifles amount to anything. They are not the dangerous class. They are only loud-mouthed. The man of the "dangerous class" is the quiet, hard-working man, who wants to solve the problem for himself and his children. He may be content with his own lot, but he will not be contented to hand that lot to his children. In a government of this kind, where you teach him to think, and where the representatives of the people are elected by the people, that man must naturally reflect, as elections come and go, on what is best to be done for him toward the improvement of his condition. If you legislate only in one direction, namely, how capital shall be directed so that it may still further shackle the community at large with its fetters, then you will drive this class of people all on one side, and ultimately they will unite themselves together.

Take, for example, the city of New York. We have in this city to-day a population of from seven to eight hundred thousand people living in tenement houses—houses that, in my estimation, are not fit for human habitation—certainly the great majority of them are not. It took two or three years to convince the legislators of this State that these crowded tenement houses, in which a family of anywhere from two to four people lived in two rooms, the principal room being perhaps ten by twelve, and the sleeping room perhaps eight by fourteen, and in these rooms they cooked and slept and washed and spent all their time—it took, I say, two or three years to convince the legislators of this State that those rooms were not a very good place in which to make cigars from early morning until late into the night. The making of cigars in these tenement houses was, however, finally abolished, and the cigar manufacturers, or some of them, are so satisfied that that is quite good enough for those people that they have engaged, I think, Mr. Evarts to prove that the law is unconstitutional.

### POWER OF THE WORKERS, IF UNITED.

Now, that is the way in which work-people are treated. Yet we have got between seven and eight hundred thousand of them living in these

Digitized by Google

tenement houses. Our population here—we all probably know what it is. If, to-morrow, the largest portion of that seven or eight hundred thousand people, or their voters, were united, they would control the city of New York, and do with it just exactly what they pleased. But for the time being, because of the difference in nationality, and because of the jealousies that exist between them, they are not united, and I do not think they ought to be united. I think it will be an evil day for this country when labor unites as against capital. But capital ought to make such reasonable concessions, and have such a care for labor that the portion of the laboring men who are not demagogues and agitators will find their extreme safety in the nation, as it exists, and in harmony with capital. There was a parade here the other day, I believe, of the labor organizations, with banners flying, and among other mottoes was one calling for "Springfield rifles." But the very day that these men undertake to use their Springfield rifles—that day will set back the solution of the problem between labor and capital in this country one hundred years.

Coming back to my original position, I think, as I said in the outset, it is a subject that we should give, in this country, our very serious and careful consideration. We have lived upon the accumulated resources of years, and gone on and accumulated more wealth and have not given this subject of labor all the consideration that we ought to give it and which we will be forced to give it.

Mr. PUGH. That is the very reason why this committee was appointed, and why it is attempting to ascertain the feelings of the people on that subject, and to take note of such remedies as may be suggested.

## THE TARIFF.

The WITNESS. When I, as a workman—assuming me to be an ordinary workman—earn $2 a day and you legislators deem it wise, in the enactment, for example, of a tariff, to enhance the value of things that I consume, you destroy the value of my labor to the extent that you enhance the value of those articles. Now, then, we have started out to protect the mechanic, to protect American industry in our tariff. We have certainly done it in many instances. But we have gone so far in that direction that all the benefits that labor has derived have been far more than neutralized by the diminution in the value of that which the laborer earns. It can matter very little to the laboring man what you call the amount of money that he earns. The question is what can he procure for that much money. And I do think that so far as legislation is concerned the legislators ought at all times to take into consideration the entire country, and not forget the effect that measures may have upon the workingmen at large. Take, for example, a coal mine. I should like to know—can any man tell me why there should be a duty on coal? But it works very simple. I own a coal mine; I am getting 10 ten per cent. out of it; it enters my head that if I can only get Congress to put a tax of 50 cents a ton on coal I may double my income; I succeeded in doing that, and I do double the value of my coal mine, nominally speaking, and I probably sell it to one of you gentlemen for $200,000, or for some amount which shall be double its original value. You are now back in the same position in which I started. You are making the same on your invested capital that I made originally on mine, and so you might go on indefinitely increasing the duty on coal in order to bring you a larger return. But you have created a fictitious

Digitized by Google

capital and the people at large are expected to be good enough to make it pay you a reasonable interest on this fictitious capital, or this "wind," as I call it.

Mr. PUGH. You are aware that in the last Congress both Houses voted to limit the duty on coal to 50 cents a ton; both Houses voted fairly in accordance with the recommendation of the tariff commission, and the conference committee, through the power and influence of the coal owners, raised it from 50 cents to 75 cents a ton, in defiance of the will of Congress, as expressed in both houses.

The WITNESS. Then I would ask you, what consideration did that Congress or committee give to the people to whom the coal is a necessity?

Mr. PUGH. Of course, none whatever, but their own interest, and they are exercising that power under that tariff now in Pennsylvania.

The WITNESS. That is a mistake that legislators frequently make, and that is the sort of thing that will eventually drive the people to one side, and make them present a solid mass. That day I should not like to see in this country.

COST OF COAL.

By the CHAIRMAN:

Q. But it has been testified here that the cost of coal, from other causes not connected with the tariff, is at least $2 per ton more than it ought to be in this city. Mr. Thurber made that statement. What are the other causes, do you suppose? You have been alluding to the tariff, from which the increase is 70 cents. How is the $2 accounted for?—A. I do not know that it is a fact any more than what I have heard here, because I have not given the matter a thought, but if it is so, it is probably owing to the mines being in the hands of a few individuals who control them.

Q. The fact that the ore and the means of transportation are both owned by the same parties, or by a combination existing between them, accounts for it, you think?—A. Yes, sir.

The CHAIRMAN. It was claimed, however, that the mines in West Virginia could not be worked at all, and that the people who were dependent upon them would be left without employment, if the duty remained as the tariff commission reported it.

Mr. PUGH. It was stated there, and not denied, that the operation of the increase would be for the sole benefit of mines within 30 miles from the sea-coast—that it did not extend over 30 miles to the interior, and was a purely local affair.

The CHAIRMAN. But the market for that coal was all along the sea-coast; and it came into competition with coal from Nova Scotia.

THE TARIFF.

By Mr. PUGH:

Q. Without intending to divert your attention, I would like to inquire whether one of the measures which you regard as most beneficial is a change in the existing duties. That, I believe, is the purport of your answers.—A. As to that, I will have to answer you in this way: assuming, in the first place, that you desire the well-being of the laboring classes of this country—and they are a part and parcel of the country—and you protect, if it be desirable, certain things that they produce—to enable them, if you please, to earn more wages—yet you wrong them when by your tariff, you enhance the value of the articles that they have to purchase for their necessities. You reduce the value of their earn-

Digitized by Google

ings. Now I say that, so far as a tariff is concerned, that matter should be taken into consideration, to permit the laborer to get as much of that which is necessary to him for the money that he earns as he possibly can, regardless of any local or particular interest, and if the question arises as between enriching those who are already wealthy and benefiting the workingman, then I say you should give the workingman the benefit of the doubt.

By Mr. CALL:

Q. Your idea is that coal is one of the things that ought to be free of duty?—A. Yes.

Q. What other articles would you recommend to be free?—A. To go into that minutely, one would have to take the tariff and go through it.

Q. You believe that the things that ought to have a low duty are those that are used by the people?—A. Yes. There is a duty on wool, I believe.

Mr. CALL. Yes.

The WITNESS. Now, the thing that is necessary to raise wool is cheap land, and when they cannot get that they cannot raise wool. If they cannot get cheap land out in the West, so as to be able to raise wool in competition with that raised in Europe, where land is dear, it is a very strange thing.

Q. Do you not think there is one difficulty in the legislation of Congress on this subject that a very large portion of the workingmen—not the agricultural laborers, perhaps, but even some of these—a very large portion of the workingmen engaged in the trades and manufactures of the country are opposed to any reduction of duty, and are generally in favor of what they call a system of high duties for "the protection of American labor," as they term it?—A. I think you are correct; it is so to a very great extent.

Q. Do you think that the people engaged in manufacture in the Eastern and Middle States are any longer in favor of a system of protected duties?—A. Well, I should have to qualify that. The laborers, probably, in the Eastern and Middle States, and in fact anywhere where they have given the matter any intelligent thought, must have come to the conclusion that all the escape from their misery does not consist in a protective tariff. But if legislation were wise in that direction, I think much good could be done to benefit the working classes, or those who live upon wages in this country.

Q. By the protective system?—A. By an intelligent adjustment of it. If you are a manufacturer, one of the things that you want is to get your raw material as cheaply as possible. That stimulates your industry. Now, if you protect your industry, and at the same time you protect to an excessive extent this raw material, you more than neutralize the effect sought to be attained.

Mr. CALL. The practical difficulty is that in the discussions before Congress with regard to taking the duty off raw material, the men who grow the raw material would say that they wanted the same protection as the manufacturer.

The WITNESS. I know it; and so we go on indefinitely; but we must endeavor, I think, in legislation, to follow Horace Greeley's maxim, "the greatest good to the greatest number."

Mr. CALL. Maxims are all very good, but the difficulty is that the representative of the raw-material man is in Congress, and has a vote, and under the forms of law feels bound to protect the interest of his constituents.

Digitized by Google

LEGISLATIVE REMEDIES.

Q. Is there any other legislative remedy that you have in your mind or any method of reaching a result in improving the condition of labor?—A. That is a very difficult question; legislative remedies will suggest themselves as we proceed. The cardinal object in all legislation should be, I imagine—at least, that would be a beginning in the right direction—to give those who work for wages some consideration in legislation, and to have a care that the laws are not so made that the rich will grow richer and the poor poorer. It is an unfortunate state of affairs when that is reached, and to say now what legislation is necessary in a general way is very difficult. I have read some theories that have been broached here by people who thought all occupations should be in the hands of the Government. That would be a nice state of affairs. On the contrary, we want government as little as possible. Let the National Government attend to what is its duty—the adjustment of tariffs and such things—with an eye to the general good. But if I had the power I should wipe from the statute books that absurd arrangement about ships; I would not put ships on the same footing with contagious diseases.

Q. You would have free ships and free trade?—A. I did not say that.

Q. You would not say "free trade" in cigars, I suppose, but do you not think that you ought to be able to compete?—A. Well, if you take all the duty off tobacco and cigars we are quite willing to have free trade, and if we had it, we would export goods all over the world.

By the CHAIRMAN:

Q. Do you mean that you could get the raw material for the cigars cheaper abroad than it could be raised in those portions of this country where it is produced?—A. No; we are large exporters of raw material.

Q. Well, if we raise the raw material as cheaply as we could get it with free trade, why could not we export now?—A. We do.

The CHAIRMAN. If we raise raw material cheaper than they raise it abroad I do not see how the tariff on tobacco has anything to do with the exportation of the manufactured article.

The WITNESS. Well, there are quite a number of cigars exported. And, of course, as to manufactured tobacco, nine-tenths of what is consumed in the world, in the shape of plug tobacco, is exported from the United States; that is all right. But there are difficulties in connection with the exportation of cigars growing out of the internal revenue.

Q. It is the internal-revenue tax that troubles you more than the other?—A. Yes. Havana tobacco, in addition to its original cost at the place of purchase, costs about forty cents for the export duty and other charges from Havana. We cannot use that in the manufacture of cigars for the purpose of export. Cigars have, however, been exported to England and some other places.

By Mr. CALL:

Q. But there is a general feeling among the cigar manufacturers in opposition to the removal of the duty on cigars; at least that was represented in the last Congress. I suppose that was on account of the duty on the raw material, was it?—A. Yes, sir.

Adjourned.

Digitized by Google

NEW YORK, *September* 24, 1883.

The committee met at 10 a. m.

HOMESTEAD LEGISLATION.

THOMAS AINGE DEVYR examined.

By the CHAIRMAN:

Question. Were you connected with the homestead legislation of this country? If so, state in what way.—Answer. Yes; for forty years and more. I went through the hard side of the campaign.

Q. You have written and studied very largely on the subject, have you?—A. A great deal.

Q. You have stated that you had some views to present to the committee upon the land question. Will you now state them briefly in your own way?—A. Well, after a century of existence of this Republic, I find these conditions offered to the man who cannot find employment by which to support his family: the prison, if he commits a crime; if not, he becomes a loafer; the poor-house, if he takes his family to it; he becomes a tramp if he looks for work, and even that is made illegal, and he will be taken up by the State authorities and thrown into prison, or, finally, if he gets tired of these conditions of life, he has the privilege of committing suicide. But now even that has been forbidden by law.

These are the only alternatives offered by this grand Republic to the distressed, homeless man, who wants to care for his family. I do not like these conditions. I do not think they are natural. The remedy seems to me to be just as simple and as single as all the remedies presented by the socialists and the trades unions and labor organizations are complicated and mixed up, and, I will add, in their practice utterly impossible, unless we get a government of angels to come down from Heaven and administer them. I have a great respect for these men. They are honest men; but they have grown up, and their fathers before them have grown up, in a great error. In Europe, all over, not only in Ireland (my unhappy country, which I left forty-four years ago), but throughout all Europe, they have been brought up there, generation after generation, with the idea, and it has been ground into them, that they have no rights whatever in the benevolence of the Creator; that the Creator sent them to this earth without any means of supporting the heavy burden of life which He laid upon them—and it is a very heavy burden; it is a responsibility that a man must meet every day or that responsibility will kill him with hunger.

Now, these men from Europe, and those brought up in this country have had that error engraved into their natures by inheritance from their fathers. It has never been disputed that land could be monopolized by a few, and that that few had a right to turn all the rest from their doors, to say to them, "I have nothing to do with your wants; this land is mine; this factory is mine"—as indeed it ought to be when he has constructed it with his efforts. But they have been put in this condition, and there is nothing left for them but the fate involved in one or the other of the forms that I have already stated.

The remedy for all this is as simple and as plain as the nose on a man's face. Congress has ample public lands at its disposal. It has a great many engineers educated at West Point, Annapolis, and other places. They are looking forward for work in their line, and they cannot get it. After educating them the nation, thank God, has very little

Digitized by Google

use for their war qualifications. If Congress would consider how crime abounds over the whole nation—that there is hardly a village free from burglars; that cities are likely to explode with crime that tramples down all law, and if Congress would take a little of the resources at their disposal and survey out of the public lands a sufficient number of townships—six-mile square townships—scientifically and rationally laid out—with, say, a mile square in the center for a village, with room for a park, for fountains, for a boulevard all around it, for walks all through it, for accommodations for machinery of every kind which these townships would want—to make its leather, if you please, from its own hill-side cutting the bark, from its own cattle getting hides. If we survey townships in that way, and then declare that the United States would offer a loan, to be strictly repaid, that loan could remain a lien upon every farm and every household around that boulevard and that square, which would be inhabited by handicraftsmen of all varieties, and those working at machinery; but whatever they have, whether a ten-acre plot or a forty-acre farm, let this loan be a lien upon the land until the money is paid back again. This could be done by the present machinery of Government at far less cost than that which collected General Jackson's surplus revenue which he loaned or caused to be loaned out to the farmers in the several States, or gave to the States for that purpose, much of which was floating when I arrived in this country. I know one lawyer living to this day who took part in collecting that, and he informed me that there was not a single dollar lost, and there was no difficulty in collecting it. Here, then, is an example by which the United States could keep itself entirely safe. I do not want to flatter this committee. I have never flattered men in my life; if I had done so perhaps I would have another story to tell; but I must confess that I have more hope that this committee will take this subject into consideration and embody it prominently in their report than I have from all the newspapers in the country, and all the trades unions and labor unions in the country.

## LABOR UNIONS.

These labor unions and trades unions have got wages on the brain. They have no thought beyond getting a little more wages and a little less work, and when Saturday night comes round, if it brings them that little extra wages, or half holiday, they will raise up their hands to Providence in thankfulness, accepting a condition totally unworthy of American citizens. It will not be in a day or a week that this error will be removed from these men, and that they will stand on their feet upright and know their own dignity. Whether in this country or among the aristocracy of Europe, no man is superior to him who toils honestly for his bread. Men must come up to that knowledge, though it may be some time before they come fully up to it, for I find one of the most prominent among them now going in with the anti-monopolists who are not anti-monopolists, but who are only half-way men—one rogue fighting another—the rogue merchant fighting the rogue railroader.

## RAILROAD LANDS.

Some time ago (at the convention before the last) the anti-monopolists came out flat-footed for the people's right to the soil, and for the paramount duty of Government to see that it was given them. At the last convention, however, they ignored the whole subject. But they

Digitized by Google

went into the subject of the enormous monopolies that in these days cover whole maps, marking out great boundaries of lands which these railroad men have taken hold of on the appropriation of the United States Congress; appropriations of the people's lands—lands that never can cease to be the property of the people.

### CONVICT PRISON LABOR.

These anti-monopolists have ignored that subject now, and one of our first reformers goes into their service, co-operating with them to preach against convict prison labor. In every direction you will find these men crying out about prison labor coming in competition with outside labor, and a very just thing it is to cry out about, but they have never dreamed of a remedy. They have never dreamed of a state of society in which there would be no prison labor at all, and very few prisons.

I say, open this safety valve—for I call it a safety valve—that would let off the danger from all the cities and villages—and where is there not danger? Encourage the formation of colonies. Do everything that a wise Federal Government can do to encourage what I have outlined; and by and by you would have no prisons, no thieves, no burglars, no dangerous men in society any more than you would have weeds in a well-cultivated field. As it is now, every man is turned loose and gets no education but what he takes up out of a newspaper.

### NEWSPAPERS.

Talking of newspapers—but perhaps it is not necessary to go into that—I regard them as one of the greatest evils of the Republic; calling themselves a free press when they are only free to their proprietors: when they are shut out from every other man. Thirty years ago I was on a Staten Island ferry-boat and saw a great danger to life from the overcrowding of the steamer. A disturbance arose upon the lower deck—it was fortunate that it was upon the lower deck—and great confusion and alarm was created upon the boat. I took out my note-book—for even then I was in the habit of taking notes of what I observed, and communicating my thoughts to the public as well as I could—I took note of that circumstance. When I came home I set to writing out my notes, but, recollecting that the chances were five to one that there was not a paper in the city of New York that would publish it, I stopped. I knew that when it would reach the editor there would be a consultation, and the question would be asked, "Do the Staten Island ferry-boats advertise with us?" and the answer would be, "Yes; they advertise with us, and one of our masters has stock in the line." That would consign my manuscript to the waste-basket. When that thought struck me I put up my note-book, and within thirty days after that date a number of people were killed by the overcrowding of the same ferry-boat. It is a mistake to say that the press is free. I have no remedy to offer, only the remedy I have spoken of.

Q. What was your connection with the inception and enactment of the homestead law of this country?—A. Well, I do not wish to parade what I have done, or attempted to do; but in answer to that question I must say that three men, of whom I was one, started in March, 1844, the National Reform Association of the city of New York. Even then there was a good deal of distress among laborers; even then there was a great advance in machinery that interfered with book-binding, and with hat-making, and a great many other trades. There happened to

Digitized by Google

be here before me a Welshman, named George Evans, who came out here when quite a young man. There was another man, named John Windt. My career up to that time had been combatting the landlords of Ireland and of England. I wrote "Our Natural Rights" when I was out of my teens—when I left the school in which the master could not teach me that a sentence should begin with a capital letter. And in the first manuscript of "Our Natural Rights" I wrote "Ireland" with a small "i." Luckily a medical student whom I knew, looked over the copy, and gave me the first idea that I had ever received of capital letters. I wrote "Our Natural Rights" disproving, as I believed then and now, the ownership by these men of the land. I saw and I said that the retirement of a Russell or the advent of a Peel, or any change of Government in England could not affect the Irish peasant in the slightest degree. Taxation cannot affect them, for they drink no tea except twice a year; and anything in the way of exercise does not affect them, for they smuggle and make their own whisky, so that the national Government was of no consequence to them. But if a peasant farmer made the least improvement on his farm, or was able to wear a decent coat, and above all, if he dared to mount a good horse, the agent of the landlord would growl and raise the rent. I had a brother-in-law, himself a descendant of a Cromwellian; his ancestors had come over with Cromwell. He was a good farmer and an honest, hard-working man, but he liked good clothes and a good horse. On coming to pay his rent on one occasion the agent measured him from head to foot with his eye, and then said to him, "Mr. Kilpatrick, you ride as good a horse as I do." "Well," said my brother-in-law, "I like a good horse, and when I have one he is as easily kept as a poor horse" The agent looked at his clothes and his top-boots, and, taking in his appearance, said to him, "Mr. Kilpatrick, your land is worth more money than you pay." Very soon he raised the rent to such a height that my brother-in-law had to leave his country and come out to America, when he was well advanced in years, with his family. Then age set upon him, misfortune followed him, and he died by his own hand.

As soon as I finished "Our Natural Rights" I found that I could get no printer in Ireland to print the work. After two years of effort I finally had a placard printed, stating the contents of the work, and posted that up here and there through the community. I was largely interested in business at that time—the linen-yarn trade. At the time I speak of there was no machinery that spun yarn or flax. It was all spun on a neat little hand-wheel by the women.

And, incidentally, I would vindicate them and the Irish people generally from a charge of laziness. I spent years in that trade—several of the most active years of my life—before I entered public life, and I noticed that a hank of yarn contained some 3,200 yards, and it constituted a very heavy day's work for a spinner. I found that if the price of yarn increased sufficiently to give two pence sterling of profit on spinning each hank, the market was overstocked with the article. Who knew these things? Who inquired into them? Who experienced anything about them? At the very same time I well remember two brothers in my village, in Donegal—sober, efficient, respectable workers, and these two never got more than ten pence sterling for a day's work, and they would at any time make, and be glad to get, a contract during their whole lives which would secure them eight pence a day, sure. That was one dollar, not for a day's work, but for a whole week's work!

To that the villainous land monopolists, shutting out every spot of escape, had reduced the people. To that they will reduce the people of

Digitized by Google

this country, if they are suffered to go on. When I finished "Our Natural Rights" I dedicated it to Wilkins Charman Crawford, who was then beginning to move in the land question. He sent me an encouraging letter which caused me to dedicate it to him. I sent him the programme which I had printed in a "broadside," and it was amusing to see me in my place of business distributing these "broadsides." I would nail them up at the market-place before my business would open, in the city of Armagh, and I would stand carelessly by and hear the comments of the people upon them. A crowd would gather around one of these posters, and read it through. My knowledge of language was very limited at the time. I had little opportunity of knowing anything about language. Books were not to be had in those days by poor people. I was very much offended at the comment of a very intelligent looking young man who read the placard to the crowd. After reading it he said, "That is a damned nervous production." I had been accustomed to understand that nervousness was a disease among old people, and I supposed that he was cursing it because of the poverty of the language.

As soon as I got it printed in Ireland (my business was then established and my first child had been born), I said to my wife, "There is a mission given to me; it is set forth in this pamphlet. I must do the work which this mission calls upon me to do. If I can do it here, well and good; if not, I must go where I can fulfill my mission." "Nonsense," said my wife; "what wildness is that? We are now settled, and starting life fairly; let us remain where we are, and we can hope to prosper." "Settled or unsettled," said I, "I will pull up stakes and go to the city of London, and if there is a mission given me, as I think there is, I will be useful to the world; and if there is not, I will take my chance; and if I do not succeed there, I will go to America."

Luckily, a friend of mine had been appointed secretary to Joseph Hume, a great Scotchman, and a member of the British Parliament. I had helped this young man to get to London; he had finished his education; he had been intended for the Catholic ministry, but the bishop would not ordain him into it, and he left and went to London and secured this position that I refer to. I had helped him to get to London, and he opened a correspondence with me. By this time that I speak of he had become one of the editors of the London Sun—editor of the farm department of it. Well, I went to London and reconnoitered, and at that time the land portion of the trip was a matter of 28 or 29 hours on the top of a coach.

Q. The point we want to get at is the development of the homestead law of this country. I thought it would be well to have that noted in our record, and we would be glad if you would reach that point as quickly as you can. It is a point of some historical importance.—A. Well, I was doubtful whether I was not making a mistake in entering upon these details; but I did so because I thought it would impress the committee with the thought that I understood the subject, having studied and worked at it so long.

### EARLY EFFORTS AT HOMESTEAD AGITATION.

Well, to cut the story short, we started in New York the National Reform Association, the object of which was to reserve the public lands for the actual and exclusive use of settlers. We issued twenty thousand copies of our programme, and we held three or four meetings in the streets and squares of New York every week from the month of March, 1844, until the winter shut us in. We held also in-door meetings in Croton

Digitized by Google

Hall, and had a room there for business, the meetings being held every week. We sent our documents to Congress and to the New York assembly and all over the land, and made a considerable impression. The result was that the question was taken up in the next legislature which assembled in 1845, and our views were indorsed by a majority of 103 to 5 dissenters. Daniel Webster was then Secretary of State to President Tyler; and whether it was from the significant vote of the New York assembly or from other information I do not know; but the following week, as soon as it could reach him, he declared in favor of it. Immediately it went up to Congress, and there the first dividing line between the North and South—after Calhoun's nullification affair—was brought about in Congress. Every man, whether Democrat or Whig, north of Mason and Dixon's line in the lower House voted for our views, that the land should be so disposed of. Every man south of that line voted against it, with the single exception in each case of one man. The Southern man's name was Wright, and he came from the high lands of Georgia. He was the only Southern man that voted for this measure. Everybody else from the South voted against it. This I consider was the first indication, if not the first cause, of the great civil war. The measure afterward matured into the homestead law.

Q. In what year was that?—A. The year of the vote in the New York assembly was 1845. We had commenced in the spring of 1844, and worked in the way I have mentioned during the whole summer.

Q. You followed that idea with your organization until finally the result was the homestead law?—A. Yes; eventually. The Senate defeated it after it had passed the lower House. The Senate discussed it for a whole week. A countryman of mine, General Shields, was then in the Senate, and a Democrat, and was well inclined to the law; but his party would not let him vote for it.

Q. The rest is matter of public record pretty largely; and as our time is limited this morning I would like to have you state, if you will, in a few words, your views upon the land theory of Mr. George. I think you have written upon it and reviewed it, have you?—A. Well, if I do not understand the land question I do not know who does. I know no one who has studied it so much as myself. But I do not apprehend exactly the meaning of your question.

## "HENRY GEORGE'S" LAND THEORY CRITICISED.

The CHAIRMAN. Perhaps you did not understand me. We have about fifteen minutes before hearing another witness who was called and who is now waiting, and if you are disposed to give us your views upon the land theory of Mr. Henry George (which I see you are reviewing in the public prints) we shall be glad to hear you give a condensed account of your views of that theory.

The WITNESS. Well, so far as the fifteen minutes are concerned, I was led into the mistake—if I have made any—by the committee listening to Jay Gould talking nonsense for I do not know how long. However, I do not want to spend much time upon Mr. George's views. I know that his plan of nationalizing the land is utterly impracticable, and if it could be made practicable it would be utterly unworkable. There is no plan but the individual homestead; no plan but that the lands of this nation ought to be limited to the farm that would be sufficient to keep a man and his family in comfort and to educate his children. Mr. George has helped to throw a great light upon this subject, but I hold that there were three men connected with the Irish World

Digitized by Google

that taught him years before he wrote a line on that subject, and that those three men raised all the noise that you have recently heard which resulted in Gladstone's land law. If you had seen my criticism of George's theory in Frank Leslie's Illustrated Newspaper two or three weeks ago you would see how I have entirely disproved it.

Q. Can you state in a few words your objections to his plan?—A. I was going to say that in that criticism you would find all my objections, but I will briefly state them. His plan is to nationalize the land. Now, how is he to nationalize the land? He must alter the Constitution of the United States first. He must say, "hereafter no man shall own any private property in land." The nation now, by virtue of this change in the Constitution, would take possession of all the lands of the nation. After getting his movement started, he would have to get the legislatures of three-fourths of all the States to indorse it. Then it would have to pass the ordeal of the people, and the people would have to consent that all private property in land should be given up to the nation. The very statement of the thing is preposterous and absurd, and totally impracticable. I have been assisting Mr. Patrick Ford for the last seven years upon the Irish World, and he and I and his London correspondent, raised all this noise that resulted in the Gladstone land law. Mr. Ford said to me, "You object to George's plan. Write a criticism upon it and I will publish it over your own name." I wrote the criticism, and he read it over and sent word to his foreman, "Print that; give Mr. Devyr as many slips as he wants, but you must not publish it." It could not appear in the paper—in fact it would have extinguished Mr. George's plan. I have copies of that criticism in my hand. I sent it to a good many gentlemen, and every one of them condemned his plan. The thing is totally impracticable, and if it were practicable and it were ordained to be the law to-morrow, how many thousands of changes it would be necessary to make! You want so much land, but you are met by the statement that you can only have that much which the supreme authority will give you. For this land you must pay a quit rent. How much will it be? Under that plan no man can see an inch before him. Mr. George is a brilliant genius, and has done much good. He has called public attention to this matter, but there is not a single detail of all his remedies that is not impracticable. That is all I have to say about it now. I was led into the error of tracing the outlines of the movement by which I became connected with the homestead laws, by remembering that Jay Gould was allowed all the time that he pleased to talk his nonsense before this committee. I will repeat, however, that I have more hope that this committee will take this matter up by means of the simple remedy which I have marked out, and will do more good in that way than by the adoption of all the wild and impracticable schemes that can be proposed. There is not a city or village government in the country that would not be interested in co-operating in such a plan. It would rescue the country from all the dangers that now threaten it; dangers that are increasing every day, and that have increased very greatly within the last twenty or thirty years. If they have increased so much within that time, where will the country be at the end of the next thirty years?

## NEWSPAPERS.

One more suggestion with regard to the newspapers. They are not the expression of the free public opinion of this country. I should suggest that a national law be passed compelling every man who owns a

Digitized by Google

newspaper to leave a blank column to be filled up with the real opinions of the people—my opinion or yours—and that every one writing a leading article should sign his initials to it. How much, for example, should we not respect an article in the New York Sun if signed with the name of Charles A. Dana? Some plan of that sort is coming to be more and more essential for the salvation of this Republic.

---

NEW YORK CITY, *September* 24, 1883.

WALTER E. BARNETT sworn and examined.

By Mr. CALL:

Question. What is your address?—Answer. No. 85 Maiden Lane, New York City.

Q. Your occupation?—A. Manufacturer of cigars.

Q. How long have you been in the business?—A. About eighteen years.

Q. Have you been largely engaged in the business?—A. Well, no, I cannot say that I am; I am what would be called, perhaps, a moderate manufacturer.

Mr. CALL. I suppose you have seen the resolution of the Senate under which we are conducting this investigation?

The WITNESS. If you have a copy of the resolution I would like to look at it. I understand it generally to inquire into anything which depends upon the relation of capital and labor.

Mr. CALL. I will read it to you. [Resolution read.] We shall be glad to hear from you anything you wish to say on any of the subjects mentioned in that resolution; any facts within your own knowledge relating to the conditions of labor, and any recommendations you may desire to make for the improvement of those conditions, or the remedy of any evils affecting them. You may do this in your own way without special interrogatory.

The WITNESS. That is what I understood to be the scope of your duties here, and, inasmuch as I am about to take a ground that will be pretty severely handled by a certain element of the press of New York, what I wish to say briefly on the start I have committed to writing, as I do not wish to be misunderstood. Unfortunately I am very busy (there being sickness in my staff), and I have not had time to prepare it as I would like to have done for this committee, if I had had the time.

### NO ANTAGONISM BETWEEN CAPITAL AND LABOR.

I may say that, although a manufacturer, I have been for the last ten years politically allied with the workingmen—working in their ranks, and helping to make their ticket, and supporting them. I believe that, under a just system, there is no antagonism, and that there should be no antagonism, between capital and labor. Capital is the offspring of labor, and should be its helpmate. The workingman is assailed at both ends of the line. Labor, to compete with his, comes here in a continuous stream, and foreign-made goods are always being imported, thus lessening the demand for his labor and cheapening its price.

Digitized by Google

## THE RIGHT OF AMERICANS TO CONTROL THEIR OWN MARKETS.

Citizenship consists of two things: the duties of the citizen to the state, and the obligation of the state to the citizen: The state usually exacts the full measure of the citizen's obligation to the state, but seldom performs its full duty to the citizen.

We hear a good deal of talk of vested rights, but there is one right which I hold to be the most sacred of all vested rights, which many public men seem desirous of ignoring, and that is the right of American citizens to the control of their own markets. This is the right which most nearly affects the workingman. If there be any self-evident right, I hold this to be the first of all, and to be the best founded. Nations prohibit the march of troops of another country across their territories, and assert their rights to sovereign prerogatives in many other ways, but strangely allow the invasion of the state by hordes of traders, and permits them to flood the markets with goods, manufactured in countries where the laborer is a mere serf of his more prosperous neighbor, and whose compensation is never higher than the bare cost of animal existence.

Such a system may not work any very great injury between countries in which the laboring classes are both reduced to the same level, but it can be seen at a glance that such international trade or exchange will work a grievous injury to any country where the man of labor is established upon a higher plane than that of the mere brute; and it is also as plain to be seen that it cannot long continue before the man of labor in both countries will be reduced to the same level. Twenty years ago the American mechanic was the most contented and prosperous of any workman in the world. After a few years he had accumulated sufficient money to establish a home and start in business. His children were well educated, and his family surroundings were refined. He was independent and manly. Look at him to-day. See what a change twenty years have worked in his condition. It is now a mere struggle with him for animal existence. He is crowded into that modern hell—the tenement house. His surroundings are no longer of the refined character they were. His children, when they should be in school, are forced into the factory to work, or into the streets to black shoes, or peddle newspapers, and in many cases even the wife is compelled to work, and after all this labor the combined earnings are only sufficient to supply them with the bare necessaries of life.

If you ask me to what I attribute this change, I answer: To the importation of manufactured goods which supply the wants of our people without employing our labor. In my judgment this is the factor.

## THE TARIFF.

I hold that a tariff should be levied primarily for protection, incidentally for revenue; and that when many goods are imported in spite of the tariff, it is an evidence that the tariff is too low, and that it would be the part of good statesmanship at this point to raise the tariff and check importations. Under a proper tariff system, this country would speedily become what I believe the Supreme Architect of the universe intended it should be—a prosperous and happy land, where peace and plenty would reign. Nature seemed to have designed this land as such. Isolated from the older lands by broad oceans, we have no need of large standing armies of non-producers to eat up the substance of the men of labor while standing guard at our frontiers. We have every climate,

Digitized by Google

from the arctic to the tropic, a fruitful virgin soil which showers plenty upon the husbandman for his toil, all of which is watered by mighty rivers, and none (or scarcely any) of which is arid. Our mountains contain all the iron and other metals we need; we have coal and oil in abundance. What more do we need but wise statesmanship to complete the sum of our existence? We could build a Chinese wall around this country and be the happiest people on the face of the globe.

People ignorant of the figures in the case sometimes ask what we will do with our surplus products. If we buy nothing abroad we can sell nothing. I would remind those people that business is business, and is not carried on upon a sentimental basis; that whether we trade with others or not, they will buy nothing from us that they are not compelled to buy, and that our home market already consumes over 92 per cent. of all our productions.

Q. That is the only remedy that you care to suggest?—A. That is the first great cause, in my judgment, of the condition of the workingmen as we find it to-day.

### MAKE RAW MATERIAL FREE.

Q. You would exclude all foreign production, I understand you?—A. No, sir: I would admit free of duty everything in the shape of raw material, the like of which cannot be raised here; if it is an agricultural product, or (in case it be a mineral) if it is mined in this country, or, as in some classes of iron ores, if a superior article of iron manufacture can be produced by blending our own production with a foreign article, I would put that on the free list. But anything for use among our people, the labor for which, or the labor to manufacture which, is found in the United States, I hold it to be the first duty of the Government to protect our citizens in the right of their own market. I have seen a great deal of the working of the tariff, being engaged in business having two branches, one directly affected by the tariff, and being in the nature of things protected, and the other branch which does not come in connection so much with the tariff, and in which wages prevail.

### EFFECT OF THE TARIFF ON THE CIGAR TRADE.

Q. In which branch is that?—A. That is the manufacture of cheap goods. Take the case of cigars: Before the Morrill tariff was established cigars were made in Germany. Tobacco grown in the United States was shipped to Germany and blended with other tobaccoes and then sent back here in the manufactured form and sold for $8 a thousand. To-day I am paying in my factory $40 a thousand for rolling up cigars.

Q. How many people are engaged in the cigar business in the United States?—A. When I was in Washington last winter Senator Allison computed the number at 480,000. It is a little above the figures I have, but my figures are not complete. I presume his are correct.

### CONSUMERS OF CIGARS.

Q. You have no idea of the number of people who consume cigars, I suppose?—A. I hold that the first duty of the Government is not toward the consumer, but toward the producer.

Q. I was only asking if you had any idea of how many people there are in the United States who consume cigars?—A. Well, our popula-

Digitized by Google

tion is computed to be 52,000,000. Of that probably almost every man over the age of fifteen——

Q. There is enough to beat those 400,000 cigar-makers on a square vote?—A. Undoubtedly.

Q. So that you would have to educate them into the theory or political view that you propound—that the producer ought to be protected and not the consumer?—A. Yes. I hold that every man, if he be not a lawyer, a "dominie," or an annuitant, is a producer of some kind—unless it is a man like Vanderbilt, who lives upon the earnings of others; and, although every man may not produce cigars, he produces something, which if protected in the same ratio as that which I produce, and as that which every other person would produce, there could be no objection upon that score.

Mr. CALL. A practical difficulty we found in the last Congress on both sides, without respect to politics) was that those consumers would always have somebody to represent them there, who voted according to that side of the question, and according to that view.

The WITNESS. Pardon me. There were a great many that voted that way, it is true, but I think a great deal of it was due to a lack of knowledge of political economy; and I think the first duty of the State, if it could be done, or of those who form public opinion, should be to induce our people to study political economy. Political economy is not taught in our schools—so much the greater misfortune.

Mr. CALL. I have no doubt there is a very great want of knowledge on that subject somewhere, probably generally.

### FREE-TRADE LITERATURE.

The WITNESS. There is another thing I blame that for. I think it is very unfortunate that we speak the language of that country which is uppermost in propagating the principles of free trade. Their writers on that subject are numerous. Reprints of English books, and English books themselves, are circulated very largely here, and people do not discriminate when they read them as to whether they apply properly to this country, or to any other, but accept them "*holus bolus*," on general principles. I think that is a very unfortunate thing. Outside of Henry C. Carey, and a few men of that stamp, we have no well-defined school of political economy. We are taking at second-hand the ideas of a country which protected its manufactures in the most rigid way for seven hundred years. The infant, therefore, was very old when it was weaned.

### CONDITION OF ENGLAND.

England is closely settled, and her people are divided into two classes, the rich and the poor. The rich are very rich and the poor are very poor. When political economists speak of England they generally speak of the England of the rich. They do not speak of the hewers of wood and drawers of water. It is said England is a "rich" country; political economists tell us that; but they do not tell us that the laboring classes there scarcely know meat once a month, and that they are worked down to a terrible condition. England saw—that is, the England of the political economists saw—that the few who would benefit by extension of trade throughout the world, had their labor at the mere cost of animal existence, that they could drive their people into the cities and produce goods cheaper than any country on the face of the globe.

Digitized by Google

WAGES OF CIGAR-MAKERS.

Q. I understand you to say you are paying $40 a thousand to your workingmen now?—A. Yes, sir; for some grades of goods.

Q. And you understand the condition of labor abroad to be that they are earning a mere animal existence?—A. When I give you $40 I give you a figure for fancy work. There is not much of that done.

Q. What would you call the average?—A. In my branch of the business the average would be $25.

Q. Do you think that that compensates labor abundantly? Are the workingmen doing well, laying by something?—A. I should like to have the committee go to my factory at any time.

Mr. CALL. I do not speak of you individually, but as a type of manufacturers.

The WITNESS. There is scarcely a man that has not a few hundred dollars laid by.

Q. You think that they are getting fair pay, that it enables them to live comfortably and lay by something?—A. Undoubtedly.

Q. Is there anything else you wish to suggest?—A. I did not know but what you might have some questions to ask. I would say that the drift of legislation always seems to be to protect the interests of importers rather than to protect manufacturers.

Q. What legislation do you refer to now?—A. Legislation lowering tariffs—this great liking for lowering the tariff and letting goods in very cheap. We are told that this is a check upon high prices.

Q. What legislation is it that has made a great reduction in the tariff?—A. I was going to point to one thing over which Congress has control, and which we propose to ask them to abolish; that is, the tendency of the law, as I say, in favor of the foreign goods always.

TENDENCY OF LAW IN FAVOR OF FOREIGN GOODS.

Q. What law is that you speak of?—A. I am going to show you, if you will permit me. I hold in my hand a box of cigars that were made in Key West, Fla. Of course that is a domestic manufacture. Now, if you notice, the name of the factory and the district of the State has to be stamped indelibly into the box. A caution or notice is put on it in that form, and that is provided for in the Revised Statutes of the United States. Now, I show you another box of cigars, imported from Havana. The Government goes out of its way to put that mark on the box; and that was not done by act of Congress either, but under the provision of the tariff law by which the Secretary of the Treasury is instructed from time to time to prescribe rules and regulations for the government and control of the Deparment; we have protested against it several times to the Secretary of the Treasury, and it has been concluded in that Department that the Secretary has the right to prescribe rules, but not to repeal them.

Q. What is the rule?—A. The Government goes out of its way to assure a market for foreign goods by putting this guarantee on this box that these cigars came through the custom-house.

Q. Let me see if I understand you. It enables a person to tell that this is an imported cigar, and that the other is a domestic one?—A. Yes; and I hold that that is not the office of the Government.

Q. The Government ought not to allow that, you think?—A. The Government ought to allow us to sell our goods on their own merit.

Digitized by Google

Q. To sell domestic goods as imported goods?—A. No, sir; that is not the object.

Q. What is the point, then?—A. The point is that there are a great many people in this country that believe nothing is good that is made in the United States; that something is better if made abroad.

Q. That is, that they prefer to smoke imported cigars?—A. Yes.

NOT THE OFFICE OF GOVERNMENT TO DISTINGUISH IMPORTED FROM DOMESTIC GOODS.

Q. And that enables them to tell that it is an imported cigar; that is the idea?—A. That is the idea; and I hold that that is not the office of Government. If you ever have any silk manufacturer before you he will tell you that Paterson could never have become the center for the manufacture of American silks, that the people would not have bought the result of the Paterson silk mills if they had thought they were of American manufacture, yet to-day these silks sell lower than the foreign goods. Our goods are frequently pushed aside. I hold that that practice grievously affects the American mechanic, and we propose to ask your honorable body at the next session to remove that.

Q. You want some legislation by which people would be compelled to smoke domestic cigars?—A. No, sir.

By Mr. PUGH:

Q. Or to enable the manufacturer to induce them to do so?—A. No, sir.

Q. What is the use of the rule, then?—A. Here is one cigar and there is another. Let a man judge of their merits and take whichever he prefers.

Q. Without knowing where they come from?—A. Undoubtedly.

Q. Supposing he was to ask you where they came from, what would you say?—A. I have a factory, and it is fair to assume that I manufacture them.

Q. Suppose the buyer should ask you?—A. Then I should tell him.

LEGISLATORS SHOULD REMEMBER THE MANUFACTURER.

By Mr. CALL:

Q. Well, the legislation should be prohibitory. Is that your idea—to prohibit the importation of foreign goods?—A. No, I do not say that it should prohibit them exactly, but the manufacturer should be regarded in the passing of the laws.

Q. Is it your object to cheapen prices?—A. To cheapen the prices of goods and raise the price of labor.

Q. Your object in that legislation is to cheapen the price of cigars?—A. Yes.

Q. How will that enable you do to it?—A. That is the tendency of all well-paid labor with a sufficient market.

Q. Suppose there are so many manufacturers that they overdo the thing and you cannot sell any abroad?—A. We should never be able to sell them abroad; but if we can make enough to supply the United States, we will be satisfied. We are seventy millions behind to-day of cigars that are imported from Cuba alone. If you agree to make us right on that 70,000,000 we won't talk about anything else for the present.

Digitized by Google

By Mr. PUGH:

Q. Straiton & Storm say that they are exporting to several foreign countries.—A. Yes; but Straiton & Storm would take identically the same ground that I do. I know Mr. Straiton especially well, and we have had talks on this question.

By Mr. CALL:

Q. Do you want tobacco free or do you want to have a duty on that?—A. I am what I call a consistent protectionist. I would have the duty remain as it is on imported tobaccoes, though we pay a large sum every year.

Mr. CALL. Some farmers think it is not high enough, and they complain about the importation of Sumatra tobaccoes.

The WITNESS. But you put 75 cents on it last year.

Mr. CALL. Yes; but they still claim that they want a duty prohibiting it, and that it is wrong to have it all.

CONNECTICUT TOBACCOES.

The WITNESS. The great trouble about that comes from our Connecticut friends, who have impoverished their soil. Two years ago you could buy their tobacco by the car-load for 9 cents a pound. I know to-day where people are demanding and will get 40 cents a pound for Wisconsin tobacco.

Q. These Connecticut farmers, then, all ought to go to Wisconsin?—A. The trouble with our friends in Connecticut is this: for a long time they controlled the market for fine wrappers; that is, wrappers fine enough to make a good class of cigar with a Havana filler. There was no State to compete with it, no State raised any tobacco of quality sufficient to make a good cigar in combination with Havana tobacco. It is a very exhaustive plant, and, instead of alternating the crops, the avarice of the Connecticut farmer induced him to plant tobacco year after year, and each year the thing deteriorated in quality. The New England farmer is a good deal of a scientist, and dabbles much in the new ideas of the day, and he went into the use of chemical manures, putting so many pounds to the acre of such a manure for the purpose of getting a dark leaf; so many pounds to the acre of some other manure for the purpose of making a thin leaf; so many pounds to the acre of some other kind to give it a glossy appearance, and so on. But it appears that those combinations do not work as well as manures as when studied out chemically, and so it did not work very well with the New England farmer. The consequence is he spoiled his land, and two or three years ago many of them went back to the old principle of barn-yard manure, and to-day they are raising a better tobacco than ever. In the mean time the State of Pennsylvania went to work raising a superior grade of tobacco, and in a few years they raised a finer tobacco than Connecticut, and supplanted the Connecticut tobaccoes in the market. To-day the tobaccoes of Pennsylvania will sell, on the average, taking the entire crop, at about $1.25, while the Connecticut tobacco sells for $1 on an average.

Q. The proper remedy for the Connecticut man, instead of increasing the tariff, you think, is to increase the barn-yard manure?—A. Yes, sir; but take Wisconsin, for example, a few years ago they raised no tobacco fit for wrappers.

Mr. CALL. These Connecticut farmers may say to you that you would have to take some of that remedy yourself; that is the natural process of increasing the price of commodities.

Digitized by Google

The WITNESS. It protects them. I am asking for protection to the farmer.

Mr. CALL. That is all right. I am not speaking of the merits of your theory at all, but only of your view of this matter.

The WITNESS. We must, of necessity, import Cuban tobacco to mix with those of our own production. But I hold that the farmer is entitled to the same ratio of protection that we are. We never ask anything else.

Q. You only want enough to give you control of the home market?—A. Yes, sir.

By Mr. PUGH:

Q. And not allowing the consumer to buy anywhere else except from you?—A. I think we are doing well enough if we can manufacture all the goods of this country.

By Mr. CALL:

Q. And you are willing to give the farmer the same measure of protection?—A. Yes, sir; and in the end, by a proper system of protection, it can be proven by figures that labor is benefited by the enhanced price, and the cost of living is lessened by protection.

THE CONSUMER BENEFITED BY PROTECTION.

Q. How about the consumer?—A. The consumer is benefited in the end. The consumer to-day of steel rails is largely benefited by the protection afforded to that industry by act of Congress.

Q. That is, he gets his rails cheaper?—A. Yes.

Mr. CALL. If you can demonstrate those things, I think that is the remedy we want.

The WITNESS. I thought I would be asked that, so I will demonstrate it.

Mr. PUGH. Oh, it has been demonstrated a thousand times, and I do not think we ought to go into it any further.

The WITNESS. I would like to give you a few figures.

Mr. PUGH. We have had lots of figures. They are all over the face of the earth.

Mr. CALL. Mr. Pugh means upon the general theory of the tariff. A witness whom we have to wait for is not here, and we can hear you a little while longer. I only meant to say this: that if you can demonstrate that the tariff or any other system can, in the first place, increase wages, and, in the second place, reduce the price of the article to the consumer at the same time, that is the very thing we want. We want to pay the workmen high prices, and at the same time get the goods cheaper for the consumer.

The WITNESS. Well, you will admit——

Mr. CALL. [Interposing.] I have no admission to make. But if you can demonstrate that any measure will give high wages to the people engaged in manufacturing, and at the same time sell their goods cheap to the people who want to buy them, that fills the bill.

The WITNESS. Well, free-traders do admit generally, I believe, that protection enhances wages, but they claim that it also increases the cost of living. Now, I will hold them to their admission on the one hand—we all know that it does increase the price of wages.

DOES PROTECTION PROTECT.

Mr. PUGH. The wage men who have been swearing here say that it does not; that they have not got any of the benefits of your protective

Digitized by Google

policy; that the manufacturer, such as you, pockets all the increased price.

The WITNESS. I can send you a large number of workingmen, sir, that will testify the same as I do in regard to this question.

Mr. PUGH. Well, they have not been here yet.

The CHAIRMAN. Quite a number have testified to that effect. However, it may have been while Senator Pugh was away.

Mr. PUGH. Quite a number that I have heard say that it all inures to the benefit of the manufacturer.

The WITNESS. But a great deal of that idea comes from the socialism of New York, and much of that is not of native origin. The men that want to testify before this committee ought to understand the principles upon which the American Republic is founded. They come here, many of them, honest, but they bring ideas from other countries and attempt to apply them here. I can produce any number of intelligent workingmen (and I mean men of foreign birth, too, but who have lived here for a long time) to sustain what I say.

The CHAIRMAN. We understand the great majority of workingmen are of that opinion, though some men advocate the views of a minority.

### RESULT OF THE PROTECTIVE TARIFF ON OUR IRON INDUSTRY.

The WITNESS. In the year 1867 England had almost entire control of our iron trade. In that year we produced a little over 2,000 tons of railroad iron, and the price in our markets then was $166 a ton. The next year we produced over 6,400 tons, and the market price was down to $158 a ton. The year following we produced over 8,000 tons, and the market price got down to $132 a ton. We went along increasing our manufacturing facilities, producing every year more iron, and marking down the price until 1881, when we manufactured 1,187,770 tons, and had by this time marked the price down to $61 a ton, and last year it got down to $48 a ton. So much for railroad iron.

### ON THE MANUFACTURE OF CHEMICALS IN THE UNITED STATES.

Twenty years ago the manufacture of chemicals was of very little importance in this country. We had to depend upon Europe for our supplies, and pay high prices for them. Then came the Morrill tariff. This stimulated enterprise, and as a matter of course reduced prices. Chloroform sold here for $2.50 per pound. We put a duty of $1 per pound, and under this duty it is now selling for 65 cents per pound.

The number of chemical factories in the United States is 1,349, employing a capital of $85,000,000, with annual sales of $118,000,000, and burning annually 600,000 tons of coal. Now I say it is better that that money should be paid to American labor than to send it abroad.

Take bicarbonate of soda. Before the Morrill tariff went into effect this article sold for between 4 and 5 cents per pound. With a tariff almost prohibitory, it sells to-day at less than 2¾ cents per pound. Aniline dyes, so largely used in manufactures, now sell at $2.50 per pound. Before the tariff was established (which made its manufacture here possible) it sold for $6.50. Fusil oil, extensively used in the manufacture of quinine, now sells for 32 cents per gallon, although the duty upon it has been $2 per gallon, until the last tariff bill, which reduced the duty to $1 per gallon.

Take acetate of soda, the rate of duty on which is 222 per cent.; the price abroad is 28 cents; the price in the United States is 22 cents.

Digitized by Google

Take caustic potash (used in all the arts, and especially in the manufacture of wood-pulp for paper); before a duty was placed upon it it cost in this country 7⅞ cents per pound. To-day it sells for 3¼ cents.

Alum used to be on the free list, and you could not then buy a pound of it for less than 3¾ cents. When the duty was put on it American industry developed its production, and to-day you can buy it for 1⅞ cents per pound.

Castor oil is protected by a duty of $1 per gallon; castor oil beans by a duty of 60 cents per bushel. If the duty was added to the cost of the article $1 would be added to the foreign cost of the oil. Is it added? Not at all. Castor oil is selling in our markets for 92 cents per gallon to-day.

ON THE WOOLEN MANUFACTURES.

Take woolen cassimere cloth. During the comparative free-trade era, from 1850 to 1860, when wool was free and the duty on cloth merely nominal, cassimerets averaged 51 cents a yard. Now, under the tariff, they sell for 45 cents. What makes this difference? It was not that labor was better paid before the war than now. The wildest free-trade lunatic would not claim this. What was it, then?

When wool was free the wool interest of this country was at a low ebb. The market for wool was in the hands of the importer. It was in the hands of the foreign grower. To-day, under our tariff system, the market for American wool is in the hands of the American grower. Every pound of wool that the American farmer can raise he sells to-day to an American manufacturer, and the money stays at home, and is not sent abroad. Do you say the price of wool has increased under this tariff of 12 cents a pound, as against the free wool of 1850 to 1860? To-day wool is cheaper, pound for pound, and has been for five years past, than it was from 1855 to 1860, when it was imported duty free.

ON AGRICULTURAL IMPLEMENTS, ETC.

Take some of our manufactures into which enter as raw material articles upon which a duty is levied, as you say, for example, iron and steel. No nation can compete with us in style or price of reapers, threshers, mowers, plows, shovels, hoes, axes, forks, scythes, wagons, harness, saddlery, hardware, &c. Our people buy better and cheaper goods than any nation in the world can sell us. Much of our hardware is found on the shelves of English dealers.

ON CUT NAILS.

Take the case of the common cut nail, a purely American industry, born of the old protective duty on wrought nails, not one was made in the United States when the duty went into effect; all were imported from England. Eight million kegs of these are now made annually in the United States. Now all the nails used in the United States are made here, and the price, instead of being 20 cents per pound, as it was when the "dear Englishmen" had possession of our markets, varies now from 3¼ to 3½ cents.

ON GLASS.

Do you want any figures on glass? Take the common tumbler that you drink from. All these were imported up to a few years ago. The price then, by the case of 25 dozen, was $1.40. Six years ago, under the much derided tariff, we commenced to make them, and to-day we sell them at 40 cents.

Digitized by Google

### ON POTTERY.

Take pottery. Kaolin, or China clay (from which our pottery and China table ware is made), cost us in England $1.28 per cubic foot. The price under protected American competition is 40 cents per cubic foot. The common crockery ware used upon the poor man's table was 60 per cent. higher in price from 1850 to 1860, under free trade, than it is to-day, under a high protective tariff. Remember also that pottery is made to-day almost identically in the same way as it was made by the Egyptians more than three thousand years ago. It is all made by hand and on the potter's wheel. The change in price cannot be charged to the account of labor-saving machinery, nor can it be said that the journeyman potter is an ill-paid mechanic, for he is paid 60 per cent. more to-day in Trenton than in Staffordshire. The proof of this is the fact that the English potters are coming here in droves.

### ON COTTON CLOTH.

Take cotton cloth. Before the tariff of 1824, unbleached cotton sold in this market at 24 cents a yard. Congress put, in the tariff of that year, a protection of 8 cents a yard. Mills started up to make cotton cloth. Before that tariff was repealed that same cotton cloth, upon which there was a duty of 8 cents per yard, was selling here for 6¼ cents. Those are facts that any one can look up for himself, and I hold that they demonstrate my position.

### EFFECTS OF HIGH DUTIES.

By Mr. CALL:

Q. I understand your idea, then, is that the effect of a higher duty or a prohibitory duty is to make things cheaper?—A. To make labor better compensated and to cheapen the cost of living.

Q. So far as the consumer is benefited he is benefited by getting everything cheaper?—A. Yes; and he is benefited by the tariff.

Q. Do you think this high rate of duty makes your cigars cheaper?—A. Yes.

Q. Then you want legislation to make your cigars cheaper than they are?—A. If you will allow me, I will show you how.

Q. You want legislation to enable your cigars to sell cheaper than they do, ifthe effect of a high tariff is to make things cheaper than they are?—A. Our object is to make a market for our goods.

Q. We understand that this will both pay the laborer better and make them cheaper to the consumer; but I understand that by your theory this high duty will make your cigars sell cheaper?—A. By domestic competition; yes.

Q. Well, why can you not sell them cheaper without legislation?—A. Because we are not secure in our legislation. To-day you have a tariff, and to-morrow you may break it down. We do not know what you want to do.

Q. Then, if you knew there would not be a tariff at all, you would be just as well off as if you knew there was one?—A. No, sir; because without this protection, or tariff, we could not exist. Take a manufacturer engaged in this city in the manufacture of whiting for kalsomining. Such a man gave me figures while I was in Washington last winter. He said, "We need the tariff that is on this class of goods to-day; but we sell it in the markets for less than the tariff." Said I,

Digitized by Google

"Why do you need this protection"? He said, "I will tell you. Our goods have to be made at a certain season of the year, to be ready when the markets open. We need this protection against foreign manufacturers, who would send in, as they have done, in order to destroy our manufacturing industries here, enormous quantities of this stuff. Its main cost here is transportation, for it sells for about a cent a pound. They would, as they have done before, dump cargo upon cargo of it upon our docks, put a red flag upon it, and sell it out by auction, and I have no doubt the Cobden Club would supply the losses. They would sell it there at a price at which it, could not be produced in this country. They would keep that up for two or three years, and that would close every American factory; then, when they have their market all to themselves, they would run the price up to 5 cents a pound."

Q. Could not you Americans be smart enough to have a "Cobden Club" of your own to counteract that sort of thing?—A. We would rather have a Carey Club. We know that the Cobden Club has raised millions of dollars to flood this market. This is the market they are longing for. We have one-fourth of the entire external trade of the world. They tell us we have no foreign trade; but we really have one-fourth of the entire world's trade, and we are only one twentieth of the world's population.

Q. In manufactures?—A. No; not in manufactures, exactly.

Q. What do you understand that we have got that in?—A. Well, the import trade of our country is the export trade of another. Here import and export trade altogether amounts to about one quarter. I have the figures here.

Q. You mean to say that our external commerce is one quarter; that we export abroad outside of agricultural products, manufactured goods to that extent?—A. No, sir; not outside. I do not care to see the day when our manufactures can be exported, because if we can export them in competition with countries like Germany, Switzerland, and England, we can only do it by pauperizing our labor down to the point to which theirs is, and I hold it to be an evil day when we can sell our textile fabrics in competition with those of England.

Q. How are you going to pauperize labor? Don't you consider the people that consume these things labor?—A. You jump off the track there, Senator. You ask me about exporting manufactures.

EXPORTS OF MANUFACTURES AN EVIDENCE OF NATIONAL DETERIORATION.

I say I do not regard that as an evidence of wealth, but as an evidence of deterioration, and I should be very sorry to hear any testimony before your committee that would point the way by which we could sell in Mexico, and Chili, and Peru, the fabrics of our looms in competition with the looms of Manchester.

Q. Suppose those things go on getting lower and lower, according to the schedule you mention there. Suppose your cigars get cheaper than the $8 a thousand of Germany. How will that pauperize your labor to have a market abroad for them—suppose your cigars get cheaper and cheaper until you have to sell them as cheap as these others?—A. But there is a limit to all things.

Q. Well, what is to prevent that coming about under your theory?—A. I do not want to sell American cigars in Germany.

Q. Admitting all that you say to be true—that if you prohibit the foreign importation of cigars into this country and encourage the

Digitized by Google

domestic manufacture, so many people will engage in it after a while that cigars will be very cheap here. Then what good will it be to protect you?—A. That is a mere theory. Everybody won't go into the manufacture of cigars, no more than everybody will go into agriculture. If this country is put upon a high protective plane there will be work enough for carriage-makers at their trade, potters at their trade, and everybody else at their own trade.

Q. What warrant have you for saying that; that there will be work enough for carriage makers, &c.? Suppose we prohibit any carriages from being brought from abroad, as they practically are prohibited now, what ground have you for saying that there will be work enough in the United States for all the persons who might come into the business of manufacturing carriages? How do you know how many carriage manufacturers there will be?—A. If there is a demand for them, people will go to making them.

Q. Does not the demand upon a thing sometimes fall off and leave a large surplus on hand?—A. Yes; but right there I want to pin a free trade sophistry. That is finely put. The New York Herald puts that about every time that they write a leader on that subject. Will it benefit the American manufacturers when there is overproduction to lower the tariff and let goods come in in competition with them?

Q. I am not discussing your theory at all. I say it may all be very true, but I only want you to answer that question; how do you know how many carriage manufacturers will be in the country, and how do you know when they will stop, and when they will commence?—A. The natural increase of wealth, carriages being a luxury, would increase, as I hold, the demand for carriages.

Q. Just how much?—A. As the well-being of people increases.

Q. Now, what proportion of the workingmen of this country will it take to fill that demand?—A. Well, I submit that that is not fair, Senator.

Mr. CALL. That is the point involved, however.

The WITNESS. I simply said a carriage maker, for the sake of the illustration. I might have said a stove maker just as well.

Mr. CALL. I mean the general position you maintain?

NO OVERPRODUCTION.

The WITNESS. The general increase of wealth by the people of this country would be such as to increase their wants, and there is not, according to my judgment, what is called an overproduction. There is, however, such a thing as a forced non-consumption. I hold to the theory that man, as a producer, will produce, if it is not filched from him in some way and his ratio of production interfered with, and that he would never produce more than he can consume.

LARGE CONSUMPTION DEPENDS ON HIGH WAGES FOR LABOR.

Q. Why do you hold that opinion?—A. Because his associations will become more refined, his children will remain longer in school. The refinements of society, as he goes up in the social scale, will require more refinements in his home. It would increase the productive capacity of America if every American's condition was such that his daughter would demand a piano in the house, and his wife a carpet on the floor. That increases the manhood of the state; a man in such a condition is a better man. We were fast getting to this condition until this free trade call came upon us.

Digitized by Google

Q. But you say that the production of anything will keep pace exactly with the wants of the people, and be no more and no less?—A. No, sir; the consumption will keep pace if it is not retarded.

Q. Consumption will keep pace with the production?—A. Yes, sir.

Q. Do you not know that there is a vast surplus of wheat produced in this country?—A. Yes; but the farmer always lives.

Q. That has nothing to do with the question of whether consumption always keeps pace with production. What would become of wheat in this country, according to your idea, if none of it was sent abroad—what would be the price of it?—A. I am not arguing that none of it should be sent abroad.

Q. I thought you were arguing that if we had a market here we would not need to send it abroad.—A. I once heard a man in Kentucky, from one of the Northwestern States, tell the story of what a great State his was—that it produced so much wheat, and that it made so many thousand gallons of whisky, "not taking into consideration the amount that was wasted in bread." So I might say of this—that we are already, to-day, producing a large quantity of wheat, and the object of the free traders would seem to be to throw people out of manufactures on to the land, and that would ruin our manufacturing industries. But we could also do something with the surplus wheat. That which we could not eat we could make into whisky, and send the whisky abroad. If you gentlemen had, in your consideration of the tariff bill last fall, allowed alcohol used in the arts to be free of duty, you would have opened up a very large market for our surplus wheat.

Mr. CALL. Alcohol to be free of duty?

The WITNESS. I mean free of internal-revenue tax. Take the internal-revenue tax off of that part of it which is destined for use in the arts and sciences (and that is a very large proportion of it), and it would rapidly increase its manufacture.

Q. You consider the compensation of laboring men now under the tariff a reasonable one?—A. No, sir.

Q. You do not think it is?—A. No, sir; I do not. In the branch of business that I am engaged in, I am happy to say, the workingman is well paid; but it is one of the best in the United States, because it is well protected by a tariff, and if the other industries were protected in a like manner the workingman would be a man and able to support his family in decency. I hope to see the day when every mechanic can make $25 or $30 a week; I want to see the day when every manufacturer will pay it. I am proud of my business because it can afford to pay it, and I want to see other men able to do the same thing.

Mr. CALL. That is a very proper desire.

The WITNESS. It is a selfish one. I hold that if every hod-carrier and street-sweeper, or person engaged in menial employment, could make $25 or $30 a week, then his consumption would rise to the level of what his manhood required, and that consumption would call for increased production. I would put the American mechanic on a plane far above the mechanics of the Old World, and then I would build a tariff wall around him sufficient to keep him above them.

By the CHAIRMAN:

Q. You hold that it could not be done without the tariff?—A. It could not. Labor and labor's productions, like water, will find their level. And I hold this to be the right of every American citizen—that is, his birthright—the control of his own markets.

Digitized by Google

By Mr. CALL:

Q. What are you going to do with the farmer?—A. I think he is the best protected man in the whole lot. To-day there is not anything that a farmer produces scarcely that is not protected by a tariff. Take the State of Iowa. Probably a farm will be 50 miles away from a railroad. There is no need there for a factory, because forsooth the tariff permits the introduction of goods, the result of pauperized labor in other countries. The farmer raises wheat to transport it to the seaboard to sell it to men, whose compensation is but that of mere animal existence, 3,000 miles across the sea. Of a sudden you change all this; you raise a barrier; prevent the introduction of these goods, and our people must have similar goods. The manufacturer takes $10,000 or $20,000, and goes out near that farm and plants a factory there. The factory employs one hundred men. They are well compensated for their labor. The farmer immediately gets a home market for his goods, and, instead of raising dead-level cereals for export abroad, he raises garden-truck and hogs, and generally a better and more variant assortment of stuff, and he immediately betters his condition. The fact of that factory going there benefits the farmer first of all more than it does the manufacturer. It increases the value of the land.

Q. Under your system, do you propose to build a manufactory in every neighborhood where there is a farming community?—A. I say the laws of supply and demand will work that.

Mr. CALL. If you could work that out it is a bright prospect. First assure a factory to every community and then you will increase the value of the land.

The WITNESS. If I had thought of this matter coming up I would have brought you an advertisement which appeared in a New York newspaper two months ago to the effect that a certain town in New Jersey would donate a plot of land, and would give other facilities, including, I think, no taxation for a certain number of years, to any corporation or individual that would establish a factory in that town.

Mr. CALL. That was a very wise thing for them to do.

Q. You have been a laborer in your trade yourself?—A. Yes, sir.

Q. And have risen from the ranks?—A. Yes; and I may add that I am a Democrat in politics.

---

NEW YORK, *September* 24, 1883.

TIMOTHY WRIGHT examined.

By Mr. CALL:

Question. Have you seen the resolution of the Senate under which we are working?—Answer. Yes.

Q. Within the scope of that resolution we should be glad to hear any facts or suggestions which you may have to make.—A. I have prepared a paper here containing a few of my ideas. It was intimated to me that I could not have much time. I had prepared a longer document; but under the intimation which I had from the chairman of the committee as to time I have since written what I am now going to present, and have laid aside the other and longer document.

By the CHAIRMAN:

Q. Where do you reside?—A. I am residing in New York City.

Q. What is your occupation?—A. I am now a student of political economy and social science.

Digitized by Google

Q. For how long a time have you given attention to these subjects?—A. I have given special attention to these subjects for ten years.

Q. I suppose more or less for your whole life.—A. Well, I have been a business man all the rest of my life. I have been in Chicago and have seen it grow up from a village of 1,000 inhabitants. Since 1850 I have been only in the real estate business. I went through all the financial revulsions of 1837, 1839, 1847, 1857, and 1866; but the last one, that of 1873, was too much for me.

### COMPETITION OF CAPITALISTS.

The insurmountable difficulty that has heretofore met the reformer at every turn in all attempts to solve the problem of labor and capital, so as to more justly distribute the joint product, is the severe competition that the capitalists are subjected to in finding a market for what has been called overproduction, but which as has been well said is only underconsumption, so long as there are many willing workers who are perishing for lack of work and wages to buy these very things, with a great many more things that might be produced and sold, if only all willing workers could be employed at full, fair wages all the time they need to work.

It is self-evident that such permanent work and wages would itself bring or be the desired market, and the only or the most profitable one, viz, the home market.

### NEED OF STEADY-VALUE MONEY.

It is equally self-evident that some condition is now wanting in the social organism; and to my mind it is demonstrable that this condition now lacking is a sufficient volume of steady-value money with which to pay such fair wages and employ such ready labor; and money that will neither inflate nor collapse the market, as the existing so-called "specie basis" system now does; and as paper money by itself alone has always done even more and always must.

### FINANCIAL CRISES DUE TO FAULTY MONETARY SYSTEMS.

Again this first difficulty in helping labor is increased by the more hard and unscrupulous employers, who take all the advantage they can of the competition of laborers with one another for the chance to do the work that can be paid for, so as to be able to undersell their rival producers in the always overstocked market; thus preventing the better class of employers from paying as good wages as they would like to do if only the price that the product will bring would warrant it. And these two at present insurmountable obstacles to any improvement of labor's condition are periodically intensified by the frequent financial reactions and crises, with suspensions of industry, which are due entirely to the faulty monetary system.

The trouble is (1) competition of products in the market; (2) competition of labor itself in the market.

These difficulties first and last are caused, as is evident, by an insufficient volume of money, with an unsteadiness of value, and by the resultant lack of elasticity, and an alternate excess and deficiency of the total volume of medium of exchange in use.

Here I must premise that I am not a so-called "soft money" advocate as against "hard money"; I am for both, as equally good when rightly constituted.

Digitized by Google

### THE PRECIOUS METALS THE NATURAL MEASURES OF VALUE.

I have looked into the money problem deeply enough to know that the precious metals in their right relation to each other are an absolutely necessary element here, for they are the natural and only value-measure in socio-economics, and that no sound and scientific and permanent monetary system, with steady value, can be instituted by any government anywhere without them; and that "a dollar with a hundred gold cents in it," to use a common shibboleth, is of even more importance to the poor wage-worker than to the rich capitalist. Divine providence gave silver and gold to humanity to be the value-measure of its labor, just as surely as it gave iron for power, corn for food, water for drink, milk for strength, wine for stimulus, wool, cotton, &c., for clothing, fire for art, light for knowledge, and air for life. These metals are exactly adapted to this value-measure function, and there is no possible substitute.

### THE FUNCTION OF PAPER MONEY.

Paper and other credit play their part, and a very important part, in the economy of exchange, but without a scientific connection with the precious metals which they have not now got there is no way of either knowing or regulating their value.

And it is equally true that the value of the precious metals themselves as money cannot be rightly regulated so as to maintain their natural steadiness of value, save as part of a rightly constituted monetary system, in which paper money of full legal tender must be a very large element. For these metals do not regulate their own value, and cannot be made to do it, and jointly with paper money only can their natural steadiness of value with a sufficient volume of money be maintained. And these two conditions—steady value and enough volume in the whole monetary medium—are an absolute necessity for the prosperity of labor, physical and mental. Wealth and capital can get on pretty well, and privileged power, monopoly, and avarice can get on better or faster with changing values and "scarce money."

### NO CONFLICT BETWEEN CAPITAL AND LABOR.

The two ruinous competitions which I first named as the insurmountable obstacle now in the way of both labor and capital will never cease until both enjoy sufficient money of steady value, and then they will cease; and then "the law of supply and demand" will work in favor of labor, and the capitalist will be even more strongly than now persuaded and more effectually convinced that there is, or ought to be, no "conflict between labor and capital," even when the laborers instead of starving in squalor are getting their fair share of the joint product; the capitalists will then be able to see so clearly that they are more than fellow-workers, more than friends, that they are father and son, parent and child, and that the progenitor's prerogative is justly to distribute the product.

### INVESTIGATING THE CAUSE OF HARD TIMES.

Having suffered through a long life-time of nearly half a century of business activity, as laborer and employer, as pioneer, merchant, lumberman, manufacturer, real-estate dealer, newspaper proprietor, &c., and finally as tri-millionaire and bankrupt—the last being made inevitable by

Digitized by Google

the ignorant and iniquitous monetary legislation of 1873–'75—having thus suffered in common with all real workers and value-producers, because of the vicious, inadequate, and unsteady-value money in vogue from time to time, hard, soft, and mixed, I set to work some ten years ago in earnest to try to find out the cause of these evils, these chronic "hard times," and "scarce money" for the million, with periodical inflations and contractions, with crises, panic, and ruin for many of the best, the most enterprising and active men, with loss of employment and semistarvation for the great mass of wage-workers and value-producers.

I came to the work with two very clear and I may say original ideas of my own, the results of life-long reflection, observation, and experience, viz, that the money-law which required specie payment on demand, exacted an utter impossibility, and was therefore not only a great hardship, but was contrary to the natural law of a wise and just God; and that there must be some better way to keep paper equal in value to specie, if such way could only be found out. The other idea was, that all other products of human labor which men exchange with one another by means of monetary units, coin, paper, and credit, are in fact, actually and practically, a great deal more the basis and security for the paper money and the other credit in use than are silver and gold.

But these ideas did not with me at first suggest, nor afterwards lead to either John Lawism or to modern greenback fiatism. I always believed, and do still believe in a dollar with exactly a hundred gold cents in it—to use again this much-abused shibboleth, amended: that is, I believe in gold with silver, at a fixed and natural and necessary ratio in the coinages, as the only possible right money-measure of labor value.

I commenced a very thorough, extensive, and severe course of reading in order to know definitely what it was that the great thinkers on these subjects had said, from J. S. Mill, H. C. Carey, Bastiat, Say, List, Ricardo, Adam Smith, Sir Jas. Stewart, Sir Wm. Petty, and the rest, too numerous to mention, away back to Justinian, Paulus, Cicero, Xenophon, Aristotle, Plato, Demosthenes, Socrates, Anacharsis, Isaiah, David, Moses, and Job. And the more I read, the more confused my mind became on the main question, the *vis-nexus* of money-value, and the right way to "regulate the value thereof." Though there were a great many sporadic and empirical truths scattered through these writings, and many right principles, laws, and relations, yet there were great differences of opinion as to the nature and relations of economic entities and factors, and of the right method of dealing with the value-measure relation, and there was no such fundamental principle of agreement as is found in all other sciences, like gravitation in physics, molecular affinity in chemics, motion in radiant matter, &c. There was also great confusion in the use of the commonest economic terms, such as capital, money, value, &c., which confusion continues down to the present time, and is illustrated every day in this room. So that an accurate thinker on monetary, economic, and social questions, must first define strictly in his own mind all the common words of the so-called science, before he can advance a step.

But one thing I found in which all the greatest thinkers agreed, "that the business of money, as in all times, so in this our quick-sighted age, hath been thought a mystery." These were John Locke's words in 1692, and later writers have not solved this mystery. The sharp disagreements of all the schools, "hard," "soft," and "mixed," "bimetallic" and "monometallic," both as to theory and method, prove that they have not solved it.

It became a passion with me, Senator, to find the solution of this

Digitized by Google

mystery that had thus stalled the greatest minds of all the ages: it became my faith in my mission. I saw humanity perishing all over the world for the lack of such a solution; and when the full light at last broke upon my mind, through the aid that the general advance of human thought gives to the truth-seeker in all realms of science, I found that it involved and illustrated the very question of human rights, "the kingdom of heaven upon earth" through "the law of judgemnt, mercy, and faith," that the Divine Son of God came down to teach us by precept and example how to solve. These terms "laws of judgment, mercy, faith," as used by the great Teacher, without any cant, are as strictly scientific as are the analogous terms, the laws of gravitation, renovation, environment; and they have to do with this monetary problem, and with the entire social science problem of human advancement, that is, of salvation in this life. And the Reverend R. Heber Newton, when he said to you the other day that we needed more practical economics and less sentimentality in our religion (I quote from memory), was "haply feeling after and finding the unknown God" of social science, despite all theological discipline. And the great cigar-maker of New York, the apostle of arbitration, that is, of peace between capital and labor, a few days later, fortified that testimony, the very Christian truth itself, from his own differing stand-point.

## NECESSITY FOR MORE AND BETTER MONEY.

My main topics here, then, shall be (1) the absolute necessity for more and better money in solving the first great difficulty that meets us in the so-called conflict between labor and capital; and (2) the way to institute such money.

But before entering upon those I desire to say a few words about taxation, confining my remarks to these two subjects, for the reason that the most certainly and quickly efficient remedial legislation can be more easily, safely, and promptly applied to money and taxation, than by dealing with the other crying evils and injustices, such as ignorance, monopoly, landlordism, adulteration, larger tenement houses, &c., relief from which the law should give as soon and as far as possible.

## UNEQUAL TAXATION.

At present the total income of the great mass of wage-workers and small business dealers and of many teachers and writers, that is, their all, for they have nothing else, is taxed for the support of the Government under which they live, fifteen fold more—not 15 per cent., but 1,500 per cent. more—than is the surplus income and wealth of their better-off neighbors and fellow-citizens. And these worse-off citizens are further taxed for the rent of their squalid homes or dens, full as much more, relative to income and assets. This statement is within the truth. In other words, one-half of all the earnings and possessions of the millions of poor goes for taxes and rent as against one-fiftieth of the income and wealth of the rich.

Now, the remedy for the taxation part of this iniquity, this robbery of the poor and needy by the rich and well to do, is very simple and easy, and ought to be applied without any delay. First. Remove all excises, duties, and taxes upon all those things that are necessaries of life to the poor, either for consumption or as raw material for their labor; Second. Lay on a graduated income tax. This is the most just and easily and cheaply and surely collectable tax that can be assessed.

Digitized by Google

Then, as to the other iniquity, the exorbitant rents now exacted for the miserable holes in which there live or exist, until they rot and die, so many of the overworked and underpaid producers of the larger part of all the values of which anybody is possessed. If capitalists and philanthropists, so called, will not see that it is both their duty and interest to do away with such conditions for workers without any further delay, then the Government, either municipal, State, or National, ought to take vigorous action at once, such as was taken with that other rotten nuisance, the old State-bank system. In this matter, "Where there's a will there's a way," despite wrong Supreme Court decisions and constitutional crotchets.

### DEFICIENT VOLUME OF MONEY.

I pass now to the monetary question. Labor and capital both suffer together from deficient money. Only usurers, speculators, gamblers, and shylocks flourish by it. The always limited market for all the products of labor, and for labor itself, is due almost solely to the deficient volume of money. The periodical, financial, commercial, and industrial revulsions, in which laborers are thrown out of employment, or their wages greatly reduced, and in which employers, merchants, and manufacturers are ruined, or reduced to great straits, and in which the Hon. Dives Shylock only flourishes and grows richer, are due solely to the unsteady value and deficient volume of money. This is true not alone of our own country, but of every other commercial country on the face of the earth, for all other social and industrial inventions have far outrun the money invention. The theory of money value in modern times, on which all systems, "hard" and "soft," are alike based, is not as true and scientific as the theory of the times of Abraham, Moses, and David, before the invention of coinage and before authentic occidental profane history began.

### MODERN CREDIT AUXILIARIES.

The invention and use of the modern credit auxiliaries to coined money is a very great advance upon earlier monetary methods, whether before or after the invention of coinage, though the theory of these later issues as to value measure is less right than the ancient. These modern issues of auxiliary paper money and other credit in such vast volume are made necessary by the still greater divisions and subdivisions of labor, and increased exchanges so caused, and by the vastly increased production resulting from the general abolition of chattel slavery, although other slavery yet remains, and from the great use of machinery, steam-power, &c. Chattel slavery uses but little money, and it, with other slavery, is largely due to the lack of money. But every dollar of this modern auxiliary credit, both paper money and money of account, save only such as has full legal-tender coin, dollar for dollar, behind it in the bank (which is true of only one dollar in every one hundred), is wrongfully issued; that is to say, ninety-nine dollars in every one hundred are issued right in the teeth of the theory or principle on which the monetary system is professed to be based. In other words, there is no right principle of value measure in the system, save what comes accidentally and unrecognizably from outside of it—nature's effort in mercy to correct man's error. And the proposed greenback-fiat issue would work precisely the same way—no better, no worse—if the volume was as rigidly limited as is the present volume of specie and paper

Digitized by Google

money together—rightly limited by the natural supply of the precious metals, and wrongly limited by the ignorant and iniquitous method of controlling the volume of the paper.

And so whatever of steadiness in value, or periodical approximations to right value in money, *per se*, there now is between the alternate decennial or other inflations and contractions of price values is due to the balance that is fortuitously reached under existing methods and theories by the reactions between the force of natural law and opposing human law.

Now, I assert that it is perfectly possible to apply a right, natural value law or principle, by statute, to the existing system as it is now in use, with all its coin, paper, and other credit, in place of the present wrong method and principle of value measure, which attempts to maintain specie value by enacting an impossible specie payment on demand. And this can be done without causing any sudden or perceivable change of values or inconvenience to any one. Whatever things in the market have now a speculative or inflated value will have to come down, as they ought to, and will, under any system, sooner or later; and whatever things are too low in price will rise.

But immediately upon the passage of a right money law, the volume of money can be gradually increased; and without increasing price values above their natural normal level; that is to say, without diminishing the value or purchasing power of the money-units by such increase of volume; which units in the right system will always be at par with the gold and the silver units of the same denominations. This increase of money in the hands of the people will come, both from gradually increased issues of paper money, and from the unnecessary volume of coin, now held in bank vaults and subtreasuries. All coin held as a basis, so called, or security, for paper money or other credit, is unnecessary, either to insure parity with coin, or, except one in one hundred, payment in coin; and is a pretense, a sham, an impossibility, save dollar for dollar. The sole object of the existing limited, exclusive coin legal-tender laws which require this ninety nine fold impossibility, is to secure parity of value between ninety-nine paper and other credit units and the one-coin unit of every one hundred units of medium of exchange in use. And so long as the parity exists no one wants the coins, except for small change, and occasionally for special purposes.

The constant steady parity between coin and credit can be a great deal better secured by the other principle, the natural law of value, if rightly embodied in human law. Indeed, whatever parity now exists, or ever has existed under the so-called coin-basis system, has not been by virtue of such specie deposit, but in spite of it. *A posteriori* facts prove this, as well as *a priori* principle. It is a great deal more difficult to maintain the parity under the existing "specie basis," and "gold basis," legal-tender laws, while a large volume of the world's money measure is locked up as it is now, and so is worse than useless, than it will be under a right legal-tender law with the coin and paper money circulating together in the hands of the people, or through the banks for safe keeping; but without any obligation to pay one kind of money in or with the other. In the existing system the paper and other credit has to be held to parity with the coin, while both are either rising or falling in value very greatly together, in the decennial or other inflations and contractions; which fluctuations are about 33 per centum each way alternately above and below the right normal level of price values. Yet the ignorant rote-learned doctrinaires of this system

Digitized by Google

imagine, right in the face of these patent facts, that the coin money, especially if made of gold, is fixed in value.

It is perfectly obvious that these frequent and great changes in the value of money *per se*, and in the price-value of all commodities thus expressed—changes in money-value which are independent of and additional to the natural changes in the value of all commodities, one with another, and each with all, due to favorable and unfavorable seasons, new discoveries, and improved methods under the law of supply and demand—it is perfectly obvious, I say, that this state of things must greatly increase the difficulty of maintaining parity between the one of coin and the ninety-nine ones of credit that the law requires to be paid on demand, each one of the 99 credit ones to be paid in, by, and with the coin one, at one and the same time, if presented, by way of demonstrating their parity of value. That is, since each one of 99 credit units is or ought to be equal to one coin unit, therefore, the whole 99 together are just equal to the one. This is the logic, so far as there is any, and a greater absurdity could not be invented. Yet this blind material law and "basis," so called, is the legally enacted monetary science of enlightened Europe and America, and of the rest of the world for that matter, in this ninth decade of the nineteenth century, and has been so for all the centuries past, save only in the state and bank of Venice, which successfully kept her credit-money at par with or above coin for six hundred years—kept it just exactly 20 per centum above for four hundred years—on the opposite, the judgment and faith, principle. The greenbackers are very fond of quoting the Bank of Venice as sustaining their ideas; but the principle which made it a success is just as much opposed to the principle of greenback basis as to the principle of specie basis.

### CREDIT INCREASING FASTER THAN GOLD AND SILVER.

The Bank of Venice might have been in existence to-day, a light to the nations, but for that hard, selfish, specie-basis robber Napoleon I, who instinctively squelched this embodiment of the law of faith, because it taught more of the principles of truth and of human freedom than privileged power on a physical basis of stolid unthinking bayonets could safely tolerate. And avaricious greed to-day everywhere instinctively resists the light of truth on the money question. Yet the difficulties of this old specie basis, or standard, ignorantly so called, grow greater and greater, and worse and worse, year by year, for the reason that the volume of credit necessarily in use keeps on increasing faster than the volume of gold and silver money, because of the vastly increased production of commodities, division of labor, and business between both individuals and nations. This has been remarked upon frequently, even by the best English gold-basis economists, like the late Professor Jevons. And the London Economist lately published the fact that the Scotch banks, which are considered to be the best managed banks in the world, and as safe as any, "now hold only one-fourth of 1 per centum gold or full legal tender to their liabilities." Is it not time that a sound scientific system was substituted for such a sham, if it can be? In crises and panic times the banks of England often have less than one-fourth of 1 per centum gold, which is their sole ultimate legal tender for their liabilities.

The difference then between the sound and scientific, the right form of legal-tender law, that is, the right method of finance, and the wrong (the present) one—for there are but two theories of money-value measure conceivable—is just the difference between enacting an impos-

Digitized by Google

sibility and a rational possibility. All that is required to insure a just and permanent parity with the naturally steady value of silver and gold, which is a very different thing from the present and past inflation and contraction value, is what I will now state in short:

### THE REMEDY FOR PRESENT MONETARY DEFECTS.

First. Make all the unmutilated coins full legal tender for all debts, public and private, at fixed coinage ratios.

Second. Make all the paper money that is permitted to circulate in the hands of the people, and is constantly measuring the value of their labor and contracts, both the exchequer note (the greenback) and the existing national-bank note, equally full legal tender, with coin for all debts, public and private; but—

Third. Make the paper money a legal tender only at the par of the coin legal tender, except to the issuers; they must always be required to receive the paper back at face value; the Government for taxes, duties, excises, land, &c.; the banks, and other creditors in equity, for all demands due them; but all other creditors will only be required to receive paper money at its current value in coin, more or less.

Fourth. In the event of the paper money falling 1 per centum below par, the Government must be required to redeem it in a bond bearing 3 per cent. interest, or less if interest rules at less (as it will under sound finances) until, say, thirty days after such money has returned to par, when interest is to cease and the bond be redeemable in coin at par, on presentation at any sub treasury of the Government. Such bonds to be in $1,000 multiples. This provision is only precautionary, for there would be no danger of such money, issued on the value principle that underlies it, ever falling below par. Yet if it did this method would soon bring it back.

### NO CONTRACTION OR INFLATION.

And under this method no one would have the right to contract the life's blood of industry and business, so long as the money was at par with coin, that is, when there was not too much, as would have been the result of the late proposed interconvertible-bond basis. In a sound and scientific monetary system the only limit to the volume of paper money is its parity; the principle acts automatically. It is obvious that there can be no inflation in this system beyond 1 per centum or less; and hence no contraction. For the purchasing power, the value, and the debt-paying power, save to the issuers who are responsible for any overissue, is and must be always at par with coin.

### PARITY OF PAPER MONEY TO COIN NOT DEPENDENT ON SPECIE DEPOSITS.

I said that it could be proved *a posteriori*, or by induction from facts, that whatever parity has ever existed between paper money and coin was not due at all to the pretense of coin payment, or to the actual deposit of specie behind the paper, save florin for florin, pound for pound, dollar for dollar, but was always due to the opposite principle—the law of faith, of judgment, that is, of labor valuation. Now for facts:

Fact 1. The Bank of Amsterdam, which was a specie deposit bank, specie-florin against florin-banco, one for one, no more, no less, save the bank's royalty, was such until after several centuries of supposedly

Digitized by Google

honest adherence to this one-for-one principle, though there was never any means of verifying it, the depositors and receivers of the money on the market always having to rely on the faith principle of money in that regard—when, in an evil day, the directors loaned out the specie basis, which belonged to the holders of the bank's inscribed credit or faith, secretly to the Dutch merchants of the East Indian seas, as was, a generation later, explained. Still, the paper and credit remained at par or better for over a quarter of a century after most of the specie was gone, that is to say, without any basis to speak of in the vaults, and might have continued so to this day had not that same robber, Napoleon I, gone for the supposed cash when he took the city, thus revealing the fraud; and the Bank of Amsterdam was known no more on 'Change forever. This proves that faith with no specie is just as good as specie, less than dollar for dollar, to keep paper at par.

Fact 2. The run on the Bank of England, in the panic of December, 1825, had almost taken the last pound of gold, when the issue of a chest-full of £1 bank-notes, accidentally discovered in the vaults of the bank, saved it from a suspension of specie payments, and saved many bankers, merchants, and manufacturers from ruin. The bank directors thus learned that the only sure way to avoid a suspension of the pretense of specie payment is to issue bank-notes illegally, by permission of the privy council, with no specie behind them, though this is contrary both to the law and to the principle of the act rechartering the bank in 1844.

Fact 3. The bank thus avoided a suspension of the pretense of specie payment in the panic and crisis of 1847, by a free, though illegal and inconsistent issue of pure "faith-money."

Fact 4. This was repeated in 1857; but the directors, having learned the lesson, and being more prompt with their issue of faith, saved their specie, which did not run down so low as in 1825 and 1847. But faith alone saved them.

Fact 5. The same process was repeated in 1866. The privy council now always compliantly suspends the act, and permits this rich bank to pay its debts in promises, since under this bogus pretense system it is the only way to save the public from dire calamities. I show you a better way, however.

Fact 6. This is a still stronger case: that of France in the late war with Germany. The bank promptly suspended the pretense of specie payment, trebled her issues of paper money, held all to par with specie for eight years of suspension, save only a small premium on coin for a short time in the very crisis of her defeat and while raising five milliards in gold to pay Germany, in order to redeem Paris.

These instances are as good as a million, for no rational, logical mind can believe that it was the specie on hand in any of these cases that caused the parity any more than it is so in the Scotch banks now (which I may call fact 7), with their one-fourth of one per cent. gold; or than it was in the Bank of Venice (fact 8), with no specie at all or pretense of it for over 600 years. What was it, then, that kept this 100 to 1, 200 to 1, 500 to 1, 1,000 to 1 of paper and credit at par? Nothing but the principle I have indicated, the principle of maintaining parity of value through the fundamental law of labor-valuation, which acts in the social world just as the law of gravitation does in the physical. A full exposition of this would require me to go into the whole science of value-measure as applicable to all sciences, which would take a great deal more time than you have intimated is now at your disposal.

But there is, as I said, *a priori* or deductive proof of the truth of my

Digitized by Google

principle. How is it that the degree of variation from parity is established, when the relative value of specie and paper have varied from one per cent. to twenty, thirty, and to several hundred per cent., as in England from 1797 to 1821, and in our own country from 1862 to 1879, with no corresponding change in the relative volume of specie. History abounds in such instances. Surely no specie basis anywhere has anything to do with this problem. Yet the public mind must decide that paper and coin are at par by precisely the same process that it decides there is a variation of 1, 2, 5, 10, 50, 100 per cent. and more from par.

There is no way in the specie-basis theory to show how the public mind solves this value-problem. Their system is astronomy without a law of gravitation and with no right idea of the relations and motions of its elements and factors. It is a world of production, resting on the back of a credit elephant, standing on a paper rock—*papier-maché* with a vengeance—resting upon a specie tortoise which has no basis or support whatever that any rational, common-sense thinker, any one but a doctrinaire, can conceive of. "Buddha does not wish us to go any farther down," said the innocent, trusting Hindu proselyte when asked, "But what does your tortoise stand on?"

These facts connect the money problem with the education feature of your committee's investigations, the education of the law-makers on the money question, for there is no possible, rational, logical solution to this money problem, and through it to the labor and capital problem, save by the social law of labor-valuation, working through the general mind of all the units of the social economy, just as the analogous physical law of motion-gravitation acts upon aggregates of matter through all their molecular units. And all of Herbert Spencer's social philosophy is but a feeling after this law, if haply he may find it.

Under the existing miserable conditions for labor, of severe competition, and no hope, the situation steadily growing worse, that curse of the old Hebrew prophet and lawgiver, Moses, seems to rest upon the wage-working laborers and upon many of the capitalists, their employers, "the heavens are brass over their heads and the earth is iron beneath their feet," so far as any giving way or yielding of their environment through efforts to permanently better their condition is seen or felt.

### CONDITION OF LABORERS GROWING WORSE.

For on the whole their condition goes on from bad to worse throughout Christendom and heathendom alike; this, despite the cry of "peace! peace!" when there is no peace, by a privileged, fortunate, worldly few who, from their own pleasant surroundings prefer to look through optimistic spectacles and ignore the great mass of squalor and suffering that "their brethren" endure; these poor, to whom the Christ—the master—whom these "scribes and Pharisees, hypocrites!" profess to serve—preached glad tidings, and who was crucified by the priests and privileged classes of his day because his Gospel was the elevation of the masses *in this life*, as any honest, intelligent reader of *the* Book can see. In the general social advance of modern times, the poor laborers, the great majority, have relatively gone backwards. And while they are a majority of humanity, these "poor and oppressed" are a vastly greater majority of the real value-producers to whom all property rightfully belongs. Those who now possess the property and enjoy it are not those who produced it. Even John Stewart Mill saw and said that ownership and enjoyment of property was in the reverse proportion to the useful productive work that has the best right to it.

IMPORTANCE OF CORRECT MONETARY SYSTEM.

A right monetary medium is the vital environment of labor, without which it cannot live; can barely exist in misery. Unless there is a sufficient volume of it of steady value and purity labor becomes asphyxiated. Such an exchange medium is very like the atmosphere in its relation to physical and physiological processes, life, and growth; and the analogy with the Mosaic symbol that I quoted is very exact. But there is more than analogy here, for this great ancient, inspired social-scientist prophesied this curse, with others, as the natural and certain results of failure to adhere to the politico-economic laws and ordinances that he had taught and enacted under Divine instruction, inspiration, and revelation, among which was the law of judgment and value that I have insisted upon, as applied to labor, through the precious metals; also anti-land-grabbing, anti-debt, anti-usury, anti-slavery, anti-oppression, anti-monopoly, just as far as the public sentiment and exigencies of the then existing conditions of society would permit him under this law of social judgment to go, with his "stiff-necked and rebellious generation, children having no faith." And what is still more remarkable, this ancient lawgiver, who was instructed in all the learning of the Egyptians, a people who had a civilization, literature, and art that were then thousands of years old, and whose works are still the greatest marvel of our age, incorporated into his law the true principle of monetary value measure, just as far as it was then possible to go—600 years before coinage was invented—a principle that all the monetary systems of the world and all their theories of value now lack. The Jews lost this principle with the invention of coinage, if not before, and have ever since, in common with the rest of humanity, been trying to get on without it. Hence "the heaven of brass above and the earth of iron beneath."

But the monetary remedy is not a cure-all; these other evils that Moses fulminated against have got to be remedied also, but there were other curses to follow the other social lapses from right. The brass and iron figure seems to have an especial relation to the labor value-measure law.

Now, one word more as to this environment symbol and the analogy between the atmospheric medium and the credit circulating medium in productive processes, whether of physical, vital, and social growth on one hand, or of social, mental, moral growth on the other. The air medium must be very abundant, very elastic, very pure; so must be the entire medium of exchange; but the air must contain a certain proportion of vapor, of water inelastic in itself; so must the medium of exchange contain a certain proportion of paper money; and again, the air and vapor together must contain a comparatively minute portion of solid matter, such as carbon, lime, &c., so the socio-industrial medium must contain a small per cent., one in one hundred or less, of silver and gold, but as none of the elasticity of the air is originally in the water and mineral elements, so none of the elasticity of labor's vital environment is in the paper and metallic money. The analogy can be carried very much further on this physical-vital side, but I turn to the mental-moral side, where the significance of the words "no faith" and their connection in the original shines out.

The monetary medium is more than analagous to faith, to the faith of the New Testament as a social force, for it is itself faith, trust, confidence, credit. Demosthenes and Aristotle saw and taught this truth as to the nature of coin-money. The word "faith" only occurs twice in

Digitized by Google

the Old Testament. The prophet Habakkuk (600 B. C.), a cotemporary of the Scythian philosopher Anachorsis, who was the first mere "sign-money" theorist or greenbacker on record, said "the just shall live by his faith," in connection with his very severe rebukes of the special social evils and wrongs for which this committee of the United States Senate, the paid servants of the sovereigns of this nation, some of whom honor its sessions with their presence, are trying to find a remedy.

If this faith-fiat of one of the latest of the old prophets and social scientists only could have all the sanctimonious emotionalism squeezed out that priestcraft has forced into this passage, and into the greater part of these old books, that it makes a fetich of; if, I say, we could once have the pure science of this old Divine-and-human wisdom without so much priestcraft cant, the poor would again rejoice in the glad tidings, the faith-gospel of the Great Captain of their salvation *in this life.*

For the Great Teacher's insistance upon faith has a much broader significance than is given it by the "Scribes and Pharisees, hypocrites!" who are always hand and glove with plutocratic privileged power; who "shut up the Kingdom of Heaven against men," the very heaven upon earth that the Son of God came to establish; "who enter not in themselves and hinder those who would enter;" who care for nothing but "the highest seats, and to be called rabbi," doctors of divinity, and honorables; who "bind heavy burdens, and grievous to be borne, and lay them on men's shoulders, but they themselves will not touch them with one of their fingers;" who "devour widow's houses, and for a pretense make long prayers." Faith has a much broader significance than these have ever taught to the suffering humanity that they thus aid in deceiving, dominating, and robbing in the name of religion, and by common and statute law. For again, when the Master said "Have faith in God"—that is, in his laws, as revealed in His word and works; "According to your faith be it unto you;" "Thy faith hath saved thee;" "If ye have faith as a grain of mustard seed"—that is, if ye be instinct with the vital promise and potency of growth, progress, and usefulness—"Ye shall say unto this mountain" of social ignorance and oppression "Remove hence * * * and it shall remove." And in many kindred utterances, he meant a great deal more than theological superstition and bigotry have ever dreamed of; he meant to teach, and did teach, the fundamental principle of social science, of the science of religion; he meant that broad structure of truth and right, human and divine, which rests upon the eternal rock; he meant, among the various subjective forms of this universal social element "Faith," the very faith-money with which the Prophet Isaiah exhorted men to "come and buy (not beg) wine and milk"—hope and strength—"without coin-money" only, "and without (hard) price" in labor; that is to say, buy with faith-money.

In conclusion, Senators, I am very solicitous to fix your attention, and that of the Government and the thinking public, through you, in your final action upon this great problem, aided by such other light as the most earnest thinkers on these social wrongs, and practical men from all classes, have been able to throw around your investigations, to fix attention upon two cardinal facts of the situation:

### ALL OTHER REFORMS DEPENDENT UPON MONETARY REFORM.

First. That the existing inadequate money-medium of exchange, with its great deficiency of volume which makes unavoidable truck-dealings,

Digitized by Google

"store-pay," slow pay, and vicious credit, with its oppression of labor, as testified to before you by numerous witnesses, and with its great variableness in value, which causes the frequent and otherwise unaccountable ups and downs in the market, and the periodical inflations and contractions, crises, and revulsions that are so disastrous to both capital and labor, the existing money, I repeat, will and must, until a better system is inaugurated, prevent almost all the good which might otherwise result from the various ameliorating measures that have been proposed; such as more just taxation, better tenements, co-operation, arbitration, trades unions, shorter hours for labor, protection and free trade (rightly balanced), land reform, anti-monopoly, &c. For whatever good there may be in many of these other remedies, and there is doubtless much good in them, the main difficulty will still confront both capital and labor, viz: the lack of a market for products, and the lack of employment for labor; the two destructive competitions that I first emphasized.

Second. That the complete, perfect, and only possible remedy for this troublesome competition problem that meets us at every turn and dominates the economic situation, is an adequate and steady money medium of exchange always at par with gold and silver, such money, specie and paper, being the basis of a sufficient volume of money of account, which, under a sound and scientific system, will never be in excess or deficiency, as is now the case. For all the necessary elasticity of the total medium of exchange in use is, or ought to be, in that part of it that is not money; the total money, specie and paper together is, or ought to be, very nearly a fixed volume, slowly increasing with population and business, and must and will control and measure the volume and value of the larger, the more elastic part of the credit medium, just as the specie money must and will control the volume and value of the paper money, after the paper-money law has fixed the proportion of the whole gold and silver supply that shall be in use as money.

I have been present at the sittings of your committee since they began in this city, and, as an interested investigator of the social, economic, and monetary problem, have listened to question and remark by committee, and statement and answer by champions of labor and of capital, of experts, editors, and dreamers—some men of both extreme poverty and some of boundless wealth—and I must here say that I fear that a great deal of the good that might result, and that ought to result, to the poor and needy workers, the producers of values which they never enjoy, the good that should result to them from this investigation by their Government, is in danger of being lost to them because of a lack of perception of the most important points, the crucial questions as presented by many of the witnesses. Those more vital points, to my mind, have been ignored, passed by, slurred over, and far more so by the press than by the committee. If the press, daily and weekly, secular and religious, would take more interest in these questions of labor's rights and poverty's rights, and if the pulpit would follow the example, there would be more hope of quick and efficient relief for the misery and death that are all around the palaces and temples of this so-called Christian land. At present the light of press and pulpit, of university and hall, is hid either under the bed of sloth or under the bushel-measure of worldly gain.

NEW YORK, *September* 24, 1883.

EDWARD KING recalled and further examined.

The CHAIRMAN. I understand you wish to make some corrections in your testimony. If so, you may proceed.

The WITNESS. The point which I wanted to correct in my former testimony is one concerning the tariff.

The CHAIRMAN. What is it?

The WITNESS. Within a day or so after my testifying before the committee, I received an invitation from the Free Trade Club, of New York, to lecture before them in this city, on account of my "admirable testimony in favor of free trade," given before this committee—so the letter expressed itself. In conversation with others, I found that such statements of my evidence as had been reported in the newspapers created the impression that I had advocated free trade.

### RELATION OF WAGE-WORKERS TO FREE TRADE AND PROTECTION.

I therefore desire to state that, speaking at that time as I felt, and as I feel now, on the position which the organized workingmen, to my knowledge, took on the question of tariff, and the position I took myself as associated with them, was that with neither free traders, nor protectionists, as at present agitating, should the working classes associate, as wage-workers. The question was one which, according to the admission of both parties, required to be settled by independent organizations of workingmen, to secure such wages as they might. I simply desire to add that so far as my opinion is concerned, and the opinion which I find to prevail among workingmen on the question of free trade, I believe that with them it is a matter of adjustment for misplaced labor. The general opinion, I find, is that given proper arrangements for adjustment of the misplaced labor in the event of any introduction of free trade, the independent organizations of labor would be able to obtain just as good wages under the *régime* of free trade as they are now by forcing their wages up under the system of tariff. That is the general opinion. I think I stated formerly that my own trade, which is protected, and before which we placed a proposition as to which of these they favored, were divided in their views upon the matter, and would not express a decided opinion either one way or the other.

The CHAIRMAN. You have some views in reference to the matter of education, I think.

### MORAL ASPECT OF THE LABOR QUESTION.

The WITNESS. Yes.

The demands made by the trades unions I think the committee will find, on reviewing the testimony presented to it, imply a great many demands not strictly of an industrial nature, but of a social character, as distinguished from that of a pure trade organization desiring to raise its wages. That comes from the complex nature of the problem which I claim to be involved in this question—that it is a problem that cannot be solved apart from morals and religion. And I claim that that view is the view which is at the bottom of all the agitation among the working classes to-day, and that that marks the difference between the early form of the trade union movement and the broader form of the labor movement now. Those conditions are demanded because it is found that we cannot organize labor on the bare, selfish principle of so

Digitized by Google

many more cents a day, or so many more dollars a week, and that the proper organization of labor, even in the strictest trades unions, implies qualities of character that are moral in their nature. It also implies prudence; it implies a certain amount of surplus savings, and the power and disposition to save, and it implies the provocatives to saving. It implies a number of conditions that are entirely novel when compared with the original demands of trades unionism.

Now, our view is that these conditions are necessary to the proper organization of labor as an economic force in the community and apart from any movement, such as the socialistic movement, or anything of that kind. The strict economic trades union movement demands certain conditions which are outside of its formal demands, and must be granted.

### THE EDUCATION DEMANDED BY LABORERS.

Among these are the questions of education, including industrial education and moral education. I would go farther if I were to express my own views; but I know that they are not yet held by the vast majority of men in the labor market, and I do not think it is of importance to give them.

To attain the intellectual, physical, and moral training of workmen, skilled and unskilled, by labor combinations which will keep within the bounds of economic law while they reduce the disturbances to industry to the lowest point consistent with the highest possible condition of the workingman is the object of the legislation demanded by the unanimous voice of organized labor in the United States, which legislation you will observe covers the question of malappropriation of public lands, regulation, and control of privileged corporations, the unnatural glutting of the labor market by the work of women and children, with the consequent injury to the family institution and public morals; also the malicious importation of foreign labor by organized capitalists as well as the discrimination by law and by executive officers against labor when a crisis occurs in its keen competition with capital. All these are demanded as being quite practical and consistent with the provisions of good Government.

### LABOR NOT A COMMODITY. WHY?

It must not be supposed, however, that because the strict trades union movement virtually recognizes the question of supply and demand as governing the market of labor it therefore believes labor to be a commodity. The contrary is the case. The discussion of that question is becoming deep and widespread among the active and serious thinkers of the day, who deal with that question more and more from the sociological stand-point, and that stand-point repudiates the idea that labor is or can be rationally dealt with as a commodity. The principle that the laborer has not got a commodity to sell is argued in the articles of Frederick Harrison (who is one of the leading advisers of the trades unions of England), and is also maintained in a work by Mr. Walker on the labor question (the gentleman who had charge of the last United States census), and also in a more recent work entitled "The Law of Labor," by Weden, and in numerous articles which are widely read by the thoughtful leaders of the labor movement in America. Originally promulgated, I believe, by Mr. Harrison, it has been widely copied and commented on, and comes into all the discussions that I have heard for the last five years. I constantly urge it myself whenever I get a chance.

Digitized by Google

The principle is, that the laborer has not got a commodity to sell, because what he seeks to do is not to exchange products, but to combine to produce. When buyer and seller meet in the market the price is paid, the goods change hands, the men part; the transaction is complete. That has no resemblance to the case of the workman and employer, which is really the formation of a continuous relationship, which for the workman arranges, perhaps, the whole of his life. The trader's sale is the simple transfer of some specific thing, while the bargain between the workman and capitalist is permanent, or at least continuous. The latter involves the entire existence of the workman in its consequences and implies constant co-operation. This is, therefore, not a contract to *sell* something; it is a contract to *do* something. It has been well said that you can buy $50 worth of pig-iron, but you cannot buy $50 worth of puddling without a puddler. The pig-iron can wait until next week or next month; it is in no hurry; but the $50 worth of puddling cannot wait even a few days. The human machine is subject to the fatal defect of starvation and death.

If one wants $500 worth of fish he goes to the market and buys it; but if he wants $500 worth of wife the whole matter is changed; the commodity must be consulted and many stipulations made. The first is a purchase; the second is a partnership. The fish cannot work with or trust the purchaser; the wife must.

In fact, wherever there are permanent or close human relations between one man and another an understanding is the regular course. It is so with all partnerships in labor. All co-operation to effect anything in common involves this mutual agreement between the parties. It is because capital insists on regarding a business concern, plant, stock, *and hands* as so much raw material, to be bought and sold, that conflicts do, and always must, prevail between workmen and employers. The employer, we know, wants to purchase the conscience, the energy, and the intelligence of a man. He is not purchasing a mere *thing*. He purchases a man, who will work when not watched, day by day and month by month, and who will not waste or ruin his machinery; who will not cheat or rob or murder. If he cannot get such a man as this he knows he will be ruined and undersold by those who can.

This is a fundamental proposition underlying all the demands of the labor movement of to-day, and it is based on the rejection of the fundamental principle underlying the works of the political economists, when we regard political economy as an independent strict science. That is rejected altogether by the working classes. The position assumed, you will observe, by nearly all the speakers representing workingmen on this platform is the social or sociological one, and while you have had before you several representatives of the socialistic labor party, there are, of course, other schools of thought; there may be various degrees of difference of opinion between them, but that is a position common to all, no matter what their differences may be.

It will be seen, therefore, that to deal with the labor movement on this principle implies a question of education in the large sense—the culture of all the faculties of the working classes.

## TECHNICAL EDUCATION.

I desire to speak, at this point, upon the special form of education known as technical education, and one upon which, I think, a great deal might be done by the Senate of the United States, and one which the Senate has shown its interest in, I know, to a very large degree. I

Digitized by Google

find that the Senate ordered the preparation of a report by Mr. Eaton on industrial education, and that that report has been published. I find, on comparing that report with my own personal knowledge of the same movement in England, that America is miserably behind; and it should be a matter of national pride, I think, that a nation like this should take an advanced position in such a matter as industrial or technical education—the scientific preparation of its people for an industrial career. I find that the appropriations for some industrial colleges are exceedingly small; and I find, also, that this report of Mr. Eaton's indicates that the appropriations have been such that they cannot be used to the best purpose, there being some conditions attached.

I also find that there is not sufficient attention paid to the scientific education of the working classes who are adults, and I am particularly interested in, and believe in the practicability and value of, a widespread movement in favor of a technical, scientific, elementary education for the working classes. I believe that they are ripe to co-operate, and that all the organized trade unions are ripe to co-operate, with such a movement. Before I came to this country I was myself examined under the technical education scheme of the English Government, and having a great many friends who are certificated teachers under the scheme of the English Government in technical education, I would like to state the conditions under which that scheme proved to be so successful.

### THE ENGLISH METHOD.

The Government arranged that annually there should be examinations in the various sciences in all the large schools, under persons who were supposed to be competent; elementary examinations and advanced examinations; and that all persons presenting themselves for examination in the month of May at such places should, by the department of education, be certified as having passed definite grades of knowledge in any of the special sciences, and that such students, when being examined, should state the college or class in which they were instructed, and the name of the teacher under whom the instruction was given. These teachers were paid on the principle of "payment according to results," as they call it there. Teachers whose students or pupils passed in the first or best grade would receive, I think, £3 for every pupil who passed in that grade, £2 for every pupil who passed in the second grade, and £1 for every pupil who passed in the third grade. I think that was the order. If a pupil barely passed, the teacher got £1 ($5). You will observe, therefore, that the direct self-interest of all the school-teachers, pupil-teachers, and educated workingmen who had any ambition in that direction, was immediately enlisted in this movement, and every person who was competent to pass an examination under the Government to qualify himself as a teacher of elementary science would start a class in his own block or school-room, or anywhere, containing such number of persons as might come to him, the Government, however, prohibiting him from charging the pupil any more than 2 shillings and 6 pence for a whole course of lessons in any special science. They limit the amount of fees also, because they are going to pay the teacher by his results. By this means they brought the thing within the reach of apprentices and people of the most limited means and humble condition.

### PRECAUTIONS AGAINST CRAMMING.

The Government limited, as I have remarked, the amount of fees that the teacher might charge, because they were going, as I have stated, to

Digitized by Google

pay him by results also. It was found, however, by experience—and this is what I think it is necessary to call special attention to from what I am aware has taken place in Boston and other places where technical education has practically been put in force in this manner—that the self-interest which was provoked by this method led to a very great evil for the first ten years of the scheme, namely, it created the desire on the part of the teachers to "cram" their students by merely enabling them to quote definitions from text-books. Professor Huxley, and Dr. Carpenter of London, testified before a royal commission on tha subject that that had the most disastrous results on the value of the education. A notice was therefore printed on all the examination papers thereafter that all students whose mode of answering questions indicated that they had committed the answers to memory would be immediately "plucked," as they call it; that is, their examinations would be postponed. They would not be examined at all, and their papers would count for nothing. The Government found it necessary to actually call all the teachers who had qualified themselves to obtain certificates to meet at South Kensington Museum, London, where Professor Roscoe, the chemist, and Professor Huxley and other eminent men in their various branches gave these teachers practical, realistic instruction of a kind which many of them had been unable to obtain in their districts where they taught school. By that means the whole character of the education has been greatly improved.

Professor Carpenter testified before the royal commission that the danger of cramming, and of mere book knowledge, was so very great that he himself doubted entirely the value of any such scheme of education, unless this cramming was entirely prevented; and he gave striking illustrations (which I have, but which it is not worth while to quote here) of the kind of knowledge which candidates for the English civil service possessed, and by which they were enabled to pass examinations.

While, therefore, I advocate the entry by our Government upon a sweeping movement for the elementary scientific education of the people, for its intellectual value, for its moral value, and for the indirect value it will have in relation to their skill as workingmen, I certainly do not overlook the evils, and would regard it as a matter of very great regret that there should be any such movement unless care were taken that it should be thoroughly practical, and should be realistic in the proper sense of the term.

## THE BOSTON INDUSTRIAL SCHOOL.

In Boston there is one of the most striking evidences of the feasibility of educating boys, and in some cases girls, and certainly the feasibility of interesting and educating adult workingmen in the "Industrial School" (I think they call it in Boston), an account of which will be found in Mr. Eaton's report to the Senate on Industrial Education. But when I was in Boston myself I was at that time informed by those who were interested in that school that it originally started in a church, by simply taking some of the boys from the gutters and giving them jack-knives and pieces of wood and teaching them to cut things of a definite shape. I think they called it the "whittling class"—taking the boys in and putting them on benches on week evenings. Those boys showed such interest and the teachers had such success in their notions that they finally got portable benches and had them screwed on to the sides of the pews; and the class kept getting larger and larger, and by and

Digitized by Google

by it became so large, and they were so sure of a successful movement, that they obtained a room in some one of the government buildings, and then they obtained chisels and other tools besides regular work-benches, and had a set of rules for the government of the school, and it was altogether so successful that it has developed now into an institution for practical technical instruction.

THE RUSSIAN METHOD OF TECHNICAL EDUCATION.

At this point I should like to say that the committee will find, if they have not already found, in the report of Mr. Eaton, that the system of technical education introduced first, I think, by Principal Runkle (I think that is his name), of the technological college in Boston, known as the "Russian system," is the one that I think above all others should have the preference, and that is the system of technical education which is least open to the objections that would certainly be raised in the event of the Federal Government taking this matter in hand. I noticed that in the case of a witness who testified on this stand on the subject of technical education there was a little editorial article in one of the daily papers to the effect that the gentleman was evidently not aware that people who had no interest in mechanical subjects—general tax-payers—would be taxed for giving a special kind of education to a part of the community. I would urge that the value of the Russian method of technical education is such that it is not open to any such objection, inasmuch as the work is applied to forms of material which are not to be used for any constructive or business purpose, but are so invented as to demand all kinds of manipulation which would be necessary in any kind of industry, and that in the event even of pupils being destined for a commercial career, the education which they obtain under this method of instruction is an education of their faculties—of their objective powers. It will always be of value to them, and it will be of value to any person, whether he undertakes to follow the life of a mechanic or a life of commerce, or anything else.

I think that a fair examination on the subject will show this committee that a technical education on the Russian system applied in the primary schools, as has been advocated, and demonstrated in Boston to be successful in, I think, a grammar school, as will be found in the report of Mr. Eaton to the Senate, would be successful if applied everywhere. That report demonstrates the feasibility and practicabilty ot the matter I am now advocating.

I believe, also, that if our Government were to imitate the English method, they would have here a far greater success than they have ever had in England. I believe that the American school boy is so much sharper, is naturally so much more apt a pupil, and his bent of mind is of such a practical character that if the Government of the United States were to make any decent effort in this direction I am positive personally that they would meet with a far greater success than even the Government of England has made.

ECONOMIC VALUE OF TECHNICAL EDUCATION.

The economic value of this is beyond question. It is calculated by Mr. J. Scott Russell, the builder of the "Great Eastern" steamship (and one of the greatest authorities in England on technical education, a man of practical business experience beyond question, and by no means a theorist), that about $125 is all the expense that the English Government was put to in educating each of the workmen who have

Digitized by Google

passed through her technical scheme of education, and that $125 per annum represents, according to him, the technically educated workman over an unskilled or technically uneducated man. One year's economic value, according to Mr. Russell's calculation, pays the teacher and the expense of technically educating such a workingman. And if that is true in England, I think it would be to a far larger extent true in America.

I think, also, that one of the most important features of the testimony before this committee given by many workmen would be met by this movement, namely, that industry has now from the introduction of machinery, become such a merely mechanical process that workingmen complain that they become intellectually degraded and have nothing to interest them in their work. Their work is done by the machine, and they stand by and merely watch the machine work. From my personal experience and observation the workmen in various employments, I believe there is no hope for meeting the actual effect upon the minds of workmen except in that kind of education which will give them a species of intellectual interest and curiosity in the work they are performing, which can only be derived by at least an elementary knowledge of the sciences employed in their business, and that by that means the irresistible consequences of the introduction of machinery in degrading the mind and character of the working classes may be met. I think that sufficient importance is not attached to that aspect of the question.

### NOT THE PAUPER LABOR, BUT THE SKILLED LABOR, OF EUROPE THAT AMERICA HAS TO FEAR.

I would ask the committee to consult, if they have not already done so, the work of Mr. Stetson on technical education, published in 1874, and quoted in all authorities dealing with this question and dealing with it from an American standpoint. I think from what I know of the movement in England, that that work is worthy of every commendation, and inquiry would be impossible without it. That gentleman states:

> Let America take note that it is the educated skilled labor, and not pauper labor, as so many believe, which she has good reason to fear and against which she can defend herself only by educating her workingmen equally well.

There is another valuable work, called "Schools for the People," by Mr. Bartley, published in London in 1871, containing very valuable information on the subject of these schools in England. I think that the experience, also, of independent people in Scotland, apart from Government aid, is of very great value.

Being called so suddenly to-day before the committee I have not with me facts or statistics which I think of very great value, especially of the scheme of a Sunday school which was very successful in the city of Edinburgh, all the teachers of which were companions of my own, and were working at their own trades during the day, and went to a scientific college in the evening, which most of us attended. The interest which was there excited in their minds, of the value of science to the working classes, kept with them so far that they started a Sunday school for elementary instruction in such sciences as were of practical value in the conduct of life as well as practical value in their trades and occupations.

### THE "JAMES WATT" EVENING COLLEGE IN EDINBURGH.

This scientific college was something like the Cooper Institute, of New York, only a great deal more successful. It was established by James Watt, whose name is associated with the invention of the steam-engine.

Digitized by Google

He established this school from the same motives that Peter Cooper established the Cooper Institute, and the Watt school has turned out several very clever inventors, and has done a very great work in the way of education. Its classes are, however, taking a wider scope than those of the Cooper Institute of this city. Every pupil pays for his instruction, and the number of pupils is more than that attending the Cooper Institute; and the interest excited in the community is represented by the fact that it is upheld partially by public subscription, by trades people, &c. The pupils pay two shillings and six pence for a ticket for one class, in any of the sciences or any of the classes. A reduction is made when they take two classes, and a still further reduction when they take three classes.

Among the other things they teach is music. The school has a regular curriculum of studies, and it grants certificates which are of very great value to the young people when they go out into business. It is attended by all classes of people—pupil teachers and clerks, as well as carpenters, and people of all occupations. But I want to call attention to the fact that every pupil pays for his instruction; and even by that method there are a larger number of students than are in attendance at the Cooper Institute in this city; yet Edinburgh is a much smaller city than New York. In fact, they cannot there accommodate all those who apply for instruction.

By the CHAIRMAN:

Q. Do you know about the number they accommodate?—A. The total number of persons at the school, I think, was nearly three thousand—attending the various classes.

Q. At a given time?—A. Yes; at a session.

Q. How long ago was that—how recent was the report?—A. That was the last report. The last report, I think, is for 1881–'82.

Q. That is an industrial or technical school?—A. Purely an evening college for the working classes.

Q. Were the instructors workingmen?—A. No.

Q. Were they scientific men—college men, perhaps?—A. Yes; the professor of chemistry, for example, of the University of Edinburgh was a professor there.

Q. The compensation paid by the students goes to the professor for his lectures, does it?—A. Well, not directly; the directors pay the professors a definite sum.

Q. Is the system of instruction by lectures or by recitations?—A. Lecture only. The system of recitation is done away with throughout the country.

Q. Are the students working men and women?—A. Yes.

Q. Of all ages?—A. Of all ages.

Q. Whoever chooses to attend?—A. Yes. My interest in it was at first brought about by an agitation, with which I was connected, for girls to attend the school. It was at one time closed against women.

Q. And the lectures are confined to such matters as bear directly or indirectly upon the ordinary industrial occupations of life—their immediate improvement in those?—A. Yes, or in their mode of living. For instance, they had a class for the harmonium. There has been a great improvement in Scotland in musical matters. Almost everybody has a harmonium.

Q. Has the improvement extended to vocal music also?—A. Yes, sir; both vocal and instrumental. At the school I speak of, when I left, ten years ago, they had an organized orchestra.

Q. This was during the week-day evenings?—A. Yes.

Digitized by Google

SUNDAY-SCHOOL FOR THE TEACHING OF SCIENCE.

Q. As I understand you, there was a Sabbath school conducted on some similar plan?—A. Yes.

Q. And in those Sunday-schools are the children included?—A. Oh, yes; it was intended originally for children.

Q. And that was wholly sustained by the workingmen themselves?—A. Yes; purely so.

Q. The compensation received by the professors connected with this workingmen's college is in addition, of course, to their ordinary collegiate salary?—A. Yes. In Scotland they have attached to every university what they call extra-mural lecturers, whose lectures students have the option of attending, and these lecturers nearly always become teachers in the Watts' School of Art

SCIENTIFIC LECTURES FOR THE WORKING CLASSES.

Q. Is there anything else of this kind in Scotland or England?—A. In Glasgow many years ago Dr. Birbeck originated the idea of scientific lectures in chemistry, physics, &c., for mechanics. He was laughed at very much about it at the time, but, to the amazement of every one, it was found impossible to find room for all the mechanics that thronged to the lectures.

The CHAIRMAN. There ought to be an institution of that kind, and it might easily be made an initiatory movement for a Government university. There are many men connected with the Government employ in Washington, as at the Smithsonian Institution, &c., that would be glad to give lectures on scientific subjects.

The WITNESS. Yes. There is one peculiarity about professors and lecturers in America; I have met many of them; they are men more apt to co-operate in that sort of movement than those in Scotland and England, who are very hard-headed sort of men.

The CHAIRMAN. In every city there are retired and intellectual men who are more or less students and who would be very glad of the opportunity of giving instruction gratuitously if a movement of that kind could be inaugurated. If the workmen of this city could hire a hall I have no doubt they could get gratuitous lectures on scientific subjects to any extent from men who live here in the city, and who would be glad of the opportunity of finding utterance.

The WITNESS. One great difficulty about that is the difficulty of getting apparatus. Mr. Eaton says the experience of industrial colleges in this country is that they cannot supply themselves properly. It is so expensive to furnish a technical college, as compared with any other sort of college, that the relative expenses seem enormous.

Q. But there could be a vast deal of instruction given that would be very useful even without any sort of apparatus at all?—A. Oh, yes; theoretical science could be taught, of course. I might state as an evidence of how far such teaching is capable of being made intelligible, that, with regard to this Sunday-school of which I have spoken, and of which a report appeared in the New York Times about a year ago (as to the number of pupils, average attendance, &c., during the year), my brother, while a teacher in that Sunday-school, taught, in addition, a class of little girls, from nine years up, in geology at his own house at 9 o'clock on Sunday mornings, and on Saturday afternoons the whole class took excursions out to the quarries adjacent to the city. That

Digitized by Google

method has always been found best—to associate practical, realistic, instruction with theoretical instruction in the science or subject involved.

I think, therefore, that while for the future technical education could be introduced into primary and grammar schools, and should be incorporated into the primary school system of the country, it should not be overlooked that there is a large adult population that should be equally interested in it. And from the stand-point of a trades unionist I claim that the kind of mechanics who would be produced after ten years under such a system would be a body of men far better able to conduct legitimate combinations such as trades unions, and far better able to conduct all other combinations of labor under the recognition of economic principles and arrangements as they now hold, than any body of men that we have yet seen in this country.

I therefore regard such a system as an auxiliary to the strict economic branch of the labor movement, and it is of indirect value in every possible respect. I do not think that too much importance can be attached to it.

I think the idea of enlisting the self-interest of teachers all over the country who can add a little to their incomes by teaching is a most important point; but must be guarded against, so far as concerns the mere book knowledge which might result from it, by demanding a degree of knowledge on the part of the pupils when passing, before the teacher gets his payment by results, demanding a knowledge which can only be obtained by apparatus and contact with the things themselves of which the theoretical science treats.

### TRADES UNIONS IN THEIR RELATION TO LAW IN AMERICA.

I should like to call the attention of the committee to a point which arose in my former examination here regarding the relation of the law to the present trades union movement—the constant liability of conflict from the uncertainty of the law.

I understand from what I have heard before this committee, in the course of discussion and examination, that there is a desire and probability of an effort in the direction of obtaining legal recognition of trades unions—national trades unions—and I certainly think that in any such law, or in addition to any such law, it is necessary to recognize the legality of *all* trades unions—for there are local trades unions which have not been able yet to reach such a point as to be organized nationally. And also, that law should be so explicit that there can arise no conflict in the case of a strike, unless by outrageous provocation and violation of all decency.

Q. Conflicts of what character do you mean?—A. When a strike occurs now, for example, as the law is interpreted here, a man is acting illegally if he attempts to persuade another man not to go to work in a shop where the strike is. We have tested that and we have authority for stating that that is the law, so far as it is understood.

### THEIR RELATION TO LAW IN ENGLAND.

In England they have repealed all such laws. The law in England simply prohibits violence by threats or intimidation, molestation, or obstruction on the part of masses of men; and it also states definitely, "provided this act shall not apply to persons who shall meet together for the sole purpose of consulting upon and determining the rate of wages or prices which the persons present at such meeting, or any of them,

Digitized by Google

shall require for his work or their work, or the time or hours for which he or they shall work in any manufacture, trade, or business, or who shall enter into any agreement, verbal or written, among themselves," and "that persons so meeting for the purpose aforesaid, or entering into any such agreement as aforesaid, shall not be liable to any prosecution or penalty for so doing, any statute or law to the contrary notwithstanding."

Now, several great strikes occurred in England after this law was passed, and in spite of the language of the law some of the striking workmen were arrested for persuading other men not to go to work where a strike was going on. Recorder Russel Gurney, of London, in the case of the cabinet-makers' strike, stated that as to "persuading others not to work (that was one of the charges in the indictment against the men), this they had a perfect right to do;" and as to the charge of "watching the place of business," for which the men were also prosecuted, it being held by the employer to be a tacit threat, while the men maintained that it was for the purpose of informing other men of the conditions of the strike, and of endeavoring to persuade them to join the strikers—all this was declared lawful by the recorder of London under that statute; and in doing so he quoted Justice Lush, who was a high authority on the subject. The statement of Justice Lush says, "There must have been threats and intimidation otherwise than by endeavoring peaceably and in a reasonable manner to persuade others to abstain from work." The same decision was given in Manchester in 1876. All the decisions (being of test cases for trades unions) were to the effect that "watching a place of business" and "persuading men not to go to work" were not to be taken as intimidation.

### NECESSITY FOR EXPLICITNESS IN LAWS REGARDING STRIKES.

Now, what I claim is that any law dealing with this subject must be explicit, and it is more necessary in this country than it is in England, for various reasons. The influence upon executive authorities in large centers of population and the association of such officers with politics, &c., lead to very grave suspicions of their motives on the part of workingmen who, in a time perhaps of famine or public disturbance, may be roused in anger and may misinterpret ignorance on the part of the executive authority for malicious intention. Any law dealing with the subject should specifically state the things which workingmen may be allowed to do and which they may not be allowed to do. And then it will be proper to decide whether workingmen in the strike are law-abiding citizens or not. I know that in making that statement I am speaking the views of every workingman in the United States connected with labor in any form. It is a constant source of public danger—the doubtfulness of the law on the question, and it would be just as well when you deal with the question to make a clean sweep of it and put it beyond doubt. I think also that the evidence given before this committee by persons professing to be friendly to the working classes, to the organization of labor, and to the labor movement generally deserves a little notice at my hands.

### CO-OPERATION AND INDUSTRIAL COPARTNERSHIPS.

The question of co-operation and industrial partnership has been discussed very widely among the organized working classes. And while the value of co-operation and industrial partnerships is neither ignored

Digitized by Google

nor denied, still there is a very strong feeling among the working classes that neither of these is adequate to solve the labor problem. It is found that what a man would save by his membership in a co-operative store, such as has been tried in this city, amounts to about $25 a year—that is the percentage that he would save on his purchases. It is found that for the successful conduct of any such concern, stability of occupation is absolutely necessary; that the man's income must be stated; that his income must be regular; his place of abode must be steady; he must almost look to living in the same place and having the same position or the same wages for a very, very long space of time, if that method is to be successful. And it is found, in practice, that these conditions do not exist; that the constant tendency of the present business system is to compel workingmen to go after their work wherever it may be found. And workmen are constantly moving from city to city, and from country to country; and I think it really does not require much argument on my part to convince this committee that this vagabond tendency on the part of labor, compelled by the necessity of looking for work, brings to bear on the co-operative system a specially difficult item to deal with. An industrious man is willing to work, and is willing to go for work, and if he has to tramp for it he is entitled to all the more respect, because he is determined to be industrious. But I say, apart from any exaggerated feeling like that, there is a feeling in the minds of the best skilled workmen in favor of such things as co-operation.

### CO-OPERATION MERELY COLLECTIVE COMPETITION.

On the other hand, I think that Rev. Dr. R. Heber Newton and other advocates of co-operation entirely overlook a most important fact which has been demonstrated in England among the most successful co-operating establishments there, namely: That the question of labor as opposed to capital does not come into the question of co-operation. As a matter of fact, co-operation should be properly called "collective competition;" that is all it is, and that is proven in the history of co-operation in England by the fact that when an institution of that sort became so successful that it had to employ workmen who were not connected with the co-operative system, it had to employ those men at the ruling market wages. Then a question arose between the workingmen and the co-operative concern, and it does not appear that they were any better able to make a solution of the difficulty than the personal employer is able. Assuming that other concerns of like character enter into the business, it is quite clear that there will be competition between similar co-operative concerns.

Q. You are speaking of the question of collection and distribution?

### DIVISION OF PROFITS IN CO-OPERATION.

A. No; I am speaking of the question of division of profits. Co-operation is simply a number of men acting together, like a joint-stock company, and a workman working for them for wages is in the same position, and bears the same relation to that co-operative association as a workman bears to an employer—as a workman in New York, for example, who is working for John Roach bears to John Roach, and that co-operative concern, if economically conducted, does not pay that workman one penny more than anybody else would pay him for similar service.

Digitized by Google

The CHAIRMAN. I understand, but I did not know but they cease to be co-operative when they employ help.

The WITNESS. In Rochdale the oldest establishment was a co-operative concern.

Q. What did they manufacture?—A. I forget the business now, but the question of division of profits came up for discussion at a co-operative congress. That question became a matter of dispute. The genuine co operatives held that when outside labor was employed by a co-operative concern such outside labor should be paid a dividend.

Q. The same as the members of the concern?—A. Yes; on moral grounds.

Mr. CALL. It is no longer co-operative unless he is a member of the concern?

The WITNESS. He is not a member of the government of the concern, but he is a worker.

Mr. CALL. He is a beneficiary without being a partner.

The WITNESS. That is all.

Q. What did they decide to do with him—that he should have a share in the profits, or that he must take wages merely?—A. I think the decision of that special case was in favor of paying the man just the same as if he were a member.

Q. Suppose that those profits were less than wages, you could not keep the man?—A. No; of course not.

Q. Therefore the principle would not work?—A. No.

Q. And the association would not work a long while unless they paid as much as their men would get in business houses?—A. Yes; from the co-operative point of view; but that system has been supported by men who have an interest in it from another point of view. George M. Holyoake and others have appropriated money to it every year.

By Mr. CALL:

Q. What has that got to do with co-operation?—A. Because these men insist that men will not go into it unless they can look beyond to-morrow, and beyond their noses.

By the CHAIRMAN:

Q. And have an assurance for the better future of their families?—A. Yes.

By Mr. CALL:

Q. An uneducated man as well as an educated man, if a member of the co-operative institution, would have the same economic benefit from it?—A. Yes; but he is more liable to ruin the business. A co-operative establishment is after all engaged in a competitive system, and they cannot afford to have noodles or fools in the directory nor as voters in their boards.

Mr. CALL. I thought a co-operative system was one designed to buy goods at the lowest possible price and sell them for just enough to pay the cost and expenses of the business, with reasonable salaries, giving no profit at all to the business?

The WITNESS. That is true in one branch of the co-operative system, the retail store system, but co-operation has also gone into productive industries.

Mr. CALL. Yes; but that should be the principle always, to divide everything without profits to the concern.

The WITNESS. Yes. Now, from that point of view, the point I desire to make is all the more apparent: If it is conducted as a business

Digitized by Google

concern it is simply a collective factor in competition; and if it employs a man to keep store and gives him wages, it has got to pay that man the same as the wages that he gets in the competitive market; it could not afford to be a philanthropist to its store-keeper. As a wage-worker he gets so much; as a member of the co-operative association he gets so much.

Now, then, the objection made by the student of the co-operative system is based on the discovery that, given a widespread sense of the co-operative movement, it would not be a solution of the difficulties involved in the labor problem, because it would be simply a thing in which those who are inside get the benefit, and those outside get none.

By the CHAIRMAN:

Q. They become a corporation, you mean?—A. Yes.

By Mr. CALL:

Q. Do you mean to say that the working people object to being partners in a business, and receiving all that that business can give to them as the fair share of their labor?—A. No.

CO-OPERATION NOT A SOLUTION OF THE PROBLEM OF "LABOR AND CAPITAL."

Q. But that is what co-operation means, is it not?—A. But when co-operation is presented as a cure for the labor difficulty—for the conflict between labor and capital—it must be taken up on its merits, on the merits on which it is presented. As a cure for the conflict between labor and capital it is not recognized by the labor classes of this country, because they have been unable to see that it is anything but simply collective competition.

Q. What do you mean by "collective competition"?—A. All those people who are shareholders are collected together, and they conduct the business as if they were one employer; they have a manager, and he has to have as good a head on him as has any individual employer; he has got to cut his coat as closely, according to his cloth, as the individual employer has.

Q. How are you going to remedy that so that you should not have competition anywhere?—A. We do not want to remedy that; but we want to have a fair competition.

Q. You are a printer, are you?—A. I am a type founder, but I have been a printer also.

Q. Then, to illustrate your proposition, suppose the law to-day were that everywhere in the United States all workmen engaged as type founders, or manufacturers of any kind, should have the proceeds of that business divided among them, after allowing a certain portion, which may be assumed to be necessary to keep their houses up, and the machinery in good repair, and that whatever is made should be divided among them, the foreman getting so much, and the ordinary workmen so much. Now, that would be a co-operative industry; they would have to pay, of course, for the house, whatever its value was, to whomsoever owned it, or, if the concern owned it, they would have had to pay somebody the cost of it. That would be co-operative industry, and that would be a universal law. Now, if some one man among them organized a type foundry and got his friends to assist him, and these friends gave him the means from day to day to carry it on, and you had agreed to help him, he would have such part of it as he might see fit, by arrangement with you, to appropriate?—A. Precisely.

Digitized by Google

Q. And you might say, "We will not pay you more than such an amount; we will take the balance of it over this"; and he might say, I am not satisfied with that"; and then you might arbitrate the matter, but the principle would be the same, of a division of profits?—A. Precisely.

Q. It seems to me it is unnecessary to confuse the matter by the term "controversy between capital and labor." Why would not workmen be satisfied with that?—A. Wherever the workmen are able to carry out any such thing they are satisfied.

Q. That is the principle of co-operative labor?

THE CONDITIONS NECESSARY FOR CO OPERATION NOT EXISTING.

A. Yes; but you observe that the objection I make, and that those working classes who did not take kindly to this solution of the co-operative system make, is that such business concerns demand certain conditions which we do not find possible in the lives and conduct of workingmen.

Q. Then your objection is not to the system of co-operative industry, but to the conditions which are demanded for its operation?—A. Yes; the general way of stating it among workingmen is that it is "too previous."

Q. What do they mean by that?—A. It is too previous by reason of the fact that it demands conditions which are not yet existing, and it demands characteristics in men which do not yet exist in full development. To be successfully carried out it demands conditions in character and in society which, if they existed, would render co-operation unnecessary.

Q. You mean they prefer the wage system?—A. No.

Q. That is the only contrast; the only question is how they shall get their portion of what is made in the factory, whether by contract with the man who directs the labor of the others, or by sharing the proceeds of what he makes. So far as concerns distribution, and so far as education is concerned, it is simply a question of the qualification of the laborer, as you say, for different employments, and higher tastes, but so far as this factor is concerned it is a question of distribution, how he shall get his share—whether in wages, or his share of the profits?—A. Yes; but the first question is, how shall he get the factory, how the management, how shall he start the co-operative concern. Dr. Heber Newton, who has been before you, has been engaged in several concerns like that, and they have all burst up.

Q. Well, you have the factory now, and the assumption is that business is being done everywhere, and the question which you gentlemen propound, as I understand, is how is this vast productive interest—engaged in the arts and manufactures—by what form of voluntary effort shall we obtain for its different component parts reasonable and adequate distribution of what it makes.—A. Yes; that is the question.

Q. Of course you do not expect a share of anything outside of what you make?—A. No.

Q. It must be a distribution of the proceeds of that?—A. Yes.

Q. And the question is how to get that, is it not?—A. Yes; and we claim that the way to get that is by trades unions.

Q. But I mean there is no way, except by paying wages, or by distributing the results?—A. Undoubtedly. But there are different methods of getting a larger share of profits. The co-operative movement is recommended by gentlemen interested, who complain that the working

Digitized by Google

classes do not help them. They say, "why do not the workingmen help to bring them up"? My answer is that the trades unions are a better educator.

Q. Educator in what?—A. Educator in habits that are necessary before men can successfully conduct co-operative concerns.

### HOW TRADES UNIONS EDUCATE MEN.

Q. How will the trades union educate a man better? I am not disparaging the trades union at all, but I particularly want to see how the argument runs. What effect will a trades union have on me as a member of a co-operative association of any kind? How would it affect me in any way, good or bad, assuming me to be a member of a trades union?—A. Assuming that you were ignorant, short-sighted, imprudent, and with not sufficient forethought to look further than to-morrow, if you looked so far as that, and were never known to take anybody's interest into account but your own—that is the condition of the man who works at a trade who does not co-operate with anybody regarding any interest. As a general thing you will find that such a man drinks a great deal, and wastes what he does make, and cannot be depended upon to help anybody who is sick. There are whole trades and occupations made up of men like that.

Q. How does that affect him in his co-operative character?—A. Let the Rev. Dr. Newton go among such men with a prospectus of a co-operative factory, and he will get a lesson that he will remember.

Q. But, now, if a man is drunken, and all that, how will that affect the money he is paid—which is a fixed sum—one way or the other? He will get just exactly according to the good judgment shown in buying and the economy of conducting the business; he will get whatever he buys at so much lower or so much higher a rate; how will that drunkenness or vagabondage affect the higher or lower rate?—A. If they buy beer, for instance, and muddle their minds, it will affect them (and they have just as much right to start a co-operative saloon as they have to start a co-operative cheese factory); but in the case of a store the objection does not hold with the same force as it does with the factory.

Q. Let us go now to the factory. We will see this drunken vagabond as a workman in a co-operative factory, and each man gets his share of the proceeds.—A. But I say you cannot get a co-operative factory until you get this man sober.

Q. Of course; but I suppose nobody would have an association of workmen that are all drunkards, and they would not have them. But you do not consider that such is the condition of the workingmen. I think you exaggerate the condition of men in that respect; there are many hundreds of thousands of workingmen who are examples of sobriety, and taking them as a class there is no better class of people to be found anywhere. You have shown us here that there are no more brainy or thinking people in the world.—A. There are certain occupations which I know (because we have tried to organize them) in which a large body of men are so degraded by their occupation and the hereditary results of those occupations and the conditions in which they live that you cannot organize them, even to protect their own interests, in their own shops.

Our argument is this, that all men are selfish in proportion as they are ignorant; and that if you are going to educate these men it is the culture of *habit* that you want, not the culture of theory merely. The

Digitized by Google

most important habit to cultivate in labor is the habit of working together. To work together with others implies self-control. It implies, for instance, not to get in a passion; it implies a willingness to hear what another man has to say; it implies also caution; it implies a certain degree of integrity in order to get men to pay their dues regularly, and one of the great difficulties is to get men to pay their dues.

The CHAIRMAN. In the great co-operative associations it is difficult to get men to pay their taxes.

The WITNESS. Yes; and it is not found easy to remedy Now, in the case of trades unions, as opposed to industrial and co-operative associations——

Mr. CALL. [Interposing.] But you cannot make any such antithesis; there is no opposition between them.

The WITNESS. There is.

Mr. CALL. They may work well or ill together; but where is the op position?

The WITNESS. The point is this, that we have the friends of the people, and we have the people themselves. The friends of the people are not generally workingmen; they are not habitually associated with workingmen. They do not know the real difficulties in the way.

Q. Why do you say that the "friends of the people" are not workingmen?—A. Not themselves, I mean. They are generally engaged in some occupations that do not degrade them. The "friends of the people" are men who, by self-interest, would not be called to work in the ordinary labor fields. Their interest in labor is philanthropic, as in the case of doctors, lawyers, and clergymen. In the case of lawyers, perhaps, it might not be; but in the case of doctors and clergymen let us assume the best motives.

Q. What interest might the others have?

EXCLUSION OF LAWYERS AND OTHERS FROM THE KNIGHTS OF LABOR.

A. As matter of fact, there is a prohibition against the admission of a lawyer in the four great organizations in which the labor movement takes form now. A politician, a lawyer, a doctor, and a clergyman are not admissible.

The CHAIRMAN. Nor a rumseller?

The WITNESS. Nor a rumseller.

Q. You consider those the four evils of society, do you?—A. No. A very wrong impression has gone abroad because of this exclusion, and of the qualification implied. Professional people are not excluded except on the ground that, in the present progress of organization, it is not judicious for the growth of the combination of labor to have these elements introduced—not because they would work harm intentionally, but because of the present condition of the labor movement.

Q. Tell me why it is considered injudicious.—A. Because integrity is one of the first conditions demanded now in the labor movement.

Q. And you think that is not to be found in those four occupations?—A. Yes, sir, when they are in their own business; but the kind of integrity demanded is that nobody shall be "on the make" in any respect. Workingmen who have been poor have found in the attempt at organization that their best men have been liable to temptations. The instruments have been frequently lawyers, politicians, rumsellers, doctors, and clergymen.

Q. What sort of temptations do you refer to?

Digitized by Google

WHY CLERGYMEN ARE EXCLUDED.

A. Well, in the case of clergymen, which must be the most vulnerable case; a clergyman might introduce sectarian feelings, unconsciously, without any intention of doing so. His special education as a clergyman naturally induces him into it. Workmen belong to all denominations, and the slightest reference to anything denominational is protested against at once.

Q. Do you mean to say that a minister, being an Episcopalian, would try to make men Episcopalians?—A. No; but he could not speak on many questions so as to convince the Catholics of an organization that he was not just a little disposed to be "down on" the Catholic church, and to put in a good word now and again for evangelicism—not specially Episcopalianism.

Q. You do not consider that their philanthropy and their intention to overcome their sectarian bias would be credited?—A. Personally I would credit it; but I say that the working classes would not. The least introduction of anything religious in any organization of labor is at once frowned down.

Q. When you say "working classes," you of course mean the people engaged in manual labor, in the arts and manufactures?—A. Yes.

Mr. CALL. We all work a great deal, you know.

The WITNESS. You work, too, but then the effects of your work are not physical. There is a physical basis of distinction.

Mr. CALL. Some of us work physically, too.

The WITNESS. Yes; but the consequences are different.

Mr. CALL. I have worked in the fields and on the farm.

The WITNESS. Well, we include farm laborers. The farm laborer is a wage worker.

WHY LAWYERS ARE EXCLUDED.

Q. You have told us why you keep out the preacher. Now, why do you keep out the lawyer?—A. Well, the lawyer is about the most miserably constituted man in this country for getting business.

Mr. CALL. I know he is a very bad fellow; but I want to know how he tempts you people.

The WITNESS. In order to get a business, it is almost hopeless for a young lawyer to sit down quietly. A young lawyer is very liable to see that he can get no career unless he goes into politics. De Tocqueville noticed that the Government of this country was going to pass into the hands of lawyers, and he has a very significant chapter on the danger to republics from lawyers. He treats in a systematic way the sponta neous suspicion which workingmen from their experience have verified namely, that lawyers, by reason of the competition in their profession, have very little chance to get business, and indeed all the bright hopes for a lawyer to have a good career seem generally to be associated with politics. Whether that is so or not, it is a fact that many lawyers think so, and many working people also.

Mr. CALL. Suppose we admit that, what then?

The WITNESS. The working classes have found that many of these lawyers are men who know the weaknesses of the workingmen. It is a profession into which any man may rise in this city.

Mr. CALL. That is, any man knows that a lawyer may become a politician?

The WITNESS. Yes.

Digitized by Google

WHY POLITICIANS ARE EXCLUDED.

Q. How is that going to hurt a man?—A. Because a politician, in the general condition of politics, is a dangerous person.

Q. Why?—A. The working classes regard the politicians, especially those engaged in local politics, to be men who might introduce into their organization elements which would tend to rend them asunder.

Mr. CALL. Suppose we admit all those who are in to be good and those who are out to be bad. We have had from you and from others here a good deal of politics, because all these remedial measures on which you talk with so much force are of course politics. Hence it appears that you are all politicians.

The WITNESS. There are two kinds of politics. There are politics and higher politics. It is the higher politics that we are interested in.

By the CHAIRMAN:

Q. It is not the higher lawyer that you would keep out, is it?—A. No.

By Mr. CALL:

Q. You had a lawyer here who was discoursing on those things?—A. Yes.

By the CHAIRMAN:

Q. If a lawyer is both lawyer and farmer, or lawyer and workman, can he get in?—A. Yes; if he chooses.

Q. The fact that he is both does not exclude him?—A. No.

By Mr. CALL:

Q. What do you mean by a lawyer; do you mean a man that knows something about law?—A. No.

Q. Do you mean a fellow who pretends to know something about law and does not?—A. Well, if he does not know much about law he is pretty harmless.

The CHAIRMAN. I think he is the most dangerous lawyer to be found.

The WITNESS. We do not employ a lawyer the ordinary way. When we have to employ a lawyer, one is selected who has been a workingman and who has retained his connection and proven by his business life that he was not ashamed to be a workingman, who has demonstrated that his life has been pure, and that his introduction to the law has not corrupted him to any dangerous extent.

Q. How are you gentlemen who abjure all existing lawyers going to carry on government after you possess the Government?—A. We have not the remotest idea of getting possession of the Government in such time as would not enable us to grow to the power necessary.

Q. Then you propose to have lawyers by that time?—A. Not professional lawyers; and if a lawyer is paid for his services, it is so much the worse. It is so much loss to the community. If I had the time and the means I would study law and would conduct cases before the court, and would not charge a cent.

ALL MEN ARE WORKINGMEN—SOME IN A PICKWICKIAN SENSE.

Q. But we are all workmen, and are you going to exclude all those of us who do not work at trades?—A. Well, we are all workmen—in a Pickwickian sense, but not in the other sense. In the real sense we are not all workmen. Men do not all work at work that degrades.

Q. Well, in what sense do you say that work degrades?—A. That is

Digitized by Google

a subject that I like very well, and would just as soon go into it, if the committee has time, but it will take a little time.

The CHAIRMAN. We must close it to-night. However, I am willing to stay as long as is necessary; but we must get through to-night.

RELATIONS OF LABOR ORGANIZATIONS TO POLITICS.

The WITNESS. I am simply stating a fact now which has really been debated seriously before all the labor organizations, and in which great difficulties have in many cases arisen. In this city the workingmen actually went into politics; they set up workingmen for legislative offices only; they excluded executive offices because those implied the handling of money, and that, they said, implied the possibility of suspicion; the least suspected offices were legislative offices. That is a very good position to take. It was also agreed that no person should be put up for those offices except actual workingmen who were members of trades unions, and who should be governed in their votes, if elected, by the decisions and instructions of the organizations who put them in office. One gentleman, however, was a lawyer who also was an editor, who also had been a workingman. His experience as an editor and as a lawyer were perfectly satisfactory; his career was known, and he was practically regarded as a professional martyr to his faithfulness to the workingmen's movement. At the same time he would not back down and claim that he was a workingman in the technical sense of the term. He said he was a lawyer, and was going to live by the law. Now, that gentleman had it in his power to be a member of a trades union, and to be technically admissible to the organization, and to be a proper candidate. He had many friends, and finally he was nominated, and the rule violated and a special exception made in his case, he being a lawyer, because he had served his time as a workman, and had kept up his associations. Still in this particular case it caused a great deal of discussion and even ill-feeling, although I may say the case was one in which all the conditions were satisfied. But so great is the suspicion that men who live by the law, under the present competitive system, are apt to be in a tight place, and are apt in their training as lawyers to lose the moral sense which is so necessary for conducting the case of the people properly, that they are excluded from the Knights of Labor.

Q. Are they not human beings?—A. Yes; but there are many human beings not capable of conducting the case of the people—or their own cases either.

WHO MAY BECOME MEMBERS OF TRADES UNIONS.

Q. You do not allow anybody but wage-workers to go into trades unions, do you?—A. Persons who work at a special trade, and persons who have worked at the trade and desire to belong to the union may do so.

Q. But there must be wage-workers?—A. Yes, no bosses.

Q. No employers?—A. No, not in the trades unions, but the Knights of Labor admit them.

Q. When you put up candidates you look forward to that organization as one to control the political power of the State, do you not?—A. Not at present.

Q. Well, ultimately?—A. No action in a political way is attempted at present, except under the system which now prevails, which is simply an accommodation to circumstances over which we have no control.

Digitized by Google

Q. You propose to control the political power of all members of the union, do you not? You propose to act as a union?—A. Yes.

Q. That is a part of your scheme, is it not?—A. Yes, sir.

Q. And all who belong to the union are to act in common?—A. Yes.

Q. You want to get all the wage-workers in the country into that union, do you? You propose to get in every man. If you could you would take in every man to-day in a trade and every woman too?—A. Yes. I understand you are speaking of trades unions?

Mr. CALL. Yes.

The WITNESS. They must be persons who belong to the trade and who have learned the trade, and are now willing to acknowledge themselves and pay their dues. I understand you have built a house and so you would have a right to belong to the carpenter's union, if you thought proper, and I would certainly advise you to do so, because you will be able to see that men get a training there of an entirely different kind from anything they can get anywhere else.

Mr. CALL. Well, I want to know what sort of training I would get which I have not got already. But what I was going to ask you was this: Suppose all the tradesmen in the country belonged to this association, would you not then be practically establishing a caste by providing that nobody but wage-workers should get into office? You exclude the employers, and if the wage-worker has the capacity to rise, which will probably be found to be the case in some instances, then, unless you propose to have all men on a level as to capacity, you have a privileged order in which you do not allow anybody but wage-workers to have any political or industrial power.

The WITNESS. Precisely.

Q. That is the theory?—A. Yes.

Q. The theory, then, is that however much the wage-worker may develop capacity to combine the labor of others, he must not be permitted to exercise that capacity. That is, all that what you call "capital" really is, most frequently, the capacity of one man to rise to a position where his fellow-men say "you have better capacity to combine our work than we have collectively, and therefore we prefer that you should do it." That is the function that capitalists develop as John Roach has developed it. I understand you to say that you propose to discard that sort of capacity, and not allow any such men to rise up to that level, or to directing power?

The WITNESS. Do you mean in the matter of political power?

Mr. CALL. No; I say industrially, and in all other ways. Is not that the tendency of that proposal of yours?

## THE WORKING PEOPLE NOT A MERE "CLASS."

The WITNESS. The object of the workingmen politically, in excluding persons whom they regard as representing class interests, is based on the conception that the working people do not represent a class interest at all. They claim to be *the people*, and they claim that they are better able to take care, even by their instincts, of the general welfare of the nation.

Q. Would it not be better to pass a law that there should be no doctors or lawyers?—A. No, sir; doctors are good enough for medicine, and lawyers are good enough for law, but they are not good enough to be invested with the life interests of people whose lives are entirely different from theirs.

Digitized by Google

By the CHAIRMAN:

Q. Would not the better thing be to refuse to vote for professional men for office?—A. Yes.

Q. That would be a tangible and feasible way, I suppose, by which the workmen could exclude such men from public office?—A. Yes.

Q. Why do they not elect their political officers from their own class?—A. The effort to do that is constantly spoiled by the liberality of the working people intrusting some men who have smooth tongues.

By Mr. CALL:

Q. Why should you assume that there is any more virtue among one class of people than another?—A. It is not a case of virtue. We assume that the selfish instincts of people are equal.

Q. You cannot possibly demonstrate that there is any more reason why you should be in favor of protecting the people than there is why I should be?—A. No; but there is more reason for supposing that a thousand men like me who vote to agree upon any line of action are more apt to correct one another.

Q. You do not let me vote as one of them?—A. We object to your coming in to manage our organization.

Q. You propose to manage it so that it will exclude me?—A. Yes.

### ADVANTAGES OF TRADES UNIONS OVER CO-OPERATION.

We claim that the trades unions by their methods are a graded system of practical education for bringing the workmen, entirely self-consciously, up to the point where they will regard the good of all other workmen in their country and their trade as of as much importance as their own, and recognize the welfare of each as bound up in the welfare of the others. The International Trades Union is the highest form of that, and that demands the best development of the best instincts. It begins at the lowest and most degraded kind of man, and is capable of lifting that man up by the practical education that it gives him, and we claim that co-operation is not capable of taking a man of that kind and doing anything with him. We claim that co-operation begins with principles of character that do not at present exist. We claim also that industrial partnerships under certain circumstances are valuable, but they have to do with a future rather than a present condition of the people.

### TRADES UNIONS THE BEST PRACTICAL EDUCATORS.

Q. In other words, you claim that the best educational system in the world is the trades union?—A. Undoubtedly the best practical education.

Q. Better than the church, better than the family ties, and better than the association of friendship? The bare fact that it is an association of wage-workers supplies all the other beneficial influences that are known to civilization?—A. Oh, no.

Q. That must be the argument, because there is nothing peculiar in the educational functions of trades unions. They may be employed as you say, but there is nothing in the mere fact that so many workmen get together and form an association and agree to pay, monthly or otherwise, so much money to take care of each other when sick. There is nothing in such facts that contradistinguishes such an association from the church or any other benevolent association, nor is the fact that

Digitized by Google

any man is a wage-worker, or is working for wages, calculated to make him a better man than another.—A. You cannot co-operate with other men in your trade without being better.

Mr. CALL. But it does not make any difference whether I am a blacksmith or a carpenter. If we co-operate to do a good thing the advantage is surely just as good as if I were a tradesman.

The WITNESS. But the peculiar training is different. The organization of the shop is not as good nor as high and does not call for the same qualities as the organization of a trade in a city. The organization of a trade in a city does not call for the qualities necessary for the organization of a trade in the country.

Q. Why is not a man in the country as good as a man in the city of the same trade?—A. A trade in the country does not educate a man as well, in the broad sense, as a trade in the city, nor a city organization so well as a national, nor a national so well as an international organization; it does not give him that feeling of international relationship with his craft.

Q. If the trades union is such a wonderful educator, why do you want technical schools?

THEY FULFILL A FUNCTION WHICH CHURCHES AND SCHOOLS DO NOT.

A. We claim this for the trades union: that it is a graduated elimination of the personal selfishness of man. The copartnership and the industrial partnership begin too high up. We claim that men cannot be good trade unionists, nor can they exercise the qualities demanded by an international trades union, unless they have learned to suppress their selfishness, and they do learn to do so.

Q. I can see a very great beneficence in the trades union; but it seems to me that you are surrounding it with a great many purely fictitious and adventitious circumstances.—A. It does not seem so to me.

Q. You assert the proposition in the first place that to make a proper man you must have a wage-worker—that is the first condition.—A. No, sir; we start with him. We are met by a special difficulty. Here are wage-workers warring with capitalists; and some way must be found to get out of the difficulty.

Q. In the second place, you must have him a member of a trades union; and in the third place, of an international trades union; and you say that these functions educate him, not only physically, but give him intellectual and moral qualities.—A. No, sir; I do not. I say the trades union is a graduated system of education which cannot be supplied by churches, by schools, nor by technical education. It is a graduated education in working together for impersonal purposes. I should not like to be misunderstood in that respect.

Q. By an elimination of personal selfishness?—A. Yes; in the conduct of a combat between capital and labor, and that nothing can supply the place of a trades union, and nothing can do the peculiar work which a trades union organization, properly conducted, can do. We demand the church, and all it can do. We demand schools, and all they can do; and we demand technical education in its relation to this wage-worker in his other characteristics.

Q. I notice that this term "capital" is very familiarly and constantly used as being the war of the dragon and its victims. What do you mean by capital? It is very familiar, and I suppose everybody understands what it is when they say that there is a great war between capital and labor.—A. The only reason I should have for not going into that matter

Digitized by Google

is that it is impossible for any proper reports of what I say to get to the public, and it would be a year before I could explain myself to a hundred or more organizations who might misunderstand what I have said by reading what they see I should be reported as saying before this committee. That is a great burden.

Mr. CALL. I do not think any of them can find any fault with what you say.

The WITNESS. Garbled statements of what I say appear before the public, and if I go to speak before trades organizations I may have that difficulty to meet. We are all under a difficulty of that kind that is not felt by professional people.

Mr. CALL. That is a great subject, and I do not suppose you would want to speak on it without preparation.

The WITNESS. It is a large subject, certainly.

By the CHAIRMAN:

Q. These organizations are secret, are they; and a part of this educational process you speak of as indispensable is a training which is to be found in your ritual and secret exercises, I suppose, is it not?—A. Well, I think, mainly in the actual circumstances, the duties that every man has to perform, or the organization is a failure. The point is that the organizations cannot be alive in the absence of certain qualities of character, and if the organizations are living it is proof that those qualities are existent.

Adjourned.

---

NEW YORK, *September* 25, 1883.

The committee met at 10 a. m.

HENRY BISCHOFF sworn and examined.

By the CHAIRMAN:

Question. You are a banker, and reside in this city, I believe?—Answer. Yes, sir.

Q. How long have you resided in New York?—A. For thirty-six years.

Q. And how long have you been engaged in banking?—A. Since 1858 exclusively in banking; but before that in banking and partly in commercial business. I have been, altogether, in business since 1848.

Q. The study and business of your life, then, has involved the investigation of the relations of capital and labor, and their combination in the production and division of wages and whatever relates to the material prosperity of the country, I take it?—A. Yes.

Q. Have you examined the resolution which calls the committee to this city?—A. I have.

Q. I will ask you then, in the first place, to make any general statement that occurs to you as pertinent, either in the way of fact or of opinion, for the consideration of the committee? We may perhaps ask you some questions after you shall have made your statement.—A. I have just looked over the resolution, and may state a few things that occur to me.

### SHORTER WORKING HOURS IN AMERICA THAN IN GERMANY.

The working hours of labor are shorter, in my opinion, in this country than they are in my native country, Germany. People do not work as long hours here as they do there.

Digitized by Google

Q. You have reference to what class?—A. Mechanics and laborers, both.

Q. About what is the length of the working hours in the different occupations in Germany?—A. For a grown person it is ten, twelve, and frequently more hours, especially in the smaller establishments. In small shops and small communities they work longer.

Q. Taking laboring men as a whole, they work longer in Germany than in the United States?—A. Yes; but while they work they do not work so hard.

BUT THE AMERICANS WORK HARDER.

Q. Taking the year through, which do you think expends the most physical force, the American or the German laborer, or which taxes the physical frame the most?—A. The American.

Q. And which produces the most?—A. I think the American produces almost as much although the hours of labor are less.

Q. What should you say as to the conditions under which the American and the German laborers respectively work? I mean by that the sanitary conditions where they work under cover.—A. I think the German conditions are preferable as far as sanitary conditions are concerned. They work more harmoniously and with more pleasure during the time they do work. In fact they do not strain their utmost during the time they work and therefore they can bear longer hours of work.

DISCIPLINE NOT SO RIGID IN GERMAN AS IN AMERICAN FACTORIES.

The discipline is not so rigid in German factories as it is here, especially in large establishments. This is more particularly the case with mechanics and factory laborers working in large establishments—more discipline is exercised—they are more sharply superintended by foremen. They are always under a spirit of personal discipline in our larger establishments—in our larger shops—which works upon the nervous system of a workingman harder than a more cordial and liberal treatment would, such as in the matter of speaking to their neighbor or their fellow-workman, sometimes. There is in our larger establishments a personal discipline which works harder upon the nervous system of a workman than if he were left a little looser and a little more alone. You can notice that even by their shy look as they come out of their factories. They have a shy look about them from this rigid discipline while at work. In smaller establishments the intercourse is more cordial and kind; and although the discipline is less severe, as much and certainly as good work is done, because the mechanic is better disposed to his employer and takes a pride and interest in the business, and in the success of his employer. In smaller establishments he gets into more immediate intercourse with his employer.

VILLAGE FACTORIES BETTER THAN CITY FACTORIES

By Mr. PUGH:

Q. Is not that the fact, too, in village manufacturing, in the country and out of the cities?—A. Yes, sir; to a certain extent. That is much preferable. I would rather have, and I think the State is better off, and safer with one hundred factories which employ 50 men each, than with two large factories, each employing 2,500 men. The more directly a laborer can be brought into contact with a benevolent and kind-

Digitized by Google

hearted practical employer, the better it works for both parties. In large factories the workmen stand at too remote a distance from the person next in interest; that is, the employer. That relates to mechanics. It is even more so with the laborer, who, of course, has less ambition to go into business for himself. That is, he is more dependent upon the employer, and will always be so. The mechanic has, and should have, the ambition to get into business for himself at the first opportunity. But the laborer will look more to his employer for advice, particularly as to how to invest his earnings and provide for old age. Not having the ambition that a trade brings, nor the ambition to start in life for himself, he should be guided, if possible, by his employer, who should always find some time to guide him.

### THE DUTY OF THE EMPLOYER.

The employer should find some time to study the interests and opportunities of his workingmen. He should gain and observe their confidence, and he will generally find it to pay him by securing lasting and reliable help.

The laborer should be encouraged to save a little money and take the first chance to secure a home, no matter how modest and humble it be. For the possession of a piece of ground, no matter how insignificant, lifts his mind and keeps him from wasting his earnings; it cheers his field of labor and his family. Instead of tenement houses in the heart of the city, neat cottages should adorn the suburbs for miles around, in which our working people could live, surrounded by a little garden where the wife may preside, caring for the children and helping to make home cheerful for the head of the family when he returns from his exhausting work. It is done already to a considerable extent here; but it ought to be encouraged.

Making a good home for the mechanic and laborer should be an object among capitalists and employers; not a home of luxury but one of contentment and cheerfulness. That is at the very root of strikes and of the dissatisfaction of the laboring classes. Pleasant surroundings will keep men at home, instead of attending meetings and plotting against their employers. The wife will then see that the husband remains neutral on all questions of violence, as long as she has a cheerful home to offer to him. But of course, such a thing is out of the question in large tenement houses.

### WORKINGMEN'S HOMES.

If large capitalists would lay out plots and build up homes for workingmen at a fair rental, with the chance to buy at cost, and put the interest as low as it is possible to make it, then they would enable the workingmen to own little homes in time, and this would be practical philanthropy of the best kind. Large capitalists retiring with millions of dollars find nothing better to do than to invest their money in United States 3 per cents, or in other convenient security, while if, instead of devoting their munificence to churches and benevolent societies, they would invest money in some such property with the sole view of bringing homes within the reach of worthy workingmen, they would really be conferring the very largest benefits upon society. Such benevolence and philanthropy will bring more fruits than the endowing of institutions. It would take their continual care, however, and would require their own individual activity to bring about this result.

Digitized by Google

I admit that there would be considerable work about it, but the end would justify it, and would pay for all their endeavors. The fruit of the exercise of such benevolence, besides the regular interest which would be paid upon the investment, would be practical benevolence such as no other course would secure. It would put the workingman into the condition of owning a home which it would be his pride and pleasure to keep in good order, and so it would be an inducement to him not to squander his money upon trifles. There are hundreds of instances where the successful career of a workingman, or the head of a family, commences from the date when he is able to call a little place his own.

Merchants, clerks, traders, and professional men also work, in my opinion, longer hours in the United States than they do in Germany, and while at work they apply themselves more closely.

### NECESSITY OF APPRENTICESHIPS.

It is hard to get our young men to select a regular trade. They should be apprentices and kept in rigid discipline until they are of proper age—seventeen or eighteen years old, or beyond. That would keep them from bad company. They are generally unwilling to apply themselves to anything like discipline. They want their choice too soon, but it is necessary, in order to steady them for life, that they should be under rigid discipline up to a certain age. It is particularly so in our societies. Having too much of their own way has been the ruin of many young men.

### NEED OF TRAINING IN HOUSEWORK FOR GIRLS.

With family labor it is even worse. This cramping up of hundreds and hundreds of young girls into shops, it appears to me, is neither good for their morals nor for their health. If they could be kept at home more, helping the mother, or if trained more for housework, it would be better for their health, and would make them better wives for their future husbands. Even taking home their work would be a great deal preferable to having these great aggregations of them in shops. By crowding into shops they find no time to properly prepare themselves for the work of the household to which they will have to apply themselves when they become wives. When they marry they have not the capacity or training to give their husbands such a home as he is entitled to, for they have not been trained to it, and have a natural dislike for it. I will just give you an instance of this:

About a year ago I had occasion to look after some rent in a district inhabited by working people. The house was inhabited by a number of tenants, and my first object was to clean and improve their quarters so as to make them nice. The second story in that house was occupied by a widow lady. Her two daughters were employed at a shop. Calling there one morning about 10 or 11 o'clock, to see whether the work had been done that I had ordered, I found the room full of smoke, so much so that I was alarmed lest there might be a fire. I knocked hard, and the old lady opened the door. She stared out at me, for it was difficult to see on account of the density of the smoke. Her eyes were red, and the whole room suffocating. The kalsomining that had been put on two or three days before was already yellow. I said to her, "Where does that smoke come from?" She says, "The chimney will not draw at all." The first thing I did was to go in and open the front window, so as to clear the rooms. Then I looked at the chimney.

Digitized by Google

In the mean time she sat before the stove, blowing as hard as she could to make the fire burn. I saw at once what the matter was, and by one touch removed the difficulty. I pulled the stove out about two inches into the room, for I had noticed that the pipe seemed to run straight against the wall, and it was impossible for any smoke to pass. The moment I touched this the fire burned very nicely. She wanted to know how it was possible for me to remedy that trouble so quickly. "Well, madam," I said, "you could have done this yourself just as well. Where are your daughters? Don't they take their coffee in the morning, and didn't they see this trouble, and could not they tell what the matter was? You see this stove was entirely out of place." She says, "I have been at it, and my girls have been at it, for the last two or three days, and we have not been able to do anything with it, and the poor things have had to go without their breakfast in the morning because I could not get a fire." Of course, from that moment there was no complaint as to the stove.

I have simply mentioned this to show how necessary it is that a young woman should find some time to attend to and have some interest in actual housework. But really they do not have any interest in this class of work, because they are tired out at the shop and get home tired, and so are disinclined to do any work relating to their homes.

Let me give another illustration: On the same floor is a tailor, whose wife complained of being unable to lock her door. She had a big son there, and I spoke to him and asked him what the matter was with the door. He said that it was impossible to do anything with it. I looked at the door, and then I said to him, "Can't you fix it for your mother?" He said "No, I can't; there is something wrong with the bolt." I found that the clamp into which the bolt ran was full of dirt, and taking out my pocket knife I picked the dirt out. They were greatly surprised to see that I could bolt the door, and they wanted to know how I could do that without being a locksmith.

If more time could be devoted by women, especially young women, to the interest of their homes they might take their work home with them, and so they would acquire more love for their homes, and they would make their homes comfortable, and thus assist their mothers and certainly please their fathers. This would make more happy homes than are to be found at present.

## SCARCITY OF GOOD HOUSEHOLD HELP.

Housewives complain of being unable to secure aid in the way of female assistance for the household, even where they are willing to pay good wages. They do not get servants who remain with them or become steady in their work, while the shops are crowded with working women at almost starvation wages. If their aid were enlisted more in the occupation of housekeeping, there would be more content and more satisfaction among the working classes.

## AMOUNT OF DEPOSITS IN SAVINGS BANKS IN THE UNITED STATES.

I desire to say that I think it shows well for a people to have such large deposits in our savings banks. It is almost without a parallel. There are about $250,000,000 or $300,000,000 in our savings banks. If one-half of that was expended by the depositors living in tenement houses in securing little homes, I think they would be better off, and the community would be happier.

WORKING HOURS OF GERMAN MERCHANTS.

Q. You were comparing the working hours of the workingmen in Germany and in this country. I would like to ask you how it is in regard to the hours of labor of business men in the two countries—men like yourself, merchants, professional men, and others?—A. They devote a portion of actual business hours in Germany to pleasure and recreation. They take longer time for dinner, and they do not attend, as a general thing, so steadily to their business as we do here. They do not work so hard; still they work long hours.

Q. Do you think that business is managed more safely in that country than it is here?—A. No, sir; I do not say so.

Q. Do you think a business man is more likely to prosper and go through life without business misfortune?—A. No; that end is reached quicker here by attending to it closer—altogether quicker.

Q. He makes his fortune or he breaks it sooner here?—A. Yes; but he can stand his business longer there than he can here without wearing out.

STRIKES.

Q. He can live longer?—A. Yes, he can live longer.

Q. I suppose that your observation has led you to form some opinion about strikes and their causes, and how they should be managed, and what may be done to prevent them.

The WITNESS. By legislation, do you mean?

The CHAIRMAN. In any way.

A. I think law-makers can do less there than schools, ministers, moral suasion, and training. These can do more than the law-makers. I do not know of a law aiming directly at removing causes of grievance of this kind.

By Mr. PUGH:

Q. Do you not think that the blame for these strikes is chargeable largely to the employers themselves in not treating the laborers—their employés—as you have just been stating they ought to do? Do you not think that the employer, by a proper course of treatment, and getting up a state of confidence and good feeling between him and his employés could do a great deal?—A. Yes; that is what I should call moral suasion.

RESPONSIBILITY FOR THEM LARGELY RESTING ON EMPLOYERS.

Q. You think the responsibility is largely with the employers in the cases of strikes?—A. Yes, sir; and is particularly so in larger establishments. The workingmen there are too remote from their employers; there is too little intercourse between the parties in interest—the workingman and his employer.

Q. In smaller industries and in the country they are trained together in personal association more, and in more personal contact?—A. Yes. There should be more benevolence, more kindly feeling between capital and labor, and it should not only exist but it should be made to appear to be. A kind word by an employer will inspire confidence in his men. He should ask questions, and they should be answered. His superior learning should properly go to the benefit of his employés, and if it does he will find that he will have good workmen. It would pay him if that disposition existed.

Digitized by Google

TRADES UNIONS.

By the CHAIRMAN:

Q. What is your opinion of trades unions as they exist in this country and in the older countries?—A. They are extremes, and are the fruits of this rigid system of discipline in the factories. These unions come in for the defense of the working people. One extreme always creates another.

Q. Do you think it is possible to prevent the formation or spread of the trades unions until this spirit of which you speak is manifested by employers toward their laboring men?—A. No.

Q. When employers treat their help in a kindly way you think the trades unions will disappear?—A. They will entirely disappear. I suppose there will always be differences of opinion, but they can be harmonized, and will not lead to violence.

Q. As a practical thing at the present time, do you think the trades union a good thing as against this spirit of the employer?—A. It is a necessary thing, whether a good thing or not. It is a thing that I should not care to see, but it may be necessary under the present state of things.

Q. A necessary evil—to prevent something worse?—A. Yes.

Q. We have heard considerable here about the matter of wages. These working people complain that they do not get as much money as they ought to get for their labor. What is your impression in regard to that?

SUFFICIENCY OF WAGES IN THE UNITED STATES.

A. They are well paid, sir.

Q. You think they are, as a rule, well paid?—A. Yes, sir.

Q. Then why is it that so many of them are living uncomfortable lives?—A. It is on account of their homes. Their homes are not made happy.

Q. Well, whose fault is it that their homes are not made happy? There seems to be money enough, you say—wages enough paid, in your judgment?—A. Well, but that money is not judiciously spent.

Q. You say that the home should be made better. How are these people to get better homes? Take a man living in one of these tenement houses getting wages enough and his family needing more than is actually expended upon them—in other words, suffering greatly for many of the comforts, and of course all of the luxuries of life—how is that man really to better his condition?—A. Well, the head of the family understands how to earn, and he earns sufficient, but his wife, or perhaps himself, doesn't know how to keep house with the money, and the causes of that are manifold. But it is particularly the wife that ought to study how to get along with what the husband earns, and not only to get along, but to get along comfortably with it, and wives can do so if they have learned to cook and keep house, as young girls, instead of spending their time at outside work that ought to have been applied to studying the art of keeping house within their means. They have tried to earn all they could in order to buy dresses and appear as if they belonged to a position that they could not maintain after getting married. They keep on trying to keep up this way of living after becoming responsible to a family—that is, after getting a family. They lack the courage of self-denial, and the knowledge and art of devoting that which the husband earns to the most practical purposes. They have not learned it, and therefore it causes dissatisfaction in the family, and

Digitized by Google

money is spent outside which ought simply to be devoted to the maintenance of the household. Some people cannot live on $200 or $300 a month, where others manage to live nicely, and have all the comforts that they need in order to keep them in good condition, and they will be happy and contented with $60 or $70 or $100.

Q. We have been into some of these tenement-houses and seen the women, and they seem to have about as hard a time as anybody, and they have seemed to be doing the best that they could. It may be, as you say, that the fault is principally with the women; but suppose the fact is that they do not possess this knowledge that you speak of—they do not know how to cook—they have not these frugal habits that you speak of; nobody ever gave them any instruction in that regard. Is not that so?

TRAINING IN HOUSEHOLD ECONOMY.

A. That is just it; they should be instructed to keep house within such means as they would be likely to have when they get married.

Q. What can be done to give the wives and mothers of the future the information so desirable for the improvement of their homes?—A. Moral suasion—teaching in church and school, and at every opportunity. They should be encouraged to devote a portion of their time to the art of keeping house economically, and, if possible, benevolence should aid them. Premiums should be given to family servants for a certain length of good and faithful service. Proper pride in that sort of work can be worked up in this way, and such prizes would be an inducement which would raise the standard of house service. Such a service is really more what would be called "aid" than many things that have been so called. There is one expression very much used now among these house servants. They do not like the word "servant," and so they do not say "I serve," but they say "I am assisting in house-work," or "I live with such and such a family." Now, it ought not to be a matter of which they should be ashamed. It ought to be an honor to learn how to keep house and to get pay for service in housekeeping. It should be a pride, and not a disgrace, to be well versed in the kitchen. That occupation could be elevated if proper effort were turned in that direction.

By Mr. PUGH:

Q. The trouble is in not having a proper training in the knowledge of domestic duties?—A. Yes.

Q. The remedy of that is with the family—with parents?—A. Yes.

INDUSTRIAL SCHOOLS.

By the CHAIRMAN:

Q. Take this parent—this woman who is without the knowledge, and who does not seem to be able to help herself—who is to instruct her children? The mother cannot do it.—A. Schools should do it.

Q. Are the schools in existence?—A. No; but they should be. There should be industrial schools. There have been schools started, however. It is a hard task, I admit, though a noble task. Children would rather do almost anything else than to do little things in and about the house, although it is so necessary.

Q. Well, until these schools are established and these new mothers are raised up and these habits and powers of economy, and the capacity to get along with fifty cents where they now need a dollar in order to

Digitized by Google

be comfortable, until then, are their wages enough?—A. Well, their wages keep them and will keep them; but they do not keep them as comfortably as the same wages would if properly applied.

Q. That is the sense in which you mean your answer to be understood?—A. Yes.

Q. Then, until society has done something for these people, do they get as much money as they really need, or should what further is necessary to make them comfortable be given in the form of charity?—A. Oh, they should have more to make them comfortable in their fashion—they should have decidedly more.

Q. Here is an immense mass of wealth that others have—more than they can well apply to their personal uses—A. Yes.

Q. So that it would seem for the time being that here is an unjust discrimination of the wealth which is actually created, would it not?—A. Yes.

Q. Now, does any way occur to you in which the immediate evils can be remedied at all by effecting some more equitable distribution of the wealth that does exist?—A. I do not know that it can be done under existing laws, nor could I devise any law.

Q. You would begin with schools, and with the rising generation?—A. Yes; but laws would have to be devised or found in the future time to equalize this.

## TENEMENT HOUSES.

Q. With regard to the tenement houses. One-half of the population are living in tenement houses that are not fit to live in, but the working people do not own these houses. Could not the men who own them make them better before they rent them?—A. Yes.

Q. They could tear them down and put up buildings with suitable appliances for life and health?—A. Yes. But why tear them down? Let them stand and be rented for cheap factories, or be enlarged and improved; but let the people's dwellings be out of the city in our beautiful suburbs. Let them select places there and build up cottages of the value of from five or six hundred to one thousand or fifteen hundred dollars, and rent them very low. In these places little gardens could be cultivated by the wife, who could have vegetables and such things for the food of the family, and could have chickens around the house, which contribute so much to the economy of a family, thus saving a portion of the husband's earnings, while at the same time the husband can avoid climbing half a dozen flights of stairs to get to his little habitation. This would make a very different man of him.

## MORAL RESPONSIBILITY OF CAPITALISTS.

Q. That is a very much better solution; but how can that be achieved unless the capitalist takes his money and invests in this little homestead, and gives the laborer the opportunity of buying and paying him on time?—A. We have so many philanthropists, so many large capitalists in this country that it would only need a man or number of men of that kind to try the experiment.

Q. But they would have to give their labor into the bargain?—A. They can well afford to give their labor so as to let the workingmen actually have the benefits of the capital at a legal rate of interest. Let the workingman pay his interest and let the capitalist receive it, but let him give his own exertions without charge. In that way it could be attained and a great deal of benefit would be conferred upon the

Digitized by Google

workingmen. One instance of that would, no doubt, lead to others and would open up a great field of practical philanthropy. There are miles of beautiful country around this city which could be covered with the happy habitations of working people, and we would have a very much better class of men.

Q. Of course what could be done here could be done in other cities. Now, is there any way in which the capitalists of the city could be induced to enter upon such a system of improvement; do you not think that capital so invested would pay well?—A. Yes. Well, it would be a safe investment at any rate; but it ought not to pay better than other just as safe investments. It should not be made to pay better, because the labor and the extra care required in order to collect this income out of investments of this kind should be for the benefit of the working people.

Q. Do you think that anything could be done to induce men of means to undertake this reform that you speak of in the direction of furnishing the opportunity for cottage homes?—A. Yes; by recommendations of men high in standing and high in office, but particularly the press, by calling upon the capitalists and pointing out to them the beauties of such benevolence.

### LEGISLATION NOT THE REMEDY FOR SOCIAL DIFFICULTIES.

Q. The thing would have to be done more in that way than by any effort at legislation?—A. I do not know any legislation that could do it. A capitalist has a right to do with his money as he pleases.

Q. Is it not a fact that most of the difficulties in society must be remedied by individuals in society who realize them, rather than by the laws?—A. Indeed, it is. It is more of a social field than a field for legislative action.

Q. Are there any suggestions in the direction of legislation that you think it would be well for the committee to consider—anything touching the land question, or the hours of labor, or a bureau of statistics, or any other subject of interest in this direction?—A. Not immediately. I have not been considering those phases of the subject.

Q. Would you be inclined to say anything to the committee in the matter of the currency in connection with wages and labor, and the steadiness of its employment and rewards? I would like to ask you this question: Whether, in your opinion, the speculation that exists in produce—in the necessaries of life—has a healthful or an injurious influence, or none at all, upon the prices of the necessaries of life?

### GAMBLING IN THE NECESSARIES OF LIFE.

A. Oh, it has. All these combinations have certainly an injurious influence, and are so much against the consumer. It is a conspiracy, but I do not know as it can be remedied by any legislation. As long as capitalists exist, and as long as they band together their capital, they have a perfect right to do with it as they please. I do not see how legislation can prevent that except making criminal these "time sales," or sales of what a person has not got—bargaining in "futures."

Q. Please explain your views on that a little more fully. There is some evidence already before the committee, and there will probably be more on that point, but I would like to get your view upon it.—A. I think that subject has been exhausted, and I would rather not express myself upon it.

Q. You mean it has been exhausted in another investigation?—A.

Digitized by Google

Yes; and before this committee, too. I do not see how this can be reached except by classifying that sort of thing under the laws as you do lotteries—making it illegal to sell things that people have not got—for that is the basis of "corners."

Q. You believe the commodity which a man sells should be in his possession or control?—A. He should have it under control, at least, and not be allowed to sell it until he has got it under his control.

Q. Is there any other matter that you would like to suggest to the committee? We would be glad to get the views of hard-headed practical men.

THE TRADE DOLLAR.

A. I would say as to the currency that, in my opinion, a wrong has been done to the workingmen and traders by this so-called trade dollar that has lately been taken out of circulation so abruptly, after having circulated for a number of years. I have had an opportunity to investigate the question of the trade dollar and, in my opinion, it has not been treated aright by legislation nor by the executive department of the country; nor has it its true standard now. The trade dollar was made ostensibly to find a circulating medium for our East India trade. This dollar was devised to be of 420 grains of silver, which was then fully worth par and over in gold. It was at that time made a legal tender to the amount of $5, being silver, but in 1876 the legal tender quality of it was taken away very abruptly by a simple resolution, saying that the trade dollar should not be any longer a legal tender; but that resolution still left the trade dollar in circulation, and, in my opinion, these trade dollars should have been called in at that time, and that could have been done without a loss to anybody. It cannot possibly be just or right to declare them out of existence, to deprive them of the quality of legal tender, which they had before. They have been left in circulation ever since, and have been bought and sold, if you please; but the people got used to them and looked upon them, after all, as real money, and they were treated as a full dollar until very abruptly, through a combination here some months ago, workmen who had been paid off in this money, and had laid it up, were told at once that people would not take trade dollars from them, they being only worth 85 cents apiece, and that the Government would pay no more for them. That caused great dissatisfaction among the workmen. The workingmen had already been taught to distrust savings banks and to distrust bonds, and to distrust the investment of their money in mortgages; and now they were called upon to lose 15 per cent. of what they had accepted as money of the United States. In my opinion, this was a wrong against traders.

IT SHOULD BE REDEEMED.

Q. What do you think should be done to remedy that wrong?—A. They should be redeemed. They are worth more than the standard dollar. A time should be fixed for them to be called in, and they should be redeemed.

Q. If that could be done do you think it would redound to the advantage of the working people?—A. It would.

Q. Do you not think these trade dollars have got largely into the hands of speculators?—A. They have been sacrificed to some extent for their immediate wants, but there are many who cannot yet make up their minds to think that the redemption of the trade dollar should be denied to them—that they should be called upon to sacrifice 15 per cent. of their honest earnings. Their reasons for expecting to have this

Digitized by Google

remedy are well founded. The similarity of this dollar to the United States dollar was such that to a man of ordinary education it is hard to understand just why it should not be redeemed. It bears all the insignia of the United States Government, the same as other money, only it is called a trade dollar—for what? Money is used in trade to be sure; and if the object was to use this dollar for the East India trade exclusively, those merchants should be accommodated, but it should be rightly named. In England the people call their East India dollar the "Canton dollar." They do not call it the Canton pound or the China pound. They call it the Canton dollar, and it has the words "East India" upon its face. Our tradesmen here were misled by the long practice of accepting these trade dollars. They thought that that money was good until it was called in. With regard to the remedy for this difficulty, the workingmen look to two things. First, they look to Congress to remedy the wrong, if it was a wrong to coin it; and, second, if it was not wrong to coin it, then they look to the court to contest the thing on constitutional grounds, because Congress should not assume the power simply by resolution or law to declare that that which was by a former act declared a legal tender should now not be a legal tender any more. To be sure it was only legal tender to the extent of $5, but to that extent it was legal tender. The act of 1874 says absolutely that the following silver coins shall hereafter be the coins of the United States: The trade dollar of 420 grains, up to $5; the standard dollar of 412 grains, and quarter dollars, half dollars, and ten-cent pieces, &c. In 1876 a resolution says that the trade dollar shall not hereafter be a legal tender. It takes it off without any ceremony. Surely this cannot be legal; it cannot be constitutional. If Congress may shape things in that way by a simple declaration, what would prevent Congress from simply declaring to-morrow that the standard dollar, or the greenback, if you choose, shall not any longer be a legal tender.

Q. Suppose that the legal tender quality should be considered divested only with reference to contracts entered into after the date of depriving the coin of its legal tender—that is to say, that it should be continued as a legal tender upon all debts and the obligations that arose when it was a legal tender, and that it should be considered not a legal tender with reference to all debts and obligations that arose after the statute was enacted depriving it of the legal-tender quality. Would there be any injustice then?—A. I think there would; yes. It would be an injustice. It would make our whole currency too much dependent on the opinion of Congress. It is against public policy.

Q. You think it should be called in and redeemed?—A. Anything excepting the true measure of values, which is gold, should be called in if not any longer wanted, and should be redeemed in that measure of values, in gold. Otherwise it is partial restitution.

The CHAIRMAN. I think your views appear to be very just. It is impossible to get notice to the world of a law of Congress; and the best way would have been to call in the trade dollar.

The WITNESS. That is what I think. It is against public policy, and is prejudicial to the interests and credit of the country; and anything that tends to depreciate the currency is a dangerous precedent and against public policy. I am for a pure unmixed measure of value, and the only thing that is accepted to be that is gold—nothing else. The time will come when the standard dollar will cause a larger inconvenience even than the trade dollar, which was only of limited circulation. The standard dollar will be the dollar that will cause most trouble to the United States in the future.

NEW YORK, *September* 25, 1883.

GIDEON J. TUCKER sworn and examined:

By Mr. PUGH:

Question. Please state your residence.—Answer. My address is the Press Club of the city of New York, 119 Nassau street.

Q. How long have you resided here?—A. I was born here.

Q. You have seen the resolution under which this committee is acting?—A. I have read it, sir.

Q. Within the scope of our inquiry, as authorized by that resolution, you may now give to the committee such information and opinions as you may have touching the subjects of inquiry, stating the opportunities that you have had which give value to your opinions and information upon these subjects.

### THE PATROON LAND PATENTS.

A. Having been connected in one way or another with the newspaper press since the age of eighteen, I claim to have been a workingman all my life, though I never worked with any tool except a pen. When I began reporting was in its infancy and stenography was only beginning to be used in this country. In the year 1845 there was much discussion in our newspapers on political subjects. The existence of the great patroon land patents in this State had become felt as an unendurable grievance by the tenantry and by those who sympathized with them. In those days conductors of journals were more willing than now to furnish room to aspiring contributors, and I found newspaper room in which to assail the land monopoly of the Van Rensselaers and Livingstons. You may remember that essays upon public matters were quite a feature in old newspapers, with their classical signatures of "Gracchus," "Agricola," &c.

### THE OLD COURT OF CHANCERY IN NEW YORK.

Another grievance of those days was the expense, delay, and arbitrary character of our court of chancery. Our young students and newspaper writers exhausted their wrath on that tribunal. We wrote "*delenda est*," which is, I suppose, in modern English, it "must go!" And we saw both patroonery and chancery go.

### STATE PRISON LABOR.

Then there was State prison labor. It has always been before the public in this State. Those mechanics and skilled workmen who have suffered by State prison rivalry have been endeavoring to rid themselves of it since the beginning of the century. Sixty years ago the Sing Sing prison was located, that the convicts might be employed in quarrying the marble found there, and forty years ago the Dannemora prison was erected in order to work the convicts in mining and preparing iron ore. I remember trades union meetings and processions in this city when I was a boy. In 1826 the property qualification for voters was abolished in this State, and from that time to this the working people (who are numerous enough to command everything in this country if they could act together) have been vainly trying to prevent the prisons from being controlled against their interests.

Digitized by Google

### ABOLITION OF FEUDAL TENURES IN NEW YORK STATE.

In 1846 a State constitutional convention met, which revolutionized the entire government of this State. I helped report its proceedings for an Albany newspaper, and knew and listened to the remarkably able body of men who took part in its deliberations. Its formation of a constitution, and the acceptance of its work by a popular majority of 136,000, was a great triumph for the radical youngsters. It overthrew patroonery, abolished all feudal tenures, and forbade the leasing of agricultural lands for longer terms than twelve years.

### LAND REFORM.

Our fathers had already made a movement, as early as 1813, in the direction of land reform, by prohibiting the suspending of the alienation of land for terms beyond two lives in being at the creation of the estate. This was to prevent the erection and maintenance of large landed properties by will or deed.

We had also copied the interest limitation or "usury law" from England. The prevision of our ancestors did not, however, foresee that the results of their incorporation policy would be the aggregation of personal property that would soon outgrow and exceed any that might be feared of real estate; and that there might be demands, before the end of the century, for the limitation of rent, dividends, and income generally, as well as of more interest.

### FREEDOM OF THE PRESS.

The new constitution of 1846 freed the press, by providing that the truth might be given in evidence in criminal proceedings for libel, and making juries the judges of the law in such prosecutions.

### OFFICERS MADE ELECTIVE.

It made all the heads of State departments elective. It utterly overthrew the appointive system and life tenure of the judiciary, and fixed the term for the highest judicial office at eight years. I am sorry to say that this has since been extended to fourteen years, which I look upon as a great public calamity, for every long official term, in any class of office, but especially in the judiciary, is an inducement to nepotism, favoritism, arbitrariness, and indolence. Indeed, we have had great difficulty to keep the elective system at all. The lawyers' "Bar Association," of this city, endeavored in 1873 to get the appointive system restored, but were happily defeated by a popular majority of 200,000.

### THE CONSTITUTION OF 1846, NEW YORK STATE.

Taken all in all, the constitution of 1846 was a great landmark in the history of the struggle between popular interests and public abuses. But the issues of to-day had not then arisen. We had not yet to deal with questions which have come with density of population and increase of wealth, namely, the social degradation of the producing classes, and the monopoly of corporations, and their remedy.

Digitized by Google

### MARRIED WOMAN'S PROPERTY ACT.

The next progressive movement of great import was the married woman's property law of 1849–'50, which was vehemently opposed at the time, as likely to overturn all the foundations of religion and society, and to abolish the most sacred features of the marriage compact. On the contrary, it has produced social amelioration, and has saved thousands of homesteads to families and children, beside leading the way to a reform which is inevitable in the future—woman suffrage.

### THE EIGHT-HOUR LAW.

In further explanation of what I have done and seen done, I may say I voted in the legislature for the eight-hour law, which was the first serious endeavor made by the workingmen themselves in their interest. I have advocated the proposition that the wage of the employés is not, as is so frequently asserted, a matter exclusively the concern of himself and of his employer or that it is to be solely left to be regulated by the law of demand and supply. On the contrary, I submit that the means of livelihood, the comfort, domestic conveniences, education, and social status of the workingman is a matter which interests and concerns every individual in the community, and none more than the class of non-producers themselves.

### LEGISLATION SHOULD PROTECT THE WORKINGMAN. WHY?

There is, and, so long as the competitive wage system endures, must always be, an irrepressible conflict between capital and labor. And as the rich man is always able, inside the law or outside the law, to protect and care for himself, I believe the weight and influence of legislation and administration should be exercised for the protection of the weaker party to the social compact, namely, the working producer.

Mankind has passed through the period of religious struggles; these are, at least, for the time being, stilled and at rest. We have settled, for the most part, all purely political questions; that is to say, "divine right" is dead and birth-right monarchies and aristocracies are on the road to extinction, and their downfall and disappearance are only a question of time. Parliamentary government by the people is to be the government of the future.

### THE QUESTIONS FOR CONSIDERATION.

If, then, religious and political questions are in abeyance, social and humanitarian questions—or questions having such bearings—only remain for public consideration. That is the class of questions which you are meeting on this inquiry. They are the outgrowth of this conflict between capital and labor. You cannot evade them in this generation; they will not be belittled; they will not "down." If the abuses and tyrannies of capital intrench themselves behind laws, those laws will be repealed; if they are incorporated in constitutions, those instruments will be amended.

### EDUCATION THE KEY TO THE PROBLEMS OF LABOR.

We must try to calculate, as well as, in the absence of all data and precedents, we can calculate, the effect of educating so many millions

Digitized by Google

of young citizens, every year, in our common schools, and enlightening them through the press. These coming men and women, educated and enlightened as they will be, and eminently practical as they can scarcely fail to be, will be willing to labor, but they are not proposing to live, like the present generation of their class, in hovels, or tenement garrets and cellars, or to starve as tramps on the highways. They will have intelligence enough to find out methods by which the blessings of government, "like the gentle dews from Heaven," shall descend "alike on the rich and the poor." Their first education in the common schools will lead to their effective combination in trades unions, those most valuable institutions, which are destined to reproduce and replace the prosperous guilds of producers who made the Dutch Low Countries so happy and rich, when all else in Christendom suffered under royal and aristocratic disorder, rapine, and misery.

The reasons for the slow progress of the working classes in this country towards accomplishing what they need have been their jealousies and disagreements among themselves (in some cases, perhaps, fostered by their employers), and their very natural suspicion and distrust of the aid and advice of educated men. But in the future they will be educated themselves.

### THE INCOME TAX.

III Income taxation is the most fair and equitable of all methods of taxation, just as capitation is the most unjust and inequitable. The man whose income is $1,000 a day costs the community which secures to him its possession and enjoyment ten thousand times as much as the man who earns $1 a day costs it, without reference to the terrible moral examples the millionaire and his family set to their fellow-citizens. The present system of taxation, both in the State and nation, are unworthy of a free and intelligent people. The test by which a protective tariff should be tried should be, Does it increase the wages of workingmen? I cannot see the benefit to the mass of any tariff which only increases the gains of the employer. All our United States internal tax system ought to be swept away. Income taxation should be substituted by degrees for all others in the shape of a graduated system, increasing in rate with increased incomes. Our State taxation should be levied in like manner; in fact, State officials ought to levy and collect all taxes, although, of course, Federal supervision might be had as to the share coming to the Federal Government.

### THE GOVERNMENT SHOULD OWN TELEGRAPH LINES AND INTERSTATE TRANSPORTATION SYSTEMS.

IV. The United States Government should own and work telegraph wires for public use as an adjunct of the postal system. It should own and run interstate transportation systems. I began life as a State-rights Democrat, fearing governmental interference and centralization, and especially the Federal Government. But this is as different a world from that into which I was born as though it were another planet. There is now no way to protect the people from the monopolies of almost demoniac power which they have created but by and through the action of Government. If you say this is unconstitutional which is demanded by our supreme necessities, the reply is that constitutions can be amended, and that they must be made to conform from time to time to new popular wants.

Digitized by Google

POSTAL SAVINGS BANKS.

V. The frauds in the management of savings banks in this and other cities have been remarkable principally for that so few of the thieves who stole the money of the people have been punished. The United States should protect the people by establishing postal savings banks, that the money of the poor may be as secure as is the money of the rich invested in Government bonds.

RAILROAD LAND GRANTS—HOW TO TREAT THEM.

VI. The transfer of every acre of public land which has, by any act of Congress or any construction of courts or departments, been filched from the actual settlers and given to railroad corporations and others, must be scrutinized. Future grants may perhaps be prevented by an aroused public opinion, but I fear there is little left to lose that is worth saving. New States will have to break up these railroad land grabs within their limits as New York broke up the patroon manors. They may tax the railroads out of possession; they may put land limitations into their constitutions; they will find a way to deal with the evil.

GOVERNMENT MONEY.

VII. All coin or paper composing a circulating medium, passing as money, should be furnished by the General Government. If banks be needed for deposit and discount, so be it; but they are not needed for making money or promises to pay money.

NATIONAL AND STATE LABOR BUREAUS.

VIII. I have seen no adequate argument against the erection by Government of a labor bureau, wherefrom statistics concerning the occupations, incomes, and welfare of what constitutes the great mass of the people can be obtained, and a supervision of the interests of the employés maintained. There should be National as well as State bureaus.

MONGOLIAN IMMIGRATION.

IX. I cannot close my evidence without an allusion to the evils of Mongolian immigration. The presence of these unassimilating hordes of Asiatics in our midst is a standing menace to every interest of society. Their presence is only desired by those who would minimize the earnings of labor and degrade the laborer. The immigration of tens of thousands of strange men without families, without comprehension of free government, without identification with our population, without capacity for American citizenship, without care for our political, social, or religious institutions, without any object in crowding to our shores but to earn money by underworking our white and black citizens enough to return to their own country—such an immigration can be conducive to naught but injury; and, since past legislation has proved insufficient to arrest their coming, more stringent precautions should be adopted on the part of Congress.

INDIFFERENCE TO SUFFRAGE.

X. Finally, I wish to remark that the greatest danger to the free government of this country and the political and material interests of the

Digitized by Google

masses of our people is the indifference of such large numbers to publi affairs. Partly this is owing to the influx of those who are strangers t free institutions, but in a greater degree it is owing to the selfishnes the engrossment in business, and the political ignorance of men wh were born and grew up here. Attempts to limit universal suffrage hav been made in this State, fortunately, as yet, without success. Under th control of Congressional legislation are those great Western Territories to which by an inexcusable anomaly, and in contrast with the States ad joining them, you deny the right of self-government, and which you gov ern, like satrapies or pro-consulships, from the Capitol at Washingto Self-government has been abolished in the District of Columbia. Nowher where the Federal Government has exclusive jurisdiction do democrati institutions exist. It is of course the fact that one of the Federal legis lative bodies—the one to which the members of this committee belong does not come, except by a very circuitous and indirect route, from th people. The United States Senate is as little responsible to the peopl as the British House of Lords. The public demand to which the Senat acceded, for instance, on the silver-dollar question and the Chinese ques tion, the British Lords would equally have acceded to.

With universal suffrage, popular education, and a free press, the caus of the mass of the people may and will sustain itself in the irrepressibl conflict. But every attempted infringement of these must be watche and resisted by those who believe that Government should seek to a complish the greatest good for the greatest number.

Q. Do you think you have gone over all the subjects that the commi tee is authorized to inquire into under the resolution of the Senate?—A I have not, sir; it would take a much longer examination to exhaust a the subjects.

### STRIKES—THEIR SUCCESS DEPENDANT ON FUNDS.

Q. Have you given any thought to strikes, their causes and rem dies, to the means which might prevent their recurrence?—A. The o igin of a strike is generally the supposed inefficiency of the pay whic the workmen receive for their labor. I favor action by trades union on behalf of the interests of wage workers, and consider it to be the onl means now practicable by which they can obtain a living compensa tion.

Q. How is it that so many strikes fail to secure an increase of com pensation?—A. Every reformation is preceded by many failures. They fail because they do not provide themselves in advance with sufficien means to fight the power of capital; because dissensions are sown i their ranks and jealousies pervade all action of workingmen and brin them into conflict with each other, so that finally they are starved out

Q. How are they to make this preparation to endure a trial with cap ital?—A. Some organizations, like the typographical unions, have bee able to do so by weekly and other contributions from their wages mad to a general fund.

### THE LABORER MUST HELP HIMSELF.

Q. It is your opinion, then, that the share which the laborer gets o the joint product of labor and capital is not just and equitable, is it What is your opinion as to the equitable distribution of that joint prod uct; does the laborer get the part to which he is justly entitled, as a general rule?—A. As a general rule, I think he does not.

Digitized by Google

. Is there any legislation by States, or by the Federal Government, ; would increase the power of the laborer to compel a more equitable ribution?—A. Yes; in some States there are still conspiracy laws ch forbid combinations among laborers for the purpose of raising r wages. There is no such law under the General Government that n aware of; and it would only be operative in those portions of the ted States, as in the Territories, where the General Government has lusive jurisdiction. However, all legislation favoring the existence influence of trades unions would have that beneficial effect. The orer must help himself. He must take the means which he has be- him to raise and improve his condition.

. How is the laborer to learn the proper use to make of his power—power of combination?—A. Only by publicity, by discussion, by onstration. By such agencies as the action of this committee intelli- t workingmen will learn.

## THE SCHOOL TEACHES THE GOSPEL OF DISCONTENT.

. It seems to be almost the universal opinion that the education of laboring masses is indispensable.—A. It is indispensable. We are mplishing it with wonderful rapidity and completeness, but as the kingman becomes educated he becomes discontented. The school hes him the gospel of discontent.

. That discontent grows out of his increased intelligence to see that s not getting a fair share of the products of his labor?—A. I believe

. The public opinion that these laborers can aid in producing re- n—is not that to be the main agent to work out the reforms that seem e demanded to improve his condition? Is there not more necessity voke the power of public opinion to rectify these evils than is to be ed for from the Government?—A. Government in any free country ld be nearly the reflex of public opinion. How far Government interfere is a question for you gentlemen to consider. I have only sted that in all these questions of capital and labor the Government ld interfere on the right side—on the helpless side.

## THE INCOME TAX.

. Do you think that public opinion, even, would have the power to edy the greed and selfishness of capitalists?—A. I would rely much e upon an income tax than upon public opinion to remedy the evils apital. Public opinion is coming to demand the income tax.

. Have you thought anything about the details of a tax upon in- e, how a law of that sort is to be enforced, and what would be the luation of it?—A. I have seen the working of one income tax which not, I admit, eminently satisfactory. Doubtless any future legisla- would profit by the mistakes which were found in levying that tax. to the details of the graduation I have not thought them out. That ld require longer consideration than could be given to it by a prep- ion for such an examination as this.

. Do you think that the burdens of taxation should rest upon in- es?—A. As the best test of wealth, yes.

. Then you tax the economy and energy employed in the accumula- of wealth with the expense of Government?—A. Say, rather, that propose to tax wealth—luxury—for the expense which it causes the mmunity and the injury it does to its morals.

Digitized by Google

Q. When you impose this burden upon income—I am not controverting the correctness of your opinion, but we are simply seeking information—when you tax the incomes of the country with the burden of taxation, how will that relieve the laborer of the power of these men who have the incomes to visit this increase upon the labor they employ? For instance, if you tax the real estate owners upon their income from real estate they would immediately add the amount of the tax to the amount of the rent which their tenants must pay. If you tax the merchant upon his income he will visit that tax upon the consumer of his goods by the increased prices of what he sells to the consumer; and how is it in the power of a Government, levying that tax for income, to avoid the power of the owners of the income to collect it again out of the labor they employ? Is it possible to avoid what has been universally the case, that taxation at last falls upon the producer—the laborer—the employers of labor still imposing the burden of taxation (which is put upon their incomes) upon the labor they employ. They will reduce the price of labor, or they will increase the price of what the laborer is bound to have, such as land and houses. How can you avoid, for example, Mr. Astor's power to visit upon his tenants any tax which you may put upon his income; or how can you prohibit the owner of capital, in lending the use of his money, from visiting the tax which he is to pay upon the borrower?—A. I admit all the difficulties in the case, but our proposition is, first, to relieve by making the tax more direct, which is now indirect; by taking off at least from persons of small incomes any direct tax. That the merchant will charge the tax on his goods against his consumer, and that the landlord will add it to his rents, is the case now. It can be made no worse by the more equitable system of taxation proposed. That it can be entirely prevented I confess I do not know in the present condition of society.

Q. Your object, as I understand it, in imposing your tax upon incomes is to increase the share that the producer gets of the joint product; if it does not accomplish that, where is there any improvement by means of that remedy?

### EVASION OF TAXES BY THE WEALTHY.

A. I believe that the great mass of capitalists and corporations do not pay anything like their fair proportion of taxation, and that by these means an additional proportion can be extracted from them. For instance, I could name, you could name, twenty capitalists in New York (men of large wealth) who now evade personal taxation almost entirely by making their legal residences outside the city, and by connivances with the supervisors or other persons charged with the duty of taxing them. They are taxed upon $20,000, or $30,000, of personal property when they should be taxed upon ten times as much. That is a great grievance. Corporations in this State, at least until recently, have escaped taxation with wonderful facility by being taxed only at the place of business on their stock or capital. In all these things I see an inequality or injustice which I think a stringent and equitable income-tax law would correct.

### WHO OPPOSE INCOME TAX.

By the CHAIRMAN:

Q. From what class is the opposition made to the proposition of an income tax to replace largely other forms of taxation? Who oppose it in the community?—A. I am not aware that there is any active opposition to it; but, with the exception of that one trial made during the war

Digitized by Google

by the United States Government, it is a novelty in this country, although perfectly familiar in Great Britain, and there a permanent tax, I believe.

Q. You think that if the proposition were made to impose in the State and in the nation, so far as it is necessary to raise funds for the nation, a tax upon incomes as a substitution for present methods of taxation, there would be no opposition to it?—A. No, I cannot say that.

Q. If it were made an active issue, what classes would oppose it—if you anticipate opposition; do you think the common people would oppose it?—A. No, I do not think they would.

Q. Why not?—A. Because no proposition that I have ever seen or heard for an income tax includes so small an income as that of the working people.

Q. It would come then from the rich classes and corporations?—A. I suppose so. I think incomes of $2,000 were exempt under the former income tax.

Q. Why should they oppose it, if as a practical result they could recollect it?—A. Perhaps they are not quite so sure that they could recollect it.

The CHAIRMAN. The last income tax, as I recollect it, was universally opposed or criticised by the wealthier classes; and I always supposed that it really did get something out of their incomes which they were not able to recollect.

The WITNESS. It was specially opposed, if I recollect rightly, by the non-producing classes, the men who lived altogether upon the income of their money.

Q. And those who had fixed incomes?—A. Yes. I myself paid an income tax as a judicial officer of the State of New York, though it was afterwards refunded to me from Washington.

By Mr. CALL:

Q. Why did they refund it to you?—A. There was a decision of one of our courts to the effect that the salary paid out of the county or State treasury was not taxable under that law.

Q. But it was taxable under the philosophy of your theory?—A. Well, that is true.

Q. I suppose, however, that you took all that the law allowed?—A. I took all that the law gave me.

By the CHAIRMAN:

Q. I suppose there was great inequality between the returns of incomes and the actual incomes of those who made returns?—A. Yes. The objection was publicly made, especially in newspapers, that it was a tax of an inquisitorial nature that went into the details of a man's business, as, for instance, is shown in the prosecution against Mr. Tilden. His books were required to be produced to ascertain the amount of his business. He was prosecuted after the Government had accepted his own statement of his income.

Q. Is there any other matter that you would like to suggest to the committee?—A. I believe I have not anything else to say. I rather carefully shortened what I had to say. I do not know that I have anything further to say.

Mr. PUGH. We have a general concurrence of opinion as to the evils. We can all see them, and they are felt and known; but the great trouble is, what is the remedy? That inquiry always confronts us, and there are just as many opinions as to what the remedy is as there are persons who relate the difficulties.

Digitized by Google

PROPORTION OF JOINT PRODUCT OF LABOR AND CAPITAL GOING TO EACH.

By Mr. CALL:

Q. Have you any data as to the amount of the production of the United States in agriculture and manufactures that goes to the laboring people of the country?—A. No, sir; I have not. I confess I have not given so much study to these socialistic questions as I might have done, but I have been rather inclined to view the social evils as things which might be remedied by the progress of thought and time.

Q. Some persons estimate that a very large proportion of it goes to the account of labor, and that but a very small part goes to capital, or to the profits, or directing power which is involved in "capital," as you called it, and that the inequalities of compensation that laborers get arise from economies existing among themselves. For instance, take a factory. How would you estimate the proportion that labor would get? A man puts up a house, whether by having money of his own or having the confidence of friends—you can call them capitalists, moneyed men, contractors, or whatever name you please—he builds the house by reason of his enterprise and good management. Then he gets machinery on credit, or for money, as the case may be, by which he may start it to work as a factory. Now, how much of the proceeds of that business shall go to labor? First you have to pay the laborer for putting up the house, and you have to pay labor for the materials of the house, and for the cost of machinery and the cost of the labor that is in the machinery from beginning to end, the cost of the direction and management of the contractor who makes his profit, and the laborers who get their wages from it. We want to form an estimate as to the relative proportions to go to labor in such a case, and to go to "capital," as you call it. How are we to arrive at any direct conclusion in that respect?—A. I am afraid that I am not able to assist the committee in respect to the details of shares of profit; but it seems to me that it cannot be possible that labor receives the greater share of profit under present arrangements.

Q. Of course you are not speaking of the wages of the laborers employed as operatives in the factories, but labor from the beginning—labor of every kind, whether of the head or of the hand?—A. Yes; it seems to me impossible that labor gets the larger share of profits; but, as I have not given it any attention, I cannot speak positively as to it.

---

NEW YORK, *September* 25, 1883.

Mrs. CELIA B. WHITEHEAD examined.

By the CHAIRMAN:

Question. State, if you please, what is, or has been, your connection with the charitable work of this city, and your opportunities to learn of the condition of the working women.—Answer. I had not supposed that your investigation was confined at all to this city. I do not live in the city.

The CHAIRMAN. It is not confined to this city. I was under a misapprehension as to your residence. You may go on and state to the committee such facts and suggestions as you see fit, upon the subject-matter of the resolution under which it is acting.

The WITNESS. Perhaps I am also ignorant of that. I saw that labor

Digitized by Google

and education were under consideration, and I thought that they covered so wide a field that it was impossible to get outside of it.

The CHAIRMAN. You may proceed in your own way. I know that several ladies have wished that you should be heard by the committee.

## "LABOR AND EDUCATION" INCLUDE EVERYTHING.

The WITNESS. The term labor and education cover so wide a field that if it were properly considered there would be nothing left to take into account. If all our people were properly educated, all would work at something; so the question of labor would embrace everybody. If everything requiring labor and education were going on well this committee would not need to be here, and I should not need to be here, and I should not need to urge upon this committee the justice and the fairness of woman's rights. But because, as the existence of this committee shows, things are not going on well, it behooves every one interested in labor and education to do all in his or her power to find out why they are not, and, so far as possible, to remove the causes of the evil. One of the members of the committee said this morning that we had plenty of exhibitions of trouble, but that it was hard work to find the remedy. It seems to me that the first step to be taken is to find the cause. If we can find that probably the remedy may suggest itself.

I suppose that the great mass of testimony given here shows that our people are sick and ignorant, and poor, and in debt, and many of them drunken and immoral. If, as a people, we are in such a condition, does it not become us as a Government to ascertain the reason why, and to attempt to apply the remedy? For if our theory is correct, *we* are the Government and you are our servants. Of course I do not wish to put it in any offensive sense, but I believe that that was the understanding and it seems to me perfectly in order that you should come to the people for your instructions. I remember that so much of a man as Saint Paul was taken by Priscilla and Aquila and instructed, and possibly a woman may make some suggestions that will be helpful to this committee.

## TWO GOVERNMENTAL DEPARTMENTS FOR KILLING PEOPLE; NONE FOR KEEPING THEM WELL.

We want to inquire if everything is being done at our headquarters towards removing sickness. We have two Departments for killing people—our Army and our Navy—but we have not any department for keeping them well, and it does not seem to me that that is just the right way to organize a government. Perhaps it was necessary at the organization of our Government, but it does not seem to me that that is the way to carry it on. Our children are dying at the rate of one-half that are born under six years of age. Now, it seems to me a great deal more important that some steps should be taken towards raising those children than it is that we should keep up an army and a navy. I suppose you have had a great many figures given to you with regard to workingmen's wages, so that it is probably not necessary for me to present anything on that head. I have some figures with me showing the proportion that is received by the manufacturers, and the proportion received by labor, after deducting a large per cent. for the repairs of machinery and the maintenance of buildings.

The CHAIRMAN. That is exactly the information that we desire.

Digitized by Google

The WITNESS. Well, they came from the census of 1880, and I suppose you have the census tables.

The CHAIRMAN. If you have simply the census tables, you need not give them. We have access to those ourselves; but if you have some condensed statements from those tables, you might give them.

The WITNESS. Very well.

### WAGES AND LABOR IN THE UNITED STATES.

The number of hands employed in manufactories in the United States, according to the census of 1880, including men, women, and children, was 2,738,94[illegible]; total wages paid, $947,919,674; or an average of $324.47 for each person employed. The material employed cost $3,394.340,029, and the value of the manufactured product was $5,369,667,706—a difference of $1,975,327,677. The capital employed was $2,790,223,500. Allowing 10 per cent. of this for pay for manufacturers' time and labor, and for keeping buildings and machinery in repair, and then deducting this amount and the wages paid to labor, and the value of the material used, from the value of the manufactured product, we still have remaining a net profit of $748,38[illegible],653. Dividing this by the number of hands employed, we find that each produces, on an average, $273 more than he or she received, and this is a clear profit over all expenses. At this rate it takes only a few slaves to support a master. You see that the average wages paid the workingmen and those employed was $324, and that the surplus left, after deducting all necessary expenses, is $[illegible]73. You can see, therefore, that the profit is nearly as much as each man and woman and child receives.

By the CHAIRMAN:

Q. In your calculation do you make allowance for interest upon capital?—A. No, sir.

Q. Nor whether it is a fixed capital or capital invested in raw material?—A. I do not know what capital is. I know what labor is, we can see the effects of it all around us; but capital, I do not know what it is. It seems to me it is a term not well defined as yet.

### INTEREST ON MONEY ONE OF THE CAUSES OF LABOR TROUBLES.

And speaking of causes, it seems to me that interest is at the foundation of all this trouble. I heard testimony here the other day regarding postal savings banks. Now, it seems to me that postal loan and savings banks would obviate a great deal of the trouble that we find. There is a surplus in the cities; in our borders there is lack of people. I spent three winters in Florida, and I know a man there who just by the power of interest is oppressing laborers so that it makes it almost impossible for them to settle there. He sells his land; he persuades them that they can buy land, and that he will make the terms easy. The legal rate in Florida is 8 per cent., although 10 per cent. is more common. One gentleman said to my husband (who did not pay for some orange trees within three or four days of the time the bill was due) that if he had had that money in time he might have laid it out at 20 per cent. To go there and pay 10 per cent. interest on the price of land, and then have nothing to start with, as a laboring man from the North can have nothing to start with (for if he gets enough to take him there he does well), you can see that to pay that 10 per cent. and buy his provisions while carrying on his work results in just what this Shylock ex-

Digitized by Google

pects. The land has to be given back. I have known of repeated instances in which that was done. The people with whom I boarded were in this man's clutches, and expected to lose their home. He is gathering for himself wealth from all hands, which it would be impossible to do in any other way. He takes the labor of others and lives upon it. If men could go there and have money loaned to them with no more expense than just what is necessary to carry on the business, through postal savings banks, that would do more to develop the resources of the country than all our boasted railroads have done.

We hear much said about laws that we want made. I think that our salvation lies in the direction of the repeal of laws. We have too many laws.

THE TARIFF.

Look at the tariff, for instance. I was in a manufacturing city not long ago, and found that an establishment there had discharged a large number of hands. While riding along the street a number of people were pointed out to me who were said to be Welshmen, and I was told that the manufacturers often brought them over to America because they were good workers in that department of manufacture. I said, "Is there any tariff on Welshmen?" and I was answered, "No." I said, "Is there a tariff on the article that is manufactured in this establishment?" "Oh, yes." My friend saw the point at once and said, "But we can afford to pay our hands much better prices by having the protective tariff on the article produced." He said they could "afford" to do so; he did not say they *did* so. I saw the gentleman's wife a few months later, and asked her if she knew what had become of all those people who had been discharged; and she said no, nor the hundreds that had been discharged since that time. That is the way we "protect" our workingmen.

Q. Do you mean to be understood that hands already employed had been turned off to make way for these imported people?—A. No; I do not mean that. They had a large order, and labor is lying around loose; it is packed in the cities; there is no way for it to get to the outskirts of civilization, and no provision made for it when it gets there. So the manufacturers are at perfect liberty to discharge men to-day because they have not many orders, and are at perfect liberty, when a good order does come in, to send across the water and bring over people from there. I am not sure that I am right in the nationality of these men; but that makes no difference, because the principle is the same. I did not think that people would do such a thing. And yet this establishment I refer to is considered a benevolent institution. I do not believe, myself, in these benevolent institutions. I think justice, not charity, tends to create self-respect. But they have libraries there for their hands, and they try to encourage them to save what little they have to save, and try to interest themselves in them; but it is impossible in a large establishment, and these men are left entirely to shift for themselves. It seems to me that, in the matter of personal comfort, our chattel slavery before the war was an improvement on the present system; because then they were taken care of; they were spared at least the anxiety of wondering what was to become of them to-morrow.

PANICS.

A gentleman who testified here the other day spoke of panics as if they were inevitable. I do not propose to discuss that question, but

Digitized by Google

there are those, I think, if you have not already had any information on that point, who could give you some. But I do not think that hard times, either acute as in a panic, or chronic as they are with our working classes, ought to exist under our form of government.

### WAGES UNJUSTLY HELD BACK.

The wages of the working people are in many cases kept back from them unjustly. I worked for a number of years in a New England factory, and I know something of the way they do things. I remember that when I had been working at buttons for $5 a week I found that by working on silver-plated ware I could do better. But I could not save much on $5 a week. If you go to work there at any time in the month except the first, you get no pay for about six weeks. They held back two weeks' pay always. I worked for $4 a week and paid $4 a week for board, and extra for washing. That is not a very hopeful condition of things, but I happened to be able to borrow money of somebody who did not ask interest. The way the manufacturers do is, if the working pleople insist on having their pay regularly or weekly, they deduct a large discount, and they get quite an income in that way.

By Mr. PUGH:

Q. Do you mean that they discount the wages of their employés?—A. Yes, sir. The old Jewish system did not allow the employer to keep the wages over-night. I think if they had undertaken to keep it six weeks there would have been serious trouble.

### THE PATENT LAWS.

I want to say a word as to our patent laws. A manufacturing firm that I know are so strong as to have a monopoly of the article they manufacture, and they have paid lawyers thousands of dollars in trying to keep another establishment from manufacturing the same article as themselves. It seems to me that there might be some different arrangement than that in regard to patents.

In regard to the public health, we have no sanitary department at Washington.

### AN INDUSTRIAL NATION: WITHOUT A DEPARTMENT OF INDUSTRY.

Neither have we any industrial department at Washington, at least I do not think we have, though I cannot say that I am thoroughly informed on the subject. Certainly we have no representative in the Cabinet in that department, yet we are an industrial nation, if any ever was. We are not a fighting nation, and it hardly seems the thing to have war represented by two departments in the Cabinet and industry not represented at all.

In the last fifteen years there may have been some law passed at Washington that had a tendency to benefit the working people. I do not profess to be well versed in the law, but I have not heard of any such, and do not think that any such law has been passed.

### HOMESTEAD EXEMPTION.

If all homes were exempt from taxation the gentleman (Mr. Bischoff) who was giving testimony this morning would find it much easier, I

Digitized by Google

think, to encourage working people to get homes. I was in Meriden, Conn., at the time of the panic of 1873, and intimately associated with the working people there. I do not speak particularly for women now; but I know that in a panic the women are the ones who suffer most. I know that hundreds of people then lost their homes. They had bought these homes, and had mortgaged them, and undertook to pay the interest. They were getting good wages, and when the wages were cut down they could not pay their interest. Where they could before have paid their interest with a few days' work—say six—the way they were cut down it took twelve days' wages, and sometimes a good deal more, to pay the interest. The consequence was that they lost their homes and that was owing to interest.

### FRACTIONAL CURRENCY.

The absence of fractional currency does not, of course, bear very heavily as a money loss; it is more an annoyance than anything else to be deprived of it. But there are some industries that have been very visibly affected by that. A publisher told me that the book trade had never revived since 1873, and that it never would until we again had a fractional currency; that that was one of the greatest helps in the book trade of anything that they could have.

### EDUCATION.

Coming to the subject of education, I have had some opportunity to know something about that, having a child at school. The first thing that attracted my attention was that he had to pass by six liquor saloons to get to one school-house. One of those saloons has been burned down since then; but I noticed yesterday in the storm that while I could have sent him only a little distance for a glass of beer, he had to go quite a way to school and had to sit all day in wet clothing because the school-house was so far off.

### THE WOMAN QUESTION.

I come now directly to the woman question. You asked that gentleman this morning a good many questions as to how things could be remedied. It seems to me that the first thing you want to do is to get into the homes of the people, where things will be talked about. As things are, politics is one thing and questions that women are interested in are another thing, as a rule. I want to give some illustrations of what women's capacity and faculties are turned to. I will read from one of our New York daily papers an account of something that happened in New York about three years ago:

### "EXPENSIVELY APPARALED HUMANITY."

"Fifth avenue, in the afternoon of yesterday, the first Sunday of the fall season, wore its old-time look of fashionable life and brilliancy. About 1 o'clock the numerous churches along the street emptied themselves of their crowded congregations, and for two hours afterward the west side of the avenue was covered with a slowly moving mass of expensively appareled humanity. The prevailing texture of dress was flannel trimmed with velvet, and all-velvet dresses in black and royal purple and dark green were not infrequent. The crowd that sailed

Digitized by Google

slowly down the avenue must have impressed a foreigner greatly with the degree of wealth, taste, and beauty in this metropolis of the New World. Not an ill or poorly attired person was to be met on this thoroughfare of fashion, and if the foreigner was to take his impressions of New York alone from a stroll on the avenue in the afternoon of yesterday, he would conclude that this must be a city inhabited by nabobs."

This writer says "the numerous churches along the street *emptied* themselves"—note the expression—"of their crowded congregations, and for two hours afterward the west side of the avenue was covered," &c. And he says that "not a poor or ill-dressed person could be seen on that avenue." It is evident that the poor did not have the Gospel preached to them in that neighborhood.

### SOCIETY DRESS IN WASHINGTON.

But I want to come a little nearer home, and I will take a description of an entertainment given to Lord Lorne in Washington. Here is what some of the ladies wore on that occasion, as described by the newspapers next day:

"Mrs. McElroy received her guests in a toilet of pale mauve silk with trimmings of mauve fringe and point lace.

"Miss McElroy wore a dress of rich pomegranate silk and white lace.

"Mrs. Frelinghuysen, black satin corsage, *en train*, with petticoat of black and silver brocade, *méchin* lace trimmings and *coiffure* of white ostrich tips.

"Miss Frelinghuysen, white ottoman silk, trimmed with deep embroidered flounces and bands of white feathers.

"Mrs. Waite, pale violet satin, front heavily trimmed with violets and finished with point lace.

"Mrs. Keifer, electric blue ottoman silk and brocade with point lace *fichu*, and bouquet of lilies of the valley.

"Miss West, trained dress of pale blue satin trimmed with *valenciennes* lace and diamond pendant.

"Mrs. John Davis, white satin and white embossed velvet with point lace, square corsage and diamond ornaments.

"Mrs. Don Cameron, trained skirt of white satin, draped with point lace, low corsage of white and gold brocade with pearl necklace, and diamond pendants.

"Mrs. Eugene Hale, corsage and train of rose-tinted satin with front of pearl satin, brocaded with roses and cascaded with point lace, *révers* of pomegranate velvet, pearl and diamond ornaments.

"Mrs. W. W. Story, dark green velvet trained dress, and low corsage, trimmed with gold and irridescent passementerie, lace, and ornaments of pearls and diamonds in setting of antique Florentine work.

"Mrs. Bigelow Lawrence, trained dress of white satin, draped with point lace, with pearl necklace and ornaments.

"Mrs. Beckwith, black satin train over a front of embossed velvet, low corsage, trimmed with Brussels lace, diamond ornaments.

"Miss Beckwith, white brocaded satin and *crape de Chine*, with draperies held by garlands of myrtle; pearl ornaments.

"Miss Sherman, a toilet of white silk mull over white silk, low corsage.

"Mrs. Pendleton, pale mauve satin and brocade with point lace and diamonds."

That shows what the attention of women is directed to. If these women were to set about *earning* these clothes the labor question would assume new proportions.

### THE DRESS QUESTION FOR WOMEN.

As something in an opposite direction, I would like to remind you of an illustration that Mrs. Blake mentioned the other day, of a young woman who was put under arrest and sentenced to six months' imprisonment for dressing in what was called male attire.

I have another instance here, and if you gentlemen were as much interested as I am in this question, you would have observed that such instances are not uncommon in our newspapers. It is not an uncommon thing for a woman to be found dressed in man's clothes earning her livelihood, and there are several reasons for that. One is that it is a much more convenient dress, and another is that the state of our morals is such that a woman going into public, active service, is oftentimes subject to insult. Another is that a man gets better wages, as a rule, simply because he is a man. This lady said that she used to work as a saleswoman in a dry goods store, and she received $8 a week. She determined to earn a living as a salesman, and she did much better. Those are great contrasts to the ladies of Washington, arrayed in all those elegant dresses, when compared with that poor girl who broke a law of this State—for I believe there is such a law—in order to enable her to earn a living. Now if I were asked what legislation can do in this matter, I would not say that legislation should decide what sort of a dress a woman should wear; but I would say that if women were given something to interest them they would not be so much taken up with dress as they now are.

That is the reason why I would urge that the right of suffrage should be given to women.

### WOMEN SCHOOL TRUSTEES NEEDED.

Another reason for that is that women are needed in our schools. I know that from my own experience. The trustees are men; the teachers are women. Most of them are young women, and there are many points about which they have a delicacy in going to male trustees. Of course our Congress cannot say what we shall have in our districts in New Jersey, but it can set an example if it chooses to do so, and it would not be long before every State and county and town would be following it up. I understand—and it is the general understanding, it may not be correct, but people generally so take it—that Dr. Mary Walker was discharged from her position in Washington on account of her dress. I do not know whether it is true or not. But if she were discharged for incompetency we could better afford to keep her, and a dozen more like her, there, doing nothing, for the sake of illustrating a healthful dress.

### RELATIONS OF DRESS TO EXTRAVAGANCE.

Extravagance is dependent on the style of dress. A physician once said to me, "You cannot prevail on women to give up skirts, though I know it would be vastly better for their health, because they would then have to give up the greatest arena for display."

Now, that is just the reason why I would urge it, and I would urge making women political equals with men in order that they might feel a greater responsibility resting on them. I remember once rowing in a boat with one oar, and I found that I went round and round in a circle, and the thought came to me, "History repeats itself," and then

Digitized by Google

another thought: "There is good reason why history does repeat itself, because we have been going on one side all the time." I have been told that if a man is lost in a forest he will make a circle finally by the extra swing of his right arm. I do not know whether that is true, but the principle—the thought with me was that history repeats itself—it has gone round in circles that have been wider or narrower according to the force of the propelling power, but have always brought man back to where he started.

### THE BALLOT NEEDS WOMAN.

We have seen nation after nation rise and prosper for awhile, then luxury comes in, then quickly pauperism, and then the nation goes down. We have seen the rise and the prosperity here. We now see luxury and we see pauperism. What is the next thing if history repeats itself? To my mind, the way out of the danger is to take hold of both oars to our boat, set both sides to work and then we can make direct progress, and not until then.

As I have said, I think that if these women in Washington were to set about earning those clothes that they wore the labor question would assume a proportion that it never has done yet. It is very much a question of the direction of their energies. But I do not urge the ballot for women simply for the sake of women. I think that the ballot needs the women as much as the women need the ballot.

### THE TRAINING OF WOMEN.

The gentleman who spoke this morning (Mr. Bischoff) said that these women that he spoke of did not know enough to pull the stove out so as to stop the smoke. Well, *he* knew enough to pull the stove out. Had he been educated to housework? Why, it was simply common sense that led him to it. It was not because he had been educated to housework that he knew that dust had clogged up a lock. The fact is that women have been kept devoting their attention to trivial matters and have not had their scope or sphere enlarged.

We hear great complaint about financial dishonesty. I would offer the same remedy. And we are asked why strikes do not succeed. I offer the you the same remedy. The women at home do not realize the position. They realize the deprivations of their class; their attention has been given to other matters, and they discourage strikers and strikes; it is oftentimes so. If both sides of the house were equally intelligent and united on these points, strikes would succeed, as in many cases they deserve to succeed.

Mr. Newton testified here a short time ago in regard to people going to church. It is a fact, and I know it to be so, that many people are kept out of church. The great display in the churches, and the fact that these people have not sufficient to enable them to keep up a respectable appearance keeps them out of the churches.

### EDUCATION TOO EXCLUSIVELY INTELLECTUAL.

Our schools, too, are not given to moral instruction. We instruct the intellectual faculties, but we leave the physical and the moral faculties uninstructed. As a consequence, we get a lot of smart rascals. We set boys to studying interest and discount, and all those things, contrivances for getting other people's money; but we do not teach them any

Digitized by Google

way of earning money for themselves, and that accounts for a great deal of this concentration of wealth. The rank of pupils in our schools is determined solely by intellectual qualifications. A boy or girl may lie or cheat or steal, or do anything; but, if they rank well in their studies, up they go. It seems to me that the moral standing ought to be taken into account also.

### THE TRAMPS.

Political differences in the sexes make differences everywhere. They make differences in work. I have had men come to my house—they are called "tramps." I never use the term "tramp" in a disparaging sense—repeatedly, and ask for something to do. I would say, "Well, if you can scrub a floor, bake bread, wash dishes, black a stove, or wash clothes, I can give you work." But of course they would have to say, "I cannot do that." Now, all these differences have a harmful tendency. There is no reason for putting a wall up between different kinds of work and saying this is man's work, and this is woman's work. Tastes are not so different by nature as by education.

By Mr. CALL:

Q. Do I understand you to say that you are in favor of changing the dress of women?—A. Yes, sir.

### FREEDOM OF DRESS DEMANDED.

Q. What sort of a dress would you give them?—A. Just what they please to wear. I would not be in favor of legislating them into any particular dress; but I would be in favor of abolishing all artificial distinctions.

Q. Do you think that dress makes an artificial distinction between men and women?—A. Yes, sir, I do; a very great artificial distinction. With time I could show that it interferes with the health of women very largely, and also that it interferes with their mental development.

Q. Do you think a man's dress is better for women?—A. Well, I think that in some respects it is. I think that any dress that follows the natural contour of the form is certainly the least inconvenient; but I think that the dress of men may be greatly improved. I have for eight years made this a particular study, for the reason that for two years and a half I was an invalid, and good for nothing. I went to an establishment where, although not compelled, I was advised to adopt a dress usually worn by women there; and now, though not as strong as some women, I have recovered my health to a degree that I had not expected, and that I feel very grateful for. My recovery I attribute very largely to the change in dress.

Q. Then you think that a change of dress and the ballot are the two necessary factors for the education and improvement of women; do you?—A. Well, fundamentally, yes.

Q. You think that would alter the relations of capital and labor?—A. Yes, sir; I do. In the first place, I think this extravagance in dress is very largely responsible for the greed of wealth. I think that many a man, for the sake of keeping up a stylish appearance in his family, does things that he would never do without that pressure.

Q. Do you not think that if we were to give the ballot to women they would vote you down on that proposition of not having any fine dresses?—A. I do not object to fine dresses. I wish everybody could have fine dresses.

Digitized by Google

Q. I thought you said that this thing of dressing is what made the men extravagant, from a desire to please the women?—A. Well, to such an extent. I think that if women should get the ballot, a great many of them would vote at present one way. I think, as a rule, women are quite conscientious, and they make an excuse that they are not instructed; but I think it would help to instruct them, and they might vote it down. I do not know about that. At any rate, I will abide by any decision of the majority; but I know that with time and the exercise of all their faculties women would grow.

Q. Do you understand it to be the sentiment of women that we should pass a law in Congress by which the women in the District of Columbia should be al owed to dress like men if they pleased?—A. I think, sir, that the majority of women have not thought much about it. You must remember that women have been instructed for centuries to have somebody do their thinking for them.

Q. You think they have not arrived at a point yet where they do their own thinking?- A. I think they have not.

Q. That is merely your individual opinion.—A. Not individual, exactly. There are many others that are interested in the same work. I have been surprised, since I became interested in the subject, to see how soon things will be brought to you. If I talk with a person who has never before thought of the subject of dress at all, I will find slips of paper coming to me after a little while, sent by those very people to whom I had been talking. These persons would not have seen those things before, and would not have thought anything about it. So I know that all such things do have an effect. I have had letters from all over the country—orders for a little book which I wrote on the subject. They had seen a notice of it somewhere, and they wrote to inquire about it. I know there is a widespread interest arising upon this subject, but not sufficiently concentrated to take any organized form. I think that in the West, for instance, women are much more awake to such questions than they are in the East. I judge so from the letters I have had from there. I have had one from Thomasville, Georgia, only a day or two since, upon the subject, requesting a copy of the book. Indeed, there is hardly a State or Territory in the Union where there is not some interest shown on the subject. In London, England, they have an organization called the "Rational Dress Society," and from them I know something of their force, because they are organized.

I do not wish to detain the committee, but will be very glad to answer any questions that may be asked.

By the CHAIRMAN:

Q. I see that you are unusually well informed upon a variety of subjects affecting education and labor, and we should be glad to hear from you such views and suggestions as you may see fit to state.

### THE AMERICAN "HOUSE OF LORDS."

A. Well, sir, I did think—I have always thought—that the abolition of the "American House of Lords," as we call it, would be a great good; but I confess that I am beginning to change my mind.

Q. Perhaps you would give us your reasons on both sides of that question.—A. Well, it is hardly to be expected that a body would abolish itself, and I do not know how otherwise it could be done.

Digitized by Google

By Mr. CALL:

Q. Would you not be satisfied to keep it if we had some women there?—A. Well, sir, I cannot say that I know any woman that I would send there just at present.

Mr. PUGH. She says, however, that she has changed her mind about abolishing it.

The WITNESS. The question was once asked, "Can any good thing come out of Nazareth?" and this committee has convinced me that some good can come out of the Senate.

Q. You will be satisfied if we pass a law giving women the right of suffrage in the District of Columbia?—A. I only ask that women be placed on a political equality with men, and then, if they want to pass any law about dress, let them do it. That is the only request I would make, because it seems to me that, as we profess to be a people's government, any law that you pass now is not really lawful in the full sense. You have not a republic now. You have simply a male aristocracy, and any law that you pass does not represent the will of the people, and will not do so until the people are represented.

By Mr. PUGH:

Q. You do not want any law making it indictable for a woman to dress as she pleases.—A. No, sir.

Q. And you want to repeal any law of that sort.—A. Yes, sir. I do not want any law passed on the subject. I think there might be more good done by the repeal of a great many laws than by passing more. A multiplicity of laws tends to give business to lawyers, but I do not know that it has any other good effect. It seems to me that more harm has come to us from laws than from lack of laws.

By Mr. CALL:

Q. Why cannot women dress as they please now?—A. There is some law against it in almost every State.

Q. There is some law preventing them from dressing like men, but there is nothing against a modification of their own dress.

PUBLIC SENTIMENT REGARDING DRESS.

A. But there is a public sentiment on the subject. For two years I wore a dress that caused me to be mistaken for Dr. Mary Walker, and I assure you that, although I gained physically very much, yet there was a great mental strain. The sentiment has been and is that women should be modest and retiring, as it is called, and that sentiment will be maintained as long as you keep us in our present political position. I do not know what might come, nor how soon it would come, but I only know that that is all that is in your power to do, to emancipate us politically. Then we are left free to do whatever we can for ourselves. But until that is done we are hampered.

Mr. CALL. Well, you must make the men in the State of New Jersey do that.

The WITNESS. I have done my best. I have circulated woman suffrage petitions for some time.

Mr. CALL. If you can ever get the women of New Jersey to ask for suffrage, there is no doubt they will get it.

Digitized by Google

WOMEN IGNORANT OF THE BENEFITS OF POLITICAL FREEDOM.

The WITNESS. That is not fair, sir. What do the women know about the benefits of political freedom? They have been slaves. In times not very far back when the slaveholders told us that slavery should continue because the slaves were better off in slavery, we abolitionists used to say—but I hope I am not touching any sensitive point——

Mr. CALL. Oh, no; we have forgotten all about that.

The CHAIRMAN. And the House of "*Lords*" has been abolished.

The WITNESS. I cannot forget it, because there is so strong a parallel in the case. They used to say that the slaves were more contented to be in slavery, and we abolitionists used to argue that that was the very reason why they should be free, because freedom is the natural condition of mankind, and any sentiment that makes people contented with slavery is an argument against slavery. The fact that women do not want to vote is to my mind one of the strongest reasons why every persuasion should be brought to bear upon them to bring that about, and the fact that the men of the country desire it would be the strongest argument that could be brought to bear upon the women.

Mr. PUGH. We love the women because they are unlike men, and we are afraid that if they have the right to vote and to dress like men they will all turn into men and we will all be alike—except our chairman here, of course.

THE MORAL ASPECT OF WOMAN'S DRESS.

The WITNESS. Let me say, sir, that perhaps you are touching on a question that I did not think of having brought up—but you have brought it up. You speak of loving the women. I understand you, and I do not wish to misrepresent you. But a social question comes in there, and that is that a great deal of what is called love is not love at all. The fact that a man loves a woman because she is not like him, is not love. That is an argument, I say, for making their dresses alike. They say that the attraction between the sexes would be lessened, and I think it would; and I think anybody who looks over our society knows that it ought to be lessened; and that is one of the very strongest arguments for it. I do not think that there is any danger that men and women will not be sufficiently attracted to one another. You may dress them as you please, and put them in any position you please, and you can never destroy the attraction of true men and true women; but it may be stimulated artificially and hurtfully, and it is done so to some extent. There is a moral aspect of this question, aside from the extravagance, that I have not considered, but which is worthy of serious consideration.

The CHAIRMAN. You might state to us briefly your views upon that.

The WITNESS. Well, sir, you cannot legislate upon it. There are many matters which legislation can only affect indirectly, and it seems to me that this is one of them. The wider the differences, as Senator Pugh says, the stronger the attraction. I believe that, and for that reason I would urge the abolition of artificial differences.

REPEAL LAWS FOR COLLECTION OF DEBT.

I also desire to urge, as a measure to promote honesty and honor in business circles, the repeal of all laws for the collection of debts. It has come to be so that what a man can lawfully escape the payment of, he feels justified in leaving unpaid. My husband often complains of the

Digitized by Google

total lack of honor in this regard. So clear is it to him that this disposition is growing, and that it has a tendency to destroy all honor among commercial men, that he often declares himself in favor of repealing all laws which secure the collection of debts. He is constantly inquired of as to the standing of business men in his community, and these inquiries are almost always regarding the man's property, and almost never regarding the man's honor or morals.

### ADVANTAGES OF FRACTIONAL PAPER CURRENCY.

Once more let me urge the restoration of the fractional paper currency. Our present system makes a discrimination between the dollar man and the 50-cent man. The former can put his money in a letter at home, can send it with his other mail to the post-office with no farther trouble, while the 50-cent man or woman must either go or send specially to the post-office in order to get postage stamps, or take the trouble to get a postal note and pay 3 cents for it; while at the other end of the route the dollar man has the full advantage of his dollar, though the 50-cent man has been deprived of part of the advantages of his 50 cents.

### THE TARIFF.

The point I wish to emphasize in my testimony touching the tariff is this: Our workingmen are obliged to compete with the pauper labor of Europe, either here or in their own country. Our present system of tariff crowds back from our markets the productions of their labor, and by the same pressure, of course, the laborers of this country, besides being compelled to pay a much larger price for what they consume, are left to open competition with as much of the European pauper labor as our manufacturers choose to import. I submit that we can better afford to compete with pauper labor, and let it stay in Europe, than to bring it here to compete with us at our own doors.

---

NEW YORK, *September* 25, 1883.

## THE FINE ARTS.

JAMES FAIRMAN examined.

By the CHAIRMAN:

Question. You are an artist?—Answer. Yes, sir.

Q. And a writer upon what subjects?—A. I am non-resident professor of the fine arts of Olivet College, and a permanent resident of New York City.

Q. You may present to the committee any facts or statistics which you desire, within the scope of the resolution under which the committee acts.

### THE GROWTH OF ART IN THE UNITED STATES—ITS NEEDS.

The WITNESS. I came before you to present the interests of art and education in this country. There is no representative body properly of the artists or friends of art in this country, and no one has been sent to represent that subject before your committee. I simply represent

Digitized by Google

one of the general democracy interested in this as in all other elements of civilization in this country.

This is the first opportunity since the inauguration of our Government to bring this matter before the nation in the sense of its responsibility and its needs. There has been such a growth of interest in the United States in the direction of fine art, and in the direction of art literature, both periodical and permanent, and of art lectures, and in the direction of art education, as to be simply amazing to those who have witnessed its growth. I have taken what I conceive to be an intelligent interest in the progress of art in this city for the last forty years, and am familiar with all of the incidents of that history. I entered the New York Academy of Design as a pupil forty-two years ago, and, therefore, I think I can speak intelligently as to our methods and our needs in the direction of art.

Let me premise what I have to say by remarking that ours is the only nation within the pale of civilization that exists, or has existed, since the days of Pericles that has not, in its nationality, fostered by direct patronage and support, public schools for the purpose of cultivating and advancing the interests of the fine arts. This may not be said in reproach to us, for we have had other things to do in the direction of first making and afterward saving a nation. But the smallest nations on earth have their art schools—even when they have drifted from almost all other representative interests of a higher civilization. We see this in Portugal and in Spain, where they still preserve in all their fidelity their art schools. Holland and Switzerland among the smaller nations have their art schools.

### ART AN INDUSTRIAL AS WELL AS SOCIAL QUESTION.

This question of art is not a social question only; it is an industrial question as well. It is social in the effect of the ministry of fine art upon the mass of people in all their relations in life. It is industrial inasmuch as the decorative, the address to the artistic faculty, is inseparable from many of the ordinary industries of life. The distinction "industrial" and "fine" art is one forced upon our literature as a phrase rather than as a philosophical distinction. Art represents every department in the decorative faculty. Our position in this direction may be epitomized by reference to a passage in a recent address by Professor Goldwin Smith, who lived for a time in our country. He said to his British brethren "America is beating us in the direction of the mechanical arts. But inasmuch as we have Kensington School and the branch schools of that establishment teaching decorative departments of industrial art, while these live, and the Americans have none, we shall have a long precedence in those departments."

### ART EDUCATION IN ENGLAND.

Thirty-eight years ago there was no art school in Great Britain except the Royal Scottish Academy in Edinborough, and the Royal Academy in London. Now there are forty branch schools chiefly employed in teaching decorative art so far as it enters into the industries of the country—in the manufacture of textile fabrics, iron work, furniture, &c. Forty such branch schools, besides the great school of Kensington, teaching art, fine art, sculpture, and painting, and also industrial art, for the two must be united in any public effort in this direction. Besides this they have given an incentive that has produced a very large number of

Digitized by Google

unrecorded schools of similar rank. These are the results of the efforts of two men. Benjamin Robert Hayden, who was recognized in Secretary Cross' address at the Bethnel Green College of Art, in giving out the prizes, when he said: "We owe these things to one man, Benjamin Robert Hayden, who lies in a suicide's grave. He committed suicide from poverty." The other man, he who carried it up so as to make a solid foundation for the present splendid system, is Mr. S. C. Hall, the retired editor of the London Art Journal, from whom I have these facts.

MONEY EXPENDED FOR ART IN THE UNITED STATES.

The people of this country now pay for art, and pay handsomely. The United States gives more money to the artists of the earth for works of art than any other nation in the world, simply in the way of buying pictures, statuary, &c. A half million dollars is invested by our citizens in the form of volunteer subscriptions for the endowment of art schools in this country, and the support or s udents abroad.

Q. Can you make any statement as to the probable amount of expenditure by the American people for works of art of all descriptions?—A. Except in this comparative sense I cannot.

Q. You have stated that about a half million dollars is expended in the support of schools, but I refer to the commodities of art themselves.—A. Not in the purchase of pictures?

Q. Pictures and statuary.—A. No; those are somewhat equivalent, for people do not always report correctly about these matters. Many of these things are unreported, and sometimes, when reported, the amounts are not apt to be correct; but the facts I have I have derived from such authorities as the veteran house of Alphonse Goupil, and others.

Q. Is there any statement you can make as to the amount that we probably pay for foreign and domestic art?—A. No, sir; I am not in possession of the figures.

Q. It must be many millions.—A. Oh, yes.

By Mr. CALL:

Q. What did you say that half a million was for?—A. It is invested in this country in the form of endowments to art schools and money given for the support of students abroad in the department of art, principally painting and music.

Q. How do you get that data?—A. From the number of students abroad, the average amount required for their support, and the definite amounts that are given for art. For instance, $12,000 a year is given in Cincinnati for an art school; $150 000 was given within the last two years in Saint Louis to found an institution—a museum which should be a memorial to a suicide son by a devoted father. Then, there is the endowment at Yale College. All these moneys amount to some half million dollars, not annually, but in the aggregate representing the amount permanently invested in art, and the money which goes annually abroad. That sum of course is not the interest, but the gross amount.

Q. It is not half a million annually?—A. No, sir; that is the permanent investment, though part of it is an annual expenditure.

Q. What is the annual investment, do you think?—A. It would represent just that, not annual y renewed; but of that amount about $460,000 I think is permanent. The remainder represents the support of students abroad. I am approximating now. I have not more particular data

Digitized by Google

with me, although I have been careful in the preparation of the material that I have.

Q. What is the scope of instruction in those art schools in Cincinnati and Saint Louis?—A. I will come to that in its order; or, if you choose, I will answer now.

Mr. CALL. Perhaps you had better come to it in its order.

### FINE ART EXHIBITIONS HUMILIATING TO THE UNITED STATES.

The WITNESS. Our position before the world is such that these periodical international expositions of art are periods of our disgrace and humiliation. The first exhibition in Paris was so bad that our American fine art commissioner (called Frank Leslie, now deceased) had to apologize to the world in four different languages for the miserable display of American art. The subsequent exhibitions, including the one now at Munich, have been no gain in artistic merit. The world is indulgent to us, and therefore we are saved from the recorded opprobrium that frequently visits others in this connection.

### DECORATIVE ART WELL ADVANCED.

In this country, where necessity has impelled it, and industry and competition called it forth, we have not only greatly advanced, but have universally acknowledged precedence in decorative art. No furniture known on earth of the solid kind—I do not mean gilded work—can equal that made in Grand Rapids, Mich., both in solidity and in decorative art. In quantity, the art of this country is vastly beyond that of any other. In household decoration we are ambitious to make great attempts. Even the handle of an ax is a work of art, and represents perfectly, although merely from the instinct of those who made it, partly from utility and partly from natural taste, the line of grace and beauty upon which Hogarth wrote his elaborate essay.

### AMERICAN PROFESSIONAL ARTISTS.

In this country there are 21,000 professional artists, so called. The profession in this country is not protected by any necessary examination or charter of any kind. May I say, loosely, that any man that can buy a slouched hat and wear his hair long, and sport a velvet coat, and affect Bohemian habits—a chronic "diner out," who lives in a garret, and always wants to borrow $5 of you—can set up here as an artist. This, however, is our misfortune, not our fault. To show how much intelligent thought there is among artists with reference to art I will mention that the only document ever presented to me to be signed in order to be presented to the National Congress was in 1867. It was a request to Congress to increase the tariff upon fine works of art, and it was signed by every member of the New York Academy of Design, from the president down. I think I was the only artist that did not sign it, but, on the contrary, sent a protest to Senator Sumner against its being entertained.

Q. Asking for a prohibitory rate of duty upon articles of art?—A. Yes; and they disguised it in the circular by an intimation that that was what was needed to force people to buy American pictures. They had so little discrimination as not to see that we were not then equal to the foreigners—department for department—historical, portrait, marine, or any other department, excepting in one department—that represented

Digitized by Google

by the great Charles Elliott, deceased, a portrait painter than whom no nation on earth has produced a greater, in my judgment. His work was in the Paris Exposition, and was the one redeeming picture—the picture of Fletcher Harper, of this city.

Q. How numerous were his productions?—A. I do not know. The book recording them is now held in a case in the National Academy of Design—where they would not hang one of his pictures when he was living, or treat him with common decency. "They build the graves of the prophets whom their fathers killed."

### AMERICAN ART WANTING IN INTELLECTUAL POWER.

The distinctive features in which our American art is wanting may be designated as the intellectual and the sentimental power. Indeed, there is a wonderfully concise delineation of what art is in the Encyclopediæ Britannica, written by Benjamin Robert Hayden. Starting out with the definition, he declares that "Fine art consists in taking the material agencies about it and so shaping them that from the senses of sight and hearing they shall stir thought." Art should be subjective—thought should be objective. That is the distinction. It is a philosophic and scholarly distinction, and therefore the ordinary person who has learned to scrub around colors and put a little of them on a canvas and make something like a picture does not comprehend, let alone apprehend, what constitutes his work as an artist. Let me illustrate: You may understand the two schools of music; for example, one the school of music for the sake of music, headed by Mozart; the other the school of music for the sake of thought, headed by Beethoven. A similar distinction exists in the formative arts—painting and sculpture. The ancient Greeks produced splendid works in the way of literal and correct anatomy, but they did not have any idea of sentimental art. Hence they represented no expression in the face. Now, we know that the best element of a picture or a statue is the sentiment or the intellectual element—the instrumentality by which thought and feeling are expressed. We lack, then, the sentimental, or, what Mr. Hamerton would call the poetic, in art.

To illustrate: a description of Niagara that should be topographically and scientifically accurate would not affect us; but a description of Niagara leaving out those features and giving the impressions they produce on a man's mind would impress us very much. It is because we go to Niagara and Mont Blanc and to other great pieces of natural scenery without these impressions upon us that we are so disappointed when we reach them. In other words, the ideal is the basis of art.

### THE PROVINCE OF ART.

I may say here that the province of art is to stir the ideal in men in the direction of human interest mingled with hope. So that I might epitomize a work of art—a drama, a poem, a work of fiction—by saying that it would mean the excitement of our sympathies by the contagion of human emotions, finally ministering to those emotions, including our sense of justice.

### SCULPTURE IN THE UNITED STATES AND EUROPE.

Our special backwardness is publicly conspicuous, or perhaps I should say perspicuous, in the direction of sculpture as seen in our public monu-

Digitized by Google

ments. A gentleman of New York, and a man of taste, offered to head a subscription to buy up and take out of the streets and parks of New York what we call our sculpture. As sculpture requires a more exact education than drawing or painting, it is there that we are weakest, and it is there that the sagacity of artists prevents them from making the attempts. To illustrate: look at any examples of what we call the statuary of this country, and then compare it with the figure of Columbus set up at Genoa, of Bismarck at Mayence, the figure of Peel at Charing Cross, of Roget De Lisle at Marseilles, all made by living men, and put up, we may say, within a few hours, in a historic sense. Those are wonders of art; they are simply amazing. This will appear when any one who sees them attempts to describe them.

### LOW STANDARDS OF ART IN AMERICA.

The standards of art in this country—painting and sculpture particularly, of course—I am not speaking now of furniture, jewelry, household decoration, and those things that have entered into industry, in which respects, aided by our sagacity and progress, we have come up to the level of foreign nations, and have secured absolute precedence over them—the standards of art outside of those are the lowest on the earth, and, although not a pessimist, I do not see any outlook that should cause us to hope, because even art cannot grow without definite, intelligent, well-directed effort. It will not grow of itself beyond a certain point any more than many other things will grow that will occur to your mind. In this country there was so little appreciation of art that thirty years ago Paul de la Roche's picture of Marie Antoinette, now on exhibition in the Louvre, was taken through this country by Goupil, from New York to New Orleans, and no one would buy it. A magnificent picture of the "Temptation of Christ," now in the Louvre, was also taken through this country, and no one would give $1,500 for it.

By the CHAIRMAN:

Q. What is that picture worth in money; or has it a price?—A. I should simply say, without using a figure of speech, that if you should cover it solid all over with the biggest gold coins of America, you could not buy it.

### ACADEMIES OF ART.

Our "Academies," as we call them, are really nothing but common drawing schools. There is no intellectual training in them. Digital dexterity is all that is attempted, and that but poorly accomplished. We actually break off and declare our pupils graduated at the very point where the English begin. Pardon me for illustrating again: If you go into the British Museum you will see men and women and boys copying the Elgin marbles—these wonderful works from the fingers of Phidias—from the Parthenon of Athens in the days of Pericles. The work of these pupils is perfectly wonderful. I could not attempt to equal these drawings. You ask them what they are doing, and they tell you they are going to present their work to the Academy of Design in order to enable them to begin their studies as pupils. I deliberately say that these drawings of those boys and girls are, on the average, better than the best of our graduates, when we finish them, in this country. I do not mean in mere point of manipulation, but I mean as well in the higher elements of drawing.

Digitized by Google

### MERE COMMERCIAL GUILDS.

Our so-called academies have drifted into that state where they are mere commercial guilds, ruling in certain places for the sale of pictures, periodically tempting artists to enter them for the purpose of getting advantages. The Spaniards have an old proverb that most men are tempted by the devil, but that some men tempt the devil himself. There are no periodical competitive exhibitions or anything equivalent to them, nor is there any public award by authority of any kind in this line, and there never has been. There are such, however, in all countries where art has assumed a high standard. I do not say that they are always justly administered. In France it was clearly proven that there was corruption in the award publicly made in the *Prix de Rome*, as they call it, and it was withheld for one year. But, as it is in all ordinary human industries, so is it in art. The failures of our attempts at art education show the system to be wrong.

### ART EDUCATION.

The system in this country is that of the ordinary national academies of Europe in their humbler elements—more poorly administered. For instance, in Paris *Les Ecoles des Beaux Arts* have the human skeleton, and the students enter with the scalpel in their hands and study the actual anatomy. We did not even have a life school here until the boys asked for it. Ruskin, as Slade professor in Oxford, recommended study from life first, and from the cast afterward, just as in English composition you would recommend teaching people to express their thoughts first and study the grammar afterward. That was the logic of his thought. In this country there was an effort to discover whether anybody could teach perspective in the organization of the Academy in New York, and it was discovered that there was not a man out of the whole lot (I am not speaking bitterly) who understood perspective, and they had to get an outsider. So they do not speak of painting as a matter of composition, that is, producing the picture in accordance with the canons of art—they do not understand the chemistry of color—and these things enter into art. I may be permitted to say that the practice of an artist in our day is that of a scholarly and scientific profession. It did not use to be so, but it has grown to that. Now, as Ruskin says with reference to perspective, it is no credit to a man to have correct perspective, but it is simply a discredit to him *not* to have correct perspective, just as you would say of English grammar in a pretended scholar. Therefore in this country our best "academies" are nothing else but drawing schools, usually under the instruction of persons so poorly paid that it would be an outrage to ask them, if they were able to discharge the functions, to do soor the price paid. May be it is worth what it cost, and may be it is not I shall have occasion to say, further on, how it is that we cannot get stronger men into our institutions of art, as in other countries, to give instruction to the coming artist.

It is sixty years since the most pretentious institution in this country commenced its existence under the presidency of S. F. B. Morse, the renowned telegraph inventor, and there has not been produced in that institution a single instructor whose name will give any credit to the country or to our profession.

### EMINENT ARTISTS: THEIR RELATIONS TO ART EDUCATION.

Artists who have become strong, and who were early in that institution, are men who have discovered that they must seek elsewhere what

Digitized by Google

they need, and have gone elsewhere to get it. Our strongest men will not accept the position of instructor there. Why? How have they got strong men in art institutions abroad? Cardinal, Fleury, Jerôme, Meissonier, Carolus Duran, these giants in art, are teachers in *Les Ecoles des Beaux Arts*, in the department of painting. How are they secured? That institution is one of such august character in the estimation of the world that it is a great honor to any man to be a professor there. We have no such institutions here. We have nothing credentialed in any public way so as to make it so respectable as to induce a man to go into it from the motive of ambition, and to gain an honorable historic place in the art of his country. These men whom I have enumerated in the Paris schools are not paid in the sense of compensation, as ordinarily understood. They look for fame from their connection with these schools. The money compensation of the position would not be sufficient to attract men of their reputation and ability. So these schools adopt the plan of drawing them from professional life only for a part of their time, just as our law schools in New York will pick out a great lawyer and appoint him a lecturer in the school. That man could not afford to go there as a pedagogue, under the salary of a professor.

By the plan adopted, however, they secure all the advantages of competence which these men can give, without taking them out of publicity or taking them out of their professional life; the schools get the *éclat* of the names of these men and the benefit of their instruction, and, what I believe is the most valuable of all, the inspiration to the student coming directly in contact with a man of eminent success in his profession.

In this country there is no salary paid to any instructor in art in any art institution that will command a mediocre man. Then, of course, it leaves those who, for some reason, cannot get a subsistence before the public to become teachers of others. That is one of the reasons which induces me to say that I do not see a very hopeful outlook for art.

### NATIONALITY: ITS RELATION TO GENIUS.

At present we are in a state of unnecessary dependence on foreign nations for our art education. I say "unnecessary," because there is not now, and has never been, to my knowledge, an American artist who went abroad and studied there and came back to this country, or remained abroad and became an American painter of originality and power, who received his instruction from some other nation. Like poetry, histrionic art, and other things that depend upon some native and emotional qualities and upon the imagination, an American cannot write in the vocabulary of a foreign nation, nor can he draw or paint in it. Our young men, when they begin to manifest some talent in this country, are taken up, out of mistaken friendship, and are sent abroad to study. They do not learn a word of French that anybody can understand; but they lose their American sabbatical ideas, and they come back and paint in broken English all the rest of their lives. That is the course of hundreds of our American students, if not indeed of thousands.

### COLLECTIONS OF PICTURES: THEIR PROVINCE.

It will be said, however, that we must have certain things to enable us to work in art with the promise of success abroad, particularly fine collections of the old pictures. It would take a long time to argue this subject, and I do not propose to do that, but beg you to take my

Digitized by Google

judgment upon it. Collections of very fine pictures, even modern ones—to which I attach, of course, a great deal more value for educational purposes—may be necessary in art education—indeed are necessary. It is a great thing to have a fine collection; it enables you to see what has been done by the brain and fingers of man, and it shows a student what he is to paint up to. But his education cannot be got from these pictures. Let me here make a broad statement: there has never been an artist in modern times who has derived his art-excellence from the study of other men's pictures. From the first artist of the Renaissance—Giotto—to the present hour, it has been original genius that has enabled a man to take a bound ahead. It is true that a man must avail himself of what has been done in the past, just as a student of engineering must examine the steam engine of James Watts. But I dare say it would amaze James Watts if he could have seen the Corliss engine at our Centennial Exposition. When you come to look at the old engine, with its wooden cylinder and beam, now to be found in Kensington Museum, you will agree with me that it required more genius to make that engine out of nothing than it did to construct the splendid mechanism of Corliss. Just so is the artist helped by seeing what has gone before. Without giving any name, I will mention this. I know an artist who had a passion for painting sunset pictures. He studied from the line engravings of the Turner pictures, as the best accredited, as well as the most effective, examples of the originals to be found in this country. He got a higher ideal of landscape art from these engravings of the Turner pictures than was sustained when he came to see the originals themselves, which are now on exhibition in London. I mention this to illustrate that the inspiration and energy of the artistic faculty does not require that we should have local collections of pictures here. It is a mistake, I think.

### THE TALENT FOR ART IN AMERICA.

In this country we have the talent beyond question. I make this general statement. There is more available talent for the higher departments of intellectual and artistic work, in proportion to the population in this country, than in any other nation on earth, or any nation that ever existed; and I will give you one or two reasons for it—reasons that are saitsfactory to me. There is more education in this country in the sense of what is in a man being drawn out of him. The average man in this country whom you meet in a railroad car is, in his general intelligence, above the average man of any other nation. We are a newspaper and magazine reading, discussing, organizing, ambitious, pretentious, superficial people. That makes available, however, the talent where the talent exists. We have twenty quacks and one genius that rises so high as to make the whole battalion of quacks respectable. That I think epitomizes our whole condition in that direction.

Look now in other directions. In poetry—speaking of the poetic germ, the eloquent in man—not pretentious epic works such as the Iliad of Homer, or Milton's Paradise Lost, but such, I mean, as we see the material of in the man—for dramatic power no nation has produced a greater poet, though his works are short ones, than John G. Whittier. Edgar Allen Poe is without an equal in his class in the world. So it is with others.

Take histrionic art. We are ahead of the world in that, and yet our stage is lower, because the average is not so high as in Europe. We have genius for the stage and for poetry, and we are rapidly rising in metaphysics; and even eastern archæology is represented at high-water mark in the State of New York.

Digitized by Google

### NECESSITY OF ART ORGANIZATION IN AMERICA.

The secret of it is: There is in this country fairly a passion for art. It is illustrated by the high prices paid for the articles and the money that is put in to try to build up institutions that will build up art. We have the secret here and the men here; but we have not the organization, and without organization we cannot have art.

In Paris, *Les Ecoles des Beaux Arts* represent sculpture, painting, and music, although the music is in a separate building, but all under the patronage of the Government. They have in the cabinet a *Ministre des Beaux Arts*, and have had such for many years. In London, the Royal Academy teaches sculpture and painting. The Government teaches music in a distinct institution. European schools have masters of the greatest eminence in all these departments. They even covet the position for the public eminence it gives them and the credentials it gives them.

### EDUCATIONAL FACILITIES.

With regard to material facilities for the study of art in Europe—I am speaking now of the formative arts more particularly—they are not so much greater than they are in this country as is commonly supposed. We have everything in this country, including the raw material in the men, to constitute the corps of professors, although we would do better, to begin with, if we get men of broader, deeper discipline, which it takes time to produce. Such men they have in Europe.

### A NATIONAL ACADEMY OF ART NOT DESIRABLE.

A great national academy conducted by the Government at Washington is not needed, nor is it desirable. Our territorial extent precludes its usefulness. If a man had to go all the way, for example, from Portland, Oregon, to Washington, it would be too long a journey, and he would be too far from home. The ministry must be more diffused, and, carrying out higher details and greater undertakings in this direction, had better be by the several States—the emulation between the States being a great advantage. It would not be desirable to have such a national institution in this country, because it would be impossible, in the multiplicity of the duties of the Government, with the rapid changes we have in our governmental officers in all directions, and the inevitable element of politics which goes into everything where Government is concerned here, would prevent the usefulness of such an academy. The importunities of unworthy men would enable them to secure the places and would degrade our art as a matter of necessity. This would be partly the result of the fact that those having the power to make appropriations of money and to make the appointments, would not be themselves sufficiently educated in art matters to act with discrimination; and allow me, with due respect to the representatives of the Senate present, to say that I have an apprehension that even the purity of Congress might be contaminated by such a power.

### DIFFERING CONDITIONS OF ART-PATRONAGE IN EUROPE AND THE UNITED STATES.

Our circumstances are different from those of other nations. Other nations have fostered art through their hierarchs, their nobles, their kings, their emperors. We do not have those personages. They have

Digitized by Google

not been an unmixed blessing in the past. The art of the *renaissance* was greatly degraded by ignorant priests dictating the themes of art to men who had to live—for *il faut vivre*, as the French say. That is the reason, too, why we have in our art galleries so many pictures that even our respect for the past and for the grandeur of art cannot keep us from laughing at. There is a picture of the Israelites gathering manna in the wilderness, and one of them has a double-barreled shot-gun on his shoulder. That simply illustrates the abounding ignorance of those times. When Benjamin West undertook in London to paint under the patronage of the Government he had the courage to paint men in the garb of real life. Up to that time there had been no English painter who had the courage to do it. Englishmen had been dressed in Roman costume, and West was told that the king would not recognize him unless he, too, painted the old dresses. But he painted with the modern dress, and the king had to recognize him. There was a necessity for new style. So with modern art; we want a style of patronage which, while giving bread to the artist, will not paralyze his arm.

### WHAT THE GOVERNMENT CAN DO FOR ART.

In this country art, if we ever have it—and we shall—will be the legitimate child of the people, and we shall have the first natural, real, non-pedantic, legitimate art of all the earth. I speak, of course, collectively of American art. But it is not necessary to have a great national academy. We cannot go a great way in this direction as a nation, because of the limitation of general authority and delegated power. The Government can do for us, however, what it already does for other departments. When it desires to foster other neglected and dwarfed interests in our country means are provided for it. It can do for art what it can do for agriculture, and through the same department. It can do for art what it can do for the fisheries; it can do for art what it can do for railroads, or what it can do for ship-building. That is not asking too much, unless art is a thing to be neglected. Let us see what practical measures could be adopted to bring it about.

### WHAT THE TERM "FINE ART" EMBRACES.

Fine art embraces a number of departments usually designated as, first, Architecture (that is, architecture in an artistic sense, for constructive architecture is a species of engineering); next, Sculpture, an art dealing with one material only; next above that, Painting, which is a higher form of expression, adding colors and groups; next above that, Poetry, which abandons these forms and, through allusion to them, addresses the understanding; and highest above all—the greatest of the arts—Music.

Histrionic art—the stage—represents a grouping together of these arts. The posing upon the stage of the graceful actor addresses the sculpture sense; the intonations and inflections of the voice address the musical sense; the face, if it be good, even though it be not in measure, expresses the poetry of thought; the grouping together in the scene behind addresses the pictorial faculty. So that the stage may be regarded as the grouping together of these four things.

It will be noticed that I have omitted oratory, for I regard oratory as a department of histrionic art, and the basis for it is histrionic art. They knew no such thing among the ancients as oratory. They had rhetoric, but that was a different thing.

Digitized by Google

Another fine art I should add to those that I have enumerated, and that is found in the literature of fiction. It is not poetry, and it is not music. It is a distinct art, and since the advent of Scott and Dickens it has risen to a majesty never seen nor heard of before.

### AFFINITY BETWEEN THE DIFFERENT ARTS.

Now, the National Government cannot undertake to teach these; it can only undertake to assist in their teaching. Some of them it cannot teach at all; but be it remembered that there is an esthetic affinity between the different arts, so that if you acquire one it will inevitably lead you to the others. You cannot study one without studying the others in a philosophical, intelligent way. It is conceded by all philosophic minds that, looking in this direction, art stands together as one thing. It is the emotion in the soul of man; what we call the fine arts represents the different channels of its expression. It is the same *animus* that makes the poet, the sculptor, the painter, the histrionic artist, or what you please. It is a divine afflatus, to use an old hackneyed phrase; it is a flame in the soul of man, calling for expression. Sometimes you will see this displaying itself in peculiar, unexpected forms. The pictures of Doré, for example, are not pictures, but poems. They are an attempt to express poetry in drawing. And so you will see very frequently that a man has a misguided passion to do that which he cannot do. Hackett died with the belief that he was a neglected tragedian. He was nothing if not a comedian. There was nothing funnier than to see him play Hamlet. But, as I have said, when one art is studied it inevitably leads to others. Plato says that if you get a hold of one great truth it will lead to the center and radiate in all directions. I have no weakness in the direction of classical authorities, but that remark of Plato's shows how old the idea is.

### PROPOSED NATIONAL BUREAU OF FINE ARTS: ITS FUNCTIONS.

How could art be assisted by the National Government? This could be done through a bureau to be instituted in the Department of the Interior. It could assume the duty of furnishing plaster casts of those of the classical models which are difficult to get, and text-books and compilations of such matter as would give correct technical guidance in art instruction. This art department could publish an annual compendium of discoveries, inventions, and new features in practical art, embracing art industries in all departments; these could be placed in the hands of persons in each locality where it was proposed to commence a school of art (where a corporate body should be founded for this purpose), as raw material to be restored to the department when from any cause the school is discontinued. General instructions could be published showing how a building, for example, should be constructed for the special purposes of art, and describing the general requirements in the organization of a simple pioneer effort at art education. This would be necessary here.

In this country there is no general exhibition of works of art accessible, on a basis of merit alone. You must belong to some organization, or have a friend in it, in order to get your pictures seen. (I ought perhaps to say that I am not myself a victim in this direction.) The bureau could show an annual exhibition of works of fine and industrial art. This will commend it to those having no special sense of the artistic, but who like industrial art on utilitarian grounds. It would educate and stimulate the people.

Digitized by Google

Among the advantages to be immediately secured—and I will not elaborate these—would be the employment of many of the working classes in an inexpensive recreation that would unconsciously educate them intellectually and morally. This would be a great advantage to all classes of the community. It has been discovered in England that the law protecting the working classes in the Saturday half-holiday has led to the most appalling increase in drunkenness and crime, showing that the opportunities for recreation given to the working classes depend for their best utilization upon previous habits and surroundings in the atmosphere in which they live.

## RELATIONS OF ART TO GENERAL EDUCATION.

Let me state one thing that is a simple fact in education. The most rapid method of educating the adult mind is through fine art. Let a man begin to study any department of art and he will find that the attempt at this study, while it is fascinating—and he will continue it for the love of it—yet touches a thin place in his education in all directions, and that place it will thicken unconsciously to himself. The ministry of fine art, the sensibility of the race, high and low, even in its humblest forms, to appreciate it, is one of the most conclusive and successful methods of proclaiming to the world proof of the universal dignity of human nature, and will make us love and protect man as man.

The logical force and necessary results of fine art are not occasioned incidentally and by indirection, but are immediate, elevating the mind and leading it in the direction of moral purity and public order. Plato uses the words "beauty" and "truth" as synonymous in his language; but they are not synonymous except in this association. Goethe contends for the use of the word *wahrheit* instead of *schönheit—truth* instead of *beauty*. Cousin's wonderful work, "*Le Vrai, le Beau et le Bien*" ("The True, the Beautiful, and the Good") is not a forced association of words for a good title. It is a logical chain or linking together of elements intimately related in our nature. The mental and moral discipline of the fine arts, and their dissemination among our people, even in a cursory and occasional way, will help to correct the defects of our system of education, by appealing to the emotional and moral parts of our nature. Ebenezer Elliott, "the Corn Law Rhymer," as he is called, was a stern, practical man, terribly in earnest, and of such great sensibility that the simplest incident, however remote, would touch his heart with the intermittent beat of suffering. His poetry is bristling prose. In reference to the working classes and their elevation, he says:

> "Outbid the house of sin, and win, by this,
> Men's minds to virtue and to nobleness."

In speaking of the degradation of the workingman and of means for his elevation (at the time when S. C. Hall was beginning to talk up those Kensington schools, that have done so much for England), Elliott wrote:

> Oh, give him taste; it is the link
> That binds him to the skies,
> A bridge of rainbows thrown across
> The gulf of tears and sighs.

William Tone, one of the greatest of the minor poets, says that the action of the heart of man is sometimes so eccentric with reference to his outside life that Tone himself could never hear of an extraordinary criminal without a desire to pierce beyond the mere judicial view of his case. I have myself, in visiting prisoners and trying to influence them

Digitized by Google

by a little sort of lay preaching, been amazed at the insensibility of some of them to human sentiment. They have usually a dwarfed imagination. When we look at a play, if we are over fifty years of age, a very simple thing makes our eye dim, because we have the greater and nobler sentiments in our nature. It is not the mock scene that stirs us, as the superficial observer might suppose, but it is the well-stored memory bringing vividly before our eyes something in life that is like the mimic scene. It stirs up within us a strain that may perhaps have lain in our hearts for thirty years. That part of our nature is awakened by it, and it makes us nobler and better citizens. It leads men to be God-like. It is a blessed thing to be able to do work in this direction.

I may say, if I may do so without appearing to parade my own importance, for I do not think I want to parade it, that I have had other avenues of life opened to me. I have been fascinated with the nobility of the ministry and fascinated with the study of fine art. (Among the calamities of my early life, I was going to say, I came near being a member of Congress from the eighth district of this city, in 1858.) There is a grand, deliberative mood of mind reached when you come into high zones of thought and feeling from converse with the dead in your library; I know nothing but a pure Christian ministry that will compare with the similar mood of mind and feeling developed by an intimate association with art.

### EFFECTS OF ART ON THE POOR AND OPPRESSED.

I do not know whether I can smite this committee with the contagion of my enthusiasm, but you will be congratulated in this world and rewarded in the next if you should be the agents through whom something should be done to lift up the brow of the neglected poor from this sordid earth, where so many of them are, as Ruskin says, like Samson, with their moral and intellectual eyes put out, grinding in the dark for bread. I know of nothing within the reach of governmental methods that will do so much for the race and do it in a way that will not afflict them with the patronage of charity. In our country we have no royal family. We have no ideal to appeal to as the ultimate source of power and the charter of our rights—the immutable thing in our governmental system—or our social system either. Stimulate the ideal, and this will be possible. Garibaldi found grand material among men of Italy who could neither read nor write, but who had stood around upon the stone steps of the grand squares of Florence and found inspiration in gazing on the noble works of art which commemorate the splendors of their country. He could talk to such men about the glories of a free Italy, and they could understand him. It did not need any poetry but that which appealed to the eye. The swords and bayonets that flourished at Solferino were wielded by those men. It was Art's contribution to Liberty. When the Duke of Wellington was at Waterloo and did not know what to do with the raw recruits from Glasgow, for nothing seemed to move them, he asked one of his staff how he could best inspire them. "Tell them," said the officer, "to drive the enemy down the Gallowgate" (the Gallowgate is the "Bowery" of Glasgow). That simple reference to a well-known spot, which called up the feelings of home, produced the greatest charge of Waterloo. The reference is authentic.

Allan Cunningham, the great writer and poet, said, "Let me but make a nation's songs, and I care not who makes its laws." I think that we Americans, in our cold-blooded, materialistic, severely logical ways of

Digitized by Google

thinking, of which we are so proud, neglect too much the emotional and moral intuitions of men. For my part, I have never seen an audience in this country who were below the ideas that I could present. I might be below them in my capacity to use the Saxon that would present those ideas clearly to the natural mind, "untainted," as Mrs. Howe says, by the "artificial ignorance taught in colleges," but the ideas themselves can be drunk in by the humblest men.

### THE STRENGTH OF THE MORAL AND SENTIMENTAL POWERS.

Art gives one a peaceful view of human nature. I have attempted to speak to prisoners and others, in the direction of art, and I have seen and talked with men of cropped hair with faces upon which crime was stamped so startlingly that nothing but the chemistry of the grave could take it off, and I have often seen, too, the indications of a higher and nobler manhood among these men, and if I could but keep such a man in such mood, I have no doubt that through the ministrations of Christ, he could be restored to society. I am not an enthusiast, or given to the use of poetic phrases; but I wish to emphasize the great strength of the moral and sentimental forces in men—forces that can very seldom be touched by mere legislation. Jomini, in his "Art of War," relates that men in the field are greatly affected by what is said to them in the bulletins and orders of the army, and that indeed it has almost everything to do with the efficiency of the army itself. You may remember that when Napoleon led his troops across Mount St. Bernard, they were weary and foot-sore. He gathered them together by the roadside and addressed them as Hannibal did his army many centuries before. He reminded them that when these campaigns should be over there was a glorious future for them; he reminded them that they had already conquered the sternest of enemies—Nature—and now they had but to conquer the less powerful enemy, when they would retire from those fields with the laurels of the victor; and when their children's children should come to play at their knees, their proudest boast would be that they had "fought with the army of Italy." It was this that overcame the gnawing agony of empty stomachs and resulted in the great victories of the Italian campaign. All things which tend to elevate men, to develop enthusiasm, to fire the soul, are factors and forces in government.

When Edmund Burke, in answer to Paine's "Common Sense," published his pamphlet called "Plain Truth," he demanded to know "What is the ultimate source of power—the immutable thing—the final basis of your charter?" Paine answered, "You ask this question. I answer: Name the time and the place; let the altar be erected and place upon it the word of God. That is the ultimate source of power and the charter of our Government." You may remember that almost before our Government had a form, when the "mad general" took Fort Ticonderoga by surprise in the night-time, got into the bed-room of the British officer and shouted "Surrender!" and the officer shouted in return, "To whom shall I surrender?" the American, astonished at the question, and without waiting to frame a more prosaic answer, shouted back, "Surrender in the name of the Great Jehovah and the Continental Congress!" That is our charter in this country. The significance of our flag commends itself to the humblest intellect. The fact that this western, last-born nation is so much greater in material things now, and going to be greater in other things soon—so far as you can make this feeling intelligible to the masses of the people—that they are part owners of this

Digitized by Google

great, broad continent, you can develop a sense of nationality that will stamp out what little is left of that old spirit that would make of this nation two where God has made but one.

### A BUREAU OF ART SUFFICIENT.

You will notice that the measures I propose are very simple. I have considered the subject carefully. I think it is all that can be safely proposed and intelligently grasped and worked out. My immediate hope would be that if this bureau of art were attached to the Department of the Interior, and these State schools should be established and credentialed—chartered—by the National Government, in a certain sense—I think then that great masters would rise among us, and those we have, if we have any, will join in the movement, and the beginning of the grand result will have been reached. And that amounts, after all, only to the same thing that you do for other industries that are really better able to help themselves already, and not so much needing Government aid. Let me again say that this is the only Christian nation, and the only nation within the pale of civilization that does nothing in its national capacity for art education. It is not done by the States either; so that it is a *tabula rasa*.

### THE ELGIN MARBLES.

I may mention, in addition, that there is not in this country a perfect set of the Elgin marbles, or plaster casts of them—these models of the age of Phidias that are so inspiring to the artist. I have no question at all but that the national Government would get, as a gratuity, from the British Government the presentation of duplicates of all those, and probably everything else in the British Museum. But even if we had to pay for them, it would be a very simple thing by national appropriation to get them, and it would be a great contribution to art. If it embraced also the archæological remains of the British Museum, especially pertaining to ancient Egypt and Chaldea, and those places so strongly associated with archæological study, it would save many a journey across the Atlantic to those who now go there to derive benefit from the study of these works. Speaking of the Elgin marbles, as they are called, and the models of ancient art, there is no question that we could also easily get, through the Government, from the Vatican collection at Rome, a cast of the Apollo Belvidere, of which there is no copy in this country at all. That is the one that Raphael introduces into the painting of the "Transfiguration." It is the finest presentation of the human face that has been made in all the ages.

By the CHAIRMAN:

Q. If we had them, what could we do with them at present?—A. It would not require much room to hold them.

Q. But where is there a single national building at present existing where they could be placed?—A. All of the Elgin marbles would occupy but a small space.

Q. But you are speaking of duplicates of the various works of art in the British Museum, as well?—A. Yes, the archæological works.

Mr. CALL. I suppose you would consider the Smithsonian Institution the best place for them?

The WITNESS. Yes. All the classical pieces proper that do not belong to art education would stand in this room.

Digitized by Google

The CHAIRMAN. I do not mean to indicate that it is a work that should not be undertaken. I believe there ought to be some provision made in the direction you mention on a large scale by the National Government and a national university also. All these things could be developed in this country, I think. You think that those could not well be obtained on the solicitation of a State government.

The WITNESS. I think they could, but I do not know the State that would undertake to do it.

### COST OF A SCH OOL OF FINE ART.

By Mr. CALL:

Q. What would it cost for the Government to establish a school of art of that kind?—A. I have already said that I did not think it desirable to do that, but it does not cost much to establish a school of art. You simply want plaster casts, and nothing else. But there should be a library. I believe I own the only art library in the United States. To establish an art school——

Q. [Interposing.] I mean in a manner creditable to the Government of a great people.—A. To secure those casts, I suppose $50,000 would be enough, even supposing that we had to pay for everything in the most expensive form. But I think that we would get casts for nothing. I know they do that.

Q. You do not think that $50,000 would be the entire cost, do you?—A. Yes.

Q. Not exceeding that?—A. No. I have carefully written out a scheme of a fine-art college in all the five departments of art, based on the French system, in the city of New York, including rent of premises, and the expense would be about $1,500 the first year. That is based on the idea of $150 for each pupil for a whole year. There is no such cheap tuition anywhere on earth.

By the CHAIRMAN:

Q. What opportunity is there in this city for the common people to visit such works or museums without expense?

### THE METROPOLITAN MUSEUM OF NEW YORK.

A. There are certain days when they can visit the Metropolitan Museum of Art.

Q. How extensive is the collection of art objects there?—A. It is the most extensive that we have in the sense of variety.

Q. And selection and merit?—A. No, sir. The selection for the benefit of the sanitary commission on Fourteenth street was the greatest we ever had in this city; but those were "loan" pictures. That is a system inaugurated in this country—it is unique here—a "loan collection." If these places were established that I speak of they would be necessarily, as an incident of their history, what is called loan collections. Once a year those who own pictures would be invited to loan them, and it would be highly educational.

### IMMIGRANTS.

Q. Here is a subject I wish to have your opinion on. New York and other large cities are full of foreigners. You have alluded to the Garibaldian soldiers, and the effects of education of the eye in opening the

Digitized by Google

souls of those men to the spirit of patriotism and the growth of high sentiment, so that they became a soldiery that overthrew an existing Government and established liberty in Italy. Do you find in the children of those men here of such of the foreigners as are sometimes called "foreign paupers" anything of that aesthetic quality that might be developed by art education?—A. No, sir; I would not say that I do, as a class.

Q. I was going to inquire whether they could be readily reached, lacking as they do lack knowledge of our language?—A. I think that would be an incentive to the study of our language, though incidentally only. But there is a law of natural selection that determines emigration from any country. It was the persecution in Holland that sent some of the best people of Europe to our Southern States, and it was the persecution in England that gave us some of the best population of the Northern States. I verily believe that if gold had not been discovered in California in 1848—and I remember it very distinctly, for I was a mechanic in this city at that time myself—there would have been most terrible suffering from the desperation among the working classes—the feeling that makes public security very fragile. If it had not been for the drawing off of our population from one section of the country to another there might have been serious trouble.

Q. What was the condition at that time?—A. Every industry was prostrated. All industries were working on half time.

Q. Where was that?—A. In the city of New York. I remember the period of 1837, also, when an army was raised in New York, I may say, to engage in the Texan revolution. They came near taking a State from Texas just from the fact that the people had to seek any direction for bread. The great mass of people must be supported in one of three capacities—either as laborers, prisoners, or paupers. Such labor as we have in the country, which represents the means by which they can get what we call currency with which to buy other things—the purchasing power—must be so spread around among the working classes as to give them all a share.

### NECESSITY FOR SHORTER HOURS OF LABOR.

I have been long of the conviction that in proportion to the increase of labor-saving machinery which produces, but at the same time cuts down manual labor, there should be legal limitations to the working hours, enforced in such a way as to make them practically universal. If we had now twelve hours a day, as we had when I was a boy, in the city of New York, it would represent a desperate, starving community. When I was a boy I was one of a committee to go out to the police stations between 12 and 2 at night to see those who sought shelter there, and I was amazed at the numbers of people who went to those stations for the mere privilege of sleeping there. I remember on one occasion an Englishman came in with a little girl and said: "Can we get lodgin' 'ere?" The officer told him "no." The man says, "Isn't this a prison?" "Yes." "Well, can't we get in 'ere and sleep? They say you let 'em do that." "No; this is a place for prisoners." "But can't a poor man and 'is little child get a place 'ere to lie in?" "No." The man went straight across the street and plunged his arm through a large pane of glass, and came back into the station and said: "Now I can get in, I fancy."

By Mr. CALL:

Q. You saw that?—A. Yes, sir; I saw that.

Digitized by Google

### A CASE OF MURDER IN "SARTOR RESARTUS."

And there was a case mentioned by Carlyle in, I think, the footnotes to "Sartor Resartus," in which a man belonged to a burial society in England, where they gave so much—I think 6 pence—a month as contribution, and if a member of the family died the expense of the burial was paid by the society, because labor is so poorly rewarded that they cannot get enough money together to pay the expenses of the funeral. In a season of distress this man actually killed two of his children in order to get money to buy bread for the other two; and, when the facts were ascertained, the society refused to pay, and the case was presented in court.

Q. Do you believe that?—A. It is a veritable incident. It is mentioned by Carlyle as such, and is well known in England; but it is a desperate case, I admit.

Q. But you do not think that such desperate cases as that are the rule in England?—A. Well, there was a time in Ireland, in 1848, when a man could be got to work for 8 pence a day—16 cents of our money—and out of that he had to find everything with which to support his family.

Mr. CALL. That, of course, is a terrible state of affairs; but it is better than the case of the man in England who killed two children to feed the other two.

The WITNESS. Oh, yes; that is one of the cases where there is a strange transition from the human to the opposite—an oscillation.

Mr. CALL. The testimony before us and the testimony of the general reports of labor in the United States is not to the effect that labor is so very poorly paid as that.

### LABOR AND WAGES IN ENGLAND.

The WITNESS. There was a meeting in England two years ago of the representatives of the agricultural laborers, at which they presented and discussed statistics and statements regarding their position. They presented to the Government the statement, as a fact solemnly averred by them, that they could not afford to touch animal food more than once a month.

Mr. CALL. We have had an exhaustive report on that subject from our consul abroad—a very valuable one, and it does not show any such condition as that, but states the condition of labor, although not what it ought to be, as nothing like such as you mention,

The WITNESS. Well, you can get plenty of men to go on the police force in London at £1 a week—$4.84; a sergeant of police gets £1 5*s* a week.

Q. What do you consider the condition of labor in this country at this time?—A. I cannot give you a very intelligent idea of that. I have been living abroad for ten years—in England, Palestine, Egypt, and elsewhere, so that I have not got a sufficiently particular knowledge of the field here to be able to make a satisfactory reply.

### A UNIVERSAL EIGHT-HOUR LAW NEEDED.

I consider, however, that what you may call the natural laws of industry in this country are producing that state of things where the wants of society can be met without giving eight hours a day of labor to the laboring classes as a body. Of that I am satisfied.

Digitized by Google

Q. Would you be willing to take the responsibility, if it were in your power, to enact such legislation as to make compulsory all over the country such a regulation as that?—A. I have not had occasion to consider the question with reference to the practical exercise of the power. I say the thing ought to be done as equity, and as a social and industrial necessity, and that it is an element of national protection in the sense of public order being needful for us all.

Q. Are you quite sure that you would not starve everybody if you were to adopt a regulation that all should not work more than eight hours a day? Are you quite certain that the economic result would not be a failure of subsistence for everybody?—A. It would practically lessen the number of laborers if carried out in the way I mention.

Q. Would it not lessen the amount of agricultural product?—A. There would be exceptional pursuits, such as the baking of bread, which it might be necessary to carry on at all hours of the night and day; the driving of horse cars or the carrying on of agricultural labor perhaps. But even those would be exceptions which wise legislation would discriminatingly take into account. I think one of the calamities of the whole science of legislation is to generalize too much and not prescribe for the specific case. I consider that our tariff was always in that state, because it was not possible to get at things except through the men who are interested in the things themselves. I was amazed at the things I heard about it. So in reference to regulating labor and the hours of labor.

There are several things that should be done that are expensive to society.

## SUPPRESSION OF VICE.

There should be a suppression of vice. The vice which is exposed daily in the city of New York is appalling. The property stolen, the people hurt, the time of men and women wasted in prison, the time lost to those who are injured through broils, &c., is very serious. But the cost of the agencies of the Government in its partial suppression of crime shows that the greatest extravagance is in attempting to be temperate with it.

Q. How would you suppress it? Are not those all fanciful ideas?—A. No sir; they are strictly realistic. I lived in Dresden a year and a half. In that city, if a woman is found doing a disreputable act as between the sexes, the presumptive evidence is acted upon at once, and the case is dealt with summarily. The woman and her paramour are put outside the city, and if they come back they are imprisoned for a year. Therefore there is no lewd women in Dresden.

Q. Do you understand that there are not done in Germany any "disreputable acts as between the sexes," as you term it?—A. Oh, there are, as there are Louisiana lottery tickets sold in New York.

Q. But not in the streets?—A. No, sir; the temptation to the young and uninitiated is not the same; the women do not stand in platoons on the sidewalk there as they do in Captain Williams' district in New York, leaning against the railing, and seizing a man and dragging him toward them; such a state of things does not exist anywhere else than here—and I have lived in Paris.

Q. Are you quite sure that the proper way would not be to study up what would be the best sort of remedial measures to adopt with such cases, instead of severe treatment?—A. The difficulty is that there is no attempt to remedy the vice in a man. I said to people in Paris that

Digitized by Google

if women ought to have licenses for vice, men ought to have similar licenses. If they should come to licensing the men as well as the women, the licensing system might do; but all attempts to regulate vice in Paris, Brussels, &c., has simply led to the increase of it. Vice, with all its incidents, including its diseases, has greatly increased wherever there is *quasi* encouragement given to it on the part of the government.

---

NEW YORK, *September* 25, 1883.

BAPTIST HUBERT sworn and examined.

By the CHAIRMAN:

Question. What is your residence?—Answer. No. 174 Worth street, in this city.

Q. What is your business?—A. I am a machinist.

Q. You may now make to the committee such statement as you desire.—A. During my life I have found that two things exist which no man can deny. The first is ignorance, and that has an important bearing on the question to be discussed here; the other is antagonism, which, from the point of view of human interest, is one that cannot be ignored. Various interests in life are opposed to each other—"every man for himself." That is the general law which guides and directs the action of men toward one another.

### EDUCATION AS IT IS, A SHAM.

The subject of education, which prepares men for the business of life, should be one of the first things to occupy the thought of people in a free country. Education as it is is a sham. It is not what education ought to be. There are men enough in the world who should be teachers, and there is material enough to build up schools throughout the civilized world; but our institutions as they are will not permit it, because if they did then those wise men who rule the world would have no occupation. If all men were wise and well informed, if all men were *savans* why, we would have nothing to do. In America, as throughout the entire world, we are dealing too much, in education, with the old things that have been taught for centuries. I am in favor of education in the broad sense—education in the old things as well as the new; but it seems to me that dealing with the old all the time and not at all or very little with the new is not a good way to educate.

### SCIENTIFIC AND TECHNICAL EDUCATION WANTED.

What we want is scientific, technical, and professional education. If young men were trained in technical and scientific schools until they were of proper age they would make much more useful citizens than they do now.

Education, after all, is at the bottom of this question of labor. There are many kinds of labor; manual labor, which is divided into industrial or skilled labor, and unskilled labor, in which a man has nothing but his hands. Brain labor is a very important element to guide the hands, but how few men are taught to use their brains in their work? It should be the object of education to teach a man how to use his brain

Digitized by Google

in connection with his labor. Education which fits a man to use his faculties for mere pastime is the wrong sort of education. He should be educated for labor.

There is plenty of room for the exercise of brains in every field of labor. I often hear people say that some man of their acquaintance is a mechanic, and that therefore he "uses no brain power." I can only say that when I leave my home and go to my shop I do not leave my brains at home. I bring them to the shop with me, and I find plenty of opportunity to exercise them upon my work, and I do not find that I can afford to do without my brains, no matter how apparently simple the piece of work may be on which I may for the time be engaged. My hands may do the work, but my brain always presides.

### ALL WORKERS, BRAIN WORKERS.

The great mistake of intellectual people, I think, is that they believe mechanics and workmen are working without brains. It is not so. Every man has brains, perhaps not highly cultivated, but, so far as his brains go, he uses them in his work. This is true not only of intellectual labor, as it is called, but it is true of all kinds of labor. Even the most humble worker uses his brains. The street-sweeper, although occupied in a very humble, and, to some, a very disgusting work, cannot afford to do without his brains. If he does not use his brains to direct him you will find the place where he sweeps to be poorly swept. Neither, again, can a man leave his body behind. His body must move with his brain.

### WAGES.

An important question in connection with labor is the question of remuneration. How is a man to be paid for his efforts according to the effort which he makes, and where are the laws to regulate men's efforts? They are in existence in name, but not in application, and we must make tremendous strides in the department of law and of politics before men understand this truth. Ever since I have been in New York—now a third of a century—I have heard great speeches from great speakers—such men as Wendell Phillips and people of his class—and they sometimes give forth a great thought which vibrates among the people, and does great good and helps the world to advance. But, after all, advancement is of slow growth, and one man is but a small part of a world, and the great question of time has yet to be solved. Where are the men who can solve it? I have been looking for a great leader who shall inspire the people with a knowledge of their power and of their rights and of their duties; I have been looking to Washington for such a man, but I have not been able to find him. I am in the dark and am looking for light. I know you gentlemen are devoting yourselves to the interests of the people, and I think this committee has done and is doing a great deal of good in conducting an investigation of this kind, because the things which you will find out here you will find it hard to see stated elsewhere.

### AMERICA MUST AVOID EUROPEAN PRECEDENTS.

This is a new country. Its institutions are strong; but they have not been harmoniously adapted to one another, so that there is jarring and confusion, and it will take time and friction to harmonize all the

Digitized by Google

conflicting interests. But if we once find the right path, and are able to follow it, there is a great future in store for the American people. If, however, we follow in the lines and along the paths that have been marked out for us by the old nations of Europe and of Asia, there is a deep pit into which we will fall. One of the steps leading to this pit is our false system of education; it is nothing but a sham. It begins with the boy when he is little, and it leads him on to nowhere. It leaves him on the threshold of manhood, as I may say, in a fog from which he cannot extricate himself, for, whichever way he turns, he cannot see much beyond his nose. That would do very well in a country where the people have nothing to say about their Government, and where other people lead them by the hand through this fog—people high in power and enlightment who can penetrate the darkness; but, in a free republic which was not made to crush the lives or souls of men, and which was established in order to make people free—in this republic things must be fixed so that men can see for themselves.

### EDUCATION SHOULD BE USEFUL AS WELL AS TASTEFUL.

The atmosphere must be cleared. Men will not be led by the hand, they will want to lead themselves. That is one of the necessary conditions of freedom, and it is one from which we cannot escape. We have certain duties in this world that must be performed, and the man who shirks these duties and throws them upon other people is not only a coward himself, but cannot expect his children to be any better than himself. Men only do this by ignorance, and they are ignorant because education has not been given to them. How can we give our children an education that we do not receive ourselves? There are enough books, and there are enough teachers; but the books are not of the right sort, and the teachers teach those things which do no good. Let them study science, and let them study the practical applications of science in the life of every day. It is only in this way that we can have citizens trained to the highest development.

It is not necessary, however, that in order to be useful we may not also be tasteful. We must admire taste and we must admire art, because art and taste are natural to men. They are parts of their nature and should be cultivated. Therefore when I have heard gentlemen speak before this committee upon the subject of art I have listened with attention to what they have said, and I have no doubt that if more attention were paid to industrial art among our young people we would have less of the brutal selfishness which we see displayed upon all hands. The struggle of life here is keen, and people are occupied so much with the mere utility of everything that they forget art and forget beauty. They seem to worship the almighty dollar; they all bend before it. This is most unfortunate, because it gives them a false idea of value—not only of the value of art, but of the value of everything about them. Men and woman are measured by the amount of money that they have, the amount of fine clothes, and carriages and luxuries in which they have indulged.

### THE HIGHEST STANDARD OF VALUE, LABOR PERFORMED.

The thing to represent value, after all, is labor performed. That is the highest standard of value. To my mind, therefore, the greenback is no more a representative of value than silver or gold. Educate your

Digitized by Google

children to regard money as a good thing in its way, but not the best thing to have in this world. It is better to have a conscience, better to have taste, and better to have adaptation for the business of life, to live honestly, and at peace with your neighbors than it is to have more dollars than you can make use of. If men would but recognize this fact it would establish among all mankind that sort of influence which is like the influence of the electric current. You cannot touch any question that is not affected by this false notion of value.

## EDUCATION OF CHILDREN.

Children should be taught from their earliest age to use their hands and minds together, and should not be taught to make of their brains mere intellectual machines without the help of their bodies. They should be taught a sufficient variety of practical matters to give them some interest in the labors of other people. If a boy is brought up in the city, he should be taken in the summer time into the country, and should be made to associate with the farmers and people engaged in agriculture, and he would have some sympathy with their wants and more brotherhood for them than city men now have for their poor hard-working neighbors in the country. When boys are fourteen or fifteen years of age they should be able to do in their schools something which would pay the State for their education, and as they grow older they should be taught to understand and to exercise the duties of citizenship. A man should only be admitted to citizenship when he gives evidence that he is fit for it. In that way you will have true citizens, and not men who sell their votes; you will not see men fighting and disturbing the peace, nor wasting their time in listening to cheap oratory among ward politicians.

## INVENTORS AND INVENTIONS.

We hear a great deal said of inventors and of inventions; and we hear it said that the inventor does not get the result of his labor and of his thought. This is very much so, and it is largely owing to the fact that men are not thoroughly trained in their business. If a man could learn to become a practical man, and could learn to use his ideas in his business, and adapt them to the practical wants of his business, then you would not see so many inventors at the mercy of the men who can give them a little money to help get out their patents, and put them on a business basis. This question of practical education, as I have said before, lies at the bottom of all prosperity in the state. The Government can do a great deal to make a practical system of education universal throughout this land. A system could be organized which, in usefulness and advantage to the great mass of the people, would be far ahead of any of the learned colleges. Each man could have his specialty, and could be thoroughly drilled in that specialty; but he could also know some little of the work and labor of other men, and so he would have a broader mind and a larger heart and better feeling for his fellow workmen, whether engaged in the same field of labor with himself, or otherwise. In that way this country could build up great men, not only in science and in the arts, but great men in the sense of good men and good citizens.

I thank you, gentlemen, for the patience with which you have listened to these few remarks.

Digitized by Google

NEW YORK, *September* 25, 1883.

EDWARD NEWBERRY sworn and examined.

The CHAIRMAN. Please state briefly to the committee what you desire to present within the scope of the resolution under which the committee is conducting the examination.

The WITNESS. I shall occupy but a very short time in the remarks that I have to make.

### HUMAN GOVERNMENT SHOULD BE A REFLEX OF DIVINE GOVERNMENT.

It seems to me, gentlemen, that the government of a nation should be a reflex of divine government, and then only can it be a success—then only will it educate, not only the people of its own country, but bring all nations up to a high state of excellence. The great end of man is affection. It is man's mission to utilize all truth in its application to life—the highest aim being the perfectability of man—as we all attribute to the Divine Being perfection—the balance and harmony of all opposing forces, all phenomena. Hence the divine will is working towards the perfection and harmony of all things in the truth, and to govern a nation should therefore be to perfect its individuals. Perfect man is a spirit of good and evil; that is, in the knowledge of good and evil—acting good in the knowledge of evil—and therefore evils must exist in the progressive education of every spirit. That, of course, we cannot alter.

But government should not make men evil, and that is what it unfortunately does, not only here, but elsewhere.

### ENFORCED CHOICE OF WRONG OCCUPATIONS.

For instance, if men are driven by circumstances into monotonous industries agreeably to their deformities, increasing their stronger faculties, which are already harmful, to the neglect and disintegration of their weaker faculties, which may be the good—if in that way they are following the law of death, it is a great misfortune to the men themselves and to all mankind.

Now, a government should have for its object something like the divine motive—to integrally organize men; to encourage them in the strengthening of their weaker faculties and in the subduing of the faculties that are too strong, and so favoring the progressive attainment of all truth in its application and uses.

How terrible must be the conscience of a man who has monopolized the rights of his fellow creatures and degraded and depressed them into semi-starvation—destroying them by monotony of existence. Why, we actually destroy ourselves and each other. It is the law of human spontaniety. Just as the strong faculties usurp the strength which should be devoted to the development of the weaker within us, so it is in the social mass called society—the strong oppress the weak by every divisable scheme; such a life is a hell upon earth, and such lives many men suffer.

### USEFUL EMPLOYMENT.

The true moral government should, in the first place, guarantee to every individual useful employment in the production of all the necessaries of life. That would produce an immense surplus even though they

Digitized by Google

exercised their faculties agreeably to their development, without any excess. Government should also establish justice, and should sell the results of the guaranteed employment at the cost of production and distribution—superseding all profits of labor, all interest on capital, and all the means by which the rich rob and oppress and destroy, not only the poor, but themselves. If we could establish that much, all things else would follow in the natural order.

We find now that everything that ought to be under the Government is not, and is not properly administered. For instance, we have here a number of medical schools of different theories quarreling among each other; they cannot be perfect because they are not free to become perfect, even in their departments. A medical institution should be like every other institution—commercial or mechanical, industrial or agricultural—all these things ought to be managed by the Government. This could be done just as well as the Government manages the post-office. If there be any department of activity in this nation which is thorough, it is the work of the post-office, and that is done at the smallest expense. If that work were done by private individuals or corporations they would be rolling up enormous fortunes for themselves to the detriment of the people. Why, then, should not everything be owned by the Government? If the Government was rightly constituted I do not see why this should not be done; if the Government was not a fraud, and if it was as it should be, this could be done. Every physician should be guaranteed his location, and should teach in the public schools in his department of usefulness and science; and when the pupils arrive at an age and a capacity to receive their diplomas, they should each go, or be directed, into that department and branch of usefulness for which they have the highest aptitude, whether under the control of the municipality, of the county, of the State, or of the nation. When they have passed through all those grades, and have become thoroughly educated—the medical student, for example, in all that is known to medical science—then they should be guaranteed their location. Why should not every man in his capacity, whether as lawyer, as farmer, as merchant, or whatever his field may be, be guaranteed the usefulness of his faculties in the same way? Why should we have great masses of people crowded up into single rooms in the cities, huddled together in centers of pestilence and disease? Why should we not have integral homes—beautiful hotels, in which people may have ample room and fresh air—in which they shall have all that science can contribute to their welfare and all that art can contribute to their tastes? This would produce for every individual the highest practicable disposition of his powers. In that way it would be cheaper to live in first-class homes than to live in the shanties and crowded tenement houses in which the masses of the people are congregated.

### EDUCATION.

Why should people not be guaranteed education in all its departments of necessity in life; in all those sciences that contribute to the elevation and progress of human kind? Children brought up under these conditions would grow to manhood and to womanhood with every advantage in their favor. When they came to vote they would have the knowledge and will to select the choicest flowers in the garden of humanity, to be placed in positions of eminence and power in the State. This would produce a social order which would be a heaven upon earth.

Digitized by Google

### TRAMPS.

There is no reason why there should be poor men or tramps in a rich land—a land as rich as any that the world has ever known. There is no occasion here for poverty; riches ought to overflow the land.

### NEW SOCIAL ORDER.

If men were guaranteed employments, and all goods were sold at cost of production and distribution, then the workers would not be supporting armies of rich idlers, and on the other hand there would be no army of idle poor as there is to-day. All men would be guided according to their capacities and tastes into that line of life and activity in which they would be able to contribute the largest degree of usefulness to the state and to society. The best people of the Old World would come to us under such an order of things, and by degrees the countries from which they came would be forced to adopt the same system of mutual guarantee and justice; and so all the world would gradually but surely develop toward perfection. It is our duty to perfect each other, not only as individuals, but as nations, integrally and in harmony with truth and usefulness. That is the great beacon light of truth to which every statesman should look for enlightenment. It would establish an order of things of which no man would complain. What a contrast that would be with the condition of things that we see to-day—the misery, the starvation, the disease, the life-wearing monotony of industry—the steady march to death of the great masses of mankind who are crushed down by the circumstances in which they find themselves placed, and from which their limited knowledge and the darkness of their intellect gives them no means of escape.

---

NEW YORK, *September* 25, 1883.

KINAHAN CORNWALLIS examined.

By the CHAIRMAN:

Question. You have given some attention, have you, to the condition of American authors in comparison with the authors of other countries?—Answer. I have, sir.

### THE POSITION OF AMERICAN AUTHORS.

Q. If there is anything peculiar in the condition of American authors as compared with those of other countries—placing them at a disadvantage so far as the American market is concerned, whether relating to the copyright laws or otherwise, state what it is.—A. The American author, in the first place, is at a great disadvantage in consequence of the absence of an international copyright law. Publishers are able to get for nothing all the books they want by reprinting the works that have already met with success in England and other countries, as well as works by such well-known authors as promise success, even though they have not been long enough published to ascertain the particular success of the special book. So long as American publishers can republish, on those terms, all the works that are printed abroad which

Digitized by Google

they think are likely to meet with popular success here, they have no inducement whatever to pay a copyright to American authors. Again, even if they had no copyright to pay to American authors, they would be to a disadvantage in printing American books, because it costs more to print from manuscript than from type. In that way they also save the cost of authors' corrections of the proof-sheets, and various miscellaneous expenses in connection with printing from manuscript.

Q. These same items of expense which are saved to the American publishers have already been incurred by the foreign publisher?—A. Yes. And in republishing a foreign work they have the guarantee of the success already achieved by that work, or the *prestige* of the author's name sufficient at least to cover expenses, if nothing more. I came here to-day unprepared to enter into particulars on this subject; but I have already embodied all the points in an article which I wrote for the Manhattan Magazine, published in this city, and it appeared in the September number. If I had the article with me it would suggest many points that may not occur to me now. But there are some topics in connection with it that I can place before the committee without memoranda.

## EFFORTS TO PROMOTE INTERNATIONAL COPYRIGHT.

With respect to the efforts that have been made for the promotion of an international copyright law, those that have been put forward by the American publishers thus far have been merely schemes for their own protection against the piracy of rival publishers—not for the purpose of securing justice to authors, or of remedying the great wrong that now exists. And there is no prospect of any movement towards a true international copyright law involving justice to authors being made in this country, at the instigation of publishers or of any of the trades concerned in the manufacture of books.

The printers, binders, and paper-makers are allied with publishers in their efforts to continue the present state of things. They have an idea, which is to some extent well founded, that an international copyright law would restrict the publication of books. Certainly it might exercise some check upon the mass of reprinting that is being done at very low figures. If an international copyright law existed, it would involve the addition of the author's copyright to the present price of these cheap reprints. It is true that would not be much; if it were 10 per cent. that is all that any foreign author would ask, or that any American author on his first print would expect. That would only amount to one cent on a ten-cent publication, and would only amount to ten cents on a dollar publication, and that would be a very small addition to the price of the book. Most of these reprints of to-day are only twenty-cent publications, and the percentage to authors on that basis of sale would be only two cents a copy; and certainly the public are very willing to pay that. But so long as the people are not inconvenienced by the existing arrangements, it turns out that what is everybody's business is nobody's business, and so neither the public in the mass nor individuals composing the public take hold of this matter. They are not individually interested. Men are busy about their own affairs and do not care to trouble themselves about the affairs of others. Therefore it is that an international copyright law has become an abstract question in which very little interest is felt except by those immediately interested. Authors on both sides of the Atlantic simply say that this is robbery.

Digitized by Google

AUTHORS ROBBED.

Q. Why do they say so?—A. Because the English author publishes his book at home, where it has, we will say, a small circulation (say a thousand copies), which at the high price of books published in England is enough to pay expenses, and secure him some retrun for his labor. That book is republished in America and has a circulation in cheap form, of from 5,000 to 20,000 or 25,000 copies, but the author gets nothing for it. He considers that he is defrauded of the copyright to which he is entitled for that circulation.

The American author looks on and sees no market for his book. He writes a book and offers it to a publisher, the publisher says to him: "You are not very well known, and we cannot compete with these reprints without having some great name on the book which we may publish, or without having some very striking and unusual feature in it." The consequence is that his book remains in manuscript, and to-day there are probably as many manuscripts of American books good, bad, and indifferent, in existence in the United States as there have been American books published in the last twenty years, showing the great intellectual waste that is going on arising from want of an international copyright law.

Q. Is it also the fact that thereby the American people are brought into contact with foreign ideas and foreign treatment of subjects, instead of with American ideas and American treatment of subjects, so that the mental and moral training of the people is apt to have a foreign tinge?—A. Yes, but there is no objection to that, because literature should be universal—the "Republic of Letters" is a broad one.

AMERICAN LITERATURE STIFLED.

But the great evil resulting from it is that American literature is stifled, and instead of our being able to build up a literature worthy of a great nation, and corresponding with our vast material progress, we are making no progress whatever in that direction. Therefore it is that the vast mine of literary wealth in this country is to a great extent unexplored. The great field of American literature is, in consequence, imperfectly worked. There are thousands of things that are inspiring and suggestive in this vast and growing country, with all its diversity of race, language, institutions, manners, and customs, all of which are but faintly represented in our national literature. The time will come when an international copyright law will no doubt be secured. Then, and not till then, will we begin to increase our literary wealth so as in some degree to correspond with that which already exists in England, or in any of the countries of the Old World. At present we compare very unfavorably with English literature.

Q. What contemporaneous literature?—A. With both contemporaneous and classical literature—old literature.

VAST DEVELOPMENT OF ENGLISH LITERATURE.

The reason why we have so much to reprint is because of the vast development of English literature—the vast amount of material that is constantly emanating from the press of that country. If England were as barren in literary works as America is, there would not be so many foreign books to reprint, and American authors would not be so discouraged. But there is such a prodigal supply of English books con-

Digitized by Google

stantly coming here, that it makes up for the dearth of American books. While that exists there is no danger of a book famine in this country. At the same time American literature is being starved by this very redundancy and plethora of literature.

Q. Do you think that the publication of American books would make a difference in the republication here of foreign books?—A. No, not much; but it would raise the price by the amount of copyright paid to the author. But I think it would have a very stimulating effect on the publication of American books if we had a copyright law in existence. At present, if a great American epic, an Iliad or a Paradise Lost, were written, it would be likely to remain in manuscript, because no American publisher would be willing to undertake the risk of publication, and, if published at all, it would probably have to be at the risk of the author.

Q. Do you not think that a work of genius would sell even against the competition of these reprints?—A. It will sell just as well if it is a republication of the work printed and sold abroad.

### ENGLISH TASTES IN AMERICA.

The American people have no preference for American over English works. On the contrary, I think there may be said to be a preference for English works, as we all know there is for English plays.

Q. There was a cigar-maker before the committee recently who said that the fact that a cigar was known to be of foreign manufacture, and imported into this country, would enable it to sell better than an American cigar, which would seem to indicate that Americans have a sentiment akin to hero worship, preferring a foreign article to an article of home manufacture?—A. Yes, I am sorry to say, that it is still true that a man may be a prophet everywhere save in his own country.

Q. Does the English author stand as well as the American author of acknowledged genius?—A. Yes. That is shown by the fact that very few American books are published in England. The English people depend on English authors for their literature. If a good American book is published, one that achieves great celebrity here, it will be read in England, just as Longfellow's, Hawthorne's, and Howells' works are

Q. Is it not a fact that an unknown author, however great his merit, has at first to make his way among his own people, and be celebrated at home—for instance, could an unknown English author's work be pirated and republished here and sold to the American people with any greater facility than an equally unknown American author's work?—A. No; but it would not be published here at all. American publishers have their pick.

Q. But is it the same with regard to American authors writing books that are well known abroad, like those you have mentioned; will they not sell abroad?—A. Yes. Longfellow's works have always been sold more abroad than here.

Q. But neither gets a copyright from abroad?—A. No. The American author is robbed also in England.

### PROVISIONS OF A PROPOSED INTERNATIONAL COPYRIGHT LAW.

Q. What provisions would you put into an international copyright law?—A. I would certainly say that the maximum copyright upon a book should be 10 per cent. upon the price of the book.

Q. To be paid as a royalty?—A. Yes. That should be the maximum;

Digitized by Google

but English authors would be glad to get 5 per cent. In other words, they would rather have half a loaf than no bread. Speaking of the success of a book reprinted in this country—an English book, we will say, reprinted here—the success of the reprint is not always in the same proportion as the success of the original edition in its own country.

HENRY GEORGE'S "PROGRESS AND POVERTY."

For instance: Mr. Henry George's work on Progress and Poverty had a very limited circulation here compared with what it had in England, and it made Mr. George no reputation until it was republished in England. There its circulation was in one year ten times what it was in this country. That fact immediately reacted on this country, and a cheap edition of Progress and Poverty was issued and became very popular, and more copies of it have been now sold in America probably than in England.

Q. Does that inure to the benefit of Mr. George?—A. Mr. George has not made a penny by all the circulation of his work in Europe.

Q. How about his own country?—A. In his own country he has a copyright, but abroad he does not receive a penny from all the sales that his book has had there. I believe it is being translated into many of the languages of Europe; but we have no international copyright law with any country, and therefore it is that if an American author does achieve a success here, his book is just as liable and just as certain to be reprinted abroad, without a penny of compensation, as is the work of an English author to be reprinted here without any compensation.

Q. You think, then, that there ought to be a system of international copyright laws, as there is a system of patent laws to protect inventors?—A. Certainly. I think such an international copyright law should first be made to apply between England and this country, and from that would follow quickly similar laws involving the right of translation with France, Italy, Germany, Spain, and other countries.

Q. You understand, of course, that inventors protect themselves by making their application or arrangement for patents in the foreign countries before the publication of the patents here?—A. Yes.

Q. Could not a system be devised by private agencies so that the author of a book could arrange for the sale of his book with some foreign publisher?—A. In a treaty such an arrangement might be stipulated for.

THE PRESENT STATE OF THE LAW OF COPYRIGHT.

Q. I mean without any treaty at all. A. Not now, unless, first of all, the book is published there. If an American author were first to print his book in England, it would be common property here.

Q. That is, if he published it in the first instance in England?—A. Yes.

Q. Would he then be protected by the English law?—A. He could copyright it there.

Q. Would his publisher be protected?—A. Yes; if he copyrighted his book in England, and if it had not been published elsewhere. He would get a copyright in England for it, but he would lose his own country.

Q. He could not get a copyright in both countries?—A. No, sir; because it would be reprinted here as an English book, and he would forfeit his right to copyright in this country by the fact of prior publication in the foreign country. Copyright, in other words, cannot be se-

Digitized by Google

cured for the same book in two countries, that is, for an American or English book, under existing laws. Having no international copyright law, an American cannot copyright anything in any country but his own, unless he sacrifices his own country, which he would do by prior publication abroad; and, in that case, his book could not be distinguished from an English work, pure and simple. His nationality would not be called into the question. If it had not been published elsewhere, he could assert his copyright here. But what he wants to do is to get what he is justly entitled to as a royalty or compensation for the publication of his book abroad.

Q. Does anything of this kind happen—that books which find their natural and exclusive market in this country are produced abroad, like ordinary school or text books, which, though produced abroad, are republished in such way as to come into competition with like books by American authors?—A. No; because the school books that are used in England are not available for the schools of this country.

Q. No; but are they prepared in England with adaptation to American wants and republished here?—A. No; I think not. I think that all school-books used in American schools are written for the purposes in America by Americans.

### AMERICAN TEXT-BOOKS.

Q. So far as the text-books of either our higher or our lower schools are concerned the rights of American authors in that direction are not infringed upon, then?—A. No; I think there is no republication of primary-school books by either country; at least I have never seen one.

Q. Or text-books of more advanced kind?—A. There have been text-books altered, adapted, or edited for our schools.

Q. Lexicons and the like?—A. Yes; take Carpenter's Physiology, for example. We have had an American edition of it with notes; and so with a great many books, as Dr. Smith's School Classics, &c.

Q. Those come in competition, then, with the books made here?—A. Yes; those come in competition with American books; but the editions are American editions with notes.

Q. But they come in direct competition with American books of like character?—A. Yes; though they must be edited here in order to have a large sale. I have never known of an American school that would adopt an English book as published. All the books I have known that were English which were adopted here have been edited for this country, and by Americans. The Harpers have published a number of English text-books in the course of their career, but they have had them edited for the purpose of having them used in America. So with the Appletons. They have published English books with American notes.

### ENGLAND AND AMERICA AS FIELDS FOR PUBLICATION.

Q. The American authors have a field comprised of 53,000,000 or 54,000,000 of people who read English, and if they produce anything, they have the advantages of sale to that large number of people, while the English authors have only 35,000,000 to sell to. Why, then, on the whole, do you not think that the American has as good a chance as the English author?—A. He might have as good a chance, but it must be remembered that we have an almost redundant supply of reading matter for the 50,000,000 or 54,000,000 of people that are here, and that they do not crave American books as such; and that the American au-

Digitized by Google

thor, if he publishes, must compete with the foreign author; he must compete with these ten-cent and twenty-cent editions. These books do not allow on their price a sufficient margin for copyright to tempt him into publication, and if he publishes he must do it so as to sell at a considerably higher price. He cannot, therefore, compete successfully with these cheap editions. They cut him out. Hence it is that the sale of dear editions of novels has been killed—the old one-dollar and dollar-and-a-half editions.

Q. You have given the reason why the American authors' work cannot be published as cheaply as the foreign can be published.—A. Yes; as I say, through the greater cost of printing from manuscript, and making the author's alterations, correcting typographical errors, &c., besides which a copyright of course is expected by an author, and the publisher does not usually like to take a book without some arrangement of copyright—he would not expect to have a work given entirely free of copyright. There must be some contingent return possible.

Q. Are there any original works which are republished in this country without the American publisher making some equitable arrangement—perhaps as high as 10 per cent.—with the authors, if they are living, or their representatives?

MONEY VALUE OF ADVANCE SHEETS.

A. I made such an arrangement once with Carleton, the New York publisher, for the republication of the Cloister and the Hearth, by Charles Reade, when I came to this country in 1860. I made an arrangement by which I got 10 per cent. from Carleton for that book, but it was very exceptional, and it was in consequence of my having early sheets which gave the American publisher a start of about three weeks or a month over any other American publisher. We made a slight alteration in it so that it would have been hazardous for any American publisher to print it here, and they would have had to wait for a month or so, and during that month Carleton's sales would have been sufficient for all his outlay, and would also secure him a profit. But, unfortunately, since that time the duration of passage from Europe to America has been lessened by about half the time. Steamers make the voyage now in about eight days, while at that time fifteen or sixteen days was the usual length of time. Consequently a publisher here, buying early sheets, would have too short a start to make it an inducement for him to give much, if anything, for early sheets. The consequence is that early proof-sheets of even the most popular authors have become a drug in the market and are worth little or nothing. Then, again, the telegraph puts publishers in communication with Europe very closely, and they know everything that is coming out, and that lessens the inducement to buy early sheets. They can order by telegraph a copy of an English work sent over to them on the day of publication, and they can get it there in the shortest possible time—say, eight or nine days—after they send their order. The consequence is that our development in civilization, I may say, has only inured more and more to the injury of the foreign author, and indirectly of the American author, too, because the more the English author is cheated, that is, the more his works are published here, the more the American author is shut out even from his own market.

Q. Of course, the profit to the foreign as well as to the American author depends upon there being some sale of the book—the book must be consumed?—A. Yes, sir.

Digitized by Google

Q. The book is consumed by reason of an intellectual sense or appetite. Do you not think that the greater cultivation of that appetite by the cheap circulation of foreign intellectual productions gives the American author really a greater market than he would have if foreign books were shut out by a duty or by this other arrangement, and the American author left to the market which American products might have secured to him?

AMERICAN AUTHORS SHUT OUT FROM THEIR OWN MARKET.

A. The cheap republication of English works certainly diffuses a vast amount of information and learning among the masses of the people, but it shuts the American author practically out of his own market. If you choke up the field with cheap foreign reprints, you certainly do not present a very inviting field to an American author who has an original work to bring out.

Q. If he is to bring out the same work, I grant that you are right, but he is bringing out an original work, and, if there is money in the country to pay for it, he has the better chance.—A. But he has to compete with these cheap reprints that have no copyright to pay, and in order to compete with them he would have to put his book down to such a price as to give him no compensation.

Q. Not unless it is a book of the same kind.—A. No; because the majority of people in buying a novel, for example, they do not care what book they happen on. It is so with books of all characters, except perhaps technical books and scientific books, and other books of more ephemeral interest that cannot find sale among a large number of people. To those the argument does not extend quite so forcibly. But even there they have to compete with works that are reprinted.

NUMBER OF PERSONS LIVING BY AUTHORSHIP.

Q. How many men or women do you believe there are in the United States who are living by authorship—by literary work of that kind?—A. I could count them on my fingers, all who depend on authorship, pure and simple, and even those have made what money they have made first through the magazines or newspapers. Take Longfellow, and Bryant, and Howells, and Hawthorne, and all those men. They received very little until the close of their labors by the publication of their books; not enough to be worth mentioning, although, as they went along they had received considerable from time to time from the magazines and papers to which they had contributed. Ten years before his death, Longfellow said that he had never made anything out of his books. In other words, he had been paid merely for the magazine use of them, and the sales of his books, until within ten years of his death, were not sufficiently large to make it a matter of any consequence. In England he had ten times, perhaps fifty times, the circulation that he had in America, and did not receive a penny from that country.

AMERICAN LITERATURE LANGUISHING FOR WANT OF INTERNATIONAL COPYRIGHT.

Q. Is there any further suggestion in that direction that you wish to present to the committee?—A. I would merely say that until we have an international copyright law American literature is liable to languish continually, as it has languished ever since the era of cheap reprints

Digitized by Google

began. Before that era began there was some chance for an American author to get his book into print; but during the last few years the competition has been so great from that source that he is practically shut out.

The CHAIRMAN. We would be glad to take your article, which, of course, presents your views more justly to yourself, and give it consideration.

The WITNESS. I shall be glad if you will. I may mention, in closing, that, in consequence of this state of things, literary talent is driven into journalism; and that, in consequence of that fact, more men are buried alive in journalism in the United States than in any other country in the world. In journalism they can earn a living, such as it is, whereas by authorship they would altogether starve.

Adjourned.

---

NEW YORK, *September* 26, 1883.

The committee met at 10 a. m.

JOSEPH MEDILL examined:

By the CHAIRMAN:

Question. You have read the resolution of the Senate directing the investigation which we are conducting. Will you please give the committee the benefit of such facts and suggestions as occur to you to be pertinent, under the resolution? You may do it in your own way, with such arrangement of topics and at such length as you desire. The committee will be glad to hear fully your views on the subject which they are investigating. Before you proceed I will ask you to state, if you please, where you reside, and what is your occupation.—Answer. I reside in the city of Chicago, and my occupation is that of publisher of a newspaper—the Chicago Tribune.

Q. For how long a time have you been connected with the press?—A. I have been connected with the press since the year 1848, and in Chicago since 1855.

Q. You may now proceed, if you please, with the expression of such views as occur to you, under our resolution.—A. When I learned that I would be summoned to appear before the committee, and recollecting the general tenor of the resolution, I sat down last evening and devoted an hour or more to condensing, as much as I could, some views that I desired to place before the committee, in the form of memoranda, which, with your permission, I will first read, and then hold myself in readiness to answer any questions you may propound, as well as I may be able.

I discuss this proposition:

THE LABOR AND CAPITAL PROBLEM; THE DISCONTENT OF THE LABORING CLASSES, AND SOME OF ITS REMEDIES.

The chief cause of the impecunious condition of millions of the wage classes of this country is due to their own improvidence and misdirected efforts. Too many are trying to live without labor—that is, industrial or productive labor, and too many squander their earnings on intoxicating drinks, cigars, and amusements, who cannot afford it. While they continue to spend their surplus earnings on these things they will not

Digitized by Google

get on in the world and will fail to accumulate property. The possession of property among the masses is really due more to saving than to earning; on small earnings a man may still save something, while no amount of earnings will improve his bank account without economy. The power of waste is vastly greater than the power of production. The wisest politician and the most original thinker on social subjects which this country has yet produced, laid it down as an axiom that "a penny saved is better than two pennies earned." It was the habit of saving which he inculcated as absolutely essential to success in life. I refer, of course, to Dr. Benjamin Franklin. It was to the working classes that he addressed his wise maxims, his suggestions, and advice. I have rarely known a steady, sober, industrious man, who saved his surplus earnings and prudently invested them but attained independence before old age.

### LIQUOR AND TOBACCO; THEIR RELATION TO THE LABOR PROBLEM.

And I have never known a workman, no matter what might be his wages, who freely indulged his appetite for liquor and nicotine, that ever made much headway. And that observation covers a good many thousand workmen with whom I have come in contact during my life—of all classes. This sort of people always remain poor and dissatisfied—complain of their "bad luck," denounce the tyranny of capital, and allege that they are cheated in the division of the profits produced by capital and labor.

### $600,000,000 ANNUALLY WASTED.

Those who have closely investigated the subject estimate that the money spent by the wage classes of our cities and towns on intoxicating drinks exceed $400,000,000 per annum. Of course, the total consumption of liquors is a great deal more, taking in the remainder of the population, which I do not include under this head; and to this enormous sum must be added at least $100,000,000 for cigars, and $100,000,000 for useless amusement, and gambling, making a total of $600,000,000 a year absolutely squandered by the discontented employé classes of this country. I have understated the waste of wages on those injurious indulgences in order to be safe in my estimate. The money thrown away on liquor by the wage-workers for the last ten years would have provided each family with a comfortable home free of rent, thereby emancipating all of them from servitude to landlords. If that squandered money had been loaned out at interest it would now amount to the enormous sum of $5,000,000,000—at a moderate rate of interest, say five per cent.—multiplied into the last ten years. And if invested in railroad stocks and bonds during that period, it would have transferred the ownership of every mile of railway in the United States to the possession of the laboring classes who have wasted their wages in drink. Drink is the evil progenitor of most of the ills which the poor man encounters and is the cause of the "bad luck" which keeps him in poverty. I have used that term "bad luck" several times because it is a stereotyped phrase in every household that has a hard struggle in life.

### SUPPORTING 250,000 SALOON-KEEPERS.

The wage classes cannot support in idleness a quarter of a million saloon-keepers, and their bar-tenders and families, and pay the rent of

Digitized by Google

their dram-shops, and at the same time hope to prosper themselves. No trade-union combinations, or knights of labor "strikes," to force up wages or shorten the hours of work will enable them to do it; and no relief that political legislation can give will essentially improve their condition in the absence of the virtues of temperance and economy, the corner-stones of prosperity and independence.

High license, and the higher the better, will do much to lessen the loss from liquor by reducing and improving the saloons that tempt men to visit them, and also by returning to the municipalities a part of the money extracted from their citizens. But upon a voluntary self-denial on the part of the drinkers themselves must chiefly depend this vitally needed reform of appetite. I have very little faith in the practical good of political prohibition or coercive laws in removing men's desire for drink.

One of the constant demands of the trades-union leaders is for the establishment of bureaus of statistics, and when they are created their most useful work will be in finding out and making known how much of the wages of workers are spent on liquor. and the effect thereof on the pecuniary welfare of the drinkers, and the injury done to health, morals, family, and society from alcoholic indulgences.

## UNHEALTHY TENEMENTS, AND THEIR EFFECTS ON THE DEATH-RATE.

I now wish to make a few remarks on another topic—bad, unhealthy tenements. Perhaps next to liquor drinking the worst ill that afflicts the tenant-wage classes is wretched domiciles—over-crowded, badly ventilated, poisoned by sewer-gas and excessively rented. Thousands of such structures in this (New York) and other large cities, including Chicago, where I reside, should be demolished by municipal authority as nuisances, injurious to the public health. It is a dreadful fact that in this naturally salubrious city the annual mortality exceeds the births by upwards of ten thousand, as shown by the sanitary statistics of the municipality, proving that were it not for the in-flowing stream the population of New York would become extinct and the city uninhabited. The proportion of deaths to births is as 4 to 3, while in London three are born while only two die. The number of births in 1882 in that city was, in round numbers, 150,000, against 100,000 deaths, showing a clear gain of 50,000, while New York suffered a dead loss, veritably, of 10,000 on one-third the population, and this is naturally, in my judgment, a more salubrious city than London. The premature deaths among the laboring population of New York and other large American cities in great degree, result from the brutal avarice of landlords and the criminal neglect of duty on the part of the demagogues who tax and rule the cities and permit such a murderous condition of things to exist.

Reform is necessary, not only here, but in all the other cities of this country, in the character of the abodes rented to the industrial classes. The rents exacted are twice or thrice too high, as a rule, and most of the houses are unfit for human habitation. And this is one of the bitterest causes of discontent among the wage workers—unhealthy and over-rented tenements. The rents of artisans' dwellings in England average about a dollar a week, as I ascertained last summer when I was there, after careful inquiry of intelligent men in several of the principal cities. Their sanitary condition is far better attended to than it is in this country, which in part accounts for the smaller rates of mortality in English as compared with the cities of America. All over England

Digitized by Google

badly constructed and unhealthy tenements are being torn down as nuisances, by corporate authority, under an act of parliament, and building companies are replacing them by a better class of houses for the working population, to be let at very low rentals. If private capital is unwilling in this country to provide decent and healthy abodes at moderate rents for the industrial classes of our cities, it may become necessary for municipal corporations to do it, and lease or sell the same to the wage-workers at a rate that would repay interest or cost. As good a public reason for this course exists as for providing school-houses, poor-houses, water, gas, fire-engines, &c., at public expense for the benefit of the people. I cannot see any good reason why the one may not be done if the other may.

I now come to another topic bearing upon this general question, which I entitle

"SHORT HOURS AND LONG PAY."

It is a standard belief in trades-union lodges that the ills of labor would be relieved in great degree by shortening the day's work to six or eight hours, as it would cut down production per man 25 or 40 per cent., thus creating a great demand for extra labor, which, in turn, would force up wages to a high point, say, twelve hours' pay for eight hours' work or fourteen hours' pay for six hours' work. And it is alleged and contended that nothing stands in the way of the adoption of this scheme of long pay for short work except the unfeeling selfishness of employing capitalists. In my opinion, this idea to get a "corner" on the labor market would prove delusive, and fail utterly, if tried; and for these reasons: increased wages for short work would instantly attract to this country countless multitudes of foreign workmen. They would rush hither as fast as fleets of steamers could bring them, and quickly swamp the demand for extra labor caused by short work. In a little while they would be soliciting employment at reduced wages, and offering to work for ten hours a day for probably half the pay that had at first been demanded for six hours' work, and this by reason of the oversupply of labor. But the panacea would fail to cure from the operation of another cause. It is an axiom that "dear labor makes dear goods." The effect of large wages and small work would be to greatly increase the cost of production and the price of manufactures in proportion to the enhancement of labor prices; the demand for such goods would necessarily decline, because the remainder of the community cannot afford to buy as large a quantity of artificially dear fabrics. Rents, too, would advance in the same degree that the cost of building houses increased, and the number of new structures would greatly decline, and that would cut off labor. Merchants would refuse to buy the excessively dear domestic goods produced under these circumstances, but would import what merchandise they needed, and if the trades unionists undertook to double up the tariff in order to prohibit importation, the great agricultural masses would sternly resist being thus fleeced for the benefit of any city class of producers.

The farmers constitute one full half of the American people, and they furnish one full half of the market for the productions of the towns. Their power to buy domestic goods is limited strictly to the amount of money they receive for their crops. The cheaper goods are, the more the farmers can purchase, and, conversely, the dearer, the fewer. The trades-union idea of short work and long pay would cut off a large part of this market provided by the farmers, leaving their dear goods unsold, and this would result in throwing multitudes of workmen out of

Digitized by Google

employment and on the streets; the farmers cannot be overcharged by the town artisans without the latter being punished for it by loss of market. This is a law of trade which the framers of our tariff are apt to overlook, and the railroad magnates who are practising the principle of charging for freight and fare "all that the traffic will bear" will do wisely to reflect that the higher their tolls are on agricultural products the less return freight or general merchandise they will carry, because their extortion will cripple the farmers' ability to pay for goods or travel on their roads. Fleecing the farmers is not the best policy on the part of either the manufacturers or the railroads.

## CO-OPERATION.

I will next say a few words on the subject of co-operation as a labor remedy. At one time co-operation was hopefully regarded as the solution of the capital and labor contentions. But after many trials in this country its advocates have become discouraged, and it is fading out as a feasible remedy for the ills of labor. Certain obstacles deeply grounded in human nature are encountered. The fundamental idea was to pay the workmen the full market price for their labor, regardless of the question of profit or loss to the manufacturer, and, if the works made any profit over interest on capital, to divide it with the operatives; but if the factory lost money, the stockholders were to stand it. The trouble was to find capitalists who were willing to invest their money on those terms—as the final outcome pretty certainly led to bankruptcy. If a manufacturer must stand all the losses when trade is bad, and divide his profits when trade is good, there is only one end to that system of business, and that is the closing up of the establishment. Where the experiment was tried, it was found that the workmen themselves soon became dissatisfied with the results of co-operation. (What I am saying now is based upon pretty close observation of a number of trials in my own city, and elsewhere, that I examined; and I was an enthusiastic admirer of this scheme, and advocated it for many years, so that I am not speaking as a prejudiced witness, but as a disappointed one.) If the mills made losses or small dividends the workmen found fault with the management or suspected their honesty, and appointed committees of investigation, who quarreled with the owners; that is always the case. Disputes also arose as to who should be discharged in dull times, and about wages when the shops were not finding ready sales for their wares. And these were very bitter causes of complaint; internecine quarrels were bred by them. Another source of discontent was the payment of equal wages and equal dividends to inferior or negligent workmen.

The trades-union lodges insist that all the workmen shall be paid alike, regardless of skill, activity, or value of service, as the loss from unfaithful or deficient work falls on the employer alone; at least they think so; that is the principle. Many other causes of weakness and disintegration manifested themselves; but probably the worst of all was the ignorance of the foreign workmen, who constitute the great majority of the mechanics in this country, and that weakness bred suspicion and destroyed confidence, and rendered harmony and united effort of workmen and employer impossible.

The co-operative experiments have therefore pretty much all failed, except in a few cases where the conditions happen to be peculiarly favorable. When these people are better educated in the future, and both sides have studied the subject more thoroughly, co-operation may succeed to some extent. Until then we must wait and hope for it as a remedy.

### HIGH-SCHOOL AND COLLEGE EDUCATION UNPRACTICAL.

I next come to the educational system of this country as bearing on the labor question. I refer to the high-school and college system of teaching. Our college system certainly does not train our youth in habits of useful industry; its purpose is not to increase the effectiveness of labor, to make two blades of grass grow where only one grew before; it does not show the pupil how, by acquiring a manual art, he can double or treble the value of his labor. It does not teach art or science in a practical form. On the contrary, college education is conducted with a view to imparting a knowledge of dead languages and the higher mathematics to the pupils, which is all well enough for the wealthy and leisure classes, but is not best suited for bread-winners. These academies attract hundreds of thousands of our youth, whose purpose is to acquire the art of living by their wits and avoiding manual labor; this, too, is the purpose of their parents in sending them to such schools. These academies have flooded the professions with men destitute of natural capacity for them, and have swollen the ranks of office-seekers, gambling speculators, and professional sharps, who subsist by preying upon the rest of the community. This American system of education has destroyed all desire upon the part of the youths to learn trades and become honest artisans, and it has crowded the ranks of the middle-men with searchers after genteel employment at wretched wages. Multitudes of farmers' and mechanics' sons seek to be salesmen, clerks, book-keepers, drummers for trade houses, and, failing to find or retain such situations, they become "sports," billiard-markers, bar-tenders, confidence men, dead-beats—anything, in short, but hand-soiling workingmen. With the exception of a few special branches of industry Americans have surrendered the mechanical fields to foreigners, and when more artisans are needed they are not trained here, but are imported, as we import our merchandise. This is all wrong. It is a cruel injustice to the rising generation of Americans and a source of weakness to the body politic. Every institution of learning should, in my judgment, teach art practically. Every college should have a department of mechanism and a chemical laboratory to impart the secrets of nature and the sources of force. We need industrial schools in every city, where the youth can learn trades that will equip them for the struggles of life and increase the power and productiveness of their labor, and elevate it in the eyes of the rising generation. They must be taught to respect rather than despise industry, and to hold working bees in higher estimation than the drones in the human hive.

When I had written thus far the hour was late, and my arm was tired, and I stopped.

The CHAIRMAN. But you do not need to stop now. Go right on with any other ideas that occur to you to suggest.

### POWER OF CONGRESS TO REGULATE RAILROADS.

The WITNESS. The next subject I had proposed in my mind to discuss briefly was what is termed "the railroad question," and how far legislation, applied in the way of regulating, governing, and controlling the movements of the railroads would benefit the community and benefit industry. From my reading, I have no doubt whatever of the constitutional authority of Congress to enact laws controlling and regulating interstate railroads—railroads passing into or through two or more States. I am referring now to the opinions of gentlemen learned in the

Digitized by Google

law, who have given the subject profound study—such men as Judge Cooley and others; and I believe it to be the duty of Congress to formulate a law of that kind for the good of the railroad companies themselves as well as of the community which patronizes them. Every merchant knows, feels, and complains of the evil to his business caused by the perpetual and unexpected perturbations of charge for the conveyance of goods and produce. The railroads seem to have no system of rates that last for any definite length of time. I print in my paper (the Chicago Tribune) a department entitled "Railroad Intelligence," and devote a great deal of space and attention to it; it is a sort of barometer of railroad doings. And when I look over those columns from day to day, and from year to year, I am astonished to observe the perpetual ups and downs of railroad charges.

### EFFECTS OF FREQUENT CHANGES IN TRANSPORTATION RATES.

We will say that the cost of conveying wheat or corn or any agricultural product from Chicago to this city is 25 cents per hundred pounds, to-day. On the strength of that rate our merchants proceed to buy wheat, corn, or oats all over the West, through a dozen agricultural States, and farmers make their bargains based on this cost of transportation from Chicago to tide-water. Suddenly, or with brief notice, the charge goes up to 30 cents. Every merchant who holds that grain, and it may amount altogether to tens of millions of bushels, has instantly lost 5 cents on each hundred pounds. That 5 cents is wiped out as completely as if it had been burned, or sunk without insurance. Then, if there is a fall suddenly of 5 cents a hundred pounds that affects not only the grain that was bought by the merchants, but the entire stock of produce remaining in the hands of farmers. At once, of course, there is a natural dissatisfaction throughout the whole farming community at this artificial fall. They cannot understand why their grain, which was worth yesterday, say, 50 cents a bushel for corn, and $1 for wheat, should have suddenly dropped down to 47 cents for one, and 97 cents for the other, while there is no change in the New York or Liverpool quotations. They cannot understand it. This will run along for a few days or weeks, and then there will be another cut down, 3 or 4 or 5 cents per hundred pounds, and down go the prices that the farmers expected to get for their products. About the time the community begins to reconcile itself to these "cuts," some undercutting or competition takes place between the railroads, and they break the "pool," one or two roads, or more, underbid, give shippers rebates secretly, or carry more grain than they pretend to carry in their cars, or charge less than pool rates, and a "war" begins. The first thing you know they are carrying grain to New York from Chicago for 20 cents per hundred pounds instead of 30 or 35 cents. All at once there is a tremendous "boom" in the market. Every man's grain rapidly advances. Then the farmers are all angry because they sold out before the cut in transportation. They have lost 10, 12, or 15 cents per bushel by having sold so soon. Immediately there is tremendous speculation. The merchants, thinking that the railroad war will last for a considerable time, begin purchasing grain, "long" and "short," and on "puts" and "calls," and in all the sorts of ways that they have of gambling in produce, until there are probably hundreds of millions of bushels of grain purchased, on speculation, more than there is in existence. And about the time they think they are going to realize on these fictitious arrangements which the railroads have induced, the

Digitized by Google

roads suddenly go back to 35 cents per hundred pounds, and away goes all the profit of these merchants and the hopes of the farmers.

They are doing the same thing in all other kinds of freight—cattle, sheep, swine, coal, lumber, iron, all sorts of general merchandise that go from the West to the East, and from one part of the West to another. There is no steadiness, no system, no fixedness for anything, and the whole country is kept in a tremor of expectancy as to whether prices are going up or going down from this unregulated cause.

### GOVERNMENT REGULATION A DUTY.

In my judgment, the railroads of the United States should not be permitted to exercise any such power as to change values in this country, up and down, at their capricious will and pleasure, or by reason of their quarrels and contentions for more than their share of the freight that is being carried. I hold that it is the duty of the people's legislatures, State and national, to stop it. They have a right to do it. These railroads are common carriers. The highest courts, national and State, as you know, have so decided. They have decided that these railroads are public corporations, exercising *quasi* sovereign powers of state which the people have loaned to them in their charters. They could not exist without it. They could not cross a public highway without borrowing the sovereign power of the state. They could not cross a man's land, take possession of it, or remove his house, or take down his barn without employing the highest power of the state, that of eminent domain. They have the protection of the law in many ways which citizens do not enjoy, and they enjoy certain rights and privileges that citizens do not. Every railroad, to a certain extent, is a monopoly. It has a highway all to itself, and has obtained that by borrowing the highest power of the state—the sovereign functions of the people. Now corporations holding such power as railroads do should not be left to their own free will, unregulated and uncontrolled. It is neither for their good, taking it altogether, nor for that of the people to permit it. I think I am safe in making this assertion: that ours is the only civilized country on the face of the earth where railroad corporations are permitted to exercise, unrestrained and unrestricted, the arbitrary power, without notice and when they please, of putting freights and fares up or down at will, and charging "what the traffic will bear," which is a cut-throat, rascally principle that the public should not tolerate in a corporation of common carriers.

A few of the States have in a small, timid way applied the principle of regulation to the railroads, fixing what is called "maximum rates," which the railroads shall not exceed, and laying down the principle that they shall not charge for carrying a ton of freight a certain distance more than they charge for carrying it a longer distance. A few of our States, I say, have got thus far along in defense of the public good, but that is not enough; it is feebly exercised, and the commissioners who have charge of the enforcement of such laws usually seem to act as though they were the attorneys of the railroads rather than the representatives of the people. I am speaking of my own State as well as some of the neighboring States.

### GOVERNMENT REGULATION OF RAILROADS IN EUROPE.

I say then, as far as I know, and I have made some inquiry, that in no civilized nation of the world is this thing permitted. In all the na-

Digitized by Google

tions of Europe the Government exercises a close and strict control and regulation over the freights and fares, and the changing of the rate of freight and fares—England less than any of the continental nations, but vastly more than has ever been attempted in this country. And England is going further in that direction. There is an important bill before parliament now, greatly enlarging the powers of the Board of Trade to control charges on the English railroads, both for passengers and for freights. In France, Germany, Austria, Italy, Russia, Holland, Belgium, and Switzerland, the Governments determine absolutely what shall be charged. And the Governments of some of these countries own all or a part of the railroads, and fix the rates themselves. In some they own a part, and make them act as regulators for the rest. The consequence is, that in those countries the manufacturer, the merchant, and the farmer can tell beforehand, for months, with absolute certainty, the exact cost of transportation of their wares and crops from one given point to another.

It is really necessary for the proper transaction of trade in this country that we should have some such system—that our merchants, manufacturers, and farmers should know, for at least a reasonable period in advance, what the value of their goods will probably be, because every irresponsible change that the railroads arbitrarily make in transportation, changes the value of the property that a man has, beyond his control, and beyond any human foresight or effort.

The price of the farmers' crops is totally at the mercy of these railroad managers. The manufacturer, figuring on his expenses, says "I can pay my workmen certain wages, based on the freights that are now charged," and he suffers loss by these railroad freight changes which increase his cost of transportation, and his business is deranged if not destroyed. He may be obliged to cut down the wages of his workmen; they strike; and a social war ensues, and enormous loss is inflicted. The men themselves lose thousands of dollars rather than submit to a reduction of wages, and the manufacturers will close up their establishments rather than submit to paying wages that will subject them to loss. All these things result from this arbitrary and perpetual changing of freights and fares by the railroads.

### STRIKES—INFLUENCE OF RAILROAD CHARGES IN CREATING THEM.

I attribute a great many of the strikes that have occurred in the United States in the last twenty years, and that are going on now, to the irritation caused by unrestrained railroad charges. You cannot throw a stone through a window without doing some damage, and you cannot capriciously change the value of a man's property without disturbing his calculations. Competition is so severe nowadays in all manufacturing lines of business, not specially protected by patent rights, that capitalists have figured everything down to a cent; they know what to expect for a certain amount of expenditure, and these sudden changes in rates disturb all their calculations. If freights decline, then the manufacturer makes an unlooked-for profit. His workmen instantly discover that, and immediately demand more wages. When he is reluctant to pay more wages, not knowing how long these low freights will last, a strike is inaugurated, and thus, perhaps, the manufacturer is forced to grant an increase of wages so as to divide the reduction in freight with his men, and by the time that is done the railroads put the freights up again, and then the manufacturer is compelled to reduce wages, after which comes either a strike or a lock-out. When we see

Digitized by Google

that sixty millions of people are affected and injured every day by this state of affairs, and that we have a National Congress of four hundred men to represent us, and nearly forty legislatures to represent the local interests of the people, why is it that we have not had some political regulation of these evils?

Some shrewd railroad men with whom I have conversed have told me that it would be for the advantage of railroad property in the United States, that it would increase the value of their stocks, if Congress and the State legislatures adopted laws that would stop this everlasting warfare and contention of the railroad companies with each other, and this constant and capricious changing of rates of fare and freight up and down. They are coming to that opinion, and some of them are willing to ask for such legis ation now. But whether they do or not, Congress, it seems to me, has a duty to perform to its constituents, the American people, who provide the freights and pay the fares and furnish the business of the railroads.

### DELINQUENCY OF CONGRESS REGARDING PACIFIC ROADS.

There is another point I wish to call your attention to, and that is, the delinquency of Congress in not regulating especially the charges of the railroads which have been constructed by the money, the credit and the public land of the American people. The fact that these railroads have in effect, been built by the people adds to the outrage, in my mind, very essentially. We have several thousand miles of railroad in the West, reaching from the Missouri River to the Pacific Coast, every mile of which has been paid for by the money of the people of the United States. The stockholders have not furnished a dollar, nothing but chromos, to the building of those railroads. Not only have the companies not furnished a dollar to build them, but the manipulators of these roads have pocketed many millions over and above their cost. The Government subsidy bonds on two or three Pacific railroads (including the first and second mortgages) represent a great many millions more than were expended in the construction of the roads, as the reports of the companies themselves, reluctantly made public, prove, and as the investigations of Congress show, and as the press of the country asserted. The managers of these railroads, in my opinion, never intend to pay either the first or the second mortgage; they intend to fleece the American people and pocket tens of millions of profits by charging "all the traffic will bear" until the bonds fall due and then they will abandon the road to the mortgage-bond holders. The Government will have to pay the first mortgage or lose its lien. They do not even pay the interest on their bonds. An enormous balance of interest is unpaid now, and when Congress insists upon the payment of the interest, they resist by every means of delay and technicality which the legal profession can devise, and they cheat the country out of its due, to the last penny.

### EXCESSIVE CHARGES OF PACIFIC ROADS.

These railroads I refer to, that are so enormously subsidized with public lands, and public money besides, have for fifteen years been charging the American people for travel and transportation of freight twice or thrice as much as other railroads of the United States charge. The subsidized railroads west of the Missouri River are to-day charging twice to three times as much as the railroads east of the Missouri River. They say they have to pay more for fuel, but they have long

Digitized by Google

hauls on level roads. I have been over them, and probably you have; and for thousands of miles the tracks are laid on a dead level almost.

Q. Is it not a fact that now they own the fuel themselves?—A. They have owned it for years. I have been in a coal mine on the Union Pacific Railroad, not far east of Ogden Station, where I saw a face of 12 to 14 feet of good coal, and less than 100 feet under the surface of the earth—coal that probably did not cost them a dollar a ton to mine.

Q. Is not that coal very largely located upon the land grants themselves?—A. All of it; every acre of it.

Q. Consequently it costs nothing but the mere work of mining?—A. The mere cost of digging it out of the ground—and a very cheap cost at that.

Q. Do you understand that what is true of the railroads you mention is also true of the northern and southern railroads?—A. Yes; especially of the Northern Pacific; it, too, has found extensive masses of coal on its subsidy lands close to its tracks.

Q. Is it or is it not, then, the fact that with all those long roads west of the Missouri, the Pacific roads, the fuel question is more favorable than it is found to be with any of the other railroads of the United States?—A. I regard the fuel question as furnishing no justification or reason for excessive charges. They are getting their coal, on the whole, more cheaply than the Canadian roads are, and more cheaply than the northern roads of this country; for instance, than the New York Central and Northwestern roads, which are a little outside of the coal fields. They are charging 6 to 10 cents a mile for carrying a passenger, and freight in the same exorbitant proportion.

Q. Will you state whether, aside from the fuel question, there are any other reasons that you know of why the cost of operating these railroads is greater than the cost of operating other railroads.—A. There is no other than that which they allege, as to the truth of which you must judge. They say that the country is sparsely inhabited and they have not a large local trade. That is largely due to their own avarice in preventing people from living on their lines by charging them so excessively that they cannot subsist on the lands. They are holding them too high, and that is another grievance. They refuse to pay taxes to the local communities, under protection of some curious court decisions, which is another grievance, as it causes double taxation on the farms of the settlers. They charge so much that a poor man cannot get to the lands with his family and outfit, and when there he cannot buy them at reasonable price, neither can a mechanic or manufacturer make anything along the lines of those roads, because of the cost of transportation, and that excludes new immigration and new population. In short, they have overreached themselves by their greed. California to-day has a half-million less industrial white population than she would have if the railroad charges to that State, and through the State, were as cheap as they are east of the Mississippi River. If the Northern Pacific Railroad, called the "Villard" road, which is subsidized with as much land as Illinois contains, pursues the same policy of charging high rates and of "pooling" with the Union and Southern and Central Pacific roads, it will have the same evil effect upon population along the territory that that road traverses. It will prevent the flowing in of industrial people and it will keep those who are there impoverished and unhappy.

ABANDONMENT OR SURRENDER OF PACIFIC RAILROAD CHARTERS.

I have been told by some Western railroad men that if the Government passed a law to compel them to carry freights and passengers at the

Digitized by Google

ordinary rates which prevail east of the Mississippi they would abandon the roads. I wish the experiment were tried, and that they did abandon them. I would like to see these railroads that have been built by the subsidies of the Government put back into the hands of the people, and let the Government try the experiment either of operating those roads or of putting them into the control of men that would do so, and at rates that would be promotive of the public interest, for the purpose of demonstrating the question whether the Government can economically manage a railroad, and how cheaply such roads can be operated and still pay interest on their *bona fide* cost.

Q. What would you say to a proposition formally made by the Government to the owners of those Pacific railroads to take the railroads, paying the first and second mortgages, and recovering control of the public lands of the United States, and paying any reasonable compensation beyond to the owners for their stock?—A. My answer would depend very much on what that "reasonable compensation" would be for the stock. If you should let the railroad companies fix the value of that stock it would not be a good transaction.

Q. I suppose you say that because they would be asking an unreasonable compensation?—A. Yes.

Q. But the condition of my question was *reasonable* compensation.—A. They would be asking a compensation based upon the profits they have made heretofore on their outrageous charges, and by defaulting on the Government mortgage bonds, and they would figure the stock at vastly more than it is intrinsically worth, as it never cost them, in fact, anything.

Q. You assert the, I think, conceded power of the Government to regulate fares and freights. Mr. Gould asserted it, in fact, the other day, with reference to the charges of the Western Union Telegraph Company, and the principle must apply to railroads if it applies to the telegraph. Now, suppose you take, as the basis of the value of the stock, the income which the reasonable charges that the Government might fix for fares and freights would afford—suppose you make that a basis upon which to calculate the value of the stock, diminished by the incumbrances upon the roads—what then?—A. I would say that if it is an alternative between buying the roads on those terms by the Government, and continuing the present system of unlimited and unrestricted rapacity, and failure on their part even to pay the interest on the second-mortgage bonds, it would be wise for the Government to do it.

### THE QUESTION OF RECOVERING THE NATIONAL DOMAIN.

Q. As having a bearing in that direction, let me ask what importance you would attach to the recovery of the national domain which is now very largely, as you know, absorbed in other ownership, so that the opportunity for homesteads are getting to be very few?—A. I am very much afraid that so far as the public domain is concerned, by the time any bargain could be consummated with the railroads, all the lands, or those of any considerable value, would be disposed of. A great deal of those lands west of the one hundredth meridian of longitude are not of much agricultural value; they are really of little value, except for cattle ranches, unless it be in strips where there is water that can be applied for purposes of artificial irrigation, as I have seen them, in traveling over them. There is very little good arable land now unsold or in hands of private owners, west of the ninety-ninth or one hundredth meridian of longitude. I have observed that some of the witnesses who have

Digitized by Google

testified before you have spoken of the enormous quantity of first class farm land still in the possession of the Government that ought to be divided up among the poor. There are no such lands. They do not exist any longer. They are absorbed and taken.

Q. Whom by?—A. By the American people in part, by the railroads and speculators in part, and the rest are comparatively arid, except for the purposes of cattle raising.

Q. Would not that process recover to the Government a large part of those lands that are in the hands of the speculators?—A. They would not surrender them if they have the title to them.

Q. You mean those who have already taken titles from the railroads?—A. Yes. They have already taken titles from the railroads, and have got hold of grants under all the varied United States laws, much of them fraudulently.

BONANZA FARMS.

Q. In that connection, have you any knowledge as to what they call the "bonanza" farms that are being created in this way?—A. Well, that is only a matter of a dozen big farms in Northern Dakota. There are only a few of them. I have been over some of them. The absorption of lands taken up in "bonanza" farms is not worth taking into account when you are talking of the public domain in this connection. A few townships of land in the Red River Valley, up near the Canadian lines are not worth considering. They will only continue until they are wheat-cropped down to a certain number of bushels per acre, and then being unprofitable to the owners, they will cut them up into smaller farms and sell them.

THE INDIAN RESERVATIONS: CHARACTER OF THEIR SOIL.

By Mr. CALL:

Q. You leave out the Indian reservations in your calculations; what of them?—A. I am glad you mentioned them. There are two classes of Indian reservations that I have seen. There is the Indian Territory proper, the eastern one-half of that is good, arable land. The western half or third of that Territory is fit only for grazing purposes, and will not produce any crops reliably without artificial irrigation. In that respect it is precisely like Kansas, north of it, and Texas, south of it, which I have been over. The other greatest Indian reservation, called the Sioux Reservation, on the Missouri and Yellowstone Rivers, is almost entirely embraced in this *quasi* arid portion of the country. There is very little land held by the Sioux, of the tens of millions of acres they hold, that is fit to plow, or would raise grain or food without irrigation. It is good grazing land for cattle, sheep, and horses.

Q. Can you give an idea of the extent of the arable land upon the several Indian reservations?

The WITNESS. Those northern reservations?

Mr. CALL. The whole of them.

A. Well, I will say that in the Southern Indian Territory reservation you might carve out a State nearly as large as the State of Kentucky or the State of Ohio, certainly as large as the State of Indiana, of good land that could be cut up into quarter sections, and that a farmer could comfortably subsist on each quarter by the plow. In the northwestern reservations, where they have a scarcity of rain-fall, it is doubtful how much of the land would do for farming. It is held by some, I know,

Digitized by Google

that when the land is broken the rains descend more plentifully, and that crops could be produced without irrigation, but my observation is that there is no certainty whatever of more than one crop in three or in five without irrigation when you get west of the one hundredth line of longitude until you cross the Sierra Nevada range and the Cascade Mountains and get over into the rain slope of the Pacific. Western Oregon and Washington Territory have humid climates, and where the land is suitable for agriculture there is no trouble about raising, in the ordinary way, any kind of crops that the temperature of the climate will permit to grow, provided there is enough rain-fall.

IRRIGATION OF ARID LANDS.

Q. What is the practicability of artificial irrigation?—A. It is costly and limited. If you take a good map of that territory of which I speak, extending a thousand miles east and west and a thousand miles north and south, containing a whole million of square miles, lying on this side of the Sierra Nevada Mountains and west of the 100th parallel of longitude, I would say, from twenty years' observation and conversation with newspaper correspondents, Government officers, cattle men, farmers, traders, prospectors, and every class of people who have been through that country, that over that whole vast area of a million of square miles, embracing one-third of the American republic, if you could irrigate one acre in twenty, by no matter what expenditure of labor and money, you would cover every acre that can ever be reclaimed to cultivation, unless artesian wells produce unlooked for sources of irrigation. I am speaking of irrigation from running streams of water. I have looked at Colorado and Western Kansas, Western Nebraska, and Western Texas, and at Nevada, Wyoming, Utah, Western Dakota, New Mexico, Arizona, and Southern California, and I think that one acre in twenty is all that crops will ever be grown on by any process, natural or artificial. But they will feed millions upon millions of cattle and sheep in that vast area on the natural herbage. The entire grain-growing capabilities of that million square miles of arid plains and mountains are not equal to those of either the States of Illinois or Iowa.

By the CHAIRMAN:

Q. Then the value of that million of square miles is as cattle ranches?—A. Yes, chiefly.

Q. If that is so does it not become very much more important that the Government should control those lands, in order that the water supplies which make them valuable may not be appropriated by individuals?—A. Well, if it is public policy that individuals or companies shall not monopolize water courses, then Government control would be advisable, because individuals and companies are now monopolizing them just as fast as they can, but then somebody must furnish the capital to construct the irrigation canals and dams to hold and distribute the water.

LANDS FRAUDULENTLY OBTAINED.

The CHAIRMAN. It is stated that by obtaining control of a quarter section under our present laws the actual control of immense tracts of land is obtained, and instances have been testified to before the committee of something like thousands and thousands of square miles controlled by the surreptitious or pretended purchase, as a homestead, by capitalists, of a quarter section, or even a section, it may be, involving the water supply—the springs themselves.

Digitized by Google

The WITNESS. Yes; that is being done every day, and the land is being fenced in with barb wire fences and defended with shot guns.

Q. Then, that being so, is it not even more important for the Government to repossess itself of the control which it has parted with than if these were agricultural lands?—A. It would be very important if the Government would take some steps of reclamation, and to put a stop to this monopoly process of absorption going on with these irrigable lands.

BONANZA FARMS.

Q. I want to ask you another question about the "bonanza" farms. Your statement is made from personal observation?—A. Yes; I have been over them in harvest time and looked at the crops, and talked with some of the principal proprietors.

Q. And as the result of that you say there is nothing in it?—A. Nothing; only a few townships of land; experimental farms on a large scale in the Red River Valley. When they are exhausted a little more by continual wheat cropping they will cease to be profitable, and will be subdivided into small farms and sold.

ARTESIAN WELLS ON THE PLAINS.

By Mr. CALL:

Q. What do you think of the practicability of getting artesian wells out there on the Plains?—A. There is no reliable answer to be given to that, except by actual boring in many places. Sometimes where they think water can be had they drill down many hundreds of feet and find nothing, and in other places they have to bore down but a few feet and unexpectedly get all the water they want. You can only tell by boring.

Q. There is no general theory that will do, then?—A. Where the contour of the country is favorable it may reasonably be expected that subterranean water can be had. Sometimes it is struck not far down, but will not rise to the surface. In other places it will spout up with force and gush forth. In and around Denver there are scores of fine artesian wells.

Q. You think the experience is not enough to deduce a general principle from?—A. No; not yet.

RAILROAD CHARGES.

By the CHAIRMAN:

Q. You were speaking of the charges on roads west of the Missouri and of their regulation by the Government. Won't you now go on and give us any further views you have with reference to the railroad question?—A. I have nothing further to say except that the present rate of charges and the capricious mode of making and changing them I regard as seriously injurious to the public prosperity. On the roads unrestricted by the State they have the unjust and oppressive habit of charging a greater sum for a shorter distance than for a longer distance—a most vicious principle. You may want to send agricultural implements or furniture, for instance, from some of our western manufactories—from Chicago, Moline, South Bend, Dayton, or Grand Rapids—over one of those roads, and they may charge you once and a half or double as much for carrying a car-load to Cheyenne or Salt Lake City or Denver, than clear to the Pacific coast. There is nothing that people complain of more bitterly, and with good reason, than that sort of outrage—that robber discrimination which is going on on all the roads not restrained by law.

Digitized by Google

WATER COMPETITION WITH RAILROADS.

Q. They allege that the water competition between the Atlantic and the Pacific coasts, on many of these heavy articles, compels them, unless they abandon the trade across the continent, to carry at these very low prices. How is it about that view of it?—A. I am aware of that pretext, and, further, I know it is true that if it were not for the competing ocean route they would continue their extortions clear through to the Pacific coast; but if they can carry at a profit for certain price 2,000 miles why should they charge more for carrying the same kind of goods half the way?

The CHAIRMAN. I hope you do not expect me to answer such questions.

The WITNESS. I am only asking you responsively, not argumentatively or expecting an answer.

Q. You assume that they would abandon the San Francisco traffic and the through traffic to the competing points unless they made money on it, do you?—A. Of course; certainly.

Q. Do you mean by that that they would make money if their sole business was between those competing points?—A. They would make some.

Q. Do you think that is clear? May it not be that they make up for losses in that way by overcharges on the intermediate traffic?

PRO RATA CHARGES.

A. I mean to say that if they were to charge between the intermediate points pro rata, or substantially so, on what they charge for the long hauls they would make less profit immediately, but not eventually, because by these excessive way or local charges they discourage and prohibit the development of the resources of the intermediate country. They restrict the raising of cattle and sheep and they do not get half the freight they otherwise would in the mining of minerals, the transportation of lumber, iron, salt, machinery, furniture—every kind of manufacture that a particular neighborhood can produce or may need in the transportation of traders and immigrants. In other words, I regard it as very short-sighted, narrow, and unjust policy for a railroad corporation, especially a subsidized one, to act on the swinish principle of giving the smallest possible and poorest service for the largest amount of money "the traffic will bear." I claim that these corporations are in one sense partners with the National Government, those of them that have national charters and subsides, and with the State government, those that have State charters and special privileges, and *that* means with the people, and they ought not to be permitted to indulge in any extortionate practices, and that it is not the right of a railroad board of directors to squeeze out of a community inordinate prices for services. I hold that it is illegal for them, being common carriers, to do it, and that they should be limited and regulated by law, as is the case in all other civilized nations.

RELATIVE COST OF RAILROAD SERVICE IN EUROPE AND AMERICA.

By Mr. PUGH:

Q. Mr. Fink was a witness before this committee the other day, and he stated that he was a commissioner representing about forty railroads east of the Mississippi, of which five were trunk lines; he knew the tariffs of these roads, and also the tariffs of the roads in Germany,

Digitized by Google

France, England, and other European countries, and he said that the tariff rates—the freight and passenger rates—in France, Germany, and England were from 25 to 100 per cent. higher than the rates of the roads that he represented in this country. I thought that was a very remarkable fact, if it be a fact. What do you know about that?—A. I think he is right to a certain extent. Wherever railroad charges are held in check by the competition of waterways their freight tolls are reasonable, and where not thus regulated they are high. Mr. Fink forgot to state that fact; at all events he did not state it, according to your remark. Besides, those are small countries geographically, and the railroads necessarily have short hauls from the manufactories to the ports of export, and the roads, as constructed over there, cost three or four times as much as they actually cost in this country. Every observant American knows that who has traveled upon them. Our roads are mostly single track; theirs double, treble, and quadruple tracks. Their right of way alone costs as much as most American roads.

Mr. PUGH. He stated that the roads there cost nearly double what they cost here.

The WITNESS. Yes; they cost three or four times as much. The English roads have actually cost, notwithstanding their cheap labor and material, as many pounds as the American roads have legitimately and actually cost dollars. It is a common thing in those countries—in England, for instance—for a railroad to have four tracks, and they cross all country roads, as well as other railroads, on viaducts, and go through all the cities on arches, and are finished in a style that we have never attempted in this country. Then, as I have remarked, their hauls are short; they probably will not average a hundred miles where they average five hundred in this country. Mr. Fink has not given credit for long hauls on cheap-built roads. The cars over there are chiefly engaged in standing still, waiting to be loaded and unloaded, and are not traveling more than a small part of the time. With the exception of Russia, there is no nation in Europe that has an area equal to Texas, and some are not larger than Ohio or Illinois.

By the CHAIRMAN:

Q. The European population is over 300,000,000?—A. Yes, and the Western 250,000,000 of them occupy only one-half the space of the United States.

Q. Would not the result of that be that the traffic over such roads as they have must be immensely greater than that over our roads?—A. Yes, as compared with our Western and Southern States.

Q. And ought not their charges, therefore, for that reason to be less, although the original capital invested is much more?—A. The reasons given in Europe by railroad men, on inquiry, for their higher charges than ours is the short hauls and the enormous cost of construction. In the cost of construction there is one item that I imagine Mr. Fink did not mention, and that is, the mere right of way. Obtaining the mere right of way in Western Europe costs more money than the railroads cost here. The usual profit that the governments permit a railroad to make is 4 or 5 or 6 per cent—6 is about the highest; the general average is 4 or 5 per cent. on the actual expenditure of capital in cost of construction.

Q. I suppose that much of this increased charge may be accounted for by reason of the fact that in Europe the Governments supervise and manage it to a considerable extent, while in this country private management and sharp competition produce or give an opportunity for

Digitized by Google

a profit on a lower charge to the people. How is that?—A. I should think not; because all the forces of competition are still in play where a European Government does not own the roads. The Government merely fixes the maximum rate and allows a road to charge as much less as it pleases. Therefore rival competition and waterways come into effect as well as Government regulation.

Q. Are both those principles operative in Belgium?—A. In Belgium and Holland the Governments owned about half the roads the last time that I investigated the subject, and fixed their tolls. The private roads are therefore forced to charge not more than the Government roads or lose the traffic. It is the same thing in Italy and Germany. And it was given as a reason for requiring an alternate road, so to speak, that it was meant to compel comparatively low fares and freights in those countries, and prevent the owners of the roads from overcharging the public. And I should also remark in this connection, that great dissatisfaction exists in England, France, Germany, and several other European countries at the high railroad charges, and public agitation is actively at work to force them down, and I notice that some concessions have recently been made and others are expected soon to follow.

COST OF CONSTRUCTION OF RAILROADS.

By Mr. PUGH:

Q. Have you any information that enables you to state the average cost per mile of constructing railroads in this country?—A. Not more than is entirely accessible to the committee. It varies according to where they are located. In hilly States it is comparatively high; in the level sections of the country it is quite low.

Mr. PUGH. Mr. Fink put it at $60,000 per mile.

The WITNESS. For a single track?

Mr. PUGH. Yes; for the construction and equipment of the road—$60,000 per mile.

The WITNESS. As the average cost of the railroads of this country?

Mr. PUGH. The *bona fide* cost; and he said they could not be built for that much now.

The WITNESS. Well, they did not cost that much in the Western country, certainly. It would be nearer $25,000 per mile throughout the West. I mean the actual cash cost, and exclude watered stock and pretended expense. The right of way, as a general thing, cost them little or nothing.

Mr. PUGH. Yes. I have no idea that it would reach $30,000 a mile in the South.

THE POWER OF CONGRESS TO REGULATE RAILROAD CHARGES.

By Mr. CALL:

Q. You consider the question of the right of regulation of rates of fare by the State authority to be settled, do you not?—A. Yes. In the Western States the question is settled affirmatively.

Q. How about the question of the national authority to prescribe rates of fare?—A. I have no doubt at all that Congress, under the constitutional authority to regulate commerce between the States, has ample power to do all that is proper or necessary to prevent extortion and sudden and arbitrary changes of freight and fare charges.

Q. Do you think that that extends to prescribing specific rates of fare?—A. I think it does; at least to the extent of prescribing maximum rates and forbidding unjust discriminations.

Digitized by Google

APPLICABLE TO SHIP-CHARGES, ALSO.

Q. Would not that proposition apply equally to goods carried by other public carriers, as ships, for instance, plying between the different States—prescribing the rates of freight and passenger charges which should be charged by them?—A. I think so, yes. I hold that Congress has complete power, if it chooses to exercise it, to regulate the rate of freight between Saint Paul and New Orleans if necessary, to break up an oppressive steamboat monopoly; but competition, as you know, has always been so severe between the boats on the Mississippi River that it has never been necessary for Congress to interfere to protect the shippers. There is no oppressive combination among those boats, and there never can be such as the pool railroads form.

WHENCE THE POWER IS DERIVED.

Q. You derive the power of Congress in that matter, from the power to regulate commerce?—A. Specifically, yes; but also by other provisions of the Constitution, I should say that it is an inherent power of Government.

Q. What other provisions of the Constitution?—A. Well, the very preamble of the Constitution, which sets forth that the Constitution is ordained for the public good, and certainly the public good requires *quasi* political corporations to exercise their powers with reasonable regard for the people's interests, and not abuse them, to the public detriment, as is done every day by the railroad companies.

Q. You consider that Congress has an unlimited power to do what it thinks best for the public good?—A. I think so, in a general way. If not, we ought to amend our Constitution. The people should not be left helpless to protect themselves against corporation rapacity.

By the CHAIRMAN:

Q. Would you not make a distinction between the exercise of the business of a common carrier on a natural waterway, like the Mississippi, and the exercise of the same business upon a railroad where the franchise is obtained in the first instance by a public grant?—A. No; not to the extent of denying the power of regulating charges on waterways belonging to the national Government.

THE PRINCIPLE OF GOVERNMENTAL RESTRAINT ON CHARGES GENERALLY.

Q. Then, if there is no such distinction as that, and you claim that Congress may regulate fares and freights on a steamboat owned by a private individual plying on a national waterway, because, and simply because, he is a common carrier and dependent upon the public for his patronage, would not the proper extension of that principle involve you in this: that Congress might regulate the charges of an innkeeper, and so prescribe the amount of hotel bills?—A. The local municipalities may do that now. I believe the common law recognizes that principle.

But to reply to your question more satisfactorily to myself: When I answered Senator Call's question affirmatively, I was supposing a case that would justify Congress in exercising such control over steamboats; it was that of complete combination of all the steamboats traversing the Mississippi River and branches, which belong to the Federal Government, forming a joint "pool," as the railroads do, and making an oppressive monopoly on the national water courses—keeping out and suppressing competition and taking advantage of that combination to

Digitized by Google

overcharge the people. That was what I had in my mind. Then, I say, it would be the duty of Congress to step in and protect the people on so much of the river as is national, or interstate, and regulate or fix some limit to the charges; and on the water courses that were not national it is the right of the State to do it, where that species of robbery may be carried on. Again, in answer to your question, Mr. Chairman, if all the hotels and inns of the cities of New York, Chicago, Memphis, or New Orleans, for example, should combine to rob the wayfaring man by extortion, I think it would be the duty, and I believe the common law will give the power (at least with legislative aid), to the local corporation to stop it—the same as the municipal corporations may now prevent overcharges by hack-drivers and omnibuses and draymen, and as they should do everywhere.

RELATIONS OF NATIONAL TO STATE REGULATION.

Q. It is the common law power to punish conspiracies against the public good?—A. Yes. "The greatest good of the greatest number" is, after all, a pretty safe rule to apply to those matters.

Q. There is one question I would like to ask you touching the railroads. The power is asserted in Congress to regulate fares and freights upon interstate railroads, that is, upon interstate commerce. Now is not interstate commerce and commerce within a single State, in railroad transportation, so intermixed that in regulating one you necessarily will regulate the other? For instance, interstate commerce is the long haul, commerce within the State is the short haul. Thus arises the difference between the long-distance traffic and the local traffic, interstate and State traffic. Is it possible for Congress to lay its hand upon the one without affecting the other, so that if it does regulate one it must regulate both?—A. Well, all that would have to be regulated by a national board of commissioners, whose duty it would be to carry the national law into force. I can conceive of cases where the exercise of the interstate charges might have the effect of reducing the charges allowed in the State; but I think, as a rule, that it would not act in that way. It would certainly not be any damage to the public if national control did incidentally reduce railroad charges in the States occasionally. I do not think there is any more danger of conflict in that regard between the State and national jurisdictions on many other questions.

Q. That may all be as you say. But does not the power to regulate interstate commerce necessarily involve the power and impose the duty of regulating it with reference to that remaining commerce over the same road, within a single State?—A. In some cases it may have that effect, like the interference of Congress with State bankruptcy laws. There might be overlapping, so to speak, which cannot be helped; but a wise exercise of discretion in the performance of the functions of the national railroad commission would avoid most of it. At any rate, the benefits to the public will so enormously overcome the infringements, that the difficulties in the way are not worth talking about. Congress should do what is best for the interests of the great mass of the people.

Q. You think that where there is a will there is a way?—A. Yes. The obstacles are mostly imaginary when brought to the test.

THE COURTS AND THE RAILROADS.

By Mr. PUGH:

Q. This question of power is purely a judicial question, to be settled by the courts, is it not?—A. In the last resort, yes.

Q. The weight of the legal decisions is, that it is in the power of Con-

Digitized by Google

gress to fix rates of railroad charges upon roads running between two or more States?—A. Yes; and in the Territories. Our national Supreme Court and our State supreme courts are growing up in their decisions to recognize the interests and necessities of the American people.

By Mr. CALL:

Q. That is a very latitudinous rule of construction, though, that the courts shall grow up in proportion to the interests and necessities of the people.—A. That is what the courts are for. They are to do justice and equity, and protect the rights of the people.

Q. Would you have your courts established on that foundation, that, instead of looking to the legislature, they shall construe the law and the powers of government to be according to the development of the necessities of the people? You have not any use for constitutional amendments in such case.—A. These very tendencies in decisions of the courts to which I refer, have avoided the necessity of a great deal of constitutional amendment which it might be very difficult to obtain in the face of selfish and combined corporation opposition.

Q. Do you approve that practice of the courts amending the Constitution and the laws?—A. There is a large latitude of discretion between what is called a liberal construction and a narrow technical construction, and the courts are supposed to work within these two lines; sometimes leaning towards one side of the center and sometimes towards the other. All lawyers know that as well as all judges. What I mean to say is that, the tendency of the decisions of the courts for a number of years past is to such a construction of the laws as will promote the good of the people rather than the greed of selfish corporations. In Webster's time the courts swung strongly to the side of "vested right" and monopoly. Now they are swinging away from that, and I am glad of it, because if they did otherwise the people would have to make some radical changes in self-protection by giving them a very different law or constitution to construe.

### COURTS AND CONGRESSES THE SERVANTS OF THE PEOPLE.

The people own their government. Their courts are only their aids and arbiters, and Congresses and Presidents are only their agents and committees, and when the machinery they have set up does not work well, it is their right to amend or change it to suit them better.

Q. Is that the place to do it, though—in the courts—without the action of the people?—A. When the courts do it within the reasonable limits of law, they are carrying out the wishes as well as promoting the interests of the people.

Mr. CALL. I did not mean to controvert your opinions upon the wisdom of such legislation as was necessary. The suggestion that you made was that the courts would grow with the necessities of the people.

The WITNESS. They are doing so in the way I have mentioned, and the truth is, if you will turn over the last half-quarter of a century of American history, you will find that about half our laws are, in effect, court-made, and the other half statutory.

Mr. CALL. There is no doubt about that. The question is whether the courts might not some time make a law that the people would not want.

The WITNESS. Then we have the legislative machinery to correct it.

Mr. CALL. According to the present theory of government, the courts

Digitized by Google

do not acknowledge the power of the legislative machinery to repeal their decisions.

The WITNESS. But the legislature can repeal the law which supports the objectionable decisions.

Mr. CALL. They can repeal the law, but they cannot repeal the decisions of the courts.

The WITNESS. Oh, yes, in effect; the legislature does that constantly. When there is a decision of a court that is not in harmony with public sentiment, the legislature at once repeals or amends the law so that it can no longer support the decision, and the decision then becomes null and void.

Mr. CALL. You know our courts have what they call vested rights, which cover a very large ground.

The WITNESS. I was remarking a moment ago that I was glad to see that they were coming down a little from their old high-horse notions of "vested rights," and were becoming more democratic and conservative of popular interests.

Q. You think that is so?—A. Yes.

Q. What decisions do you refer to?—A. To several decisions; the general tenor of the decisions.

Mr. CALL. But I mean the Supreme Court.

THE GRANGER CASES.

The WITNESS. I would instance the Granger railroad cases and the affirmed right to build public and railroad bridges across navigable streams, though they may obstruct navigation to a certain extent.

Q. Did they decide anything more in the Granger cases than that the authority of the State over charters granted by the State was complete and had not been parted with—that the sovereign authority of the State to control its own creature, the charter, in those respects remained?—A. Well, that was a great advance on the doctrine previously held; when a court has decided that one legislature has no power to cede away a sovereign right of the people or tie up the next one, they have in effect or in fact upset the vested rights which enroach on the public good.

Q. Was not that always the doctrine of the courts until a few years ago?—A. I do not think I have been able to find it in any of the books until a few years ago.

Mr. CALL. Oh, yes; I think there is no doubt but that that was the unvarying course of decisions.

The WITNESS. Then why did the attorneys for the railroad corporations make such a bitter fight on the law and plead vested rights if that had always been the law?

Mr. CALL. The point had never risen on the subject of railroads until it arose in the Granger cases.

The WITNESS. Well, at all events, their decisions are in the right direction, as I view them. Fifty years ago they would have decided against the Grangers.

By Mr. PUGH:

Q. What you say here is not apt to influence their decisions in the future, I suppose?—A. No; except that they are public servants and are subject to the influences of their environments as other men are. I think the American courts never forget—they ought not to forget certainly—that they are a part of the American Government and established by the people to conserve the popular good.

Digitized by Google

Mr. PUGH. I made that remark for the purpose of not impairing the value of your testimony by going into the discussion of those unsettled questions.

The WITNESS. I should be very sorry to think that what I have said would have any deleterious effect on the decisions of the courts. If you apprehend that it will have that tendency, let your reporter strike it all out.

Mr. CALL. No; I think your opinions are valuable; but it is well to ascertain definitely and precisely the extent to which you wish them to go.

HOW LAWS SHOULD BE CONSTRUED.

By the CHAIRMAN:

Q. I understand you to say that you consider the courts would decide within the law as it is?—A. Yes.

Q. And where it is uncertain what the law is the courts are now inclined to give that interpretation of the law which is most consistent with public good?—A. That is my observation.

Q. Not that they make law, but that they enunciate the law liberally?—A. They construe it liberally and in behalf of the people's rights and interests.

Mr. CALL. He has just stated that one-half of the law of the last fifty years has been made by the courts.

The CHAIRMAN. Defined by the courts, he meant.

By Mr. PUGH:

Q. You want us to go as far as we can under the Constitution?—A. I do, in the interests of the people. I want you to be liberal in the interests of the people.

Mr. PUGH. It is an old interpretation, that the preamble of the Constitution is not a source of power to Congress, but a mere definition of what the express and implied grants are.

The WITNESS. It is a good guide.

The CHAIRMAN. It is the lamp, or light, by which the whole Constitution is to be construed.

The WITNESS. Yes; the preamble, in my judgment, is in the nature of a compendium to what comes after, intended in a comprehensive way of stating what is said in detail in the body of the instrument.

By Mr. CALL:

Q. What office do you assign, in your theory, to the limitations of power contained in the Constitution?—A. Well, I have answered the question, not directly, but in substance, by saying that the powers given to Congress by the Constitution should be liberally construed in the direction of the public welfare—whatever will promote the general good of the American people and curb the rapacity of monopoly.

Q. Will any liberal construction avoid the effect of an absolute limitation?—A. Not where there is a plain absolute limitation, like a wall that you cannot get around nor over; but I would not go about imagining I felt a wall that did not exist and say, "We cannot cross that line."

Q. You would not deny that it was there, however, if it was there, and you saw it.—A. No; I would respect it.

THE TELEGRAPH IN AMERICA.

The CHAIRMAN. I would like to have your views with regard to the telegraph system of the country.

The WITNESS. In what respect?

Digitized by Google

The CHAIRMAN. In this respect, whether you consider that there is any abuse that the people suffer under from overcharges or through discrimination as between individuals or associations, or different sections of the public, evils that the general public suffer from in the exercise of power by telegraph companies over the intelligence, and the transmission of intelligence, of this country.

The WITNESS. You ask with reference to Congressional remedy?

The CHAIRMAN. With reference to actual fact, and whether the remedy is in the State or in the nation.

The WITNESS. Like the railroad system, its rates have been subject to the same constant change arbitrarily and suddenly, and up and down without any logical reason or necessity that I have been able to comprehend; and there are possibilities of abuse that are very serious in the telegraph monopoly. I am willing to concede that the tendency, as a whole, has been to lower rates, but less so since stock-watering has been practiced so immensely. The reductions have been in consequence of competition to some extent, and to duplex and quadruplex, and other improved methods of telegraphing which have enormously cheapened the process, and the immense increase of business that has thrown into the hands of the telegraph companies so much money that they could not, in very shame, keep the rates up. Their profits are still so immense on the actual investment, partially concealed by watered stock, that they could not give the people any decent reason for charging so much. So they have been lowering the rates a little, and they have found that as they reduced them they recouped themselves by an increased business, so that they have not lost anything by it. That is a well-known principle, that consumption increases in proportion to the reduction of cost.

### THE TELEGRAPH IN ENGLAND.

The English Government, when it bought up the telegraph companies' wires some years ago, made a uniform price of a shilling for twenty words all over the United Kingdom. That was a great reform, and it pleased the English people wonderfully, and it paid the Government notwithstanding that the Government was shamefully cheated in the purchase. They paid for the property twice as much as it was expected to cost. They paid $48,000,000 for a plant which they thought they were getting for half the money, for reasons not necessary to name now. But the Government cut down the rates to a shilling a message for all distances, and now it is about to reduce the rate to a sixpence or 12 cents in American currency for 20 words for all distances.

### IN BELGIUM, FRANCE, AND GERMANY.

In Belgium they only charge 10 cents (half a franc) for a message of twenty words. In France they charge about the English price, and in Germany somewhat less. But all the telegraph lines are in Government control. There are no private telegraph companies that I know of in Europe. The whole telegraph system is in the hands of the post-office departments there, and they make the rates uniform. One great objection to the American system is, that there are so many rates that nobody can ever tell what a message will cost from one city to another. There is a certain rate to one town and a higher rate to another town of less distance, although I see a tendency lately to divide the country up into districts which will permit some uniformity of rate. At present it is a great and absurd nuisance, these multitudinous rates.

Digitized by Google

## POSTAL TELEGRAPHY: OBJECTIONS TO PURCHASING WESTERN UNION LINES.

I am decidedly in favor of the national Government establishing a system of telegraph wires in connection with the Post-Office Department, without any interference with private wires. I should oppose the purchase of a mile of private wire. You could not enter upon that without suffering the English experience, probably in magnified form. You could not buy out the present watered plant of the Western Union Company by arbitration or condemnation proceedings without being cheated one-half, without paying a price out of all proportion to the real value of the property. The owners would insist on a price representing the profits their monopoly can squeeze out of the public, irrespective of what it would cost to duplicate their plant. And there would be raised a cry against Government monopoly. But if the Government proceeded to establish its own system of wires, in connection with the Post-Office, fixing its own price for the transmission of news at a moderate rate, not at an inordinately low price, but at a fair compensation for services rendered, you would then accomplish two things. You would furnish to the American people a certainty of cheap and uniform service at steady tolls, and you would constrain the private companies to charge no more than the Government rates. They could not overcharge without losing their business. That would give everybody a choice between two systems and sets of lines—those who would distrust the faithfulness or secretiveness of postal officers would go to the private companies. and if the Government wires were overcrowded they could go to the private offices with their messages. In my judgment there would be business enough for both systems. This country is growing very fast, particularly in the use of electricity.

### NECESSITY OF A GOVERNMENT TELEGRAPH.

Then again the Government itself would have great use for the wires for its own business. At present the Government can only use the wires to the extent that Congress votes appropriations for the different branches of the service, and that is but a very limited amount. Now, in a country like ours, with thousands of miles of territory, the Washington Government cannot correspond with its officials all over the country by mail as quickly as it ought to. It cannot communicate with San Francisco by mail and get an answer in less than a fortnight or more. It cannot communicate with New Orleans or Saint Paul and receive a reply in less than a week, or with Chicago, Cincinnati, or Saint Louis in less than four or five days by mail. By telegraph, of course, it is always a matter of mere minutes, or, at most, instead of days, of hours. The use, then, of the wires for the fiscal business of the American Government would be of great value, and in using its own wires it would be at the lowest possible cost to the Government.

### EFFECT OF A GOVERNMENT TELEGRAPH ON STRIKES.

In the next place, I think the danger you have seen lately of an operative combination and strike would be averted. The next strike made by the employés of the telegraph company will be of the most formidable and injurious character. Those young men in the telegraph business will profit by their late failure, and the next time they "strike" they will derange the business of this country, both by rail and wire,

Digitized by Google

beyond endurance. They will be prepared next time to stand out unitedly until, after a long and destructive warfare, the companies will succumb to their terms. And having secured control of the companies they may then proceed to devour them, as the companies would like to devour the community, if they could. You cannot tell how far they would go. If outside men are allowed to dictate to you in your business you do not know where they will stop short of your utter destruction. If the Government had a system of wires of its own running in connection with the Post-Office Department throughout the United States its employés would be Federal officers, and they would be paid fair salaries. The Federal Government, as a rule, pays its employés liberally, and does not overwork them, and everybody likes to work for the Federal as well as for the State governments. It is an "office" which has some dignity to it, and it is very attractive to men's minds.

The young men who would seek the places of operators under the postal system would, of course, keep their places during good behavior. You cannot very well turn a man out of such service on the ground of his politics. He must be appointed as an expert, and retained, under the civil service rules, on account of his skill and capacity.

Again, Congress fixes the salaries, and it does that only once a year, so it would be useless for the operators to make a combination against a postmaster for an increase of pay because he could say: "I have not got any authority to raise your pay. You will have to wait until Congress meets, and you must present your claim there, and if Congress finds that you are not receiving sufficient compensation it will give you more." The result would be, that there would be no strike, or any serious attempt at it, if a telegraph system were in the possession of the Government. If the employés of the post-office or telegraph system should enter into a strike conspiracy throughout the United States, knowing these facts, I would apply the conspiracy laws to them, and clap them in jail, and try them for conspiring against the Government and the public good. But a strike of that kind would not happen once in a hundred years. The telegraphers are intelligent men, and they would be no more likely to strike than the clerks in the Treasury or custom-houses, or Post-Office Department, or the Army officers. Office-holders don't resign *en masse*. The postal telegraph system would stop strikes of the operators of the private companies, because, if the Federal operators kept right along at their instruments, as they would, what would be the use of a strike against the private companies, as the business would immediately flow right on to the Government wires.

### ITS EFFECT IN RAISING WAGES OF ALL OPERATORS.

On the other hand, if the Government would fix a fair price for its men, as it always does, the private companies would have to pay substantially the same price to their employés, as they would not work for much less. There would be a standard fixed of the same pay for the same service and the same capacity, so that much of the labor problem would be settled. The Government would have as many wires as Congress and the American people would desire. I do not think we would have any more than are needed, or that the private companies would have more than they should need. The only thing that would be stopped would be the building of parallel lines for blackmailing purposes, to be sold to the existing companies. That would probably stop. The speculating class of hawks that get together and lay out parallel lines, and tell the people they are going to reduce the rates of telegraphing, and that they

Digitized by Google

will give greater facilities, and will never sell out, or pool with other companies, are frauds; they construct lines for the express purpose of selling them to the existing monopoly at big profit. That is the only purpose they have in view, and that purpose will be materially interfered with by this plan of a postal telegraph.

WAGES IN NEWSPAPER OFFICES.

By the CHAIRMAN:

Q. I want to ask you some questions about local compensation to laboring people in Chicago and vicinity. I believe you have been connected with newspaper work a good many years?—A. Yes.

Q. Will you please give us an idea of the compensation paid to reporters and gatherers of news? I do not speak of proprietors, but the men who work for wages or fixed compensation, whether by the piece or otherwise, so that we may have a comparison between the compensation of that class of men in Chicago and in this city. We have testimony already as to that matter in this city.—A. We pay for typesetting on a morning paper in Chicago 42 cents per thousand ems; for book-work the same; on an evening paper, 37 cents per thousand ems. We pay the foremen from $36 a week to $24, according to the responsibility of their work.

We pay our pressmen in the principal offices of the city about $30 to $40 a week, according to their position. On the afternoon papers, where the work is lighter, the pay is somewhat less. Stereotypers are paid perhaps a little higher in most of the offices of the city, and their assistants in due proportion, if they are men, and of course less if they are boys learning the trade. We pay our clerks $20 to $50 a week, according to the position they hold. We pay our reporters from $20 to $50. A general average for fair men, I might say, would be $30 to $35. Young men beginning to try their hands as reporters are not paid so much. "Short-hand" men are paid better than "long-hand" men, because that requires additional skill. They get $5 or $10 more per week. Proof-readers possibly average $30 a week—the best ones as high as $36 or $40 a week. Our compositors—those who set type, working six to seven hours of a night, for, say, six nights in a week, expect to make $3.50 to $5 a day, according to their skill—$24 to $30 a week is about what a fair compositor would earn on a morning paper; on an afternoon paper something less. The printing profession is paid rather higher than any other trade, because it is supposed to require a higher order of intelligence than other mechanical occupations. The man has not only to be a mechanic, but he has to have some educated thinking power.

Q. Speaking of pay by the week and for regular periods, let me ask do you have a class of newspaper men in Chicago whose pay depends upon the acceptance of what they produce, and who get paid according to the length of the article?—A. Well, to a limited extent. We have never introduced that piece-work system much in Chicago. We have, however, a few men who do not hold regular situations, but when there is extra work they are called on and are paid for that work either by the quantity or by the day. Our general rule in Chicago is to pay men by the week for reporting—a fixed sum of money.

HOURS OF LABOR IN NEWSPAPER OFFICES.

Q. How about the hours of labor in the newspaper work?—A. On morning papers reporters are expected to come on about noon, or earlier

Digitized by Google

when necessary, and to stay until their branch of work is disposed of. The commercial reporters have to begin early, but they get off early; with marine reporters it is the same; with law reporters the same. Every class of business that is transacted during the day is generally written up during the day, but reporting that runs into night work, such as public meetings, council meetings, conventions, and the happenings about the city in the night, those reporters do not get off until late. We have reporters who remain in the office past midnight, and of course they commence later in the day.

Q. Can you give us some idea of the number of men who are employed upon some of the leading newspaper establishments?

The WITNESS. In what capacity?

The CHAIRMAN. I mean in doing the ordinary work of the paper—not the editorial writing, but the common work that goes to the make-up of the paper from day to day.—A. The Tribune has about thirty reporters. The Chicago Times has perhaps as many; the other papers have less. I think none of the papers have less than ten or twelve. The Chicago Tribune has on its pay-rolls a list of perhaps two hundred and fifty men as compositors, proof-readers, pressmen, stereotypers, clerks, reporters, &c.

Q. In different parts of the country?—A. No; in the city of Chicago. The other papers have fewer. This does not include, of course, such occupations as paper-makers or distributors, or carriers, or correspondents, but only men that work directly on the paper.

The CHAIRMAN. You were going on to speak of the pay of tradesmen and clerks.

### WAGES OF CLERKS.

The WITNESS. Well, the clerks are the lowest-paid people in our city. Their wages are very low. There is an enormous surplus of them, and they have cut each other's compensation to pieces. Many work really for starvation wages; that is, store clerks do.

Q. Why do they do that? Why do they not go about something else?—A. The principal reason is, they have not any other occupation. They have learned no other trade—I mean they have learned no mechanical trade. They are farmers' sons and mechanics' sons and small shop-keepers' sons, and the sons of professional men, that have picked up a little smattering of education in our schools and academies, and have never learned any manual labor and do not want to go back to farming (if they are farmers' sons)—it is at least very difficult to get them to do it. And at any rate the man that is not raised on a farm cannot do well on a farm. A town-raised person would almost as lief stay in the penitentiary as to work on a farm. Farm labor is hard work and poor pay, and is a sort of *quasi* solitude. These young, half-educated farmers and villagers flow into the cities and stay there and take the first genteel employment they can get, at any wages offered them, if it is barely enough to pay their board and washing, and to keep them in clothes.

### NECESSITY FOR TECHNICAL TRAINING.

Q. For that state of things what remedy occurs to you?—A. Well, I tried briefly to state it in my opening remarks before the committee this morning. The most practicable remedy that I have been able to think of is the industrial school system—to teach trades to boys that are growing up—which would take the pressure off of these lighter avocations

Digitized by Google

called the "genteel employments," and put these young men into productive industries.

Q. But so far as the farmers' sons are concerned, and that seems to be the most numerous class, they already have the farmer's trade and will not work at it?—A. Very well, they would learn other trades if they preferred them. At present, if a farmer's son leaves home, there is nothing for him to turn his attention to unless something like clerking. What can he do? He does not know any trade.

Q. Do you think that the difficulty is other than that the trade involves manual labor and he wants to escape manual labor?—A. Yes, there are other complexities in the problem.

### TRADES UNIONS.

Our trades unions, composed chiefly of foreigners, are almost universally hostile to American boys learning trades—any boys outside of their own. Of the present American mechanics, the enormous majority of them are of foreign birth, and they prefer, when there is a vacancy, to send for a brother or cousin or chum of their own in the old country if a mechanic; and so they secure places for them and limit the places which might be had by Americans, and in that way they keep the Americans out.

### OBJECTION TO APPRENTICES.

Another trouble is, that the "bosses," as they are called, the proprietors, do not like to be bothered with apprentice boys, and do not want to give up the time of their foreman to teach these boys. They prefer importing ready-made mechanics from Europe. They prefer to have men that already know the trade than to be troubled with teaching boys for three or four years the art they are working at; so that between the disinclination of the proprietors to incur the trouble of instructing boys and the hostility of the trades unions to Americans getting into the trades, our boys are squeezed out. Then there is a vicious idea taught in families among the American people, that it is not quite respectable to follow any vocation that soils the fingers or the shirt cuffs, and the mothers as well as the fathers like to have their sons go into what are called "genteel employments," even if they are beggarly paid. The dignity of labor is not held up at all, and mechanism is not held in the respect that it ought to be in this country. For my part, I look upon the mechanic as being about the best man to be found—next to the farmer. I regard the farmer as the first.

Q. Where were you born?—A. In the territory of New Brunswick, on the Saint John's River, a little east of Maine, and emigrated from there to Ohio some 52 years ago. I was born a farmer's son there, and continued to be a farmer until manhood, when I drifted out of farming into town, as millions of other young men have done.

### INDUSTRIAL SCHOOLS.

No, our American boys have no chance at present to acquire the manual arts, and it is the duty of the State governments, if not of the Federal Government, to assist in the institution of industrial schools, where mechanism will be taught, and where natural philosophy, electricity, mineralogy, and chemistry will be taught practically.

There is altogether too much time wasted on Greek and Latin and higher mathematics in the schools, and not enough time devoted to art,

Digitized by Google

applied science, and practical chemistry. We ought to have more laboratories, polytechnic institutions, and manual schools. There is hardly a place in the United States to-day where I could send a son to learn a trade, except to force him into some shop where the boss does not want him, and where he would be unwelcome to the trades union, and where he would be kicked and cuffed about pretty roughly, and to get rid of him they would try to break him down and discourage him by all sorts of tricks and meanness.

### THE FRONTIER FARMERS: THEIR CONDITIONS OF LIFE.

Q. Have you knowledge of the actual condition of the farming population in the frontier States like Minnesota and the eastern portion of the Territory of Dakota, and in Kansas and Nebraska, where the farmers are upon the frontier?—A. I have a general idea.

Q. I do not mean those in contact with the cities, but those who are out.—A. Yes; I have a pretty general idea.

Q. What is their real condition?—A. One of very hard struggle for a number of years—just as hard work as it is possible for the human mind and body to endure, unless they are well supplied with money when they go out. Any man who will go out to these frontier settlements with such limited amounts of money as they generally have who go there will encounter a hard struggle until he gets his house built, his fences and his stables up, has broken land and raised crops, and has some comforts about him. In the winter it is very cold, and the frost sets in early and lasts late. He is very apt to be destitute of sufficient fuel; there is very little coal in that frontier country, and no wood. Coal has to be imported at great cost, and he has to lay in enough to last him some time, or else in the winter he will be short and his family will be in a condition bordering on freezing. Sometimes the winter is so severe that the streams freeze up and the cattle perish. All that frontier farming is a desperate business for poor men for a number of years. If a man has plenty of money and can put up a warm house right away for his family and get some comforts about him that takes the edge off the difficulty, of course. But the crops are uncertain at first, and he may lose a crop or two and so be nearly ruined. But those who hang on and stick to it become, eventually, independent.

### THE HARDEST OF ALL TRADES TO LEARN—FARMING.

Q. Then really it is not much use to tell the surplus population of our cities to "go West"—since they have nothing to go with?—A. It is an absurd remedy. They won't go West. They won't go on land. I understand from the reports in the newspapers that some people have testified before this committee that it is a solution of the labor question to send town's people onto farms. That is a totally impracticable solution. You will have to find some other one. Men raised in the city rarely succeed on a farm. It takes an apprenticeship to make a farmer. One must commence it when a boy, and spend 15 or 20 years of his youth on his father's farm to learn the whole art and mystery of agriculture. It is the hardest art of all to learn thoroughly and to know all about crops, soils, seasons, live stock, drainage, manures, seed, breeds, markets, diseases of animals, fruit-growing, butter-making, poultry-raising—everything necessary to learn.

Digitized by Google

By Mr. CALL:

Q. Does a man need to be a farmer in order to work on a farm?—A. Well, he won't work to much advantage otherwise. He will make a poor plowman or planter, and is not good in getting crops in or taking them out.

Q. How long will it take a city man to learn to plow?—A. Longer than you could get him to stay on a farm. He leaves before he arrives at that knowledge.

Q. But supposing he staid?—A. Well, I should say that perhaps in a season, if he had a practical farmer to instruct him; but merely learning to plow is but a very small part of the agricultural art.

Q. He would make a pretty good plowman then, would he not?—A. Fair.

Q. And earn a good living?—A. A very poor living. He would have much else to learn to earn wages. Farmers only pay half as much as workmen are paid in town.

Q. Taking his board into consideration are not the wages paid pretty fair?—A. No, sir; the general rate is $12 to $16 a month.

Q. And board?—A. And board—but I don't know of any mechanic in a city, and I think there are none here—able-bodied men—who for double $12 or $16 a month and board would put in the hours of hard toil that farm hands are required to labor.

Q. You think the average amount of wages, then, amount to board and more than $12 to $16 a month for the mechanic in the towns?—A. I certainly do, as that is only 50 cents a day and "found."

Q. How about the man who cannot get employment as a mechanic, though; would he not do pretty well to get board and $16 a month on a farm?—A. Yes, but he won't work on a farm, preferring to tramp or starve.

Q. I have no doubt you are right about his unwillingness to labor as a farm hand.

## THE WESTERN FARMERS INDEPENDENT.

What is the general condition of the farmer in the Northern and Western States?—A. Outside of the fringe of pioneer country, fairly prosperous, and many of them quite so, that is, prosperous from their standpoint.

Q. Comfortable and contented as a whole?—A. Yes, and independent

Q. Are they generally in debt and their places mortgaged?—A. No, sir; that is an exception.

Q. They are independent, then?—A. They are quite independent and getting to be well off.

Q. And satisfied?—A. As far as men are apt to be, yes. I think they are the most contented portion of the community. Since you have asked me that question, I will say in addition, and it may not surprise you because you have been living in a farming community, that I have been watching our calendars of crime and the social and domestic "unpleasantnesses" that are reported in the courts, and I think it would be within the limits of truth to say that nine-tenths of the divorces of the United States are in towns, and nine-tenths of the intemperance is in towns, and nine-tenths of the crimes, nine-tenths of the violation of law, and nine-tenths of the inmates of reformatories and penitentiaries are all in and from the towns, although half the population live in the country.

Digitized by Google

Mr. CALL. No doubt you are right about that. The country people are the contented and independent portion of our population.

The WITNESS. Yes; farmers do not make as a rule more than small profits, but they work away steadily and make a fair living and raise their families virtuously and religiously and clothe them decently and feed them well, and educate them fairly. They are generally religious people; have very few *isms* in their heads, and each year, if their crops and the prices received for them are at all fair they make a little something to improve their holdings or lay by for a rainy day.

Q. And that something is all clear?—A. Yes; they are the backbone of the Republic, and have been in the past as well as in the present, and will be in the future.

Mr. CALL. I agree with every word of that.

By the CHAIRMAN:

Q. Have you in your mind any legislation, either State or national, that you think should be enacted for the benefit of that class?—A. Only the legislation that is named in the early part of this testimony—that which would prevent the railroad carriers of the country from capriciously, constantly, and unexpectedly changing their freight schedules and thereby the prices of the farmer's products. Give freights a little more stability, so that farmers will know what they are going to get for what they have, and forbid the railroads to charge more for a short haul than for a longer one. I think they are more injured, and feel more dissatisfied with these continual and unjust discriminations and ups and downs of railroad prices than anybody else; they are the class who have complained most bitterly of railroad extortions and discriminations, and have, in fact, given their own name to the decisions of the courts on that subject—for those decisions are called the "Granger" cases. It is the farmers that have revolutionized public opinion and law on that subject. It is the chief grievance the farmers talk about. Of course, they have their notions of the tariff and taxation like other men, and I think that, as a whole, they do not believe that the higher the tariff is the better for them—except on wool—by those who raise sheep.

RELATIONS OF DISTRUST BETWEEN LABORERS AND EMPLOYERS.

Q. We are required to inquire into the relations between labor and capital, and we have construed that as implying that we should try to learn something of the personal feelings that exist between laborers, as a body, and the employing class, and have taken some testimony in that direction. Now, as you have observed it, what attitude or feeling do you think these two classes occupy with reference to each other?—A. Well, I suppose a feeling generally of distrust and dissatisfaction. They are not amicable, as a general thing.

Q. Is that feeling that you refer to on the increase or decrease in this country?—A. I think it is on the increase steadily.

Q. Do you think it of a character sufficiently serious to occasion any alarm or require attention?—A. Well, it is a serious question. Yes, sir; it is a growing dissatisfaction. The trades unions of this country are feeling more and more dissatisfied with their position, and they are developing more of what might be called a communistic feeling—a tendency or desire to resort to what may be called revolutionary and chaotic methods of rectifying things. They are not satisfied with their division of the profits of business, and they look at the enormous and sudden acquirement of fortunes by a few speculators with feelings of dissatisfaction and anger. I think that expression is not too strong.

Digitized by Google

PUBLIC UTILITY OF THIS INVESTIGATION.

By Mr. PUGH:

Q. I would like to get your judgment as to the public value—and by that I mean the value to the public—of the work which this committee is authorized to do under the resolution which you have read.—A. I do not know, until I see your report, and see what you propose.

Q. Do you think that the thing to come out of this work will be of any value to the country?—A. Well, you are the gentlemen whose duty it is to make a report that will cover all the practical grounds. I think you are able, after hearing so much testimony, to tell Congress and the country how far legislation can better the condition of those complaining classes, without doing more harm than good.

Q. Have you noticed the character of the testimony that we have been taking here?—A. Yes; I have been watching it pretty carefully as far as I have seen it reported in the press.

Mr. PUGH. It is very imperfectly reported in the newspapers, and you cannot get much idea of it from those reports.

The WITNESS. I have read all that has been printed in the New York papers and telegraphed West.

Q. You think, then, that it may be made of some use in solving this problem of directing public opinion to the troubles?—A. Well, you can do this: You can either make some suggestions to Congress that would improve the condition of the complaining people, or you can show why there is nothing possible to be done within the limits of congressional legislation. Now, that is your problem, not mine. You will have to study that problem.

By Mr. CALL:

Q. The question, I take it, is not so much as to the efficiency of this committee as to the value of the inquiry in gathering opinions of thoughtful and experienced men upon these subjects—whether such a body of opinion, authentically taken, will be of value to the country and to Congress.—A. Well, it will depend on what comes out of it finally, and what your conclusions will be, what schemes of amelioration you will formulate. Everybody in the United States may testify before you, and every man may present his notions, and unless you can draw some extract from them it would be of no use.

THIS, THE WAY TO GET INFORMATION.

By Mr. PUGH:

Q. How can this Government attain, in its legislative department, information otherwise than by authentic reports of the practical experience and opinions of its business men?—A. That is the way to do it. It is the way the English Government always does it. It always has one or more commissions in session searching for facts from the people interested in economical questions.

Mr. PUGH. You will allow me to say that I consider your statement here to-day worth all that it will cost the Government to have this information.

The WITNESS. Well, that is complimentary. I am afraid the printer's bill will be a good deal more than the value of the report of my testimony.

The CHAIRMAN. The committee will not discriminate, of course, between persons. We want to hear all classes and get at the public sen-

Digitized by Google

timent and at the feeling on this problem that you say is looming up in our presence, and which must be met. We cannot suppress a man who comes here to testify. We have got to get all the information that we can; it may be crude, and some of it may be "cranky," but it is the mass of opinion that we have to look at.

The WITNESS. You asked me a moment ago in regard to the dissatisfaction of the laboring classes. I only half answered it. I will now add the rest of it.

### EFFECT OF SUPPLY AND DEMAND ON WAGES.

There is an almost universal impression prevailing among the trades-union people—those engaged, I mean, in labor combinations for mutual defense. I am not making any attack on them at all. I recognize a great deal of good and usefulness in those unions; but there is a universal impression prevailing among them that the employers in the United States could afford to pay much larger wages than they do if they wanted to without increasing the prices of their goods, and that they do not out of pure selfishness. I think the dissipation, if it were possible, of that fallacy would be the most useful thing that could be done. I think that if the laboring classes of the United States—the mechanics especially—could be brought to see that under the fixed laws of trade, of supply and demand, the employer has really little more control over prices where not protected by patents than over the winds and the weather, the largest possible good would be done; for if the mechanics saw that they are really, as a whole, paid about as much as it is possible to pay them they would then yield to the inevitable and seek other ways of improving their condition, and the feeling that they were being systematically cheated all the time would die out. In my newspaper, and in personal discussions, I have tried in my small way to get them to see that in a country where competition in trade has free play and full operation, it really fixes the maximum price on the whole for wages, and I have tried by iteration to get this idea before them: never to strike for higher wages on a falling market on the line of goods you are working on, for if you do you will inevitably be defeated, as your employer in that case can always make more money by locking up his shop than by paying the increased wages demanded while the prices of his goods are declining. I have tried to get this further idea into their minds: that no man is carrying on manufacturing from motives of benevolence purely. He has behind his motive gain, and if he does not see a reasonable prospect of making a satisfactory profit on his investment he will quit the business and not risk its dangers and losses, and that the time to strike is on a rising market, and that is the time that they do not often need to strike, because, under the law of active demand, the employers searching for new workmen bid one against the other, and it does not require much combination to get better wages on a rising market. And when the market is bad or sluggish or standing on a poise, the men had better arbitrate, and they had better arbitrate any way in all cases than to strike. I have tried to teach those lessons, and I have endeavored to show that every strike, even if successful, costs more than it is worth; and if unsuccessful, the loss chiefly falls on the workmen, and nobody gains. It is a species of civil war every time. Now, if any method could be devised by the legislatures to stop strikes it would save millions upon millions of dollars of earnings to the classes who live by their hands in the United States and to the men that hire them.

I have tried to teach the workingmen another lesson: that it is not

Digitized by Google

even to their interest to force the employer to give up substantially all his profits or to keep only a small reserve; that that is a foolish policy, and that the effect of it is to prevent the employer enlarging his business and thus hiring more men; that in this country the rule is if a man makes money in his business he usually puts it back into his business, in order that it may grow, and he could not make it grow without hiring more men, and he must have new machinery and new stock if he has more men, and that adds to the business of the country in almost every direction.

Q. Has not much the greater part of the gross proceeds of your own business gone for the compensation of labor in some form or other?—A. Yes; in the last thirty years we have paid back to labor, and for fuel, light, materials, machinery, repairs, and paper 80 to 90 per cent. of all that we have taken in; and some of our neighbors have not made anything. It is a pretty accurate estimate to say that 80 per cent. of the gross production of the country goes for shop wages, raw materials, taxes, insurance, &c.; fully that; and if we take panics into account, such as those of 1837, 1858, and 1873, it is perhaps nearer 90 than 80 per cent. I include, of course, middlemen's commissions, freight charges, interest on borrowed money, repairs, and replacements, and all necessary expenses. The final net profit, after taking out living expenses, is far less than the trades unionists are generally aware of, and that is a chief reason why so many men fail in the manufacturing business. They have to sell so close. The competition is so sharp and perpetual that independent of anything that they may do there is rarely any more than a moderate margin of net profit unless there is what is called a "boom" in prices, which is always succeeded by depression.

Q. The evils then that would seem to oppress labor, and of which it so justly complains, arise from economic causes?—A. Yes, I think so; to competition in production, as I have stated.

Q. And in various forms appertaining to the whole community?—A. Yes.

Q. Of course it is a very large subject, but it has not been touched upon. After all, is not this competition among employers very largely the secret of the troubles of labor itself—the failures, the panics, &c.; do they not arise from causes which lie beyond and outside of the laborer, and for which he certainly cannot be blamed?—A. Yes; the panic of 1873 was produced by causes which neither the employers of labor nor the workmen should be held responsible for; but I am speaking of the effects of competition on manufacturing, that it cuts down profits to the lowest point and determines a market rate for wages beyond the control of employers, to raise them and continue in business.

---

NEW YORK, *September* 26, 1883.

NICHOLAS HEINTZELMAN examined.

By the CHAIRMAN:

Question. What is your residence and occupation?—Answer. My occupation is a chaser and decorator in metal. My residence is No. 110 Fourth avenue, New York City.

Q. Are you an unusually skilled workman in your business?—A. I claim to have made some of the best work in this country.

Q. What class of work have you done?—A. I have been confined to chasing patterns.

Digitized by Google

Q. State some of the sort of work you have done—patterns of what?—A. Patterns for silver-ware and castings for decorative work.

Q. For what firms have you worked?—A. Tiffany's and the Gorham Company, and the Whiting Company, and I have worked largely for all the small establishments throughout the country—in New Orleans and elsewhere.

Q. Have you done the best class of work for those several firms?—A. I claim so.

THE TARIFF.

Q. What is the grievance that you have to allege to the committee?—A. The exclusion of the competition in skill—the tariff, which excludes competition in skill.

The CHAIRMAN. Go right to your particular grievance in your own profession.

The WITNESS. In these large establishments they steal their designs on a large scale. The tariff permits the stealing of designs; that is, it makes it profitable in proportion to the tariff. Stealing of designs would be bad enough under free trade, but the tariff is just so much of a premium on stealing designs.

Q. What effect has it? Where does it hurt you about your pay for your work? Do you sell abroad?—A. No, sir.

Q. Did you not say to me that your heaviest orders came from abroad?

SUPERIORITY OF AMERICAN SILVER-WARE.

A. They come from abroad, because the work can be done here cheaper and better. We have beaten Europe in the three last exhibitions—the exhibition of Vienna, the exhibition of Paris, and the Centennial Exhibition. American silver-ware has been superior to any done in Europe.

Q. That is to say, you have the foreign market and the home market both? Now, how does that hurt you?—A. It hurts me because I cannot get in my own designs.

Q. Why not, if you have a market both abroad and here to sell in, and exclusion of foreign competition; you can sell here, and sell there too?—A. I have no market as a workman. These men monopolize the margin, and it is disastrous to me.

Q. What men?—A. The large manufacturers. If I should manufacture an article I would not be able to sell it.

Q. Your complaint is that you are a workman, and not a manufacturer, is it?—A. Yes. I would like to become an independent workman, and I would like to find a market.

Q. If, as an intelligent workman, you have both Europe and America to sell your work in, why are you not as well off as you can be as a workman?—A. I do not claim that I have America and Europe to sell in. I do not claim that I have got the market. I am compelled to work for the wages that are now stipulated for me.

Q. Can they not pay you higher wages when they can control the trade of the Old World than when they cannot?—A. I do not think so.

STEALING OF DESIGNS.

They can impose a low grade of work on the market. They can suppress rising skill. I think the Government aids these men in stealing foreign designs that are good enough to duplicate; and they will not pay for promoting original ideas in art as long as the Government gives

Digitized by Google

them 40 or 50 per cent. in stealing these designs, to the exclusion of the originals from the market.

Q. What designs do they steal; European designs or American designs?—A. Largely and chiefly Japanese designs and the better European designs.

Q. Do you complain that Japanese designs are cheaper than American designs?—A. They are if they can sell them and exclude the Japanese goods from the market. If their goods came here free, there would be no premium on stealing them, and they would have to promote original designs and original American art.

Q. And you want a higher tariff to keep out the designs, don't you?—A. No, sir; I want free trade. I am not afraid of competing with the skill of the world.

Q. What pay do you get?—A. My wages would be now less than they have been, if I worked in a shop.

Q. I ask what pay it is that you do get?—A. I have been working lately at what has been stipulated—so much for the work.

Q. If you are a first-class workman do you not get first-class wages?—A. I do not. I was told by a manufacturer that he did not want that kind of work; it did not pay him; it took too much time.

Q. Do you not think that you, as a first-class workman, are dissatisfied rather because you are a workman and not a manufacturer, and that you desire to be a manufacturer rather than to work practically?—A. No; I believe that I aim at art.

Q. Have you stated your grievance?—A. The destruction of the competition of skill diminishes the demand for high quality of work. They are under no necessity to compete with the skill of other nations. Therefore they are under no necessity of promoting skill here. They can impose any work they please on the market, and they do not want me to do good work. I believe the tariff gives no encouragement for art in this country.

---

NEW YORK, *September* 26, 1883.

REUBEN CARROLL examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. I reside in Richburg, Allegany County, New York.

Q. What is your business?—A. I am at present engaged in the development of oil territory principally. I have some other business, however.

Q. Are you connected with any association or company; if so, in what capacity, and what is the name of the company?—A. No, sir; I am operating individually.

Q. In the development of the oil region?—A. In the development of oil territory; yes. Abstracting oil from the ground. I am usually called an oil operator.

Q. How long have you been engaged in that pursuit?—A. Since 1864.

Q. Since about the time of the discovery of oil?—A. I did not commence quite so early as that, but in 1864 I went into the oil business.

Q. The discovery was when?—A. In 1859.

Q. Have you been quite familiar with it since 1864?—A. Yes; quite familiar.

Digitized by Google

The CHAIRMAN. I think it would be quite interesting and instructive to the country, if you feel strong enough to do it in a preliminary way, to give us a narrative of your experience and knowledge of the development of the oil industry. Take your own time and do it in your own way.

The WITNESS. I would prefer to do that at some future hearing. I have prepared some notes that relate, I presume, to a matter which you are called upon to investigate, and I would prefer to be heard upon that first.

The CHAIRMAN. You may have your preference as to the order of hearing. You may go on, then, and state anything you think pertinent.

The WITNESS. I take it that your committee is organized for the purpose of investigating the cause of collisions between capital and labor and labor problems generally.

The CHAIRMAN. Yes; I will read you the resolution under which we are acting, in order to show you what liberty you have so that we may not get outside the limits. [Resolution read.] You may now go on and state what you think would be of use to the country.

### INTEREST ON MONEY AS A FACTOR IN THE LABOR PROBLEM.

The WITNESS. The greatest of all causes operating to oppress and rob labor, resulting in frequent conflicts between it and capital, is usury, commonly called interest. It is utterly absurd to seek to reconcile capital and labor or to relieve labor so long as the present unjust rates of usury prevail. As well seek to save a burning building without first having extinguished the flames.

Money obtained through interest or usury is not the result of production. A dollar will not produce, like a fruit tree or a kernel of wheat. Therefore, he who obtains wealth through usury is simply transferring to himself the earnings of others. "He has gathered where he hath not sown."

Usury is the direct cause of drones in the human hive. It enables men to live without labor; and therefore sets at naught the command of the Creator, "In the sweat of thy face shalt thou earn thy bread." Either usury is wrong or this decree of the Creator is wrong.

### THE IMPOSSIBLE TASK IMPOSED ON LABOR BY INTEREST ON MONEY.

The legal rate in this State is 6 per cent., and this rate, if paid semi-annually, implies that the laboring people of the State shall by the proceeds of their labor double the value of all the property now in the State in a little less than twelve years, besides supporting themselves. This imposes upon them a truly impossible task. Hence we hear the complaints and groans of labor.

Q. Do I understand you to mean, and to say, that the interest paid amounts every twelve years to the value of all the property, real and personal?—A. The following will explain, perhaps. If any doubt the correctness of my premises or conclusion he may test it in this way: Suppose that the present owners of the property in the State should agree to rent it to a foreign people, stipulating that they should receive as rent 6 per cent. on the value, rent to be paid semi-annually. Then in a little less than twelve years the present owners would have received from the foreigners in rent the full value of their property, and would yet own the property. Now, could an equal number of any foreign peo-

Digitized by Google

ple make all the improvements, clear all the farms, build all the houses, construct all the railroads, erect and equip all the factories in a little less than twelve years that has cost the labor of over a century of our own industrious people? Clearly they could not. Therefore 6 per cent. usury requires impossibilities of labor.

Mr. Kellogg, in his most admirable work on finance, says, "If the laboring classes could make as many improvements in a new country as now exist in this, and could afford to give the whole improvement for the use or rent of this country for ten years, then 7 per cent. would be a just rate of interest. If the people require twenty and one-half years to perform this labor, besides making a comfortable provision for themselves, then 3 per cent. would be the just rate; if thirty-five years, 2 per cent., and if sixty-nine and one-half years, 1 per cent. would be the true rate." This estimate is based upon the fact that at these different periods money loaned at these rates would double, interest being paid half yearly, as rent usually is.

The laboring people of this country received less than $1 a day for their labor during the past year. But let us assume the average wages at $1 per day. At this rate a laborer in sixty years, working three hundred days in the year, would earn $18,000. Money will now readily loan at 8 per cent. on bond and mortgage in almost any section of this country, and in some sections at a higher rate. Now $1,000 loaned at this rate for sixty years, interest being paid semi-annually, would amount to $134,107.05; or, in other words, it would take the entire earnings of more than seven laboring men to pay the interest on $1,000. This estimate makes no account of the cost of supporting the laborers and their families; and taking into account the fact that a laborer could scarcely subsist on less than $1 a day we can only conjecture how many laboring men must give their surplus earnings to pay the owner of this $1,000 for the use of it for sixty years. This gives but a faint conception of the oppression and robbery of labor implied in 8 per cent. usury.

But while these laborers will have produced millions of bushels of grain, built thousands of houses, and produced an abundance of the necessaries and comforts of life, and blessed humanity and enriched the world, what has the owner of this $1,000 done? His thousand dollars has not increased one penny. It has not produced even a spear of grass during this time. Then why should society award to him, a drone, eight, ten, twelve times more than the honest worker who produces the honey?

## DOES CAPITAL INCREASE?

Q. You hold that capital as an element in combination with labor is not a producing power?—A. It does not produce anything. It does not increase, as I said, as a tree increases or as a kernel of wheat increases.

Q. You take a thousand dollars and put it in the form of a reaping machine; the machine and the thousand dollars are substantially identical. Now, is the reaping machine and the human labor not a producing power?—A. It is the reaping machine that does the work; but I will touch upon that after a while.

Q. I want to understand this: From your statement so far I do not quite understand whether you hold that rates of interest are excessive, or that rates of interest to any extent are wholly unjust?—A. If you will be good enough to make a note of any questions you think of that are not answered I will answer them after awhile.

Digitized by Google

The CHAIRMAN. I do not care to make any notes. I can tell as you go along whether my points are answered.

The WITNESS. Then seeing the oppression of labor wrought by 8 per cent. usury, what must be the fearful effects of 10, 12, 15, and 20 per cent. compounded semi-annually, and frequently quarterly rates, now actually prevailing in some sections of this country? We can only conjecture, and are led to the conclusion of Napoleon Bonaparte, who, when shown an interest table and after having pondered it a while, exclaimed, "The deadly facts herein revealed lead me to wonder that this monster interest has not devoured the whole human race." But again, as Lord Bacon said, "Usury gathereth the property of the nation into the hands of the few."

## INTEREST ON MONEY THE CAUSE OF PANICS.

It is the direct and certain cause of money panics, so detrimental to labor. A money panic simply indicates that settling day with the lenders of money has come, and the production of past labor must be surrendered to them. Then manufacturers suspend, and laborers are thrown out of employment—to beg or starve or steal. No adequate estimate of the loss entailed or the demoralization of a people subject to a money panic, such as has frequently prevailed in this country, can be made. That money panics must result from usury is very evident when we consider the enormous proportions of usury. We speak of interest on money as though all money paid in interest was paid for the use of money alone, when the fact is that but a small portion of the interest paid by the people is for the use of money. Every debt, no matter how created, whether for the transfer of real property or the transfer of watered stock, implies interest. Money loaned by banks soon finds its way back to the bank, and is reloaned over and over and over again, and each loan and reloan piles up the interest, which laborers must pay. So that the accumulated interest in this country on public and private debts soars into the billions, and is in amount beyond the possibility of computation.

But not in times of panics alone are the baneful effects of usury felt by the laborer, as well as by all other classes of the community. In times of comparative prosperity, such as the present, we witness them—heavy failures reported this morning in this city being the direct result—the inevitable sequence of the high rate of usury which business men are compelled to pay.

Then usury enters into the cost of all production; and when the laboring man is compelled to buy anything to eat or to wear he is compelled to pay usury; he cannot escape it. When in the early part of this season the Secretary of the Treasury was throwing millions into the circulation weekly, to relieve the stringency of the money market, he produced no visible effect in that direction. This was regarded by business men as something very extraordinary; but after investigation it was ascertained that the Secretary's millions were absorbed in interest, mostly by large fund holders.

## MONEY THE "YARD-STICK" OF VALUES.

Then in another manner usury becomes a very great factor in the robbery of labor. The Constitution of the United States makes it the duty of Congress to coin money and regulate the value thereof. Congress has provided for the coining of money, but has utterly failed in regulat-

Digitized by Google

ing or fixing its value. The yard-stick—the measure of length—will always measure the same number of yards of cloth of the same length, but our dollar, no matter whether of paper, gold, or silver, will at different times measure different values—sometime the purchasing power of the dollar doubles or trebles in a few months or weeks, and this always results in the robbery and oppression of labor by transferring the product of labor to the owner of money at one-half or one-fourth its value. In times of money panics the purchasing power of the dollar expands often treble and quadruple, thus resulting in changing of values, and thus robbing debtors. A man giving his obligation to pay so many dollars six months hence is simply gambling, with the odds fearfully against him. The dollars which he promises to pay may, at maturity of his obligation be worth three or four times more than the property which he gave his obligation for. For, be it remembered, that the debtor must buy the dollar with which to meet his obligations with property, and while money is a tender for property, property is not a tender for money. The law is inexorable; the debtor must pay in money and the debtor must pay the price in property which the owner of the money may demand, no matter how exorbitant. Therefore it is very evident that in times of panic the owners of money have, in Wall street parlance, a "corner" on the property of debtors and can squeeze them to their hearts' content.

This terrible crushing despotic power of money is, of course, given to it by law, as money is the creature of law, and demonstrates what I have already asserted—that our dollars have no fixed value, and are simply loaded dice, frequently in the hands of sharpers to fleece the credulous and unsuspecting public.

Senator Jones, in his report made in 1877, on the fifty-fifth page, says, "A loan of money made in 1809 if repaid in 1848 would have been repaid with 145 per cent. increase in the purchasing power of principal and interest." Those who have loaned money to the Government in 1861 have received nearly as much in the increased value of their money as in their interest. Then if we examine this matter more closely, we will find that usury or interest on money is at the bottom of this mischief. A dollar, like a rented house, is worth to its owner proportionate to the rent which it will bring. Therefore a dollar that will bring in 12 per cent. at usury is worth to its owner just two of the dollars that will only bring 6 per cent. In this light it is easy to see why the purchasing power of money is so greatly expanded in times of panic. The rate of interest jumps up double, and consequently the dollar is worth double to its owner, and will command double the products of labor. In the same ratio that the rates of interest jump up will the value of property go down—fluctuate with every change in the rate of interest. With this changing standard of value constantly and sometimes greatly changing all values, is it to be wondered at that labor is oppressed, and that so few merchants and business men succeed in amassing a competence?

It will clearly appear from the foregoing that with the ever fluctuating rates of usury it is utterly impossible to give any fixed value to the dollar.

### RATE OF INTEREST DEPENDENT ON VOLUME OF CURRENCY.

But there is another very important element entering into this problem. The rate of interest depends largely upon the volume of money in cir-

Digitized by Google

culation. The less money in circulation the higher will be the rate of interest. Then clearly it is to the advantage of those loaning money that the amount of money in circulation should be as small as possible. Therefore by every possible means they will endeavor to decrease the circulation, so that usury, in addition to its robbing of labor by absorbing earnings, aids to drive money from circulation, and thus forces labor to idleness. In view of these facts, can there be any doubt that usury is labor's greatest curse? Its effects are clearly evil, only evil, and that continued.

But, seeing that the rate of usury depends upon the volume of money, is it not strange that any sensible people should give to those whose advantage it is to get high rates of interest the power to control the volume of their money? What claim to common sense could a people have who should give to their merchants and others dealing in cloth, the power to expand or contract their yard-sticks at pleasure? Yet this is the very foolish thing that we have done regarding our money. We have given to those dealing in money the power of expanding or contracting its volume, and thus the power to unsettle values and dictate terms to labor, the producer of all wealth.

### STEADY VALUE OF MONEY NECESSARY FOR JUSTICE TO LABOR.

Now, it must be evident that, with this ever fluctuating and uncertain standard of value, justice and equity to the ordinary debtor and creditor is utterly impossible. And this is why political economists have never been able to ascertain the just relations between capital and labor. While the days, hours, and minutes of labor are accurately and definitely measured and must be honestly rendered, the dollar which measures the value of that labor is so manipulated as to only measure 25 or 50 cents frequently to the laborer. While the products of labor are definitely measured and weighed by the yard-stick or the pound-weight, with no chance to rob capital, the dollar, which is the yard-stick and pound-weight measuring and weighing the volume of those products, can be and is so manipulated as to measure and weigh the value to suit the selfishness of capital.

Q. Do you think that is so?—A. I think that is so.

Q. Suppose I hire money of you when produce is very low, and I repay it when produce is very high—I hire money of you when produce is 50 cents a bushel, and repay you when produce is $1 a bushel; in the one case you (being the capitalist) get half as much as you do in the other. Would you not say that capital there is at the mercy of production or labor, instead of reversing it, and saying that labor is at the mercy of capital?—A. I speak now in a general sense. When the money panic comes we know that the products of labor only bring one-half the amount brought before. To illustrate: I know a man who purchased a farm in Ohio in 1865, paying $100 an acre for it; in 1877 he was compelled to sell it at $30. And I suppose there are other cases.

### IS MONEY A COMMODITY?

Q. Undoubtedly, there are cases both ways; but you do not look at money as a commodity, that a man owning it will sell for the best price he can get, and if he can get no price for it will keep it in his pocket, being himself the safest custodian of his own?—A. I think the word "sell," that you employ, does not exactly give the meaning.

Digitized by Google

The CHAIRMAN. Then to lease or let.

The WITNESS. Well, when men "let" they do not "sell." The man who lets gets his money back—he simply transfers the use of it for the time being; and when we say that a man who has money to loan has the same right to "sell" as a man who has wheat, we are guilty of a sophistry, because he does not want to sell; he wants to loan.

In times of panic, when capital is gathering in the products of labor, the dollar is trebled frequently in purchasing power; but after the panic, when capital wishes to realize, to resell those products to labor, the dollar shrinks immediately in purchasing power. When, a few years since, the people's bonds were being sold to capitalists they were worth less than 50 cents on the dollar, weighed by gold; but when in the hands of capitalists, and the time came for the people to redeem them, to their great surprise they were worth $1.20, besides the interest, weighed by the same standard.

## MONEY—THE POWER TO ISSUE IT SHOULD BE EXERCISED ONLY BY GOVERNMENT.

Now, is this not sufficient cause for the conflict between capital and labor? Make the dollar honest, as labor is, and you have solved the problem. Make it just as impossible for capital to cheat labor as it now is for labor to cheat capital, and the conflict will cease. And this can be done by making the dollar an honest one, so that it will register the same value at one time as another.

To do this, in the first place the volume of money must be kept steady. There must be no sudden inflation or contraction, and to keep the volume steady the power to issue money must be taken from where it is now deposited and, as Mr. Jefferson said, "vested in the Government, to whom it belongs." It is idle to suppose that if you give this great power, as you do, to bankers, or those dealing in money, they will not use it to their own advantage. The many millionaires now in this country afford ample proof that they have employed this gigantic, crushing, despotic power to their own advantage.

Q. Do you think that it is the currency that is bought and sold as between capital and labor, or is it the property that is behind it belonging to capital? Do you not in substance hold that Government must own all the property and issue money as the people want it?—A. No; I simply wish to convey the idea in the first place that the volume of money should be kept steady, and that that cannot be done so long as the issuing power——

Q. [Interposing.] But the money is of no account while in the Treasury. It must be passed out into private ownership before it becomes available to labor or to anybody that hires. Now, that ownership rests, in your idea, with the capitalist, and he is the man that hires the laborer; it is not the Government. Even if the Government issues the money it first goes through the capitalist and the capitalist deals with it as his own, whether he or the Government issues it.—A. Let me explain the idea I was seeking to convey: I was saying that it was illogical and improper to allow, to those dealing in money, the power to issue money—giving them thus the power to expand and contract its volume—and thus giving them the power to expand or contract the value of your property and mine, and everybody else's, and that this power to issue money should be taken from the bankers and put into the hands of the Government, as Mr. Jefferson has said.

Digitized by Google

Q. But I say it can make no difference in results, since it must first pass through the hands of the capitalist, the power resting in the first place with him.—A. It would make a great deal of difference in results. The instance I mention, where this land was bought at $100 an acre and sold at $30, was the result of a contraction of money.

Q. But that was not caused by the Government. The issue had already gone up to and beyond the necessities of trade. Then came a contraction; but the Government did not contract it.—A. Let it be made how it may. The point I am making is that money is the yard-stick that measures values. If to-day double the money were issued by the Government, values would jump up double; and if half were taken away values would go down double.

Q. Do you mean that the Government should lengthen or shorten the yard-stick, according to circumstances?—A. I say no; it should be kept steady.

Q. But who is to handle this yard-stick?—A. The Government itself is to issue this money. That is where the Constitution places the power. There is no power given in the Constitution to any one but the Government to issue it.

The CHAIRMAN. Money issues from the bowels of the earth primarily, in the form of the precious metals dug from it, and the Government has power to coin or stamp on that the insignia of what you call money and make it a legal tender, but the value is in the property itself. But is this to be a prolonged discussion of the nature and uses of money?

The WITNESS. No, it is not.

The CHAIRMAN. I understand that your theory is that the Government should issue the money. That is a question as large as the face of the earth, and penetrating some distance into it; and the literature on that subject *pro* and *con* is very extensive. I would like to reach the subject-matter which we had particularly in view, as soon as possible, because we want to try to get through here this week, and there are many witnesses yet to be heard; still I do not wish to prevent your stating your point.

The WITNESS. Allow me to say that I think you are in error when you say that the money issues from the bowels of the earth.

The CHAIRMAN. Well, I will admit, for the purposes of the argument, that I am in error. Now, assume that, and proceed with your main point.

The WITNESS. We will get to that after a while.

The CHAIRMAN. I want to reach these grievances about labor.

The WITNESS. Money is a very important factor in these grievances.

The CHAIRMAN. You can assume that the committee has "read up" on this subject on both sides. I think you are stating your views very strongly, and, as I said, I do not wish to interrupt you, only that this part of the subject need not be too prolonged. Still I wish you to understand distinctly that we want you to make your points as you have arranged them. I do not mean that any gentleman should go on the stand and not have a fair chance.

## THE COST OF ONE MILLIONAIRE.

The WITNESS. I now continue. The general distress and all complaint of labor points conclusively to where this crushing power of money is felt most heavily. The existence of these facts leads one to estimate

Digitized by Google

the fearful cost to humanity of one millionaire. How many paupers and beggars does it take to make one millionaire; how many human lives must be crushed out; how much misery must be endured; how much squallor and poverty does it cost; how many criminals must be thrown upon society in order that one millionaire may revel in luxury?

By Mr. CALL:

Q. What is your theory—that all these troubles come from the variation in the amounts of the currency—the volume of the circulating medium?—A. No; but that that is a factor entering into it; that that has very much to do with changing the value of the dollar. I say that so long as the dollar fluctuates, as it is ever fluctuating, and is made to fluctuate, honesty and justice between man and man cannot prevail.

Q. Do you think that keeping the volume of money the same would prevent fluctuation?—A. Not that alone, but I apprehend that it would go a great way toward it.

UNIFORM VOLUME OF CURRENCY—ITS EFFECT ON VALUES.

Q. What reason have you for thinking that keeping a specific volume of money or currency afloat would regulate the values of things?—A. I have the same reason for supposing that it would do that if it were kept steady (inasmuch as money is the yard-stick that measures values), as I have for supposing that the ordinary yard-stick would always measure the same number of inches.

Q. Suppose that we apply your theory to cotton, wheat, or any other staple, and suppose a bad crop comes, and that the crop of cotton is only one-third of what it was; do you think the price of wheat would be the same?—A. That establishes my idea exactly. If you have only half a crop of wheat, you will get double price for it.

Q. But money will remain the same.—A. But it is the wheat that we are talking of.

Q. When you come to buy a dollar with wheat, you will have to give twice as much for it, won't you?—A. Certainly; the wheat is worth twice as much. If the dollar registers the same, it will be right that way.

Q. By what standard is it the same? The dollar will buy twice as much wheat as before; it is certainly worth twice as much.—A. If you have half a crop of wheat, you will get double for it, for the same reason that if you withdraw half the volume of money, the dollar will be worth double.

The CHAIRMAN. It is not possible that there should be a new money theory, and your testimony will be principally valuable in reference to these oil matters. At least, that is what we wanted you to come for, and I wish you would give some thought to that matter.

The WITNESS. Very well. I will trim this matter down.

The CHAIRMAN. We have excluded witnesses from the stand on the money matter on the ground that we have all read somewhat on the subject. It has taken fifteen years to discuss it, and it is not settled yet, so that I shall have to ask you to be brief on that point.

The WITNESS. As I am not feeling very well for the moment, I will ask to be excused for to-day, and will enter upon the other subject, with your permission, to-morrow.

The CHAIRMAN. Very well.

Digitized by Google

NEW YORK, *September* 26, 1883.

WILLIAM H. MORRELL examined.

The CHAIRMAN. You have indicated that you had something which you desired to state to the committee. You may now take a half hour and exhaust the subject.

The WITNESS. Shall I respond to questions or proceed direct?

The CHAIRMAN. Proceed direct.

ELEVATED RAILROADS AND RAPID TRANSIT IN NEW YORK CITY.

The WITNESS. Our rapid transit system in the city of New York being an entirely new development in this country, must be of interest to all large cities, and having taken an active part in bringing about the system here in this city, and watched it attentively since it was developed, I thought I might give you some points regarding it.

The system, as you know, sprang into existence in 1878—quite recently. We have had the effects of it for five years upon city real estate. Great fears were expressed that this rapid transit system would detract from the value of the central property of the city while it was acknowledged very generally that it would add to the value of the property at each extremity. It has added materially to the value of the property at each extremity—below Wall street, between the two lines of elevated roads—the east and west side lines—I should say 50 per cent., and at the other extremity of the island real estate has advanced within three years about 100 per cent.—that is to say, it has doubled. This cannot be all credited to the rapid transit system; but a half of this advance I should say, in my judgment, could be credited to it. It has not detracted from the central property of the city.

Some people argued very strenuously when they were advocating the system, that you could not improve property at both ends of this island without improving the property in the center. This has proven to be the fact. The people are now very desirous of having it extended into our annexed district across the Harlem River, and the sooner it is done, and the sooner we acquire the park territory necessary for improvements and for aquariums, zoölogical gardens, and other educators of the people that are not now possessed by New York City, the better it will be for all concerned.

NEW YORK CITY PARKS.

There has been a committee appointed by the legislature to lay out new parks. They are busy at their work, and it is to be hoped they will give us a park large enough for all purposes. Perhaps that exhausts what I wished to say with regard to rapid transit, but if you have any questions, I shall be glad to answer them.

By the CHAIRMAN:

Q. The rapid transit system gives access to these educators, &c., that you expect to create in the suburbs?—A. Yes; and the sooner these parks are got the better it will be for New York City.

Q. And the rapid transit system has proved an undoubted benefit, has it?—A. Yes; most emphatically.

STREET REFUSE: EFFECTS OF DUMPING IT IN NEW YORK HARBOR.

Q. Now, what is it that you wish to say on the disposal of our street refuse and garbage? I understand you have something to say on that subject.—A. That has been a very knotty subject for many years.

Digitized by Google

Perhaps the impediment to a greater improvement in the system has been the influence of local politics upon the efforts to secure a more modern method of disposing of the great quantity of refuse matter of this city. That we should take our garbage, coal ashes, cinders, and dirt of all kinds, and dump it into the entrance to our harbor seems, to say the least, barbarous, and people would seem to be crazy in doing it. We have got a fine harbor, and yet we allow all those things to be dumped into the mouth of it, and the result of it is only too clear—that the effect will ultimately be disastrous to our harbor. That has already been shown.

This refuse matter may be divided into three classes; first, our street manure, which should be and could be very economically given to the surrounding gardeners and farmers for at least enough money to pay for taking it up; secondly, the garbage which is allowed now to be thrown in with the ashes and dumped into our harbor, to come back on the shores of Coney Island and Long Branch; and thirdly, our ashes and dirt accumulations from builders, &c., such as sand, gravel, stone, &c. These could be and will be, I hope, at an early day brought into a system of disposal that will be beneficial and will be almost self-sustaining. The ashes, cinders, gravel, and dirt that are taken from the streets—not to mention the manure part, the sweepings—are rapidly filling up the harbor. If that were taken and put on the sunken meadows near us we would have it all solid earth within a few years, just as part of Harlem has been filled up and built upon with four and five story buildings where nothing was before but a marsh.

Q. You mean that the New York City authorities are permitting this principal port of the country to be destroyed?—A. I do.

The CHAIRMAN. There can be no doubt that that is something that the nation could interfere with.

The WITNESS. That is something which the nation should look at certainly. And not only that, but they throw this garbage into the harbor, and the light stuff floats off and gets on shore at our watering places, and that is very detrimental to the health of people there, besides being an eye-sore.

Q. How does it happen that that is done?—A. It is done, and I say it is barbarous, and I want to raise my voice against it.

Q. Who are responsible for it?—A. The city authorities under the laws of the State, are bound to take it out to a certain distance. They get it there in a storm, their barges begin to bother them, and they dump it into the harbor.

Q. Is there no way for the State to enforce its laws in that respect?—A. They have made a spasmodic effort, but it has not amounted to anything so far.

Q. Who are the men that take the garbage away?—A. The city authorities contract it out. We have a commissioner who is now doing his duty very well, I will admit. The city is divided into two or three contract districts, and the contractors work under the supervision of the commissioner.

Q. Do these contractors get any large sum for this work?—A. Not less than $1,000,000 a year.

Q. What is the reason that this cannot be used as refuse matter by farmers on their lands, instead of throwing away a million dollars and destroying the largest harbor in America?—A. The question has been agitated, and I think A. T. Stewart or Judge Hilton at one time offered to clean the streets of New York for less than the authorities were doing it, with the view of building up the place that Stewart had bought be-

Digitized by Google

fore he died on Long Island. It is very detrimental to the harbor, the way it is now disposed of. The refuse stuff frequently floats back up and injures the health of the people.

Q. Who is responsible for its being contracted out and put into the water, anyway; why is it not disposed of? If there are business men in the city of New York why do they not sell this matter and save the expense?

EFFECTS OF POLITICS ON MUNICIPAL BUSINESS.

A. Well, the politicians foil them every time.

Q. It is a political abuse?—A. It is a political abuse. Now we have to dispose of the street manure so as to take it off our streets and throw it away, while it would be a benefit to our neighboring gardeners and farmers.

Q. What authorities make this contract?—A. The street commissioner.

Q. Is he a city or a State officer?—A. The work has been done under a State law.

Q. But he is a city officer?—A. I think he is a city officer, appointed by the mayor under a law of the State—a city and county officer. What I have said relates to manure. Now, as to garbage, I say we should cremate the garbage—put a big tank at each of the dumping grounds, and put this garbage into it and burn it up, and then add the result to the manure, which would make a good fertilizer in places all around the city. The ashes and cinders become a component part of the matter that goes into the harbor, while really that is necessary for filling in the low land in the neighborhood, and by giving the manure to the farmers, and cremating this refuse matter or garbage and adding it to that, we add to its volume and make it a good fertilizer.

Q. You promote health and the fertility of the soil at the same time?—A. Yes. And it would not be a detriment to the harbor.

Q. This matter of health concerns others in the State of New York, does it not?—A. Yes.

Q. If this were a city of pestilence would it continue to be a city of commerce?—A. I think not. If the harbor is filled up the city would not be good for shipping.

Q. Then, why is not this question of public health in this city of commerce a national question?—A. That is what brought me here.

Q. Is that all you wish to say on that subject?—A. Yes; I think so.

TENEMENT HOUSES IN NEW YORK.

Q. Your next point was as to the tenement houses and their effects on the city. What have you to say as to that point?—A. This is a matter that has been brought prominently before the public for the last five or six years. One or two attempts have been made to build large tenement houses by organizations of citizens. They are, to a certain extent, successful, but they cannot reach the masses. We have an enormous population living in tenements in this city. I have not got exact figures, but it must be over half our population in numbers. The old-style tenement that we have down town here in what we call the Five Points region, the Sixth ward, and other wards about there, have generally water introduced very imperfectly—we might say in one place for a whole house.

Now, air, light, and water are the three great life-giving commodities

Digitized by Google

that we have in the universe, and we certainly should not shut out half our population from sunlight or from air or from water, as we are doing to a large extent. The modernized tenement has the water carried up to the various floors; but the old tenements, which still exist by the hundreds, and, indeed, I may say by the thousands, in the lower part of the city, have the water all in one place.

There is hardly five feet of space between the houses, and, of course, no sunlight, and very little air can penetrate there, unless there is some specially favorable opening. At any rate, water can only be carried up stairs by the occupants in pails.

### THE MANUFACTURE OF CIGARS IN TENEMENT HOUSES.

This is something that requires public attention, and perhaps legislation. It seems as though, if nothing else will do, legislation ought to take this matter in hand, just as they tried last winter to legislate the manufacture of cigars out of rooms in the tenement houses where typhoid fever patients and small-pox patients are often found. Very often the cigars that are made in those tenement houses are smoked next day by the young men about our cities, and it is easy to see that in the case of contagious diseases, such as small-pox, the cigar might spread the disease. The legislature has taken that subject up and has passed a law which goes into operation next month, that the manufacture of cigars in tenement houses shall be prohibited. They have been manufactured in those houses by the thousand, in little rooms where people sleep and work, and it must be very objectionable to health to carry on manufacture in that way.

Q. Is clothing manufactured in those same places in the same way?—A. Clothing is manufactured in the same tenement houses, and brought out.

Q. Does that law which you speak of do anything to prevent the manufacture of clothing where there may be the seeds of disease?—A. It does not touch that branch of industry yet.

Q. Which is the more important to protect, the cigar industry in that regard, or the clothing industry; which is the more likely to disseminate disease?—A. The cigar was believed to disseminate disease, and the evil was growing more rapidly.

Q. But I am speaking of the disposition to generate disease by the scattering of this clothing all over the country.—A. Well, sir; I do not believe that that would disseminate disease as fast as the other.

Q. Suppose a suit of clothing were made in a room where there were small-pox patients, and then that that suit were sent to Oregon, do you think the disease would go with it?—A. I do, indeed; but I do not think it is so apt to bring disease to the lungs of the man in Oregon as the cigar that is put up by small-pox fingers almost, and inhaled into the lungs the next day.

### LEGISLATION NECESSARY TO REMEDY TENEMENT-HOUSE ABUSES.

Q. What is the remedy for these tenement-house abuses; is there anything except law?—A. It seems, too, that the strong hand of the law should come in and enforce the carrying of water to every floor in tenements, and insist upon a proper ventilation of our down-town tenements that are crammed together, and running from three to six stories high. Of couse it affects the whole health of the city when one-half of the population lives in those houses.

NEW YORK, *September* 26, 1883.

CHARLES PARTRIDGE affirmed and examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. My business is in this city; I am residing at present in New Jersey.

Q. What is your business?—A. My business is the flour commission business.

Q. And your address?—A. My address is No. 17 Moore street, of the firm of Partridge & Smith.

Q. How long have you been engaged in mercantile affairs in this city?—A. I have been in the flour business since 1862.

Q. Have you been connected with the Produce Exchange?—A. All the time; yes.

Q. In any official capacity at any time?—A. No.

Q. But connected with the Exchange during all those years as a commission merchant?—A. Yes.

Q. Were you a witness in the investigation ordered by the State of New York last winter on the subject of "corners"?—A. I was.

Q. You heard the testimony in that investigation?—A. Yes.

Q. And testified yourself, I think?—A. Yes, sir.

By Mr. PUGH:

Q. You are advised of the subjects about which we desire to hear your statement, as covered by the resolution of the Senate under which this committee is acting. Have you read the resolution?—A. I have not read the resolution constituting this committee.

Mr. PUGH. There is a copy of the resolution which we shall be glad if you will read.

[The witness read the resolution.]

Mr. PUGH. Within the scope of that resolution, we would like to hear any statement you desire to make.

The WITNESS. That resolution refers first, I believe, to education.

Mr. PUGH. It refers to labor and capital, their relation to each other, and to strikes, their causes and remedy.

### DEFECTS OF OUR EDUCATIONAL SYSTEM.

The WITNESS. I think first that our system of education is very defective in several particulars. I think that when a child has learned to read and write and cipher, the duties and work of life should be introduced. In our schools children should be instructed in those things which they would need to do in life. I think for girls there should be a room where they can be instructed, and, not only instructed, but taught practically to do the work itself, of cooking every kind of food properly, of setting table, and of doing housework, and everything which comes naturally within the scope of a family, such as making their own clothes and mending them, and giving girls something besides books upon which they can live, if they are driven to a point where they have got to work. We educate our girls now entirely in books so that they cannot even darn stockings, and cannot make a biscuit; they do not know how to cook a piece of beefsteak, and do not know anything of the duties of their lives, as a general thing. The result is, that if they have to go out and get work they are in a very bad condition.

Digitized by Google

WORKING-WOMEN'S WAGES.

With regard to wages dress-makers, I believe, get $4 to $7 a week now, the average being about $6 for good working-women, an amount upon which they cannot live. I have before me a statement made by a woman that I know—a woman of middle age—one of those who make ladies' skirts. Here is her statement: In a dozen skirts there are 450 yards of tucking, 72 yards of seams, 32 yards of hemming, 34 yards of gathering-back, 36 yards of bands, 24 yards of bands over gathering, making 636 yards of sewing—price, $1.75. Out of that they pay for thread 50 cents, and to go and get the material, which is cut for them, and to take it back the car fare is 10 cents, leaving as the result of making a dozen skirts, with all that quantity of work upon them, $1.15, and the best workwomen, I am told, cannot make over two dozen and a half a week, making $2.87 for the week's work.

The CHAIRMAN. Is not that enough?

The WITNESS. I think it is enough just to mention it to make men ashamed to think that our females work for that price in this city, when they have to pay at least $5 a week for their board. They make $2.87; where are they to go and get the rest of it? I do not think that under these circumstances men have any right to injure or to criticise their conduct.

Q. Do you think that that is a fair average pay of the seamstresses in this city?—A. No, I do not say the seamstresses; but this is the pay of a large skirt-making establishment in this city, and that is a fair statement of what they pay.

Q. How about the difference between the $2.87 and the $5? You say they have to pay $5 to live. Don't they live?—A. They live; and I think the low price which they get for their labor is the cause of so much complaint against their characters. I think that they are in a dreadful condition, one in which they cannot live by their best efforts in work.

Q. What could be done to prevent that? They have been told that the law of supply and demand and of competition fix wages.—A. That is the question. One thing I should advise, is that females should have all the rights and privileges of voting and holding office that I have.

Q. That cannot be done for a number of years. What can be done for them now?—A. I do not see that anything can be done; I do not know that there is any remedy for it at present. But I think men who have managed our Government and industries, and permitted this condition of females should be obliged to pay females as much for the same service as they do males.

Q. Why not introduce and popularize suicide?—A. We do not need to popularize that; it is popular enough now. We cannot take up a paper without seeing some instance of suicide, and the condition of females as to earning their living invites suicides.

Q. But there are many thousands that have not resorted to it yet, are there not?—A. Oh, yes; but these things lead to suicide and all other misdeeds—the frightful burden put upon half-paid labor.

Q. You think it must go on so for several years any way?—A. I am afraid it must. I do not know of any remedy now, except to give females all the rights and privileges that men have.

Q. Do you think the people who pay those wages could not afford to pay more?—A. No; I do not think they could.

Q. Competition is such that it would destroy the business entirely?—A. Yes.

Digitized by Google

Q. Can they not do anything else?—A. They do not know anything else. Therefore I want to see that females are educated in all the duties of their lives, so that they can do better than they are doing, and fill the places of men in dry-goods stores, and in clerical positions, and be paid the same price men are for doing the same work, and these men give up females' natural work and pursue men's work; cultivate the earth, &c.

By Mr. CALL:

Q. Those you spoke of before are skirt-makers?—A. Yes; they do 2½ dozen a week, which makes them $2.87.

By the CHAIRMAN:

Q. How much is there left after paying their bills?—A. After paying for thread and the expense of going and coming from the house for the work, they have $2.87 left.

Q. How many persons are there engaged in the business of skirt-making?—A. Oh, I do not know; a great many thousands. Even seamstresses only get $6 and $7 a week.

Q. Can they not live on a dollar a day?—A. I think they can; but, of course, they are crowded into garrets, and several are in a room. Another reason why I should recommend that all girls should be educated in all branches of preparation for life is this: If they are turned out of employment at any time at one branch of a woman's business they would be able to do other work offered. If they are turned out of sewing, for instance, they ought to be able to do something at cooking, enough to make a living. Then they would have the means within themselves of living, and they can easily find places if they have some instruction in those things; but when they are instructed in only one branch and are turned out, why, they are turned out simply to walk the streets. They have nothing to do, and there is no help for them.

Boys are in pretty much the same fix. I think that when they have learned to read and write and cipher, they should commence to be instructed in the work of life, and as far as possible, to have them not only see the work done, but to do it themselves, as a matter of education. For if they go now into our schools and come out, what are they? They want to be gentlemen at once, and they do not know anything to do, nor how to do it. Labor is considered not genteel, and therefore they turn themselves towards some of the schemes by which they can live without really earning anything; so they go into those schemes of speculation, and there are plenty of them. Plenty of our young men who ought to be on farms, or in manufacturing business where they would be doing some good for themselves and the community, are found lounging around in our cities doing nothing but idling their time—nothing that is valuable to themselves or the community—in fact living on somebody else.

## "CORNERS" IN GRAIN.

Another branch of your inquiry relates to the products of our country and how they are handled, and whether there are any schemes in the handling of those products that put burdens upon the consumers. I will mention the schemes of cornering, so called, and illustrate a corner in wheat in our market. It was called the "Keene corner" (in 1879 and 1880); but Keene was not the only man that was in it; he was then in Chicago and was associated with men here in New York, and not only here, but elsewhere; there was a clique of them. In 1879, when our crop

Digitized by Google

was very good, but foreign countries were short, and it was supposed that all our crop would be wanted, moneyd men left their ordinary business and entered into a clique, and after buying up all the wheat they could, circulated the opinion that wheat would go up to $2 and $2.50 a bushel in this country, and that foreigners had got to pay their price for it or starve; that is, they had not enough to live without paying the price they put upon it here. Certain men combined to buy up the wheat and put their own arbitrary price upon it, and consumers have to pay their price or starve. These men don't help people to live, but help them to starve. The Keene corner in 1879 and 1880 lasted during ten months, from about the 10th of September to the 10th of July, during which time the 50,000,000 of people of America consumed about 186,000,000 bushels of wheat, at the average fictitious cost at least of 25 cents per bushel, which the Keene corner put on it and which the consumers were obliged to pay, making $46,500,000 in excess of the actual or natural value. That one corner put a burden upon the consumers of $46,500,000 in ten months.

Q. Will you explain how that was done?—A. Yes. The way it is done is that this Keene clique made their arrangements to send out men all over the country. I have been in the country and have met these buyers of wheat at the door of the mills in the country buying in competition with the millers when the wheat comes first into market, which is the time of the lowest price in the season, when some of the farmers are obliged to sell, in order to pay off the expense of raising the wheat. These people bought up the wheat, all the time circulating the idea of a large crop, to help them to buy it cheap. After they have bought what they can of the farmers, who are obliged to sell the crop early, they buy what they can for future delivery, and then get control of a large portion of the wheat.

Q. How early is the wheat crop purchased?—A. It begins usually in September—the winter wheat crop. This gambling trade is chiefly in number 2 red winter and number 2 spring wheat. They buy and hold it, as I have said. They continue to do so, and, of course, some will sell "short," as we call it, and there will be a great many "short" contracts out, most of which the clique secures and receives the difference between the price named in the contract and the price they put on wheat at the time the contract matures.

Q. What are those? Give us an explanation of those technical terms as you go along.—A. When a man sells what he has not got at a price that he thinks at the time it matures he can supply it for, that is selling "short." These men—the clique—buy up the wheat, and also the "short" contracts for future delivery, and the other man is not able to supply it; therefore he has to pay these men a very high price for the wheat, whatever price they arbitrarily put upon it, or the difference in the price named in the contract and the price the clique put on wheat in money.

Q. That man who sold it—not having it, how has he sold it?—A. He has sold "short." Sold what he did not possess nor expect to have, but to pay the difference in the price.

Q. What about the other man, the "long" man?—A. I will explain that further on. Now, in this corner the country lost the difference between what foreign countries would have paid when they wanted it and what they did pay when Keene and others shipped it and forced it on them about June and July, 1880, at about a dollar a bushel, making a loss to this country of 25 cents per bushel, amounting to about

Digitized by Google

$30,000,000. That is the difference on that crop which these men held and could have sold it for, and what they did sell it for, and that loss is to this country, because if they sold it to foreign countries it would have come back to our people in gold or its equivalent.

Q. Who would have got it?—A. Why, they, the clique, would have got it, but it would have been in our country instead of in any other country. That is the difference. The Keene clique deceived the farmers who did not sell their wheat into an expectation of getting $2 or $2.50 a bushel; that is, after the clique had bought up what they could get at a low price early in the season. Now, suppose that one-third of the farmers held their wheat, amounting probably to 150,000,000 bushels, which they sold for 25 cents per bushel less than they could have got for it when it was wanted. That would amount to $37,500,000 loss to the farmers, who were deceived by circulars and false reports of produce exchanges into the expectation of getting from $2 to $2.50 a bushel. Then, when the corner broke it went down to $1 a bushel or $1.10 in this city, and then they had to sell it.

Q. What made it so high? Was it not the corner?—A. Yes; the corner.

Q. That is a fictitious price that you say the farmer might have got for it?—A. The corner made it high, as I have said, but during the time the farmers could have sold all their wheat to foreign countries at $1.30 per bushel as the fair legitimate price if there had been no corner. When the clique had got the wheat in their hands then they said that it would go up to $2 and $2.50, and the farmers who held back expected that, and then the "corner" broke, and it went down from $1.65 to about $1, and they had to take 25 cents or more a bushel less than they could have had for it.

Q. Why could they have got 25 cents more? Was it for any reason only that they held it back and the price went up unnaturally?—A. No; they could have got that during the time when Keene and his clique were holding it from $1 to $1.65 in this city. After the wheat crops were gathered and the deficiencies and surplus of countries ascertained prices went up naturally.

Q. But Keene and his clique could not have made that if the farmers had not held the wheat back.—A. No. The farmers holding their wheat saved the clique from carrying so much. The clique at that time would have bought it up rather than have it go on the market. They would not have the corner broken on account of that little quantity of wheat that was held back; but the farmers holding for $2 or $2.50 a bushel helped Keene and his clique to carry so much less wheat.

Q. They believed too much in what the clique said?—A. Yes; and they lost 25 cents a bushel by that.

Q. Can you say that they did lose 25 cents a bushel?—A. Yes; there were times they could have sold to go out of the market for more than 25 cents a bushel than they finally did sell it for.

Q. And they make these representations?—A. I say they do. There are two reporters on the Produce Exchange, and they differ in their reports. One for gamblers, the other by the rule of supply and demand.

Q. Well, in that case what did they say; that there was not a good market abroad?—A. At first no; but after they got into the season somewhat then they said there was a good market abroad, and wheat would go up; that the markets abroad were short.

Q. Do you mean they lied about it?—A. I don't think it is much short of that.

Digitized by Google

Q. Did they know anything about the condition of the markets abroad?—A. Yes; they knew.

Q. Did they know whether there was to be a large or a small crop abroad?—A. Oh, yes.

Q. How can they corner that information when the London and New York papers make it public?—A. The New York papers generally use the official reports, which are under their influence; but I say the farmers did not generally get foreign information.

Q. Did they not read the New York papers?—A. Yes, some few; but as a general thing they do not, and the New York papers generally publish the official reports of the produce exchanges which are elicited by gamblers, and are influenced by them.

Q. Did they not get the truth then in regard to the crops abroad?—A. I say this: When this clique bought up this wheat in the early part of the season there was not much said about the short crop abroad; but when they had got it bought up, and when these farmers were holding it, then they said there was a short crop, and the wheat would bring a large price, $2 to $2.50.

Q. It was a conspiracy to deceive the country, then, in regard to the natural condition of the markets?—A. Well, they did deceive the farmers, and, through lack of principle, and burdened with greed, deceived themselves, and the burden of which was put upon the consumers of the wheat, which burden in this country amounted to $46,500,000, as I have said, and then the loss to the country by holding it over when they could have sold it at a high price, instead of selling it at a low price, I estimate at $30,000,000. Then, the loss we will say to one-third of the farmers who held their wheat over, expecting to get these high prices, I estimate at $37,500,000, making a total loss of $114,000,000 to this country by that corner of Keene and others in 1879 and 1880.

Q. How can you say that?—A. I have given the figures.

Q. How do you know what the foreign price would have been if Mr. Keene had never existed? How could you tell what amount would have got abroad?—A. We know foreign countries required all our surplus, and would have paid from $1.25 to $1.40 per bushel for it. We know they went to other foreign countries, and to some countries that they had never had any wheat from before, and brought out wheat for their requirements, because the price was so high here and they found it cheaper elsewhere, which defeated the cornering clique, while at the same time and for the same reason some three hundred ships which came here to take our wheat away to where it was wanted lay here for months offering to take it at almost nothing, and some of them even for ballast; but they were obliged to go away, and many persons had to mortgage their ships to pay expenses. The loss to shipping was very great, besides offending the captains and owners to such an extent that some of them declared they would not return to New York for freight as long as gambling was permitted to control our products. Commercial rules and laws were overruled and commercial confidence destroyed. Our country was irreparably injured by driving its customers for our wheat to other countries for their supplies, and stimulating an active competition in Russia, Egypt, New Zealand, British India, Eastern Turkey, and Prussia, and now at this day and this week samples of wheat from those countries are on exhibition on our Produce Exchange in New York which compare favorably with our wheat in prices and quality. That is the history of the Keene corner.

Digitized by Google

PRICES OF WHEAT IN 1879 AND 1880.

Now, as to the prices of wheat during those different months, they commenced to buy in New York September, 1879, at $1.09¼; the highest $1.30. I will tabulate the prices:

| | Lowest. | Highest. |
|---|---|---|
| 1879. | | |
| September | $1 09¼ | $1 30 |
| October | 1 28 | 1 51 |
| November | 1 35½ | 1 48½ |
| December | 1 48½ | 1 65 |
| 1880. | | |
| January | 1 39 | 1 58¾ |
| February | 1 43½ | 1 58 |
| March | 1 37½ | 1 50 |
| April | 1 26 | 1 40½ |
| May | 1 27¼ | 1 46½ |
| June | 1 15 | 1 33 |
| July | 1 05 | 1 09½ |

About June or July, 1880, Keene made large shipments to foreign countries, and it is believed he only realized about a dollar a bushel.

Q. At that time were the ships here waiting to take our wheat over?—A. No, they were here probably from October to February and March.

Q. When did you say Mr. Keene commenced to ship?—A. In June or July, 1880, I think.

Q. He held it through the winter?—A. Yes, it could not be bought less than the above prices until spring. There were sales made (during the clique's control of the market) to go *out* of the market at less price than they asked for it to gamble with *in* the market. The idea was to hold it and make us pay for it at their price, or starve, since America could not import it from abroad.

Here were option contract settlements made at $1.35 when the price to go out of the market was $1.05. Wheat could be bought at $1.05, but this option contract had to be settled at the gamblers' price, $1.35; and in these various ways the clique wrung money out of the people. In pork there were settlements for $20, when it could be bought for $15 to go out of the market. These option trades are made like this: I sell you so many hogsheads or tierces of lard, or boat-loads of wheat, and I give you a contract, and the price goes up ⅛ or ¼ of a cent, and you sell to another man at an advance of ⅛ or ¼, and so on through indefinite number of hands. It was testified before the New York State committee in this book which constitutes their report, page 148, by one of the most reliable men on our exchange, that he had seen one of these contracts which had gone through sixty-five hands, and one delivery settled them all. Every person through whose hands it passed had to pay a brokerage, and that was added to the price of the wheat, pork, or lard, and when it it goes through sixty five hands we may understand that if it was wheat it went from about $1.20, or in that neighborhood, up to $1.50 or $1.65, and all persons who eat bread had to pay for it. This difference goes directly into the hands of the dealers or gamblers, I call them—to the injury of the consumer, and with no benefit to the producer.

Pork is dealt with in the same way. In the report of the New York State committee it is testified that 250 tierces of lard settled gambling contracts for 25,000 tierces. It passed through very many hands, but

Digitized by Google

one delivery settled them all. It is a scheme that these young men, who are not educated in the duties of practical work, go into for the purpose of charging the expenses of their useless lives to the necessaries of life, which constitutes in my mind a conspiracy against life—of no benefit to anybody but themselves. It is a scheme to do that very thing, and they do it. It is just the same way with cotton and most other products.

Q. Do they make money by eating each other up, or the final consumer of the article?—A. They make money by eating us up. When it is sold for use we have to pay for the brokerages and all the profits the gamblers have made. In like manner we have to pay the addition of 25 or 50 cents a bushel on wheat, which goes into the hands of these option dealers, as they are called. Flour is not dealt in that way. I am glad to say that. But the price of flour is increased by the fictitious price put on wheat.

Q. What is it that you are speaking of, the wheat?—A. Yes.

By the CHAIRMAN:

Q. Well, that is the same thing in my mind. You mean that the flour goes to the consumer at this fictitious and inflated price?—A. It has to do so, yes; because here is a miller that is furnishing us with flour. The miller says that wheat is such a price at his mill, and he can't sell the flour at less than the price he charges, and that price includes the increased price made by all these fictitious dealings in wheat. It takes five bushels of wheat to make a barrel of flour.

Q. Well, is all the wheat involved in this?—A. Yes; but number 2 is mostly gambled in. But the price of all wheat is relatively increased in price.

Q. It is saying that practically these people control the whole market?—A. Yes; they control the price of the whole crop of wheat, corn, oats, pork, lard, cotton, and other products gambled in. I think some weeks this year our whole surplus crop of wheat has been sold in this country in futures, options, puts, calls, straddles, and other gambling terms.

Q. That is certainly an imaginary evil to some extent, because we do not have to consume the whole of it in one day. Now, what is the evil that results from selling the whole crop speculatively in one week?—A. Well, if our whole crop is sold fifty times in one year, it is done because they make money out of it; and if they make money, the consumer is the sufferer, and has to pay the fictitious gambling price. They do not do it without pay; they do not do it without charging the expense of their useless lives to the necessaries of life, and they do charge it. What could we do in this country when Keene held that wheat at the price I have mentioned, say $1.60? Foreign countries could get wheat elsewhere 20 to 30 cents per bushel cheaper than we could. We had to pay him his price, which carried flour up $2 per barrel, and we in this country had to pay it or starve. If gamblers run up the price 20 cents per bushel it increased flour $1 per barrel.

Q. But after awhile the thing broke and he had to sell here at a good deal less price than he thought?—A. It broke, and he came pretty near breaking.

Q. I can see how from day to day there could be hardship, but when the things fall do not provisions fall in price; and if so much more is paid now, you get it at so much less in six months?—A. I think I may say they never fall below the price at which supply and demand would regulate, for the reason foreign countries would take it; but supply and

Digitized by Google

demand does not regulate prices now. It is entirely set aside, and the price of wheat every day in the year is what gamblers are interested to make it.

Q. You think you may assume as the lowest it ever gets, the natural prices that are regulated by supply and demand?—A. When it gets down there it is the natural price and has quick sale to go out of our market.

Q. The price that supply and demand would not have made is the price which you complain of as being made by the corner?—A. Certainly.

Q. Here it is held back when the new crop is coming in, and the speculator and farmer both see that when the new crop is to come it will be added to the old, if the old is not used up, and the new crop will be precipitated on the market?—A. Yes.

Q. Would not the result of that be that the remnant of the old crop would be put hurriedly into the market, and that it would reach the consumer at a good deal less than it would have reached him if the corner had not existed at all?—A. Not at all.

Q. You think that that can be relied upon as "hard pan?"—A. Yes; supply and demand is the natural regulator of prices, but when the wheat goes down to this natural price, foreign countries will take all that we have. So I say it does not go below that in any event.

Q. You state that as a fundamental proposition, in your opinion.—A. Yes; and I think it is correct, because here are all these men ready to buy whenever they can buy at the rate which the rule of supply and demand would give. The trouble is that people have to pay more all the time under this system of tyranny. The people of this country have to pay more. Now as to the Keene corner. Suppose it did break and went down to a dollar, why the large stock of flour that was in this market cost from a dollar to two dollars per barrel more than it would naturally bring, and, of course, the millers who owned it wanted to hold, hoping that they would not lose so much; they had to buy the wheat at the fictitious price to keep the mill running and supply their customers; they had large stocks of flour in this and other markets; they all suffered terribly; one flour-house in New York and their consignees lost $70,000. The millers all condemn this thing, because they can't tell to-day what the price will be to-morrow. If they want to buy a stock of wheat, they cannot tell whether they will make a profit on it or not; and not only the millers, but the commerce of the country and the shipper all condemn this gambling. When Keene was holding wheat the railroads had but little freight to bring, and when it went forward they had more than they could bring, and they complained of it.

By Mr. PUGH:

Q. In all these contracts for future delivery, that you call gambling contracts, does not the right exist to demand the actual delivery?—A. Yes; and that is all there is in it—*the right.* And the dealers in it, both sellers and buyers, know that it is not intended to make an actual delivery, but settle these contracts by paying the differences in price.

Q. What is the difference, in quantity, between the actual crop and the quantity that is sold under those contracts?—A. I do not know what the difference is—probably fifty to a hundred times.

Q. In other words, how do you compare the ability to deliver with the contract to deliver?—A. They don't deliver 10 bushels in 100 bushels sold. When I was asked to testify to the senate committee of the State of New York, about a year ago, I took from the authorized reports

Digitized by Google

of the New York Produce Exchange only the amount of wheat that was reported sold each day from July, 1879, to April 20, 1882, the amount of wheat that was sold as they report "spot or cash," that is, for *use*, either in the city or to go out of the city—actual transactions—then I took the amount that they sold, called "options, futures, puts, calls, longs, shorts, straddles," &c. Now, I will answer your question. What they sold for *use* amounted from July, 1879, to April 21, 1882, to 244,675,000 bushels; what they sold in options, futures, puts, calls, longs, shorts, straddles, &c., amounted to 1,154,267,000 bushels. During this same time, and in 1879, 1880, and 1881, there were not anywhere near that number of bushels surplus to sell.

Q. Then the fact was patent and perfectly manifest that while the contract was to deliver there was no ability to deliver?—A. No ability at all; the wheat did not exist.

Q. And hence you call it, for that reason, a gambling contract?—A. Yes, most decidedly, gambling.

Q. A mere game upon a thing that did not exist?—A. Simply that. The passing of a paper that falsely purports to represent wheat and other grains or pork or lard, cotton, &c., when there is no wheat and other grains or pork or lard to represent the contract of sale, neither is it expected by the party who buys it is false and fraudulent; in a word, it is gambling.

Q. How does that contract to deliver three hundred times beyond the ability to deliver affect the market price?—A. It increases the price.

Q. Well, then, the purchaser does not suffer?—A. The actual purchaser of these goods, the consumer, does suffer.

Q. It is only the parties to this contract that are the sufferers?—A. No; I am the sufferer, because it has increased the price of the flour and other grains, pork, lard, and cotton, 25 per cent. These poor women are the sufferers who get only $2.87 a week for their work, and have to pay 25 per cent. more for their flour and pork and such other necessaries of life that are gambled in. That is one of the reasons that they cannot live any better than they do, and the chief reason for strikes, prostitution, and suicides.

Q. The effect of this system or practice is to increase the price of the product to the consumer?—A. Yes.

Q. That is your objection to it?—A. Well, it is not my full objection to it. It is unprincipled and dreadfully demoralizing.

Q. I mean that is one of your objections.—A. It is one objection. But I want to call your attention to this list. This was taken from July, 1881, to April, 1882, and I wanted to compare so as to see whether these fictitious gambling dealings in produce in our country was increasing. For the month of June, 1883, the sales upon the Produce Exchange in New York City, "spot or cash," amounted to 2,547,200 bushels. During the same time there were sold in options, &c., gambled in, 86,602,000 bushels. Just see the difference between those two items; and that represents the tendency to increase this pernicious business of gambling on the New York Produce Exchange in the necessaries of life.

Q. Have you ever made any estimate of the number of people employed in the business of buying and selling under future contracts?—A. I do not know them all; but we have about 3,000 members of the New York Produce Exchange, and at least 2,000 of them are engaged in this gambling business.

Q. Two thousand of the members of the Produce Exchange you think engaged in that business?—A. Yes; and they control the Exchange and its report in their interest.

Digitized by Google

Q. You have no idea of the number outside?—A. Oh, no; if you come into Moore street at 2 o'clock in the afternoon you can hardly get through on the sidewalk, there are so many men and boys there engaged in this gambling business who cannot afford to have a ticket to the Exchange. But these boys, that have not been educated in the duties of life, that I have spoken of, are there to see if they cannot put $5 or more into an option and make some money on it.

Q. What is the moral effect of this business?—A. It is terrible. I say that where a man descends to gambling in the necessaries of life, all humanity goes out of him every time; they all smoke hard, and most of them have to treat and rinse it down with brandy.

Q. What is the difference in the effect upon morals of that practice and betting or dealing in faro?—A. Not any; it is the same thing; these are the men that were educated to do nothing, and they are doing it. They get their living in these scheming, fraudulent ways.

Q. Now, that is the evil; what is the remedy?—A. The remedy is for you gentlemen to make a law of Congress that no person shall sell that which he has not got to deliver, and no person shall buy that which he does not intend to receive and pay for.

Q. Suppose the Supreme Court decides that you have not got the power to do that?—A. Then I say amend the Constitution until you have the power; and, if you do not do that, I fear for this country. If we have got to be ruled by this gambling influence, I fear for the country. Here is a man that we see by the papers to-day either committed suicide or shot himself accidentally; many on the Produce Exchange think he committed suicide, because he got into trouble in these dealings. There was a man in Chicago recently who failed for a very large sum because he had dealt in options in pork and lard.

Q. Some of the courts have decided that those contracts are illegal, have they not?—A. Yes.

Q. Now, suppose Congress had the power to pass a law of that sort; how could you prevent the practice; you could make it a penal offense and punishable by fines and imprisonment, declaring it gambling; is that your idea?—A. I would make a penalty in connection with it describing what it is, attempting to sell the necessaries of life when they have not got them to deliver.

Adjourned.

---

NEW YORK, *September* 27, 1883.

The committee met at 10 a. m.

REUBEN CARROLL recalled and further examined.

### DEGRADING EFFECTS OF HIGH RATES OF INTEREST.

The WITNESS. Time will not suffice to point out all the evils resulting from usury. Their name is legion. Go to India or China where rates rule high, and have ruled high for ages, and read its demoralizing and debasing effects upon humanity in the degraded conditions of the masses of their people.

Yet there is one more very great evil in this country affecting our people, our political institutions, and our civilization, which should not be overlooked, and that is the utter disregard of law which usury presents. All men are positively forbidden in this State to take more than 6 per cent. The law of the United States forbids national banks to

Digitized by Google

charge more than the legal rate in the State or Territory in which they do business, yet banks in this State violate these statutes with impunity. And so common has this practice become that scarce any one seems to think it wrong, overlooking its demoralizing effect. Reverence for law is society's only safeguard. Violation of law tends to weaken the only bond that holds society together. It comes with very bad grace from violators of law to rail at communists. It seems very absurd to punish labor-strikers for violating law when many of the lawmakers themselves are in the daily habit of violating it. A very able political economist of England says: "A certain 10 per cent. will insure the employment of capacity anywhere; 20 per cent. will beget greediness; 100 per cent will cause it to trample upon all human laws; 300 per cent., and there is not a crime which it will not run, even to the chance of its owner being hanged.".

OUR SYSTEM OF FINANCE DEVISED TO ENSLAVE LABOR.

Our whole system of finance is a fraud. It is copied from the English system—cunningly devised to enslave labor, to keep the masses in poverty and in subjection; and that this has been its results all English history attests. The present impoverished condition of laboring people of Great Britain attests this. The Government itself furnishes the most conclusive evidence of the evils of this system in its late appropriations to shift 50,000 families of its late pauperized subjects abroad. In adopting this system we have been putting new wine into old bottles.

But to conclude this branch of the subject. I quote from the report of the committee of Congress already referred to, of which Senator Jones was chairman, which I indorse as expressing my views fully. On page 57 they say:

"It is not against capital, but against our false financial system that permits the volume of money to either shrink or unduly increase that the hostility of society should be aroused. Let labor and capital be put on equal terms so that idle capital will be as unfruitful as idle labor, and the conflict between them will cease to be destructive."

ADVANTAGES OF THE ABOLITION OF DEBT.

But now for the remedy of the evils against which I protest. I would abolish debt by the abolition of all laws for the collection of debt. This would abolish usury, for debt is the occasion of usury. Debt was the trap set by old Shylock in which to catch the Merchant of Venice that he might cut out the pound of flesh nearest his heart, and debt is the trap set by usurists of the present in which to catch and rob the producers of wealth. It is just as true to-day as in the days of King Solomon: "The rich ruleth over the poor, and the borrower is a servant to the lender." The man with a mortgage on his property, which he cannot discharge is the serf of the man owning that mortgage, and must do his bidding or forfeit his means of livelihood; and he who eats his bread by the sufferance of another man is that other man's slave. Then, this power given to the lender often makes him a tyrant, so debt is equally demoralizing to both debtor and creditor, making a serf of the former and often a tyrant of the latter. Freedom cannot be perpetuated by a race of slaves, and this is why the Roman and Grecian republics failed. The masses were first robbed of their property through debt. The many were impoverished for the benefit of the few, and, as Solomon says, "The rich ruleth over the poor."

Digitized by Google

The CHAIRMAN. That question of the abolition of debt is a question often suggested. The objection, of course, would be that a man having capital would not part with it; a man having articles of use essential to those who are without them, would not part with them without laws for the recovery of debts, and of personal chattels, &c., when their temporary possession is parted with. If you should pass laws by which the temporary possession would not be parted with at all, traffic would cease, and the inevitable interdependence of individuals upon each other, unless a remedy of this kind should be afforded, would result in the practical destruction of society. That is the way it looks to most people, because, then, intercourse would cease. Constructed as we are, who, in such a condition of law, would part with anything that he is perhaps even temporarily possessed of, when he would be glad to do so if he could take possession of the chattel for the capital with which he parts?

The WITNESS. Those matters I discuss further on, and at the winding up we may discuss them a little further.

The CHAIRMAN. Very well.

The WITNESS. First, this would prevent the recurrence of those fearful things called money panics. "Out of debt, out of danger."

Second. It would drive the capital now employed in discounting paper into productive industry. It would go into the construction of rolling-mills, cotton and woolen factories, &c., thus furnishing employment to labor.

Third. It would take fully 25 per cent. from the cost of all products, as it is estimated by economists that the credit system enhances all production to this extent.

Fourth. It would relieve the people from the payment of large sums of money now collected through taxes to support courts, juries, sheriffs, &c.

Fifth. It would make the United States the manufacturing mart of the world, for we could then manufacture and sell goods much below any nation employing the credit system.

Sixth. It would save to the people the expense and taxation of much litigation.

Seventh. It would force the drones who hang around courts, like carrion crows, fattening upon unfortunate debtors, into some honest, legitimate business.

I say nothing against lawyers as a class. That profession has furnished some of the noblest men that have ever blessed humanity. But I refer more particularly to those shysters who hang about courts seeking opportunities to reach litigants or to be paid upon juries.

There are many other benefits which I think the abolition of debt would confer upon society. Especially would it establish a higher order of manhood. To rob a man now is regarded by many as all right, if it be only done legally, but if all debts were debts of honor, they would be paid just as promptly as debts of honor are now paid. Many men who will not pay a tailor's bill, if they can help it, will yet pay what is esteemed a debt of honor. I would make all debts to be debts of honor. Besides, if John Doe trusts Richard Roe for a sum of money, it becomes his own business to see that he gets it back. What right has society to tax you and me to assist John Doe to recover it?

But I am aware that, in these investigations, we are dealing with grave problems—problems that have baffled the wisest in the past, and I do not assume that I have found the true solution of any of them, but simply hint at what I think would produce better conditions in society—would tend to the elevation of the race, and I beg for them careful consideration.

Digitized by Google

DEBT HAS NO WARRANT IN NATURE.

With regard to the impossibility of getting loans if my system were adopted, I desire to say: Debt has no warrant in nature; you cannot get into debt to her; you must pay as you go. You cannot raise a crop of wheat on bond and mortgage. You must pay in honest labor before you get possession. So with all nature's treasures. She has stored them in her great laboratory and you must pay for them in the sweat of your face before you get them.

Of course, my theory would require a very great expansion of the volume of money. Money is kept within the limits that we are employing it in order that it may bring higher rates of interest of course, and if all laws for the collection of debts were abolished, the volume of money would, of course, have to be increased. And whether it would ever become necessary to borrow is another question—whether or no it is not the design of nature that every one should earn before he obtains. I admit that there is a problem there, but that seems to me to be the true view of the case. That was the point that you suggested, I believe.

OIL MONOPOLY—THE STANDARED OIL COMPANY.

The CHAIRMAN. Yes. You may now go on, if you please, with your testimony touching the production of oil, and, of course, the pertinency of the testimony is its bearing upon the increased cost, if there is any increased cost, of oil as an article of human consumption, by reason of any abuses or exactions or wrong things done by anybody.

The WITNESS. Well, after stating some general matters, I will then be subject to your questions in regard to the matter as you may see proper.

It is true that the Standard Oil Company is a giant monopoly; that it has the entire control of this product, and it is equally true that oil producers are its serfs. They have no control over the shipment or sale of their oil, nor the price at which they shall sell. In all these matters they are compelled to submit to the dictation of the Standard Oil Company. To give you a full understanding of this, I shall have to enter into some details.

The wells are bored by the producers, and by them the oil is taken from the ground and placed on the surface, but, when there, all real control of the product on the part of producers cease. The producer cannot get it to market except at such times and prices as the Standard Oil Company chooses; he is in fact a serf. Now, to understand what I have said it must be premised that the Standard Oil Company owns what are termed the pipe lines that carry the oil from the tanks of the producer to wherever it may be wanted, either to the railroad siding or to the cities, which, of course, the producers have no control over. Oil men are serfs, and yet in point of business capacity, enterprise, push, and general intelligence, they are not surpassed by any class of business men in the country. Now, when such men can be reduced to a species of serfdom, it becomes interesting to know the means whereby that end was accomplished—and thereby hangs a tale.

THE STANDARD OIL COMPANY AND THE RAILROADS.

In the frequent collisions heretofore between the Standard Oil Company and the producers investigations have been had as to their differences—the wrongs that were heaped upon the oil men. In one of

Digitized by Google

these investigations Mr. Cassatt, who, I think, was then vice-president of the Pennsylvania Central Railroad, was called before one of those committees, and he testified that he, as pool agent for the four great trunk lines of railway (the New York Central, the Erie, the Pennsylvania Central, and the Baltimore and Ohio) had paid as rebate to the Standard Oil Company from these trunk lines for the carrying of oil between November, 1878, and March, 1879, a little over $10,000,000.

By the CHAIRMAN:

Q. Rebate on freight?—A. Yes, I think those were the dates.

Q. That would be only four months?—A. Only four months. It was a time of great activity; and yet it may have embraced some accounts prior to that time; that I don't know. I think, however, that those were the dates. I have his statement, but have not got it with me. I won't positively assert that those were the dates, but I think they were. Now, we have the key to the situation.

Q. Which railroad was it that paid this?—A. Mr. Cassatt paid it as agent for those four roads that I have mentioned. He was their "pool" agent. They "pooled their issues," as it were, and so much was charged no matter what road it went over, and rebates were paid proportionate to the amount of business that each road did. He testified that he paid a little more than $10,000,000.

Q. Do you know what proportion of the whole oil supply was furnished during that period by the Standard Oil Company?—A. They had entire control of the shipment. You see the rebate of 80 cents a barrel gave them entire control of the shipment, because no one could ship in competition with them.

Q. They pay in the first instance full freight?—A. Yes, full freight.

Q. And get it back afterwards?—A. They get back 80 cents a barrel as he testified. That is a good deal more than oil has been selling for recently.

Q. They pay back 80 cents a barrel?—A. Yes, a portion of that time at least. I don't know that he testified as to all the time.

Q. Do you know how much they retained?—A. Well, it was a very low rate. I don't remember now exactly the amount per barrel, but it was a very low rate. The managers of the railroads claim that it was not a paying rate—that they lost money in the shipment. It was so testified.

Q. Do you know what the price of oil was at that time—the rebate you say was 80 cents—of course it was not quite the whole amount of the freight?—A. Oh, no; oil was then higher, I think; perhaps in the vicinity of $2 a barrel.

Q. What was oil at that time worth in the hands of the shipper; not after it reached the market, but immediately after production?—A. You understand that the Standard Oil Company buys all the oil—you could not sell to any one else.

Q. Did they buy all the oil at that time?—A. Yes; and they pay certain rates, varying from day to day.

### THE OPERATION OF TRANSPORTATION REBATES.

Q. In what way, if they then bought all the oil, does it injure any other person—any other oil producer—that they get this rebate?—A. Why, were it not for that rebate you would have very many independent refineries here in New York City. These refineries could go there and buy the oil and ship it here and refine it themselves; but as it is, and as it has

Digitized by Google

been with transportation in the hands of the Standard Oil Company, of course no competition is possible, with these rebates.

Q. At that time was the Standard Oil Company supplied with pipes of its own?—A. No; not as it is now. Then it depended upon the railroads for its shipments. Now they have pipe lines to the seaboard.

Q. Then with no competitor among the producers of oil at the wells, the Standard Oil Company having purchased the whole, and being the only shipper, and there being no pipe line, and the Standard Oil Company being obliged to depend upon railroads, what motive had the railroads for granting this rebate?—A. I will explain. We will say that I represent the Standard Oil Company; you are its agent. I am a refiner, say, having a refinery here in New York City. I am running that refinery, transacting my own business and managing it to suit myself. I go out to the oil regions and buy oil at, say, $2. You, as manager of the oil company, do the same thing. I ship my oil here and pay $1.20, which was the rate at that time, I think. You ship your oil and you pay 80 cents.

Q. I see. That is where there is another shipper, but at that time there was no other shipper.—A. There were a great many independent refiners besides the Standard Oil Company, for that company not only ships oil but refines it, and controls the product. At that time there were many independent refiners here and at Baltimore, but they were compelled to suspend and sell out to the Standard Oil Company at whatever price the Standard would pay them, and many of them did sell out at a quarter of the cost.

THE MOTIVE OF THE RAILROADS IN GIVING REBATES.

Q. I can see how that special favor extended to the oil company extinguished the other refiners, but the question I asked was what motive had the railroads as such for granting this rebate to the Standard Oil Company. You remember you stated that the Standard Company was then the only shipper.—A. Yes.

Q. For some reason these refineries had already been closed.—A. Not already.

Q. Or they had some idea of the crookedness of things?—A. Allow me to correct you. There were some already in existence in Pittsburgh, Baltimore, and I think some here.

Q. Then some of them were still existing?—A. Yes.

Q. But I still fail to see what interest the railroads as such had for granting the rebate to anybody, they having control of the entire transportation at that time, whether the oil came from the Standard Oil Company or through these independent refineries or from the local shippers.—A. An agreement had been entered into between the Standard Company and the presidents of these railroads. Of course, the Standard Oil Company being the greatest shipper, all these roads were anxious to have its patronage, and therefore they entered into this arrangement, and possibly some of the officers of the roads may have had an interest in this inside ring. Of course I can't say that, but it rather looks so to me.

Q. If anything of that kind existed it was in violation of their trust relations to the roads?—A. Yes.

Q. Was that charge of transportation by the roads (that is, the highest charge on which the rebate was granted) an extortionate charge at all, or was it a fair charge for the transportation?—A. The railroad officials claimed that it was simply a fair price. I think the schedule price

Digitized by Google

at that time was about $1.20. Of course it must have been very remunerative, or they could not have made so great a rebate. Some of the managers of the roads were brought before the committee, and they claimed that the railroads had been losing money in transporting the oil.

Q. That is, at the rate of 40 cents a barrel?—Yes; at the reduction.

Q. Was it $1.20 a barrel?—A. I won't say that 80 cents was the steady rebate. I think that perhaps for one month or two that was the rebate granted, but I think some of the officials testified that they had shipped oil for something very much less than 40 cents—I think for 10 cents a barrel during a large portion of the time—that they lost money on it largely.

INJURY INFLICTED BY THE STANDARD OIL COMPANY.

Q. I would like you to explain how it is that the existing state of things is an injury to a local producer, the owner of the oil well who produces the product sold to the Standard Oil Company.

The WITNESS. How the present condition of affairs injures him?

The CHAIRMAN. Injures the present producer or owner of an oil well.

A. Well, if you could explain to me how, for instance, the taking control of the management of any man's business, dictating the price at which he is to sell his goods and when he shall sell them and to whom he shall sell them, then I can explain to you how it interferes with other men to have the Standard Oil Company do it.

Q. Won't you explain to me how it is that the Standard Oil Company takes control of the business of the independent oil producer. That is the precise point?—A. As I told you, after the purchaser gets his oil upon the surface of the ground he has no means to get it to market except through the Standard Oil Company.

Q. Can he not take the railroad, as he could before there was any Standard Oil Company?—A. He can take the railroad, but the cost of transportation by the railroad would far exceed what the Standard Oil Company could deliver the oil for at the end of the road, consequently he could not compete with them; in other words, he would lose.

Q. Then it comes from the fact that the Standard Oil Company owns the pipe lines?—A. Owns the pipe lines and the means of transportation.

Q. Are the pipe lines the means of transportation?—A. They are, principally. Between short points they ship a little yet by railroad, but the pipe lines are the principal means of transportation now, but you see in the inception of this thing it was the power of the roads over transportation that made serfs of the oil men, and they are now tied hand and foot.

Q. How many of these oil producers are there who work independent of the Standard Oil Company?—A. It is claimed that there are about a hundred thousand persons who are directly and indirectly connected with the production of oil.

Q. The men and their families.—A. The men and their families.

Q. I suppose that would be about twenty thousand heads of families?—A. Yes.

QUANTITY OF OIL PRODUCED IN PENNSYLVANIA.

Q. How large a proportion of the oil we have, or of the petroleum produced, is the work of these twenty thousand?—A. Outside of the Standard Oil Company, do you mean?

Digitized by Google

The CHAIRMAN. Yes; take all that is produced in Pennsylvania and in that locality by the Standard Oil Company, and by the others—what proportion is it that the others produce, and what is produced by the Standard Oil Company?—A. It is pretty difficult to ascertain that. There are a great many companies—one called the Union Oil Company, one called the Hazlewood Company, and the other companies who are supposed and generally believed to be the Standard Oil Companies—although we have no definite information about that—they act independently and go along, yet it is generally believed that they are connected with the Standard. From my knowledge I should say that the Standard are now producing one-third of the petroleum produced.

Q. And the independent producers how much?—A. Two-thirds.

Q. And does that include the two companies whose position you think is doubtful?—A. I include them with the one-third that are probably Standard men.

Q. Then those that are well-known to be independent of the Standard Oil Company produce two-thirds of the oil?—A. I should say so.

Q. And they have to get their market through the Standard Oil Company?—A. Yes.

QUANTITY OF OIL PRODUCED IN AMERICA.

Q. What petroleum product is there in this country outside of that in this oil region that you represent?—A. It is estimated variously now from 60,000 to 75,000 barrels a day.

Q. Outside of that district, I say—I want to see what there is outside of that particular district, if any?

The WITNESS. You mean within the limits of the United States?

The CHAIRMAN. Yes.

A. Well, I estimate that outside of the immediate oil fields of Western Pennsylvania and New York there are not 10,000 barrels of oil produced.

Q. And about 70,000 produced there?—A. No; the estimate of the whole yield is from about 60,000 to 70,000 barrels. You know that producers, outside of the report of the Standard Oil Company have no means of ascertaining the production, because the Standard Oil Company are the only men who "tank" oil, consequently they are the only men who know what the real production is, but taking their reports, the entire production is about 62,000 or 63,000 barrels per day; but it is sometimes estimated at higher than that.

Q. What is that now worth per barrel; not in the market, but at the wells?—A. I think the market closed yesterday at $1.16

Q. The Standard Oil Company pays $1.16?—A. Yes.

Q. Then they transport it and refine it?—A. Yes.

Q. At what price is the same sold after transportation and refining?—A. I think it is reported at 8¼ cents a gallon.

Q. And the barrel is how many gallons?—A. I believe their barrels are estimated at 40 gallons.

Q. This refined petroleum is such as is used for lighting purposes?—A. Yes.

PRACTICABILITY OF OPPOSITION TO THE STANDARD OIL COMPANY.

Q. Two-thirds of the capital invested in the production of oil seems to be invested in wells not connected with the Standard Oil Company. Could not those other capitalists, by combination, establish an inde-

Digitized by Google

pendent line of pipes, as the Standard Oil Company has done?—A. If they were to attempt it, it would be, on the one hand, a case of organized capital directed by a superior intelligence, and on the other hand, disorganization.

Q. But could they, I say, do this? You see that one real difficulty seems to be that the Standard Oil Company seems to own a cheaper means of transportation than the railroad transportation, and the others have no such means of transportation. Now the producer, the man who owns an oil well, ought not to be obliged to pay for this increased cost of transportation by rail, when he can have his oil at the reduction which results from its coming through the pipes. The consumer will find fault, and it would seem that he would have some right to do so, if he were compelled to pay this unnecessary cost of transportation, would he not?—A. Certainly.

Q. That being granted, what way is there for the producers of these other two-thirds of the oil but to obtain an equally cheap means of transportation?—A. That would imply on their part, in the first place, a capital equal to the Standard Oil Company's capital, which means many millions of dollars. It would require combination and tenacity of purpose to the same extent that the Standard Oil Company has manifested it. People have attempted that several times, but you see they are met with injunctions by the courts and with litigation at every turn, and in every way obstacles are thrown in their way until they are overruled. There is now in existence what is called the tide-water pipe-line, in opposition to the Standard; that is, it was organized by a number of heavy producers for the purpose of transporting their own oil. It, of course, was feeble in the beginning, and we don't know what influences may have been brought to bear by the Standard Company, but there is practically but little difference between the two. It is generally surmised that the Standard Company control the other. At any rate, there have been several companies attempted to be established, which the Standard Company have either bought out, or thrown obstacles in the way of, obstacles that have been insurmountable on the part of the others, so that they dwindled down and died.

Q. Are the heavy oil producers interested in this rival line?—A. Yes; they were heavy oil producers who organized it, but they organized to make money, and if they could make more money by selling, of course they would sell.

Q. That is analogous to the way in which the rival telegraph lines are absorbed, I suppose?—A. Yes.

### PROFITABLENESS OF OIL PRODUCTION.

Q. What is the fact as to the profitableness of oil production, even under these disadvantages?—A. Well, oil varies very much in price. I have sold a great deal of oil myself, and as low as 55 cents a barrel. Oil has been very much depressed for the past three or four years. I have sold frequently as low as 55 cents a barrel, but its production, even at its present price, say $1.16, is something of a lottery. If a man has territory that is rich and will yield largely, and if he is situated so as to develop it; if he has the machinery and means to develop it, he could make money at the present price of oil; but if he has to pay, say three-eighths of a cent or one-half a cent royalty, and has not the means of developing it, has to work at a disadvantage, has to pay high prices for money to develop it, of course fortune would turn against him. And, upon the whole, it is not a productive business

Digitized by Google

at present. It is a business that the majority could not make a competence in.

Q. How long has this condition of the oil business existed?—A. Well, the Standard Oil Company was organized about 1870, I think. It was then called the South Improvement Company, and it commenced some of its extortions, and the oil producers got indignant, and it seemed as though there was going to be a revolution. They smashed tanks, and there were other demonstrations of violence, and it seemed for a time as if there was going to be a revolution. Then the managers seemed to have got scared and they dropped that organization and subsequently organized under the name of The Standard Oil Company. I think that reorganization took place about 1872 or 1873.

Q. And do you mean since that time, to the local producer, the business has been depressed and unprofitable?—A. Well, not to the same extent that now prevails. You see, of course, they had to gain their power step by step over the producer, because if they had commenced with the same despotic sway that they exercise now it would have created a revolution at once. The producers would not have stood it a minute.

Q. Is any oil of any consequence transported by rail at the present time?—A. No, sir; I think not. The railroads cannot compete at all with pipe-lines in transporting oil. It can be done very much more cheaply by pipe-lines than by railroad.

PIPE-LINES, THEIR EXTENT AND CAPACITY.

Q. Can you give some idea of the extent of that pipe-line system, and also of its cost and of its capacity?—A. Well, the lines of the Standard Oil Company, in the first place, extend throughout the entire oil region, they cross and recross in every direction, so that they may reach every tank of every producer. Of course they make many hundreds or thousands of miles, because the producing field now developed in extent is perhaps 200 or 250 miles in length, and it is perhaps in width an average of 2 to 3 miles, in some places more. Then, in addition to that, these lines are used to run the oil from the producer's tank to the tanks owned by the Standard Oil Company located in that region. They have large iron tanks usually holding about 35,000 barrels each.

Q. They have main lines extending to the seaboard?—A. Yes.

Q. That is how much farther?—A. From the region there to New York.

Q. Some 300 or 400 miles?—A. Yes; 300 or 400 miles.

Q. How much of the oil region itself, that which can be improved for producing oil and the establishment of wells, is owned or leased in such way as to control the production, by the Standard Oil Company?

The WITNESS. What proportion of the lands?

The CHAIRMAN. Of the capacity to produce, I mean.

The WITNESS. Yes; I know; that would be very much less proportionately than the number of producers connected with them. They would not own near one-third, because they are unable to monopolize the production of oil owing to the new fields originating, and owing to the fact that they don't know where to go to seek the best territory. The outside producers seek out the new fields; then the Standard Company, or its agents—these companies that I have been speaking of—are pretty sure to be on hand to secure the best portion of those fields when they are struck. Consequently the amount of land owned and leased by them would be less in proportion than the men engaged.

Q. Is it in such way that the men outside—the producers who are

Digitized by Google

independent of the oil company—could by combination and by the withholding of production bring the company to terms at all, or could the company then enlarge its production and be independent of them?—A. The majority of the oil producers outside of the Standard must have their returns weekly, or nearly so, in order to meet their expenses. They are poor, consequently they are unable to withhold, and they are unable to tank, even if they could withhold it from the market. They have no pipe-line facilities, no method of connecting their tanks with any other tanks to hold their oil, consequently they could effect nothing in the way you indicate.

Q. You spoke of these small producers; about how much on an average do they produce daily; or perhaps you cannot strike an average, but can state the amounts that many of them produce daily?—A. You mean the owners of wells, what they produce daily from the wells?

DAILY PRODUCT OF SINGLE WELLS.

Q. You spoke of those people whom you called "serfs." How much oil does a serf produce in a day?—A. Well, it would be pretty difficult to strike an average, owing to the fact that wells vary so much and the ownership of them varies. One man may own one well and others a dozen wells, and others only an interest in a well, so that it would be very difficult to state an average.

Q. The production of wells varies very much, I suppose?—A. Yes; very much.

Q. Well, what do wells produce?—A. Sometimes very largely.

Q. How largely?—A. Three, four, five, six, seven, or eight hundred barrels sometimes, but I should say that the wells throughout the entire oil region now would not average beyond, say, six hundred barrels a day; but of course that is merely a rough estimate. I merely estimate from that portion of the field that I am most familiar with.

Q. Have you any impression as to whether this oil supply is likely to be lasting or not?—A. Well, my opinion is that it will last for ages. Of course wells run down in oil, but some of the first wells struck in the oil region are yielding to-day.

Q. Have there been any geological examinations which throw light upon the probable supply?—A. No, sir. There have been geological investigations, but geologists seem to differ, and there is nothing really to determine how long the yield may be; but the yield is sometimes so small that at the present price and at the prices that have been ruling for the past three or four years, the wells become unprofitable and are abandoned. Very many wells are abandoned on that account that are still producing.

Q. I suppose that when one well is abandoned on that account new ones are opened?—A. Oh, yes; new developments are constantly taking place, but my opinion is that if wells were carefully handled and the price would warrant oil could be gotten there for ages.

Q. Do you know anything of the prospective development of supplies elsewhere?—A. Well, somewhat. I have been looking at that a little.

Q. What is the prospect?—A. Well, there is quite a prospect of an oil field of considerable dimensions in California; in fact they are getting considerable oil there now.

OIL PRODUCTION IN RUSSIA AND INDIA.

They are getting oil in Russia in considerable quantities. It is an inferior article, however, to ours, and costs very much more to refine. It

Digitized by Google

does not yield anything like the illumination proportionately that our oil does, so that I apprehend it can never come in competition with our oil in the European markets.

Q. Are there any supplies in other parts of the world that you know of?—A. Well, there is some oil in India. Oil has been extracted from certain districts there for ages, but they don't seem to know how to handle it. It is not brought into competition with our oil in the European markets.

Q. You do not anticipate that there will be any substantial competition with our oil for many years then?—A. No, sir.

Q. What should you say as to the price at which oil is furnished to the consumer now and has been furnished hitherto; I mean whether it is furnished to the consumer at a reasonable or at an extortionate rate?—A. Oh, it is at a very reasonale rate now. The gentlemen composing the Standard Oil Company are simply human beings. They are doing what others would do under the circumstances. They have secured the means to do what they are doing to enrich themselves, just as other men would do. I lay no particular fault at their doors, but I do find fault with the organization of law and of society that permits it.

REMEDY FOR OIL MONOPOLY.

Q. In what way would you remedy this evil?—A. Why, as I told you before, the power to control the transportation of petroleum was the means whereby the Standard Oil Company were able to build up their present fortune and to secure the control they now have over the producer and over the people. Instead of that being in private hands, in the hands of corporations that could make these contracts with the Standard Oil Company, it ought to be directed by the State, through some organization of the State; for inasmuch as the people are all interested in transportation it seems to me that they ought to have some voice in fixing the rates which that transportation should cost.

Q. Suppose that that was so, and that there were competing routes for the transportation of oil, or that the Government controlled the rate at which it should be transported through this one route, but, on the other hand, that those who control or own the oil region should combine and decide at what rate they would supply it for transportation, how would it be then? Suppose the producer should establish a standard oil *producing* company, and by a large capital spread themselves over a large producing region, should the Government interfere with that?—A. The law of supply and demand is soverign and will assert itself in the end. Therefore I can see no danger in any combination on the part of the owners or the men producing the oil. I can see no danger in their combining to raise the price upon outside consumers.

Q. Suppose the Standard Oil Company, then, owned the producing power as well as the transporting power *in toto*, you would think there would be no evil whatever? Would not then the question come between the Standard Company (owning production and transportation) and the consumer, and would not they hold the consumer by the throat?—A. The evil then would consist in permitting any one company or any dozen men or hundred men to monopolize a product that should be for the benefit of the whole people. There is where the trouble would come.

Q. Oil is no more necessary than wheat, is it?—A. No.

Q. Would not the interference of the Government, then, to control transportation in this case, if followed out logically, and so as to guard against any of the evils you speak of, involve the necessity of the Gov-

Digitized by Google

ernment taking the control of all the substantial business interests of the company?—A. certainly not. Transportation enters into the cost of all production.

Q. But production enters into the cost of everything that is consumed?—A. To a certain extent.

Q. Except air and water, and such things as are common to all?—A. As I told you, in production the law of supply and demand, which is supreme, will govern; but in transportation there comes in another question altogether.

Q. If the transporter charges so high for his transportation that the producer cannot afford to take the oil from the ground he has nothing to transport.—A. But you see transporters are public carriers; transportation is for the public good. Therefore I urge that inasmuch as the public are all interested in that transportion they should have a voice in fixing it or saying when it was too high; or, in other words, that a few men should not have the power to tax the entire country undue and unjust rates for transportation. That is the position I assume.

Q. Have these men any exclusive power?

The WITNESS. These men who control the Standard Oil Company?

The CHAIRMAN. Yes.

A. The power they have they got, as I have told you, from the power of transportation.

Q. Yes; but they have no exclusive power of transportation. There is room for one hundred pipe lines if the public see fit to establish them, and there is perfect freedom for their establishment.—A. But the moment they attempt it the agents of the Standard Company come in with their litigation and injunctions and bother and perplex and trouble them.

Q. That is to say, the new combination is not strong enough to hold its own against the old combination?—A. That is it, exactly.

Q. That is the ordinary attrition between the forces that operate in society—masses of capital in collision with each other—in which case the weaker goes to the wall. That may be attended with hardship, and no doubt is; but in what way is it practicable for society, or for government, which is the agent of society, to prevent it?—A. Well, of course that is a problem, and quite a grave problem, which we individually should aid in solving.

Q. That is just what we want, because the analysis of this whole Standard Oil case brings us directly there, before we have reached any remedy, does it not?—A. Yes; it comes directly there.

Q. Then what suggestion can you offer as to the solution of that problem?—A. The only suggestion that I have now to make would be the one I have already made—that Government should interfere in transportation and take charge of it.

Q. You mean that Government should say at what rate the Standard Oil Company should transport the oil from the well to the seaboard?—A. I mean to say that there should be some power in the Government to see that undue rates are not charged for transportation.

Q. That is, that the Government should regulate the charge?—A. Yes; I think that should be done.

Q. I understood you to say that the Standard Oil Company, through its refiners, furnishes the article at reasonable prices to the consumer?—A. Well, yes, I think they do.

Q. Then if it does that, if the price to the consumer is a reasonable one, how can it be claimed that the Standard Oil Company is guilty of any abuse, either in what it pays or what it charges for transportation or for refining and perfecting?—A. The Standard Oil Company changes

Digitized by Google

the price of both refined and crude oil to suit its own convenience, to make money itself, and thus grinds out of existence often men who have invested their means in refining and producing oil.

Q. It is not a thing that affects the consumer so much as the producer?

INTENTIONAL WASTE OF OIL IN ORDER TO KEEP UP PRICES.

A. Not so much, although the consumer is, of course, affected somewhat. For six or eight or ten months, perhaps, a very large quantity of oil went down the stream.

Q. It wasted?—A. It wasted, simply because the Standard Oil Company did not wish to take care of it. It did not wish to depress the price. It flowed off down the stream. Of course consumers are all interested in that matter. If that oil had all been garnered and taken care of it would affect the future price of oil.

Q. Why was it not taken care of? Why was it produced if it was not to be taken care of?—A. Because when a producer gets his well down, if there is gas enough, which there nearly always is, it throws it all out, and he cannot stop it without injuring or destroying his well.

Q. Had the Standard Oil Company the means of stowing this which was wasted?—A. Well, of course they could have got the means if they did not have it. They claimed that they did not have it, but they were not making any great effort. The truth is that they wanted to compel producers to suspend operations until the stock on hand was out.

Q. It was a case of alleged "overproduction?"—A. Yes; and of course in that matter consumers were interested with producers, because that oil was wasted to the world.

Q. I gather that the chief actual abuse or grievance to the producer comes from these frequent fluctuations in the price?—A. Yes; or from ruining men.

FLUCTUATIONS IN PRICE OF OIL.

Q. Please explain a little more fully what those fluctuations have been, how much and how frequent, and as nearly as you can just how they hurt.—A. Well, frequently the Standard Oil Company make contracts for the sale of oil three and six months in advance. They frequently make contracts for the delivery of refined oil in Europe three or six months in the future. Now, after having secured a large number of contracts of that kind, of course it would be to their interest to depress the price so that they could supply oil or fill their contracts at a lower price than the crude was ruling at at the time the contracts were made, and because Europeans understand the cost of refining, and the prices that they would agree to pay would depend upon the prices at which the crude was selling at the time. Now, then, suppose they had made large contracts, of course it would become their interest to buy the crude as low as they could to fill those contracts with, and inasmuch as they are the only buyers they can put the price to where they choose. Of course after a man has invested his money in the production of oil (for to sink those wells costs a great deal of money), when the price is let down on him he is ruined. That is often the case.

Q. And the prices that exist when he is making his investment, and which he reasonably expects to continue, are suddenly lowered?—A. Suddenly lowered often.

Digitized by Google

COST OF SINKING OIL WELLS.

Q. How much time is necessary, ordinarily, in sinking a well?—A. Well, as a general rule, a well say 1,400 or 1,500 feet deep they put down in about eighteen or twenty days.

Q. What would be the cost?—A. Including machinery, probably about $2,500. It is very much cheaper now than formerly to sink wells. In, say, 1872–'73 and along there, I think the average cost of a well would be $5,000, but they have simplified it and made improvements in machinery, and it does not cost so much now. Machinery is cheap and the iron tubing, casing, &c., that they employ are very much cheaper than they were.

Q. When you speak of a well that has cost $2,500 with machinery, you mean by that the necessary apparatus for the production and caring for the oil until it is ready for sale—that is, the cost to the company?—A. Yes.

Q. A well all ready to produce oil?—A. Yes.

Q. Such a well, I suppose, may continue in operation a week, a month, or for years; how is that?—A. Yes, sir.

Now, if you have other witnesses waiting, I would like to withdraw for the present. I am not feeling very well. I can come again.

The CHAIRMAN. We have other witnesses and can relieve you temporarily. Before you leave, I would like to say that I wish you would go over in your mind this matter of the condition of the oil producers and make sure that, as their representative, you have stated all that you think the committee should know.

The WITNESS. You mean before I come on the stand again?

The CHAIRMAN. Yes; we would like to know what the difficulties of the producers are, and if you know any remedy that can be suggested, we would like you to suggest it. You have probably thought over it sufficiently to suggest something if anybody can.

The WITNESS. Well, I have felt the power of the oppression of the Standard Oil Company myself, and of course I am pretty familiar with it. I will think the matter over, and when I come on the stand again, perhaps I can suggest something.

---

NEW YORK, *September* 27, 1883.

FRANK J. DONALDSON sworn and examined.

By the CHAIRMAN:

Question. What is your business?—Answer. I am a lithographer, of the firm of Donaldson Bros., lithographers, of this city.

Q. How extensive is your establishment?—A. It is one of the largest in the United States.

Q. Located here?—A. Yes; in New York City.

Q. At what place?—A. At Nos. 56, 58, and 60 Park street, commonly called the "Five Points."

Q. Please explain what your business is—what you do.—A. We make reproductions of pictures for advertising purposes—make show-cards, as they are called—banners, cards, and all sorts of things that go into printing for advertising purposes for various businesses.

Q. What do you print on?—A. On lithographing stone.

Digitized by Google

THE LITHOGRAPHIC PROCESS.

Q. Give us a better idea of how that is done—what kind of a stone it is done upon, and how the stone is treated to produce the work.—A. The stone is magnesian limestone. It comes from the limestone quarries of Bavaria. It is imported into this country. These stones are of certain sizes and weights, and have prices proportioned to their size and quality. If a person wishes to have a show-card drawn, we take a stone of sufficient size to accommodate the number of square inches of work needed. The stone is then prepared by being ground and "grained," as it is called, to give it a surface analogous to that of drawing paper. The work is then drawn on this stone with a preparation called crayon, which is composed of lamp-black and soap and other articles in combination, which, when marked on the stone, leaves an indelible impression. The stone being sympathetic to anything of an oily, soapy, or fatty nature, retains the lines drawn with this crayon, and when the drawing is finished on the stone, it is prepared with a preparation of acid to fix the drawing so that it will not go beyond the places where the lines are drawn; otherwise it would spread in the process of printing. I suppose I could enlarge on this for half an hour, but it would only take up your time.

Q. That stone, then, is used as a printing surface?—A. Yes. Of course if a show-card is to be of ten or twelve colors, there are a certain number of offset impressions made from the original stone onto other stones, so that they may be registered in such manner that one color will fit upon the other. When all is done, it is then "proved," and is ready for printing.

Q. How extensive is that business in this country now?—A. I should think the profession during the past year would aggregate something like twenty-five to thirty millions of dollars throughout the United States.

Q. What number of men do you employ?—A. We have about 125 in our establishment—men and boys together.

Q. Have you had occasion to consider the relations between labor and capital somewhat, and the questions that come before the committee under the resolution of the Senate authorizing us to act?—A. Only in one way—I can hardly say a peculiar way—but we have always labored to make our employés feel that they had a home with us as long as they chose to stay.

SATURDAY HALF-HOLIDAY.

Eight years ago we commenced giving our men a Saturday afternoon holiday—working them up to 1 o'clock, and then allowing them to go home and enjoy themselves, and paying them as if they were working right along. We did that for four months right along, in June, July, August, and September, and we found that the advantages to the employés were so great that last year we concluded to carry it through the entire year, and now, and henceforth, from one year's end to another, our employés leave at 1 o'clock on Saturdays.

Our men had been so faithful and worked so hard during the past year and a half, it being necessary to work a great many hours of overtime, that we found it desirable, this past summer, that they should have a holiday—and ourselves too—so we concluded, as we had repairs and other things to make, and it would take about a week to do it, that we would give them a week's holiday and send them away with their

Digitized by Google

pay. If you could see our men themselves and talk with them about it, you would see how pleased they are.

I have here a copy of a letter which our employés sent us after their week's holiday, which I will read, as showing the feeling of our men:

NEW YORK, *June* 30, 1883.

GENTLEMEN: At a meeting of your employés, held last evening, the undersigned were appointed a committee to convey to you their thanks for presenting them with a week's holiday with full pay. Please accept our earnest assurance that we fully appreciate your kind liberality, and besides recognizing in this a new proof of your interest in our welfare as fellow-strugglers in life's battle, permit us to thank you, for the first time in a formal way, for the Saturday afternoon holiday which we have so long enjoyed.

Please believe that we will endeavor to show appreciation of our obligations to you, by unremitting faithfulness to your interests in the prosecution of our work, and that we express the earnest and hearty sentiments of the entire force when we wish you, jointly and individually, the most abundant success in all your undertakings.

With great respect, we are yours, very truly,

WM. GILCHRIST.
W. F. COOK.
JAMES PRITCHETT.
M. B. FOY.
JOHN McLELLAN.

Messrs. DONALDSON BROTHERS.

Q. What are your usual hours of work?—A. From 7.30 in the morning to dinner-time—one hour being allowed for dinner—and then from that on until 6 in the evening; but on Saturday they get off at 1, making about 55 hours work in the week. They used to work 60 hours up to 5 o'clock on Saturday.

Q. How long have you been in business?—A. We started in 1872.

Q. Have you found any difficulty in getting along with your men?—A. None at all.

Q. Have there been any complaints about their pay?—A. No, sir.

Q. Or overwork?—A. No.

Q. Have you had any strikes?—A. No, sir.

Q. Nothing in that direction?—A. No; nothing of that kind.

Q. How do you explain the difference between your experience with your laboring people and the experience of so many other employers?—A. Well, in our particular business, we have no "vexed questions" which arise. We have always made it a point to begin with everybody at the foot of the ladder as well as we can. Of course when we first started, we had to engage men such as we could get, but after starting we made it a point never to engage if a man there was anybody in the place who could step into his position. Now, for ten or eleven years we engage boys to begin with, and we teach them the business and do it thoroughly, and show them that if they are steady they will ultimately rise to the best positions in the trade. Five or six of my best men began with me at $2.50 a week—men who are now earning $10 to $45 a week, and that is an inducement that we still continue to hold out.

Q. How is it as to your personal acquaintance with your men?—A. It is of the pleasantest character.

Q. Is there any such thing as personal intercourse between you?—A. Oh, yes; in a certain way. If they have a certain task given them and they do not understand it, they come to us to find out, and we are glad to show them.

Q. You are just working superintendent?—A. Yes.

Q. You superintend your men?—A. Yes; entirely.

Digitized by Google

COMPENSATION OF LITHOGRAPHERS.

Q. If it is not a private matter, you might state the compensation of your employés.—A. Of course it varies. It runs all the way from $2.50 a week up to $45 or $50. One of the most important of our pressmen gets $45, another gets $40, another $35; then they go on down—$30, $20, and so on, per week.

Q. You say there are some beginners as low as $2.—A. That is the first step—they are boys.

Q. And as fast as they learn they are paid better?—A. Yes. There is no regular scale or standard of wages in our establishment. We pay everybody just what we think they are worth. I think they are pretty well satisfied.

Q. You have no difficulty with the trades unions?—A. No, sir; there is no difficulty now with the trades unions. In the old days of hand-presses, before the introduction of steam power, there was an association at that time that used to cause trouble to employers, but now there is no trouble from that society.

Q. From your observation, what are usually the causes of the difficulties and feeling of estrangement which seems frequently to exist between employés and employers? Can you make any suggestions to the committee on that subject?—A. Well, it is a very difficult thing to say. I am a very young man in business, and I have devoted myself to business and not to those questions. I believe the great trouble is that they expect the maximum of work for the minimum of pay, and that is a principle we do not go on.

Q. You mean that that is the expectation of the employer?—A. That is what I think it is.

SKILL AS AN ELEMENT IN WAGES.

Q. Do you think that, as a rule, the employés—the wage-workers I mean, in the various pursuits or occupations throughout the country—really have as much in the way of wages as they ought to have for the work performed?—A. It is only by comparison that I could answer that question.

Q. I will put the question in another form: Is there any just ground for this complaint of labor, that it lacks proper compensation in this country?—A. In a great measure it is, owing to the ground upon which labor stands. In most trades, or at least in a great many trades, the laboring men combine themselves together, and say that Smith, Brown, or Jones, or whatever their names may be, shall have a certain compensation for labor performed, without any regard to the ability of each of the several persons named to do that amount of labor, or without taking the ability of Smith, for instance, into account—he, perhaps, being able to do twice as much or earn twice as much as Brown or Jones. They set up an absolute standard and so drag up the poor miserable worker and drag down the intelligent worker. That, I think, is one of the principal causes of trouble—that the laboring men will combine themselves together and say that so-and-so must give each one of his employés a certain sum of money, without any regard to his ability to do the amount of work for it.

Q. The fixing of that rigid rule is done by the employers generally, is it not?—A. No, sir; I think not.

Q. Take the men, for instance, engaged in transportation—engineers, firemen, conductors, &c—are not fixed prices established by the corpora-

Digitized by Google

tions themselves to which all conductors, &c., conform, regardless of the question of whether one is better or not so good?—A. I think not. I think you will find that conductors, engineers, and brakemen have a sliding scale of wages, and that some have greater wages than others, depending on the services they perform.

Q. It may be that the grades are classified among themselves—some conductors getting more than others; but the principle, as I understand you, gives to each man as nearly as it can be what he earns?—A. Yes; I pay what I think he is worth to me. I do not allow any combinations of men to say to me that Smith must receive the same amount as Jones.

Q. Do you think that employers, as employers, of labor, would find it practicable to discriminate between men individually; are they not obliged to classify them?—A. I am afraid that that is too deep for me. I only came here to testify to the present relation of labor with ourselves.

The CHAIRMAN. The example of a firm that gets along with its workmen in the pleasant way that you do is worth a great many theories, so that you must not think that your failure to express your views on a theory tells at all against the value of your testimony.

### MEN LOOKED UPON AS MERE MACHINES.

The WITNESS. Well, I think the laboring man is not generally consulted as he should be. He is looked upon as a mere machine. The fact that he is a human being may be thought a little sentimental, but I think a little sentiment pays in that sort of thing. We have got along very well with our men for the ten or twelve years that we have been in business.

Q. You think that your men can be relied on to see the reason of your actions?—A. Yes; and that the true economy is in liberality with your working force. That is our experience.

Q. You deal with your men as men and not as machines?—A. Yes.

Q. And you make a distinction between the man and the stone that he works on?—A. Precisely.

---

NEW YORK, *September* 27, 1883.

CHARLES F. WINGATE sworn and examined.

By Mr. PUGH:

Question. Please state your residence and occupation.—Answer. My residence is in New York; I am a sanitary engineer by profession.

Q. State the opportunities you have had to acquire such information as would be of use to this committee under the resolution of the Senate empowering us to take testimony affecting the relations of capital and labor.—A. As I understand, this is an inquiry into the condition of the laboring classes, and it seems to me that the physical factor is a very important element, and that the sanitary conditions of their surroundings are matters of very deep import. I have been a professional sanitary engineer for some six or seven years, and before that time had very unusual advantages for studying this problem of the condition of the working classes, and I propose to state somewhat their condition, more particularly in this city, although what I have to say applies to nearly all the cities of the country—in fact, to all crowded communities where

Digitized by Google

any manufacturing is carried on. I propose also to state some of the remedies which have been provided, both in this country and Europe, and some of the remedies which I myself may think desirable, and which others of better authority are recommending.

PREVENTABLE SICKNESS AMONG THE WORKING CLASSES.

In the first place, any person who looks into the condition of the workingmen, whether from the side of the philanthropist, the engineer, the statesman, or the employer, comes face to face with the fact of the enormous prevalence of sickness among them. I might mention a vast amount of data which I have collected, of which I have memoranda here, but I will state that if you eliminate this tremendous fact of the extent of sickness among the working classes—and when I say sickness, I say, as a sanitarian, *preventable* sickness—if you can diminish that preventable sickness, you have done an immense deal to diminish the trouble of labor. The Government report of England shows that 72 per cent. of the pauperism of Great Britain is caused by sickness. You will see the facts bear out my statement.

WORKINGMEN'S SOCIETIES: MILLIONS OF DOLLARS PAID ANNUALLY FOR SICK RELIEF.

Take any of the large trades unions in this country and abroad and you will find that one-half of their income is spent for sick relief. For example, 136 mutual aid associations in the United States, with a membership of nearly 70,000, have paid out in a single year between five and six million dollars for relief. That was in 1879. You find that after the yellow fever epidemic an order of united workmen paid out a quarter of a million of dollars. In the same time you find that trades unions, like carpenters and joiners, not subject to industrial diseases, spent a quarter of a million dollars for relief.

OTHER MILLIONS OF DOLLARS ANNUALLY LOST IN WAGES OF WORKINGMEN BY SICKNESS.

The reports of the Massachusetts labor bureau show that the average time lost in sickness by our workingmen is thirteen and a half days per annum, and the experience of the English friendly societies shows an average loss by sickness of very nearly two to two and a half weeks a year, and good authorities in England estimate that the total average loss to the working classes of Great Britain from this cause is $66,000,000. I think I am right, therefore, in saying that this is a tremendous fact, and a fact, which, strange to say, has never been brought before the public mind as it ought to be, nor before the workingmen themselves. I can hardly conceive how it is that, while spending a considerable share of their earnings in this direction, they have not taken some action on it. Some of their leaders, like Karl Marx in Germany, have had their attention called to it, and the action of Bismarck with reference to the insurance system shows that the seed has taken hold, and the question has been mooted whether it would not do to levy a special tax on every workman from the time of his birth to insure his support.

SICK RELIEF AFFORDED BY PUBLIC DISPENSARIES IN EUROPE AND AMERICA.

There are other statistics which I will not burden you with, but the reports of the public dispensaries in Great Britain and in this city are

Digitized by Google

important. For instance, to quote a single item: In one year one and a quarter million persons sought advice and medicine from the free public hospitals in London, and in Liverpool the same figures were given. Since I was called on by this committee I saw a statement from one of the dispensaries in New York City that they annually relieved thirty thousand persons, requiring the aid of thirty physicians. Remember that these facts do not give the whole effect to be derived from them, because an immense number of people never get any medical attendance. There are millions of dollars spent annually for quack medicines, and large numbers of people are their own physicians. So that these figures combined with others show that the sanitary factor of the labor question is a very large one.

### DECREPITUDE AND PAUPERISM CAUSED BY SICKNESS.

There is another point which should be mentioned, that, as an effect of this sickness, a very large amount of decrepitude and misery is produced in hereditary form. For instance, one-third, it is stated, of the deaf and blind persons, and a large share of the insane and epileptic are due to certain forms of zymotic diseases, like scarlet fever, so that this hereditary taint produced by these diseases is something very important to be considered.

I might now speak of two or three effects of this condition of things. In the first place, I have shown that preventable sickness consumes a large share of the workingman's savings; next, it consumes his vitality, his health, which is his capital in life. But it also destroys the family life. The head of the family, if taken sick, is obliged to go to a hospital; that leads to the breaking up of the domestic circle. The children are thrown on the street; the woman has to seek some sort of existence, and when we come to analyze the conditions of crime, pauperism, and vice in general, we will find that it is very largely traced to the breaking up of the domestic circle, due to sickness and to the unsanitary conditions and surroundings of the people.

By Mr. PUGH:

Q. This sickness and these unsanitary conditions are due to their pursuits, are they?—A. Partly to their pursuits and partly to their homes. The question of industrial sickness is a very large one, which I should hardly like to go into, but it is more directly due to their homes, which I shall speak of now.

### EVIL EFFECTS OF TENEMENT-HOUSE LIFE IN CITIES.

I suppose a small library has been published on the subject of the tenement-house problem in New York City. I do not propose to talk mere sentiment on this matter, or to exaggerate its evils; I wish simply to state some facts, and rather to soften them down than to exaggerate them; and while I shall speak specifically of tenement houses in New York, I must repeat that these conditions are to be found in Boston, in Philadelphia to a less extent, in Savannah, Ga., which I lately visited, and even in the smaller places like, Newark, Paterson, and manufacturing towns generally where there is a large operative population.

Now, we start out with this fact: that although it is barely forty years since the first tenement house was built in New York City, there are at the present moment some 21,000 such houses there, with an estimated population of a half a million of people in them. In 1869 there were a

Digitized by Google

little over 14,000 of those buildings, so that in fifteen years there has been an increase of 6,669, and there is a steady tendency toward their increase, and a steady tendency toward their increase in the same localities where they already exist, and that this concentration and massing of population, which I shall presently show is very large, is not rectifying itself in any way; that there is no remedy, as is the case with some evils, in the evil itself. For example, take some of the facts in regard to the growth of population. We find—

DENSITY OF POPULATION IN NEW YORK: 290,000 PEOPLE TO THE MILE.

That while in London the most densely populated locality has 175,000 people to the mile, in the Fourth ward of New York City there are 290,000 people to the mile. There are some single blocks in New York City which have at the rate of 750 persons to the acre, and this tendency toward accumulation keeps steadily onward. I suppose it is hardly necessary to describe the tenement houses of New York, because they are pretty well known to most people.

Mr. PUGH. We have had some descriptions of such houses.

The WITNESS. I presume you have. I would make this statement, that notwithstanding it may seem a paradox, yet from my experience the sickness and the death rate is not so much greater in many of the worst slums, as they are called, such as the quarters of the rag-pickers and the bone-gatherers, as it is in what would outwardly seem to be good tenements. I can show the committee a single block within half a mile of Murray Hill, of what would seem to be fair houses—not "double deckers" or barracks, yet where there is a death rate of six or seven every year in a population of only 70 or 80, which is three times the ordinary death rate of the city, and vastly greater than it ought to be.

By Mr. CALL:

Q. What do you attribute that to, in that locality?—A. Those buildings are occupied by Bohemian cigar-makers, and the trouble is, simply, concentrated foul air—the fact that they are massed together in that way and with bad air, and of course there is considerable sewer gas in the houses. But bad air (whether called "malarial taint" or "sewer gas") is the cause of the great trouble.

DEFECTIVE VENTILATION IN TENEMENT HOUSES.

There are one or two specific things to speak of, and I shall aim, all the time, in my criticisms of these buildings to say what can be cured. I assume at the outset that four-fifths of these troubles are preventable, and that they can be cured. For instance, it is impossible to ventilate the ordinary tenement house, because they call a ventilator a shaft which is open simply at the top. They build a skylight or light shaft and put an opening at the top, which is not always open, and then allow the tenants to close all the windows connected with it. Then the halls are closed in on all sides, so that there is no possibility of any fresh air getting in. Then there is always a "living room" for such families, which is an interior room, and it is impossible to secure a draft of air through it. Yet, by securing air below and having an opening at the top of the shaft, you would secure a great deal of air, and sufficient ventilation, or by making the shaft larger you would get more air.

Damp cellars are also a great trouble, yet that is entirely curable.

Digitized by Google

It is nearly fifty years since cellar occupation was forbidden in this city, yet you see many people living in cellars to-day, and business carried on in them. It is perfectly feasible to have dry cellars, and if you had them you would win half the battle. From my experience I should say that damp cellars are the chief cause of sickness in cities.

### DEFECTIVE PLUMBING.

While a large number of the tenements of New York have plumbing in the house a large portion have not, and the people are compelled, if they are going to be cleanly or decent, to carry up all the water they use from a hydrant in the yard, which, in the winter time, is apt to be frozen. It is manifestly unjust to expect that with such labor anybody can be cleanly. The mere fact of carrying water up four or five stories for cooking purposes is as much as can be expected—if they have to carry all the waste water back, four or five stories.

### WATER CLOSETS IN TENEMENT HOUSES.

Furthermore, these four or five stories representing eighty or ninety persons, there is sometimes nothing in the way of sanitary conveniences except four or five or six water closets, or "privies," in the yard. Now, calculating the amount of time that a person requires to attend to the ordinary wants of nature, see how four water closets would supply eighty persons, and you can infer what a serious physical drawback it is. It is a great injury to the people in those houses; and when we consider the moral effect of massing those accommodations for the benefit of everybody, and allowing men, women, and children to go to these places, the evil is greater.

### FIRE ESCAPES.

You will find also that while fire escapes are usually provided in these buildings, they are generally filled up with lumber or something, and are of no possible utility in case of fire.

### INSUFFICIENCY OF LIVING ROOM.

Another evil is that the rooms of the poor are so contracted that they can do nothing. When a woman wants to do anything, or carry on any little occupation, there is no room in which to do it. If you can supply homes where the people can carry on labor, washing or sewing, or a little light manufacturing, you assist the tenants or workingmen very much. It is considered one of the great reasons of the prosperity of the workingmen of Philadelphia that they have small homes and can carry on such industries; and even in this city, as I notice in hot weather, when people leave their windows open, as you ride along the Third Avenue Elevated Road, you will see scores, if not hundreds, of places with one, two, or three mechanics at work at some small industry. One of the most remarkable features in this country is the number of petty industries that are carried on. I heard a statement made by a person of authority that in the construction of a walking cane, taking into consideration everything, such as the painting, varnishing, making the ferule, and putting it on, &c., sixty persons are occupied; and the more you can diversify the employments of the people the more benefit comes to the workingman.

PUBLIC LAUNDRIES IN EUROPE.

Take the case of a poor woman; if you could have public laundries, as they have in Europe, they could be made to pay. A poor woman could go there and do her own washing, or could do some other washing as a means of existence, or of earning something. Now she has to do her washing in her room, and the result is, the day after washing-day all the children are down with the croup, and sometimes everybody is sick.

By Mr. CALL:

Q. What is the system you speak of in Europe?—A. In London, Liverpool, and other large cities of Europe, they have public laundries where a person can go and pay a small sum, not over 6 cents a day, and, I think, a less sum, for the privilege of having an abundance of hot water and soap, and in some cases a wringing machine and a drying room. These are combined with public hot baths.

Q. Provided by public authority?—A. They were started by benevolent enterprise; and a movement has been broached to do the same thing here.

PUBLIC HOT BATHS FOR WINTER—THEIR NECESSITY TO HEALTH.

While speaking of that, I will mention that there is nothing like a public bath in any city in this country except in the summer time, and from the consequent lack of personal cleanliness there has been an enormous growth of skin diseases. Within a year a new house for the treatment of skin diseases and cancer has had to be opened here.

Bathing is a matter of much importance to my mind. It seems to me that any person accustomed to bathing feels the need of it; and as a sanitary regulation, of course it is of the highest importance. Some of the highest authorities among the medical men of England emphatically say that the great trouble with the whole question of treating sickness is the difficulty of getting at people and teaching them how to take care of themselves. As Sir William Gull, the great English physician, says, it is not a question of drugs, but a question of getting people to be properly washed and fed, and half the battle is in seeing a man in his own home. The dispensaries are so crowded with people that they can hardly find physicians to attend to them. Statistics show that the dispensaries treat patients at the rate of one person to every minute and a half of time. They have just time to ask them "What is the matter? Stick out your tongue." Then they pound them on the chest, and then write a prescription. The whole thing is perfect child's play. In this city, one of the large charitable associations has undertaken to visit the poor in their homes, and give them this personal attention, and they state in their report the details of this work. For instance, they will say, "Case, typhoid fever; term, five weeks; cost of attendance, nursing, medicines, &c., $5 ($10 or $15)," as the case may be; "result, man saved from going to a hospital, and restored to his work." Take the case of a man coming out of a hospital, convalescent, but not strong enough to work. He is immediately thrown upon the poor relief societies.

We have heard much about "sordid landlords" and the "inexorable agents," and a great deal of these conditions are no doubt due to them. But still, landlords are anxious in many cases to correct these troubles, and if they can be shown where the trouble is, and how to correct it, I

Digitized by Google

believe that they are willing to correct it. And, if the people generally can be shown what to do, I think they are willing to do it. The people themselves are anxious.

### THE DEATH-RATE IN CITIES.

If the health authorities could have more funds to prosecute their investigations, and compel the landlords who are not willing to do what is right, very much could be accomplished. Seventy-two per cent. of the deaths in this city are in tenement houses, and these are mostly of children under five years of age. That is, the greater part of the deaths in the tenement houses are of children under five. In the year 1878, 12,410 children died in the city of New York, which is 46 per cent. of the whole mortality.

By the CHAIRMAN:

Q. What is the whole number of deaths in the city?—A. I have not got the figures; but the children formed 46 per cent. of the whole morality in that year.

Q The total death-rate of the city would be about 30,000 then?—A. Just under 30,000.

There are some important facts which illustrate the growth of the city in two directions—the direction of the very rich and the direction of the very poor. These statistics were taken a year or two ago, and show that since 1845 the attendance in the Episcopal churches (which represent people of more than average means) has increased 216 per cent., and the attendance in the Roman Catholic churches (which represent the mass of the people) has increased 900 per cent.

These sanitary conditions do not affect merely the people who live in these houses, but they are a menace to the whole population. If such industries as the clothing manufacture, the cigar manufacture, and others are carried on so extensively in tenement houses, it is evident that the chance of contagious diseases being carried to the whole community is very great. But, still further, if we find, as we do, that the sections east and west of Murray Hill, which are occupied by a mass of residents—if we find this section gradually building up with tenement houses, and that through the sewer pipes there is direct communication from house to house, so that the millionaire living on Murray Hill is exposed to typhoid fever from the home of a poor laboring man living on Tenth avenue, that is, of itself, an interesting fact to the whole population, and it affects its most selfish interests. This is a very brief statement of the difficulties of the problem.

### NEGLECTED SANITARY CONDITIONS;—COMPLAINTS FROM TENANTS.

You have heard from the health authorities what has been done in the way of sanitary inspection and the correction of the existing evils.

The childrens' aid societies take the poor children who are left by those broken-up families, and they remove them to the West. There are summer excursions which take sick children out of town for a day or two. The New York Association for Improving the Condition of the Poor employs a special inspector to visit the houses of the poor. They first put an advertisement in the Daily News offering to examine any place having bad smells. But the poor tenant is afraid to make a complaint, even if he sees death staring him in the face, because of the fear of being turned out of his place. And when the inspectors go to these

Digitized by Google

places—and they visit thousands of them frequently—it is with great difficulty that they can get information. People will point to the sink, and say, "There is where the smell is, but don't you mention my name." Some of the letters written by people on this subject are of the most pitiable character. I will read a few extracts from the thirty-eighth annual report of the board of health, in which some of these letters are quoted:

EXTRACT FROM REPORT OF NEW YORK BOARD OF HEALTH.

Without going into detail as to all sources of discomfort and disease which reveal themselves to an inspector, a few of the leading troubles may be alluded to:

Want of proper and adequate openings for ventilation in the roof at the top of the hall.

Want of traps to sinks and ventilation pipes to waste pipes.

Foul-smelling privies.

Foul, damp, dark, unventilated cellars, often reeking with excrement and garbage, and flooded with rain, tide-water, or leakage from leaders, waste and soil pipes.

Insufficient water-closet accommodation.

Noxious privies and defective plumbing are perhaps the most common of all the causes of sickness and of the wretchedness endured by the occupant of the average tenement. Premises where these antagonists to health and comfort exist are so numerous as to be, practically, beyond computation. Leaving out of the question the effect upon the death-rate created by these sources of stench, it cannot be doubted that an indirect deteriorating effect is made upon the moral condition of those scores of thousands who, sleeping and waking, have no other air to breathe.

The sanitary code provides for one privy for every twenty persons. More generous accommodation than this is seldom met with among tenements. The subject is a delicate one, but calls for attention; twenty persons using a closet, and consuming five minutes each will keep it occupied for one hour and forty minutes; under the most favorable circumstances some one has to suffer—but considering the prevalence of diarrheal diseases during the past summer much sickness of a painful nature must have been caused by this inadequacy of accommodation. Many houses lack even the meager number of closets which the sanitary code requires. At 561 Hudson street there is one closet for from forty to fifty persons, and at 304 W. Eleventh street there is but one closet for fourteen families—or from sixty-five to seventy persons.

Last spring the following advertisement was inserted in an evening newspaper—one which is read chiefly by the working classes:

"A notice sent to John Bowne, secretary of the New York Association for Improving the Condition of the Poor, 79 Fourth avenue, of any defect in a tenement house, will receive prompt attention. Communications confidential."

The above appeared for six weeks, and was responded to by complaints—chiefly anonymous—relating to upwards of two hundred houses, and indirectly to about one hundred more.

The complaints, in many instances, left the story only half told, generally referring to one particular nuisance, inspection revealing other defects.

A perusal of all the letters received would repay any one desirous of gaining a knowledge of tenement-house life, and of the struggle against adverse circumstances which render the lives of the poor of New York so pitiable.

The following quotations will serve to reflect truthfully, but only partially, a picture of the condition in which so many of our fellow-beings and near neighbors live:

"The privies of —— Forsyth street are in a horribly filthy condition."

"Will you please to try and do something to relieve the poor tenants of —— Tenth avenue; the stench to-day is beyond everything; it can be traced a block away; you will be doing an everlasting gratitude to the—(Poor People.)"

"Is there any remedy for a tenant to live in a stable, as I might call it, but is named a tenement house, where the yards and halls are reeking with filth.—(—— Washington street.)"

"The smell from the sewers is bad for the tenant's health; they were inspected a year ago, but it was hushed up.—(—— Avenue A.)"

"The water-closet * * * is disgraceful, and some one will fall through the rotten boards before long.—(—— Third avenue.)"

"The stench (privies) is something terrible.—(—— E. Fourteenth street.)"

"It would be an act of charity to look after the water-closets; the stench is dreadful and the closets are almost flowing over.—(Suffering Tenants, —— and —— E. Fourteenth street.)"

Digitized by Google

"The housekeeper and her children create the most nuisance; they sit in the hallway as in a water closet.—(—— W. Thirty-first street.)"

"It would be a charity and a blessing for the tenants to have something done for them.—(—— W. Thirty-second street.)"

"The cellar is overrun by water; * * * it seems useless to talk to the agent; you can see through the flooring in the basement, and the children there are always sick with colds. (A Neighbor, —— W. Thirty-third street.)"

"The filth (of the privies) oozes out all over the yard, and the stench is intolerable. * * * The stench that was coming up through the front grating was horrible. (A Sufferer, —— W. Fortieth street.)"

"There is a terrible bad smell from the water-closets, * * * the yard flags are loose and the smell comes up * * * I see in the News you will help us poor men.—(—— E. Thirty-eight street.)"

"The smell (from sewers) that comes at times is terrible.—( Neighbors.—— Ninth avenu .)"

"The roof leaks and the water pours in streams; the house is damp, and we cannot get the owner to fix it.—(—— Cannon street.)"

"There have been three cases of typhus fever taken away yesterday; * * * the cellars are filthy.—(—— Sullivan street.)"

"There is a dreadful stench constantly coming out of the sink; there has been sickness all through the house —(—— Third avenue.)"

"* * * Manure is thrown into our yard every day; our children have no other place to play in.—(—— E. Sixteenth street.)"

"I was glad to see your advertisement. * * * I have reported to the board of health three or four times; * * * the sewer pipe is broken, it is making the people in the house sick.—(—— Roosevelt street.)"

"The privies are full to overflowing, the flooring is all broken, to give the odors better ventilation.—(—— Third avenue.)"

"The stink (from the cellar) is enough to knock you down. * * * If you will look after this the whole house will be greatly obliged to you.—(—— E. Seventy-fourth street.)"

"If this evil (foul smell from sewers) is removed and our safety secured by your means * * * you will have the thanks and prayers of all the neighbors.—(—— E. Seventy-seventh street.)"

"There is only one (water-closet) hole for fourteen families; * * * the smell from said closet is most offensive.—One of the victims in said house, (—— W. Eleventh street.)"

"* * * And also the stench pipe from which there is a fearful smell. * * * It requires the attention of your society, which is doing such good work to investigate this pest hole. (From a poor tenant, —— E. Twenty-first street.)"

"It is a shame how public officials neglect their duty. * * * In the cellar, below the sidewalk, people are dwelling just above the sewers; * * * the filth inside (the house) is quite comparable with that in the street.—(—— Ridge street.)"

"Look at the cellar and you will be surprised that all in that house are not sick; * * * there is not a bit of water in the yard; they (the tenants) are obliged to bring back the slop pail and wash it in the sink that is in their room. * * * There is an officer sometimes comes to inspect the cellar, but he never saw the inside of it yet. * * * We pay high rents and cannot use the stinking cellar. * * * Thank the good gentlemen that watch over the poor; only for that the greed of the house owners would let them die of stink.—(—— W. Forty-first street.)"

"* * * There has been in house No. — several deaths since last January of diphtheria, I myself lost two children this last month, and one death occurred last night in the same house * * * and others are sick in No. — with diphtheria; * * * you will receive the blessings of myself and others.—(——to —— Third avenue.)"

"See to leaky hydrant and water-closet that empties its filth into the cellar. * * * The house belongs to Trinity Church.—(——Washington street.)"

"We ask the agent for water, and he says we must move out or pay the rent, water or no water.—(—— Third avenue.)"

"* * * Am compelled to submit to a great many inconveniences, owing to the neglect of the landlord.—(—— Mott street.)"

"A tenant paid $9 a month, in March last, 'in a filthy house.' After a month, not dealing with the landlord, a high-priced grocer, the tenant found his rent raised to $10. On May 20th, he writes: 'Imagine my surprise this evening when he came to my door and told me, with an oath, if I did not move I would have to pay

Digitized by Google

$12." The description of the house which follows, and the condition in which it was found to be, was of the worst.—(—— East Thirty-fifth street.)"

"* * * We are poor and dare not complain, or there would be a bill put up for our rooms and out we go. * * * There are only two water-closets for three houses, down in the cellar, for over one hundred people.— (—— East Twelfth street.)"

"* * * And the water-closets are in an awful condition * * * Please do not speak of this letter.—(——to —— Ninth avenue.)"

"The ceiling is all down and the rain comes in, and the waste-pipe runs through the room, so that when it rains we cannot stand the smell, and the roof and roof-stairs are in a terrible state; the roof had no door on all winter. We spoke to the landlady several times about it, and she paid no attention to it.—(—— Third avenue.)"

"* * * After reading your kind notice * * * visit the defective sinks in tenement house, No. —. The landlord does not seem to care. * * * Please do not say there is complaint made; if the landlord would know I am the person he would have me put out, therefore I will not give my name.—(—— Second avenue.)"

"A tenant writes complaining that he is evicted because it has been discovered that he made complaint to the board of health concerning the defective sewerage of his late residence Another tenant of the same house, who indorsed his fellow occupant's action, has also been ordered, with his family, to vacate his rooms. —(—— E. Thirtieth street.)"

"A visit would show you a state of filth. * * * We can get no redress from the landlord.—(—— Beach street.)"

"I pray you to receive this confidentially, as not wishing to have the landlord's enmity.—(—— Water street.)"

"I have had charge of two tenements * * * for about three years, and during that time have felt like a man that was committing murder."

This last letter is from a janitor, who felt that he did not dare correct the evils that he saw.

I have here a report on the tenement-house system of New York by a committee of gentlemen, at the head of which was Rev. Henry C. Potter, D. D., which I wish to submit:

## THE TENEMENT-HOUSE SYSTEM IN NEW YORK.

### ITS UNHEALTHINESS.

The estimated population of New York City July, 1878, was 1,097,563; or, allowing 48,960 for the Twenty-third and Twenty-fourth wards, 1,048,603 on Manhattan Island. The children under five years of age are estimated at 125,000. The total number of deaths in 1878 was 27,008, or 24¼ per 1,000, being 25 per cent. higher than in Philadelphia.

If, as is supposed, there are 28 cases of sickness to each death, this death rate represents the effects of want, ill clothing, neglect, physical debility, &c., in addition to 756,224 cases of sickness, of which 25 per cent. might probably be saved under other conditions of life.

The mortality of children under five years, there being no epidemic in 1878, was 12,410, or 46 per cent. of the whole number of deaths, and nearly 10 per cent. of the children of the city.

Of the deaths 70 per cent. (18,857) occurred in or in connection with tenement houses, the numbers being 4,313 in institutions, 14,354 in tenement houses, and 200 in the streets.

The whole population of tenement houses is estimated at about 500,000, not far from 50 per cent. of the whole.

The total number of tenement houses is estimated at 21,000.

In 1869, 14,494 such houses were visited and inspected, their population being 113,402 families, with 463,592 inmates. Since then 6,441 have been built. In the last ten years 7,041 tenement houses were erected, at a cost of $82,368,086, and last year 358 such houses were put up in this city.

### ITS OVERCROWDING.

The inhabitants of the city, estimated at 1,097,563, dwell in an area of about 24,860 acres; of these, 1,048,603 occupy Manhattan Island, with an acreage of 12,570. The Eleventh ward, with 64,000 inhabitants to 196 acres, has an average of 326 to the acre.

Digitized by Google

The Seventeenth ward, with 101,000 inhabitants to 331 acres, has an average of 305 per acre.

These figures, while far in excess of the ratio in other cities, do not convey the whole measure of truth, as in one single block in the Eleventh ward there are to-day 52 tenement houses occupied by 589 families, representing 2,376 inmates, some of these containing 18 and 20 families each; and there are several such blocks with an average of some 750 to the acre.

In the Eleventh ward, during the last ten years, 257 new tenement houses and in the Seventeenth ward 427 such houses have been built.

UNHEALTHINESS AND OVERCROWDING AS CAUSES OF CRIME, VICE, AND PAUPERISM.

The total number of arrests made by the police in 1878 was 76,484, of which 30,373, or 19,538 males and 10,835 females, were for drunkenness, and 15,628 for disorderly conduct, chiefly the effect of drink. About 12,000 of these were made in the three crowded tenement-house wards, the Eleventh, Fourteenth, and Seventeenth.

Of the whole number of persons arrested for crimes other than drunkenness 90 per cent. are offenders against property, and of these 60 per cent., or more than half, are absolutely in the habit of crime. By the records of the prisons, house of refuge, reformatories, &c., these are traced directly to tenement-house influences.

The police records for the last quarter of 1878 show that 609 lost children were found; 999 persons taken to hospital from the streets; 16 women found in labor in the streets, besides dead and still-born infants to the number of 26. These cases mainly come from the crowded lower wards of the city. The younger criminals are traced almost exclusively to tenement houses. In fact they are the consequences and victims of low social conditions of life and unhealthy overcrowded lodgings, brought up in an atmosphere of actual darkness, moral and physical.

A letter from Professor Chandler is to the same effect: "The influence," he says, "of the tenement-house system upon the moral and physical welfare of our citizens is a matter of the utmost importance, not only to the half of the population actually residing in such houses, but to every family in the city. Through mechanics, tradesmen, servants, and others, there is a constant intercommunication, by which the influences which affect any considerable class are brought to bear upon every other class of our people. There is no way in which a family can so isolate itself as to avoid suffering in some way from the evils of our tenement houses. The system of crowding from four to twenty or more families into a single house makes them hotbeds of moral and physical contagion.

"While the health department devotes a large proportion of its labors to the tenement houses, and while under its system of inspection and the enforcement of the provisions of the sanitary code there has been a steady and decided improvement during the past twelve years, nevertheless much still remains which is bad. In fact, remedies have yet to be devised for many of the evils of the system.

"It is therefore of the greatest importance to call the attention of the public to the subject, as it is only by an enlightened public opinion that the most effective reforms can ever be secured."

Mr Charles L. Brace, of the Children's Aid Society, says: "After twenty-five years' experience among the children of the poor in this city, I can truly say that there is no one cause so fruitful of crime, vagrancy, and bad habits among them as the condition of the tenement houses. How they ever grow up to purity, honesty, and decency is a wonder when one knows how they live. The enormous number of vagrant children in this city, our lodging houses alone reaching some 15,000 different homeless boys and girls in the course of the year, arises from the influence of the tenement houses."

A citizen specially interested in the temperance movement writes: "The discomforts of close, gloomy quarters, and above all the discouragement from the sickness and consequent wretchedness sure to prevail in such dwellings, do more to fill the dram shops than any other material cause whatever. A mechanic who had nine children to bring up on about $800 a year told me that until he moved out of town he had paid $90 annually for doctor's bills and medicines; and this was no uncommon case. In the families of day laborers, whose wages average, say, $375 per annum, the loss of children is frightful." (See also the Thirty-second Report of the Prison Association.)

Another well-known advocate of law and order writes: "The tenement house and the grog-shop are mutual helpers. The misery of the one sends the man to the grog-shop, and the grog-shop makes him a drunkard and a pauper, so that he can never get into a better atmosphere than that of the tenement house."

It should be known that there are now 6,110 places in New York licensed to sell liquor to be drunk on the premises, and over 2,000 unlicensed places besides. It is needless to say in what parts of the city these most abound.

### THE RECENT ORIGIN OF THE TENEMENT HOUSE.

Tenement houses may be considered as the result of a sudden influx of population into this city, and of the necessity of providing house room for them. The earliest tenement house appears to have been erected about forty years ago, when what was known as Gotham Court was built on the Wood estate in Cherry street. In 1850, the Baptist church in Mulberry street was sold and converted into tenement-house property. The returns were large and induced similar investments; so that soon all along Mulberry, Elizabeth, Baxter, and the neighboring streets private dwellings were changed into this class of property. Below Canal street many tenement houses have given place to stores, warehouses, and manufactories. Efforts have been made at different times to control and reduce the evil. In 1853–'54 investigations were made by the Association for Improving the Condition of the Poor, and a committee of the legislature reported on the subject. In 1865–'67 the labors of the Citizens' Committee of Hygiene obtained for New York the passage of the tenement-house act, and led to the establishment of the board of health. But still the evils of overcrowding exist.

### WHAT IS A TENEMENT HOUSE?

To understand this question it is necessary to determine what is meant by the name tenement house. The law defines it as "a house occupied by more than three families, living independently and doing their cooking on the premises; or by more than two families on a floor, so living and cooking, and having a common right in the halls, stairways, yards," &c.

This definition would include apartment houses and similar dwellings, but the only houses here referred to are those of the type recognized as the tenement house proper. This is generally a brick building, from four to six stories high on the street, frequently with a store on the first floor, which when used for the sale of liquor has a side opening for the benefit of the inmates and to evade the Sunday law; four families occupy each floor, and a set of rooms consists of one or two dark closets used as bedrooms, with a living room 12 feet by 10. The staircase is too often a dark well in the center of the house, and no direct through ventilation is possible, each family being separated by partitions. Frequently the rear of the lot is occupied by another building of three stories high, with two families on a floor.

It therefore happens that on one lot 25 feet by 100, there may be twenty to thirty families, with forty or fifty children, using one yard and the same hallways. (Dr. Harris found ninety-six children in one such house.)

The following is a condensed report of three tenement houses of the *average* condition, prepared by Dr. Richard H. Derby, after personal investigation, undertaken at the request of the State Charities Aid Association:

A. This building is six stories high. Its middle rooms throughout receive almost no daylight. In one room servant girls out of employment find board at 10 cents per night. On the fourth floor in a rear room lives a widow, who takes five boarders. On the sixth floor lives a laborer; has wife and four children. The husband and wife very often fight, and the children are all said to be ruptured from violence, either inflicted by parents or incurred through their neglect. In this house live 90 persons; of these 17 are men, 36 women, and 37 children.

B. The ground floor and cellar of this building is occupied by a distiller. There is no carpet in the house, and everywhere there are signs of penury. Every family is distinct from every other family, and nearly every set of rooms is occupied by one. Here are many children. Out of every ten children from five to fourteen years of age two are habitually absent from school, three attend the ward schools, one the Protestant Mission School, and eight the Catholic parochial schools. These people are on the lookout for "relief." They are familiar with all the regularly organized charities of New York. Sixty-nine people live in this house; of these 13 are men, 22 women, and 34 children.

C. This building is five stories high, in a sparsely-settled neighborhood in the northern part of Manhattan Island. Dependent for light from the front and rear, there are thirty-two rooms that receive light and ventilation from other rooms. The men who live here are mostly laborers, and frequently intemperate. The crime of wife-beating is common in this house. There are 92 occupants of the house; of these 19 are men, 22 women, and 51 children; of the children 22 went to school.

Here is a picture from life of three tenement houses of the *worst* class:

No. 1. Down in the basement, a resort for vagrants of the worst class, at midday were nine men and three women, all sodden with stale beer; the passageway was obstructed by a helpless wretch who had been ejected from the adjacent room. A little later this same man, after he had been revived by fresh air, was fiercely assaulted and beaten by a woman. In another room where rags and bones, not devoid of putrid flesh, were being sorted, the air was so vile the visitor could not remain. In this building but four closets were provided for the 182 inmates. An attic room here,

Digitized by Google

lighted by one small window, is occupied by four men and four women, almost certainly not married, at a monthly rent of four dollars. In another room three men and four women live—all rag-pickers. Here was a young girl, who was represented as "stopping for a few days." She looked as if she might be saved, for she was obviously ashamed of herself and her friends. In this entire tenement were 182 persons; of these 122 were men, 37 women, and 23 children.

No. 2. A structure of the poorest class. A basement room was unfurnished except with a stove, a keg of stale beer, and boxes used for seats. Around the former were huddled four men and three women, four others being in the room. Humanity gets no lower than these people are, and they are looked down upon by the other denizens of the place. The proprietor of this room (which is 14½ by 10 feet in extent) takes from eight to twelve lodgers at night. Stale beer is sold at two cents a pint or three cents a quart. Another room, the darkest in the house, is occupied by two Italian men and three women. In only four rooms was there anything like a family organization. The police report the arrests for assault and battery in this house to average one a week. In this house are 14 rooms, occupied by 72 persons; of these 19 are men, 24 women, 12 children, and 17 lodgers.

No. 3. In the court are four closets, used by the 118 inhabitants of the house, all in a sickening state. The water leaks from the roof to the ground below through the two intervening floors. In one of the second-story rooms live one woman, six men, two large boys (18 or 20 years old). The woman is unmarried. On the third story in a small room live three men and three women, all unmarried Irish and Italians; 118 people live in this tenement; of these 87 are men, 18 women, 13 children.

Fair examples of two classes of tenement houses have been given here. In the one an almost entire absence of family organization, concubinage, drunkenness, and vagrancy are well illustrated. The better class of tenement, with its badly lighted and illy-ventilated middle rooms, its overcrowding, its neglected children, affords no overdrawn picture of the average New York tenement.

### REMEDIAL MEASURES SUGGESTED.

I. That it is possible to improve the condition of the inmates of even the worst class of tenement houses has been shown by some recent efforts in this direction.

Last year an old house in Park street, occupied by a very dissolute population, and condemned by the building department as unsafe, was rented by a lady who personally attended to the requirements of her lodgers, and by firm but gentle enforcement of simple rules has completely changed the character of the place. She has been encouraged by the success of this trial to extend her operations, which are the same as those employed by Miss Hill, of London. (See "Homes of the London Poor," Macmillan & Co.) Another experiment has been made with considerable success in connection with Ascension Church. Some houses had been built and turned over to the clergyman by a member of the congregation; and they have proved a valuable center of Christian work, while paying a good interest as an investment.

One source of mismanagement of tenement houses owned by wealthy and respectable landlords, is the employment of merely business agents who have no sympathy with the tenants. Some of these middlemen have been known to practice extortions of the most outrageous kind, and only maintain their positions by keeping the owner and tenant so separated that even the name of the former cannot be discovered. The tenement-house agency has thus become a most important and lucrative business in New York.

The change required is, not to do away with agents, for they will always be necessary, but to induce landlords (1) to select persons who are known to be humane and of correct moral character, and (2) to take more personal interest in the moral and social condition of their tenants.

II. The process of reforming and remodelling the present tenement houses is, of course, the first consideration, if it is possible. There is, however, no difficulty in constructing buildings in the future which combine all necessary sanitary and domestic conveniences.

The following letter from Mr. Alfred T. White, of Brooklyn, the pioneer in the way of tenement-house reform in this direction, points out the business feasibility of his plan:

"The property owned in Brooklyn by my friends and myself, on Hicks, Warren, and Baltic streets, now houses over 600 persons, and will soon contain over 1,000. Houses with eighty dwellings were opened in 1877; seventy more dwellings and fifteen stores were completed in 1878; seventy more dwellings will be ready May 1, next.

"Our apartments are generally of four rooms, a living room, a scullery, and two bedrooms. Such sets rent for from $6 to $10 per month, averaging $8.

"The apartments open by short halls upon slate balconies reached by slate staircases carried up in fire-proof towers open to the air. Each set is complete in itself,

Digitized by Google

securing domestic privacy and family independence, things utterly impossible in any old-style tenement house.

"The sanitary arrangements prevent any foul-air diseases from originating within the buildings. (Such cases of contagious disease as have been communicated from without have, with a solitary exception, never proved fatal.)

"The low rents give a chance to the poorest laborer, while the complete privacy and the convenience of arrangement attract the well-to-do mechanic and tradesman. Thus the tenants are of all classes and of all nationalities. They respect their obligations and appreciate their homes.

"In the same neighborhood we have six-room brick houses at $17 and $18 per month, and nine-room houses at $22.

"Similar tenements and similar small houses could be erected to-day in New York with equal profit to tenant and landlord. All unselfish considerations combine with fair business inducements to make the provision of better homes for the working classes at once a good investment, an essential sanitary protection, and the best charity that can be done—a decent home at a fair price for every man who wishes one."

With respect to improved single tenement houses it is perhaps enough to say that in the recent prize competition for such a building, one hundred and eighty-eight designs have been submitted; proving that architects do not consider it impracticable to combine health, cleanliness, and sanitary improvements with business requirements.

III. Another great opportunity for solving the difficulty is presented by the improved modes of rapid transit, which practically extend the city limits, so as to allow a portion of our population the choice of living in the country at small expense.

There are other ways of minimizing the evils of overcrowding, each of which will find its own advocate. The Peabody Building Fund in London has been quoted by many as a success. But it is not in any sense as a *charity* that this movement is advocated. Benevolence and profit go hand in hand in this instance. There need be no risk of loss to any one embarking in a movement like this, which increases the happiness and welfare of his fellow-citizens, adds to his own and the general security, and enhances his income.

It may be stated that whenever from time to time improvements have been made in particularly bad quarters, and light and air freely admitted, the police records have shown a marked decrease of crime and arrests, and of destitution. In Glasgow, Scotland, where the property owners have recently expended $7,000,000 in destroying, cleansing, and reforming tenement dwellings, they have been rewarded by a diminution of more than 25 per cent. in the amount of crime. (See Ninth Annual Report of the State Board of Charities, page 139 *et s q.*)

But if all other means fail, there remains the right of appeal for legislative action to prevent overcrowding and overbuilding, to authorize the demolition of the vilest of these dwellings, and to enforce the observance of existing laws and regulations with respect to tenement houses. All citizens are interested in an abatement of the evils here described, for it must be remembered that disease, like crime, gains force in these houses and under these conditions of life; while it decimates the poor it does not spare the rich. All may see that it is a common interest to secure the benefits of decent, healthy homes to the wage-earners—male and female—of this city, who are able to pay for such accommodations, but who now seek for it in vain. All thoughtful persons must be anxious to retain here that part of the population who contribute so much to the industrial importance of this city, and to prevent them from drifting to other centers of industry where happy and healthful family life is a possibility. By a reform of the tenement-house system something may be done to strengthen the foundations of society among us—to strike a blow at one cause of crime and intemperance, and to open the doors to the extension of religious and moral influences.

### WHAT SANITARY INSPECTORS SAY: EXTRACT FROM THE REPORT OF THE BOARD OF HEALTH.

The discomfort and danger of living in tenement houses would be very much diminished if the halls and staircases were properly lighted by windows opening to the external air. I am sure I express the sentiment of every medical practitioner in the city when I protest against the further construction of buildings in which the stran-

Digitized by Google

ger, entering from the glare of the street, has to grope his way from floor to floor in darkness, in fear of collision with other passengers, and in dread of contact with unseen filth. The unclean and unwholesome condition of many of the tenement houses in my district is largely due to failure to secure the cleaning of the streets. If the streets were cleaned the unpleasant and injurious results produced by the distribution of mud and dust would be entirely removed in the lower districts of the city, where the ground is completely occupied by buildings and covered up with pavements. (Page 187.) Of course where families are so huddled together, as we find in certain houses; where houses are so built that often there is not more than 12 feet intervening between front and rear houses, the most unceasing vigilance can accomplish but little good. While such conditions are allowed the death returns cannot be materially bettered. Where the most good may be done is not only by exercising a most careful espionage over the buildings already occupied, but by preventing the construction of new buildings unless all requirements are carried out. * * * Until house-refuse is removed regularly and thoroughly it will be out of the question to have clean streets. (Page 189.) The habits of the Germans render them much less susceptible to the insalubrious influence of the atmosphere which surrounds them, vitiated as it is by emanations from multitudes of human beings huddled together, from insufficiently drained houses, from thousands of privy vaults, from defective public sewers, from ill-paved and uncleanly streets, and from street gutters often filled with stagnant water. It is scarcely necessary to treat under separate heads of these various unhealthful conditions. They exist to a greater or less extent in all the tenement-house districts of the city, and require the constant watchfulness of the few officers to whom is intrusted the sanitary supervision of so extensive and populous a territory. (Page 191.) I again advise the propriety of the passage of a law compelling the owners of tenement houses to provide housekeepers in each house, whose duty and responsibility it shall be to attend to the cleanliness and good-keeping of the interiors, exteriors, and surroundings of such houses.

There are two great evils connected with tenement houses in this district which must exercise a very great influence upon the death record of the city. I refer to overcrowding and filth. The overcrowding in the portion of the city of which I have charge undoubtedly results chiefly from poverty. There are vacant rooms sprinkled in great numbers all over the district, quite sufficient I should judge to dilute the population to a more healthful degree of density; but from lack of means a family which, to obtain a sufficient supply of fresh air should occupy four rooms, is crowded into two at half the price. They cannot afford more roomy apartments, and so are as limited in their supply of oxygen as in the quality and quantity of their food, and pass their lives with physical wants only half supplied with what are real necessities, to say nothing of the almost total destruction of decent morals which results from a constant and unavoidable commingling of the sexes. If the sexual immorality of the tenement houses of New York could be laid bare by some Asmodeus, the community would be aghast at the revelation. (Page 200.) The question of the construction of a tenement house so that its occupants may enjoy the benefits of the many improvements of modern science without too great an increase of rent, is one of great importance. In answer to any questions on the subject of improving the standard of this class of property, almost all of the architects and landlords reply: "Oh, yes, we can put in all these things, but they cost so much that we cannot rent them for the price poor persons can afford to pay." This may be true to a certain extent, but there are a few rules from which no deviation should be made. Light, air, and cleanliness are three indispensable agents in the preservation of life and health, and should always be kept in view by architects in designing all kinds of tenement or apartment houses. The lighting and ventilation of halls by means of an open window at the end is a subject which has so often been dilated upon by writers on sanitary matters that it seems like tautology to again mention it; the more so as it is a direct requirement of the tenement-house law of the State; but, I am sorry to say, it is a dead letter in the eyes of those in charge of the construction of buildings. (Page 204.) The plumbing of tenement houses is found, upon careful examination, to be generally defective. In the investigation of many cases of diphtheria and typhoid fever I found, upon an examination of the house drainage in the majority of cases no stench-traps in the waste-pipes of the sinks, and, as a consequence, the sewer gases were allowed to escape into the interior of the dwelling. (Page 211.) Already the tenement houses of this locality (E. Forty-sixth and Forty-seventh streets) are in a most foul condition. The inmates seem to be slovenly, and certainly lack the neatness and thrift of people in other localities; for example, a door out of repair is suffered to remain so; a loose stone in the sidewalk trips people up, but they are too shiftless to repair it. The walls are smeared with filth and the gutters are filled with boots and straw. (Page 214.) In nearly every case of diphtheria and typhoid fever which I have been called upon to investigate in tenement houses I have remarked the absence of traps in the waste-pipes of the sinks and the proper ventilation of the soil-pipes. (Page 219.) The subject of sewer gas is a very grave one, affecting so widely the class referred to, and it suggests

Digitized by Google

the necessity for an ordinance requiring that all soil and waste pipes be trapped and ventilated in the manner described; and further than this, that all sinks in tenement houses shall be located in ante-rooms and hallways; for, however effectual the above precautions may be for the purpose required, they do not obviate all the objections which may be raised to the presence of sinks in dwelling apartments. (Page 222.)

Many so-called improvements have been carried on and completed in this district (Seventh ward). Lots formerly vacant have been built upon, and many dilapidated old structures, once used as tenement and dwelling houses, have been destroyed, and in their place seemingly fair buildings have been erected. But to my thinking these buildings do not often constitute improvements. The pretentious high-stoop, brown-stone front tenement house may be fair to the eye, but in reality it is full of all unsoundness. The public health gains nothing by the erection of such buildings. (Page 230.)

Rear houses, in themselves a nuisance, give rise to so many others that a law to prevent the building of them would be a blessing to the poorer classes. Built solely to afford the greatest number of rooms in the smallest space, no attention whatever has been given to the means of lighting or ventilating them. Many of the rooms on the lower floors are never visited by sunshine, and the halls are so dark that at mid-day one is obliged to feel his way through them. Of this darkness dirt is a necessary attendant. Another evil connected with this plan of building is the ever-present vault situated in the narrow area between the two houses, and but three or four feet from the rooms in which the tenants live, eat, and in many cases sleep. The short, wooden shaft extending but a few feet above the roof of this building for a ventilator being entirely useless for that purpose, and the sewer connection being often obstructed, they become extremely offensive and prejudicial to the health of the tenants. (Page 227.)

CONDENSED EXTRACT FROM REPORT OF AMERICAN PUBLIC HEALTH ASSOCIATION (VOL. II, P. 115, ET SEQ.)

Foremost among the insidious causes of ill health is the want of a sufficient amount of air space. How is pure air possible in the pent-up quarters of tenement houses, when loaded with organic exhalations from the lungs and bodies of persons occupying these crowded apartments, and the innumerable other impurities inseparable from the average condition of tenement populations. These organic impurities adhere with peculiar tenacity to the walls of a room, to furniture, and clothing. What is known as the "tenement-house smell," indicates the commencement of that condition known as crowd-poison, with which typhus, ship, and jail fever are allied. Persons exposed year after year to the morbid influences arising from defective hygiene, must deteriorate in health and social standing. Hence prevailing diseases reap their greatest harvest in such localities.

Moreover, large numbers of tenement houses are built upon "made ground" formed by the filling of depressions, or by filling up low ground naturally covered with water. Another peculiar feature of tenement-house life is the too close proximity of sinks and cess-pools, which send their poisonous odors around to find entrance into the house by open doors and windows. In neglected tenements these vile odors are so offensive as to compel the inmates to live with windows closed day and night. The cheerless condition of such houses, the devitalized condition of the atmosphere, enfeeble the animal power and create a desire for stimulants, and hence disease, intemperance, and crime. Large numbers of tenement houses have their first floor occupied for the sale of liquor, which becomes a sort of club-room for the inmates. To carry water, coals, and heavy burdens up several flights of stairs is one feature of labor incidental to tenement-house life; how much of suffering and disease to females and young persons arise from such causes can easily be imagined. More air space, better ventilation, improved systems of house drainage, are self-evident necessities.

By Mr. PUGH:

Q. Is that a report made by the gentlemen whose names are given?—A. Yes.

Q. Who did they make it to?—A. It was prepared to be read at a meeting to be held in this city on the subject of tenement houses.

By the CHAIRMAN:

Q. Has this information which you have now been giving, and which is contained in that pamphlet, ever been brought to the attention of the city authorities?—A. It has, repeatedly.

Digitized by Google

DEFECTIVE MUNICIPAL ADMINISTRATION IN NEW YORK.

Mr. PUGH. The sole power to remedy these evils is with the city authorities, and it is amazing to me that they have not been remedied. It seems most extraordinary.

The WITNESS. Let me answer that remark briefly. Our board of health is a good body. They have certain funds. They receive six thousand, or more, complaints in a year from all sorts of buildings, from the best to the worst. They send their inspector to examine the buildings. He comes back and makes a report, and a notice is sent to the landlord of the character of that report and of the difficulty existing at the house, with instructions to remedy the difficulty. The inspector goes there a second time, and reports again, and if the remedy is not applied another notice is sent to the landlord. The same thing is done again, and if the third notice is not attended to proceedings will be taken to sue the man. This requires a great deal of labor, and you cannot expect officials to do any more than they can.

By the CHAIRMAN:

Q. The remedy is in the destruction of these tenement houses?—A. The remedy is in rousing public sentiment, and allowing the board of health to do more and to have more money.

By Mr. PUGH:

Q. That is, in changing the character of the buildings in which these people live.—A. Precisely. I will come to that in one moment.

In Great Britain, where they have sovled these problems earlier than we have, they take sections of cities like Glasgow, London, Edinburgh, &c., declare the property uninhabitable and destroy it. They do that every day. It is the rarest thing for the New York board of health to condemn a building and to compel it to be torn down.

By the CHAIRMAN:

Q. Why is that? I do not understand that statement.

BUILDINGS UNFIT FOR HUMAN HABITATION.

A. I state it, then, as a fact, that buildings have existed in this city, held up by nothing but the elements, you may say; buildings notoriously unfit for human habitation, and only after months have they been condemned by the board.

Q. Why is it? What is the trouble? Have the people no courage to condemn such a thing, and remedy it?—A. The board of health was stated some years ago to have arbitrary power. It was stated, for example, as a joke, that the Shah of Persia was going to have a board of health like ours, established in his Government, to carry on the affairs of his Kingdom. They have ample power, but they cannot rise above public opinion. And, if they find $200,000,000 of capital invested in tenement houses to combat them and only half a dozen men to sustain them, what are they going to do?

Q. Can they not say that such a building is unfit for habitation?—A. Well, I do not wish to criticise the board of health, but I can take you to buildings which are unfit for human beings to enter, in which you could not cross the halls without having your feet covered with filth.

Q. Does anybody live in those buildings?—A. Yes.

Q. Where are they?—A. In this city.

Q. Where?—A. One in Fifty-fourth street.

Digitized by Google

Q. When did you see it?—A. Two of my associates inspected it within thirty days, and reported it to the board of health. There are buildings in this city, of the better class, not tenement houses—where people paying as much rent as I pay myself—book-keepers and clerks and middle-class of people—in Yorkville and Harlem, "skin buildings," as they are called, without any party wall between the cellars, the houses supported by wooden braces, which are splitting with the weight of the buildings—in which the coping of the roof is built with mortar which has nothing but sand in it, and buildings where the sewer pipe has burst and its contents have come up into the room that a poor washerwoman lives in. These are facts. In fact, this whole city, from a sanitary point of view, is simply rotten.

Q. Do you mean to say that the board of health, knowing these facts, do not state them?—A. I mean to say that the board of health, from want of courage, or from some cause that I will not state too explicitly, is either ignorant of them, or has ignored them, or has delayed attending to them.

Q. So that the officials, you say, know these facts, and have not made them public?—A. The newspapers have made them public, but the officials in their reports have not made them public, because they issue no reports. We have not had a formal report in New York City for several years.

Q. Are they expected to report?—A. Yes; but they have not the funds to pay for the printing. The only medium they have for communicating with the public is the City Record and the daily papers.

Q. There does not seem to be anybody to blame then; it is very much like the verdict in the case of a railroad accident.—A. That I will not presume to say.

As I was going on to state, in London and elsewhere in England, they have first demolished a large portion of the buildings in a given territory, and compensated the owners for the value, after it was assessed, and they have then built a large number of model tenement houses. Under philanthropic direction—that of Miss Octavia Hill, assisted by Ruskin and others—they have taken houses, and beginning with one, and adding others by degrees, have reformed those houses by giving them personal attention. That same thing has been done in New York City, and has solved the problem, by showing that if landlords would take the trouble to clean their buildings and watch their tenants, they would secure a better class of tenants.

Miss Helen Collins, in this city, has some excellent tenement houses, paying a good interest on the investment, in the middle of old Cherry street, which used to be one of the worst parts of the city.

One of the great difficulties in the action of the board of health was that they could not find who was the landlord, so that frequently they would be thrown out of court.

The CHAIRMAN. Colonel Clark, the secretary of the board of health, testified about this matter, and said that there were difficulties; but he denied quite emphatically the existence of such facts as you testify to. I am sure those facts cannot be in the possession of the board of health.

### BUILDINGS CONDEMNED IN 1865 STILL TENANTED IN 1883.

The WITNESS. This very report that I have submitted to you has been in the hands of the board of health for a year or more. It is a notorious fact, which has been published broadcast, that buildings in New

Digitized by Google

York City, which were condemned by the citizens' sanitary committee in 1865, for being in a bad sanitary condition, are in that same condition to-day.

Q. Then the report must be untrue?—A. They were reported as being in an unsanitary condition fifteen years ago, and I say they are so to-day.

Q. But you were speaking of this report of the existing condition of things?—A. Yes; the letters that I read are within the knowledge of the board of health.

The CHAIRMAN. I feel that I must dissent from that, because we have had evidence to the contrary from the board itself. There must be some misapprehension.

The WITNESS. The plan of condemning large sections of territory has not been attempted in this city, because we have not as yet reached the point of taking hold of that problem, but we have done a great deal in the matter of building model tenements. I have here some pictures of model tenements which have been constructed in Brooklyn and in this city, to which you have probably had your attention called. These buildings are all profitable, and pay a good return on the investment, and are a success. Some of them are in Brooklyn, and some are in New York. Here are some of the plans and photographs of the present tenement houses [showing them], just as they are at the present time.

Q. Are you sure that the inspectors in the different parts of the city make reports of these facts to the board of health? May not the difficulty come from some neglect in that direction?—A. I am sure of it.

By Mr. PUGH:

Q. You say that these facts which you have stated are open to the eyes of anybody who will go where they are?—A. They are.

Mr. PUGH. Then it seems to me they are physical facts, about which there can be no mistake, and the truth or falsehood of what the witness swears about them can be ascertained by ocular demonstration.

The WITNESS. That is so.

By the CHAIRMAN:

Q. You have seen them?—A. I have seen them; I can bring you column after column of description in the New York papers of the last two months—the Sun, the Post, and the Tribune—which are simply duplicates of things that have been published in the same papers every summer within my knowledge, till I got tired of reading them; they are facts. The reporters find them out and state them, and that is all the good it does. For instance, one reporter says, "I find a whole family of Jewish tailors living in a cellar, working ten or twelve hours a day, tumbling off their benches and going to sleep on the floor, and getting up and going to work again—in a cellar condemned by law, and unfit for any human being to live in." Another says he found "a woman who had lived in a cellar for twenty years, with a stable twenty feet away, and she said she was very healthy, and had a large family there." It is a question involving no dispute.

By Mr. PUGH:

Q. If the board of health had not this information they could easily get it, I suppose, the facts being in existence and open to the discovery of everybody?—A. Precisely; in fact, their own records show it.

Q. Well, then, for them to say that they had not the information would seem to be very remarkable, would it not?—A. It would. Of course I have my explanation of those things, but it is not proper that

Digitized by Google

I should give them publicly. I appeal simply to the record. There are the facts, and they can be substantiated publicly, and I can duplicate those pictures in a hundred places in New York. The fourth remedy, which has been carried out and very successfully, has been the enlargement and amendment of the plumbing laws of the city, by which the board of health has absolute control of the plans of all new buildings, both to regulate the size of the building itself, so that it shall not cover more than 60 per cent. of the lot, and preventing the jambing up of buildings as before—controlling the ventilation by light-shafts; so that I am happy to say that all the new buildings since this law was passed are a great improvement in that respect. In these new buildings there are 30,000 people living at present, in comparatively decent homes, so that the remedy in the way of new buildings is being applied; but the board does not feel strong enough to assail existing buildings.

### LIGHT AND AIR IN CITIES—NECESSITY OF PUBLIC PARKS.

Now, next to the actual improvement of the buildings themselves, comes the question of their surroundings. All authorities agree that the great want in this city is of more lungs or breathing places. If you stand on the top of the pier of the East River Bridge, or any high place in the city, you will, on looking down, see nothing but bricks and mortar. It seems as if the health of the people had never entered into the consideration of anybody, for they have been filling up almost every inch of space. There are no children's play-grounds, or spaces for air or recreation—nothing but bricks and mortar everywhere. As you look down you see no possibility of air or sun-light. And in this respect the wealthiest men are no better off than others. I have been brought into the houses of men of large means, from Jay Gould down—hundreds of them—and I find that it is becoming a perfect mania to exclude light and air.

The public must be brought to the point of appreciating the necessity of having large areas in this city for the purposes of parks. The original intention of Central Park was that it should be put right in the midst of the thickest part of the city—about Fourteenth street—so that a mechanic would have to go through the park in coming from his work in the evening and in going to it again in the morning. Now, I understand, the workman is not allowed to pass through the park if he has his tools with him, and the people generally are very much restricted when they go there. I have seen children who have scarcely ever seen a tree and hardly know what a bird is. It is perfectly amazing what ignorance there is in New York City about matters belonging to the open air. It will come in time that we will find children like those of whom we read, who lived under the London bridge and had never heard the name of God, and didn't know who Queen Victoria was. Central Park, in fact, exists for the benefit of the rich, and not for the benefit of the poor; and it has not been of the least benefit to the poor people in the lower part of the city, for to get to it will cost them ten cents.

### HOMES FOR THE POOR WANTED.

We want in New York many thousand houses for the poor. We cannot get them in the city, as the land is so valuable that it is almost out of the question. At the same time many people do not go out to the suburbs, as in Westchester County, because the commutation is too high.

Digitized by Google

Q. What do you mean by "the commutation?"—A. We call the railroad rates by the month or year commutation rates. They cannot go to Jersey, because the immediately available country is too high in value, and then workingmen are always pressed for time. In other words the mechanic cannot run the risk of fogs and delays of that kind. He cannot run the risk of anything which would prevent his arriving at his work at 7 o'clock in the morning. So that the only outlook may be said to be the suburbs of Brooklyn. And what can you do with a bridge that calls for 5 cents fare, and a city with no rapid transit? The only outlook, it seems to me, is across Ward's or Blackwell's Island, Mott Haven, and along there to Long Island.

By the CHAIRMAN:

Q. But won't that land be all taken before those improvements can be made and the people get to it?—A. Well, there are millions of acres on Long Island. Some men can go a little way out, and others not quite so far.

Q. If time is the objection would it not apply there?—A. Time, of course, would be something, but the principal thing needed is certainty in transit, so that there will not be delays of fogs and such things. Certainly something can be done.

Q. The land is not likely to be controlled in advance by speculative purchasers, is it?—A. Well, in the first place, speculation does not want that class of persons of whom we are speaking. They want people of the wealthy class. Then the wealthy people want to live in New York. So that the tendency is not in that direction. I do not think there is any reason to expect that the land will be taken up.

Q. When is the new bridge over Blackwell's Island to be built?—A. They have begun it.

Q. Will it take as long as the other?—A. Oh, no; it is comparatively an inexpensive structure.

Q. Can you get under it with a ship?—A. It is to be a suspension bridge, with piers on the island and on the shore, and at least the foundation of one of the piers is constructed. There are reports in the papers about it, and I understand it is fairly under way.

Q. How far up is that?—A. About between Forty-fifth and Fiftieth streets.

Q. These people down this way, how are they going to get up to the bridge; that will cost something?—A. They are not down this way. While there has been a tendency to growth in the largest districts, still the largest growth has been about Murray Hill.

Q. But there are a half million people on this side of Fiftieth street?—A. Well, there is a large number up town.

Q. And the evils are down here. People are worse off down here, are they not?—A. As soon as we have rapid transit in Brooklyn, that will work relief to this end of the city.

Q. The bridge, you say, costs 5 cents, and it costs something to get through Brooklyn?—A. The bridge fare must be reduced to a cent in order to amount to anything.

Q. Then that would be part of the remedy—a reduction of the bridge fare. What is the fare on the ferry?—A. One cent.

Q. They could walk over the bridge for 1 cent?—A. Yes; but they will not do it. It takes a considerable amount of time to walk over, and when men are very tired with a day's work they do not feel like walking very far.

Mr. PUGH. The solution is that they must stay here and die. That seems to be the only solution of it. They are dying now.

Digitized by Google

### REMOVAL OF CITY FACTORIES.

Q. How is it about taking the factories out to the suburbs; would that help some?—A. I was coming to that. The workingman is going to live as near his work as possible, and if the factory is moved, why, that will give him relief. For instance, the Singer Sewing-Machine Company has gone out to Elizabethport, N. J. Others have gone to Bridgeport, Conn.

The Appletons have moved their bindery to Williamsburgh, and, to show the benefit of this course, they stated to me some time ago that they scarcely had any demands upon their sick fund, which is raised partly by contributions from the employés and partly by the firm; whereas, when they were in New York City the whole of the sick fund was consumed every year. There are any number of communities which have grown up around factories, as, for example, the clock works at Greenwood, N. J., and a large factory at Mott Haven. Ther is an interest also in binding the workman to his home, but there comes, on the other hand, the suspicion that the workman is only to be tied faster to his shop and that he cannot get away.

### NO RELIEF FROM THE ELEVATED RAILROADS.

The elevated railroads have, so far as I can learn, supplied no relief whatever to the tenement population of the city. They told me at a station at Fifty-ninth street that there were about 400 workingmen daily riding down town, and I know that from 5.30 to 6.30 p. m. trains going down town are about as full as trains going up town. Large numbers get out at stations in the central part of the city, around Houston and Grand streets, and many go to Brooklyn.

Q. Do you think the elevated railroads charge as much as they ought to for fare?—A. I think 5 cents fare is as much as they ought to charge.

Q. They charge 10 cents, do they not?—A. They charge 10 cents during the day.

Q. And only 5 cents during those hours that accommodate the laboring people to get to and from their work, is that it?—A. Yes. The reduced-rate hours are from 5 to 8.30 in the morning, and from 4.30 to 7.30 in the evening, during which hours the fare is 5 cents.

### MORE SANITARY INSPECTORS NEEDED.

When alluding to the necessity of baths and public laundries in the city I meant to have spoken of the necessity of another improvement, and that is that instead of spending all the money that we do spend on sanitary work, and in building hospitals, and supplying dispensaries for relief, we should spend money rather in the direction of visiting the poor in their own homes. Every summer we have a corps of fifty physicians specially appointed and paid for doing that very work, and they do it and are thus able to reduce the death rate very materially, which shows the benefits of their visitation to the people. It seems to me that it would be very easy to continue that corps all the year round.

Q. I suppose that in that way they give the people themselves a great deal of valuable instruction of a sanitary character?—A. They do. We want sanitary tracts to assist in that work.

Digitized by Google

### TAINTED FOOD AND WATERED MILK.

Now, next to the factors of light, air, and water, comes the great factor of food. The physicians will tell you that more children die in the summer time from bad or tainted food than from any other cause; and I consider, therefore, that the laws passed in New Jersey regarding the adulteration of food and the stricter enforcement of the laws in regard to skimmed and adulterated milk are both steps in the right direction. Then, a very short time ago, a committee connected with a charitable association reported that the milk question seemed to them the most vital of all questions affecting the health of the poor. Even people who have a cool place in which to keep milk get very little nutrition from the milk if it is watered. A large and respectable milk-dealer in Brooklyn told me that the poor people would go to those who kept the poorest quality and cheapest kind of milk—half water—and buy that for three or four cents a quart, for their own use, and would at the same time come to him and buy a few cents worth of his milk for their children. We see the same disposition shown when people will pay the highest price for brandy, if it be ordered by a physician, or for anything else in the way of medicine, if they can pay the price, for then they feel that it is right for them to do so; in fact, I think there is quite as much intelligence among the poor in such matters as among the better class of people.

Q. What do you mean by the "better class"?—A. I mean the so-called intelligent class. I do not use the word "class" except relatively. I have no other term.

### LEGISLATIVE REMEDIES FOR COMPELLING SANITARY REFORM.

So, that as to the city of New York, in order to have complete or anything like complete sanitary arrangements, we must have more water for our poor people as well as more food, air, and light. I do not see why it should not be made obligatory upon the owners of tenement houses to supply water to their tenants, even though the water does not rise by natural pressure. I am not much of a believer in legislation in such matters, but——

Q. [Interposing.] How did you get rid of the cigar-making difficulty in the tenement houses?—A. Well, that was prevented by law, and yet the board of health has reported over and over again that the manufacture of cigars in tenement houses was not detrimental to health.

Q. You have a law now which prohibits it?—A. Yes.

Q. How can you say, then, that you do not believe in law for these things?—A. I had not finished my statement in that respect. I say I do not believe in a law that is not capable of being wisely enforced.

Q. Then it is not a law if it is not enforced?—A. Well, it is called a law. It is perfectly reasonable that landlords of tenement houses should have a tank in every building, and that there should be an abundant supply of water; that is one of the few things in the way of legislation that I should urge.

### NECESSITY OF LICENSING PLUMBERS.

The plumbing acts have accomplished a vast benefit in regard to new buildings, but they do not touch upon old buildings; and while, if you build a new house, you are sure that the plumbing will be under inspection and properly executed, yet you have no security that if you

Digitized by Google

call a plumber in to do repairs, you will get a man competent or scrupulous, and, therefore, it seems to me that it is important, and I would urge it very strongly upon the committee, and emphasize it, that there should be a regulation of buildings in all parts of the country. They are doing it a great deal, in imitation of the New York law. Furthermore, the licensing—and the licensing after an examination—should be insisted upon, of all mechanics like plumbers, who deal with matters relating to life and death. I do not clearly understand the injustice, though it might seem an injustice, to say that a man who is in a business should be interfered with. It is said that if people are allowed to go into a business they should not be put under examination, but I do not see, on the other hand, why the life of a whole community should be jeoparded in order to allow a lot of ignorant and unscrupulous men to gain a livelihood at that for which they are entirely unfitted; therefore I think that they should be examined and licensed. They are now licensed, but without examination, and it is a mere matter of form. When you send after a man you have no security that you will get a plumber.

Q. The fact that they are licensed is taken as a sort of proof that they are competent; otherwise they would not have received a license.—A. It is a step in the way of progress, no doubt, even to give a license. If you go into a man's shop, however, and you see the words "Licensed plumber," you would naturally suppose that it means something, but it does not really mean anything. In many cases you will find that the bosses and men carrying on the business are not the best men; they are not picked men, but they are the men who failed as journeymen.

Q. They are licensed very much like men are who are permitted to sell liquor—licensed to do harm?—A. It is very much that way.

## TECHNICAL EDUCATION.

Having touched considerably on the subject of the sanitary conditions, I should now like to say something on the subject of technical education, but I will leave it to the committee to say whether I shall say anything on that subject. I have had some unusual opportunities of observation on the subject; I have had considerable to do with the question of technical education. I think I could get through in ten minutes.

Mr. PUGH. We would be glad to hear you, sir.

The CHAIRMAN. Take all the time you desire.

The WITNESS. Next to the question of health and its effect on the labor problem, it seems to me, from evidence that I have collected, that the want of practical training comes next. I remember asking a judge of the criminal court in Brooklyn, who has had as long an experience, I presume, as anybody, what, in his judgment, was the cause of so many boys and young men coming before him for punishment—expecting that he would give me for answer, "intemperance." On the contrary, he said that the cause of so many young men hanging around the corners and getting into trouble and getting arrested was the lack of some practical training for life; the lack of special capacity to do something or earn something. The Massachusetts Labor Bureau puts that in very much the same language. "The want of a proper occupation is undoubtedly the forerunner of pauperism, and an important cause of it."

Digitized by Google

APPRENTICESHIP.

It is not necessary to go much into the question of apprenticeship. We find that many of the immigrants who come here are unskilled laborers, but they do not make the majority of paupers and beggars. The principal difficulty is with the rising generation. If you ask an employer he will say that the boys come and stay in his shop a few weeks; they have to have some pay in the beginning, and the moment they get so that they can earn a dollar or two more, they leave; so that in hundreds of cases employers have refused to take any apprentices. In some statistics lately published you will find that there are very few American boys going into trades. In fact the effect of our public school system is to train most boys to be lawyers, clerks, and messenger boys, such as you see in Wall street. I think if your committee would investigate the effect of that kind of life on boys it would very much open your eyes.

The CHAIRMAN. Suppose you state the facts and make such suggestions on the subject as you choose?

THE SPECULATIVE MANIA; ITS EFFECT ON BOYS.

The WITNESS. Well, if you go into a bank at this hour you will see fifteen or twenty boys around the paying teller's desk. They handle millions of dollars as if it were nothing but pennies; and they get the idea that everything in life depends on speculation; that every boy can become a Jay Gould or a Vanderbilt; that honest industry and steady labor is all foolishness; and in other words they begin to believe in "luck," and the whole effect of that sort of thing is utterly demoralizing; there are so many of these messenger boys and boys of that class now that they are becoming an important factor in the community. They are drawing boys away from the regular trades. A boy does not want to take a trade any more. I have asked a lot of boys in the public schools what occupation they were going to follow, and out of some fifty boys there were only two who had any idea what they were going to do for a livelihood. One was going to be a mechanic and the other a clergyman. The whole tendency of life here is to Wall street. A first-class mechanic whom I know has gone into a speculation in oil, and is now bankrupt and ruined for life. He is only thirty years of age, and he started out at sixteen as a plumber.

By the CHAIRMAN:

Q. Are you speaking of that man as a type, and will he not return to his former avocation and build up again?—A. I do not believe that he will. That man was one in a thousand. He did not drink. He "received his tools" as the saying is—that is, he finished his apprenticeship experience in a little over a year, while the usual time is three years. He is a first class mechanic; and he is now destroyed by this terrible influence of speculation.

I remember that at a meeting of Social Science Association I heard a lady who was a teacher in a Western city or town, who happened to be speaking on that subject, say "What can we do with our intelligent boys and girls in the way of an occupation; and if you should have a son who had the natural capacity of a Ferguson or a Faraday or a Watts or a Thurlow Weed, what would you do with him?" As things are that is a hard question to answer. A friend of mine who has a son that has a palsy of the hand and could not therefore go into a clerk's

Digitized by Google

life, tried to get him into a silk mill or a hat factory, but he could not get him in.

Q. Why?—A. Because the trades unions kept him out. In the "trades school" in this city, Mr. Auchmuty's, they aim to train plumbers, brick-layers, and others. A man who was a steam-fitter came there in the evening and wanted to know a little about plumbing, so that he could do a little repairing occasionally. Immediately the boys refused to stay there, and said they would not stay with anybody but those who would become practical plumbers. The feeling has got about that "We don't want any more boys at all." I gave up all my interest in the thing; I felt it could not amount to anything.

### HOUSE BUILDING; EVIL EFFECTS OF THE CONTRACT SYSTEM.

Now what is the effect of these things and the others I have referred to? The effect is, that if you want a workman to build a house you cannot find him. The houses in this city and in London, as Carlyle described, are rotten dog-hutches. The term, "contract building" has come to mean a certain thing well understood. A man in this city who is building several thousand houses has been hauled up several times on account of sewer gas, and he has to build houses under other names, but there are the houses. I am told by a mechanic that out of ninety-six houses built in Harlem there was not one in twenty that he would live in. The president of the Exchange told me the same thing. And when Mr. Vanderbilt wanted carving done upon his house he had to send abroad. When you want good men to execute your orders you are entirely at a loss; you cannot stand over a man all the time and see that every movement of his hand is correctly made.

I will call your attention to a circular issued by the Bureau of Education on this subject of the benefit of education to the man. It mentions the item of cost to an employer in "putting a five-dollar man to watch a two-dollar man," and that item of loss from watching men is very considerable. I have got so that I do not care to examine work. My work is to examine buildings, but I will not undertake to stand over a man and see that every movement he makes is just right. I say life is too short for that kind of thing. This contract system is at the root of the trouble. A man with no capital and no honesty can go into the open market and compete with the best workmen that we have and get the work.

The CHAIRMAN. When the laboring people were putting in their testimony before this committee it seemed quite apparent that as much injury resulted from incompetent employers as from incompetent employés, and much of the failure and disorganization and trouble seems to grow out of the fact that men go into business who have no capital or competency to do the business as from any other cause whatever. You seem to have come in contact with that same difficulty.

The WITNESS. Yes; I remember that a plumber was sold out at auction in this city, and his total assets were 75 cents. Any man who can get an old broken basin and half a coil of lead pipe and an old carpet-bag, and can make it look as if he had tools in it, can start business in this city as a plumber, and can compete with the man of twenty years' experience who has thousands of dollars invested, and can compete successfully, too. And I find such ignoramuses as those in the finest houses in this city; men who cannot make even a joint well; they are trusted with the most important plumbing contracts.

Digitized by Google

THE RIGHT OF GOVERNMENT TO REGULATE TRADES.

Q. If a body of men are going into the banking or insurance business they have to show that they have capital. Do you think that such men have any more to do with society than these contractors who erect the buildings and dwellings in which people live? Is there any more reason why society should regulate the one form of business than the other?—A. It should regulate such matters, I think. If we protect the deposits in a savings bank by having a public official to see that a bank is solvent, I think we should protect the householder in matters affecting life and health by seeing that the mechanic is competent to a reasonable extent.

Q. But there is the contractor, without whom the mechanic cannot get work at all.—A. Well, there comes in a question. If you license certain plumbers and eliminate those that are incompetent, then, by licensing, you give the competent plumber an advantage which he has not had heretofore. He has been handicapped in the race. Let me give an example. Here is a contract to be given out. A good, honest, capable plumber puts in a bid, say $1,800, to execute that work. That man had done, perhaps, twenty pieces of work just like this and knows exactly what it will cost. Two or three other men who are just as capable and honest put in bids of $1,300, $1,400, or $1,500. Another man puts in a bid of $1,100, and another $1,000; and the contract is given to the thousand-dollar man. How can that man do that work well at that price? He cannot do it. It is my misfortune to have to watch him in the attempt, and I feel that every minute of the time that I am away he is trying to cheat.

Q. Are there any inspectors of such work?—A. Yes; but you cannot get inspectors for $60 a month. It comes back to the question of whether you can get a man to do $100 worth of work by paying him $5. Those things, after all, are matters which you may say depend upon public enlightenment, but they depend also upon this licensing and regulating, so far as the public can deal with that.

When the English people came to discuss the factory question, the Duke of Argyle's book on the *Reign of Law* was looked into. It is a discussion of the question whether the Government had any right to interfere with the rights of men that way, and the people decided then that the Government had such a right; and we are more and more taking a larger interest in humanity and carrying out the principle of Jefferson, that human beings have the right to life as well as to liberty and the pursuit of happiness.

While I do not think it would be well to follow out what some people think on that subject, I think there could be more done than is being done now. It is the duty of the citizen to sustain the Government, to hold up its hands; and it is also his duty to criticise that Government, or its officials when they do not do their work. If I go to the board of health and ask them why they do not do this thing, "why," they say, "if we do anything more we will have all the politicians against us." Professor Chandler's life was made a burden to him for trying to do these things. We have in this city one or two other associations—private associations—sanitary reform associations, &c., consisting practically of a dozen gentlemen—men of weight in the community. If they come to the public and say that they think the board of health ought to have more money or more power, then the board of health gets it. If they say the board of health ought to have more law to protect them, they get it.

Digitized by Google

We have now in the United States 170 such societies in little places with only 500 inhabitants. There is a very broad field of work in it, and my special interest just now is in trying to extend that work—trying to multiply these societies so that the officials shall have some power and public sentiment to back them up. Dr. Crosby has stated that question, I think, very forcibly. At the same time the theory of government in Europe is that the citizen has nothing to do but to obey the official. A policeman tells you to move on, and you move on. The theory in this country is that the official is the representative of the citizen and the official should be sustained by the citizen; and it seems to me that all over this country there is needed in this line of work the sort of co-operation displayed in Brooklyn in the "Young Men's Republican Club." Then, when we come to the legislature and say that we are backed by the citizens, the thing works.

To show you how it works, let me say that I had occasion to go myself as the representative of a small society in Brooklyn that has a half dozen active members. From the simple fact that I was there from an association, and with an officer of the board of health and the medical society, we got an appropriation of $2,500 to enforce a plumbing law that was passed without any money being allotted for it. Next to the association comes the individual.

### THE PRESS.

The press is always ready to help every good thing.

Q. What was the trouble with Professor Chandler, then?—A. I say the press is ready to sustain every good thing, but sometimes the press is supposed to be critical. They blamed Professor Chandler for the Hunter's Point smells——

Q. [Interposing.] You mean simply this: the press gives circulation to whatever is in the community?—A. More than that; the press will give extensive publicity to things which will in themselves seem very small, but which have a principle of growth. For instance; I have known a convention to be reported fully by the press when at the opening of the meeting there were only seven persons present. They have felt that it was a good movement and ought to be sustained. I am myself an ex-journalist of some years standing, and I think that any good work is apt to have the support of the press.

### TECHNICAL EDUCATION AND THE PUBLIC SCHOOLS.

There should be some modification of our public-school system of training, so that while there should not be a regular industrial course in the day school, yet that the subject of drawing, for example, should be taught just as much as writing, and that the evening schools should be turned into industrial schools. Cooper Institute is so crowded with applicants that they have to turn away thousands every year. That shows that there is a demand for that kind of education. The Evening High School, which gives some technical instruction in the line of book-keeping and languages, is a very great success. As an illustration of the demand for educated men, I was told by Mr. Packard that he could not supply the demand made by merchants for graduates from his school, and that if he had two hundred to-morrow, they would be taken up. You can get, by advertising, ten thousand men of fair intelligence to work for five or ten dollars a week, while his graduates can get immediate employment at ten or twelve dollars a week to begin with.

Digitized by Google

### THE COOPER INSTITUTE.

I think the Cooper Institute ought to be publicly endowed. It is doing an immense deal of work. There is something that is not said of it that ought to be. The curator of the Cooper Union says that what is wanted for the public at large is not libraries, but simply large, warm, attractive reading-rooms, and this, by inference, may be applied to the question of the tenement-houses. The people want some place to go to; they have no place except the grog-shop, where they can find a comfortable room. It would be easy to multiply these places without much expense.

### TECHNICAL TRAINING IN BUSINESS ESTABLISHMENTS.

I have been asked to say something of the experiments in several large establishments to supply the lack of technical training. In Hoe's printing establishment they have some two hundred boys who are required to stay down two evenings in the week during the winter and receive regular instruction in reading, writing, drawing, and some other technical things. The firm pays the supper of the boys, but makes it compulsory on them to come. In Brewster's carriage factory they make an arrangement with every one of the public schools that every intelligent boy of the best class shall be sent to them when they graduate. In that way they get a number of bright boys who are put under the direction of a superintendent and get to earn something for themselves. The result is that the firm get much valuable service from them, and the boys earn much more than they otherwise could. They told me that a boy of seventeen or eighteen was the best carriage-cushion maker in America; and they ascribed the success of this largely to the intelligence of their superintendent.

I don't know whether the question was brought up in dealing with the subject of manufactures, but it does not seem right to expect that the employer should teach his employés, because he has no time for it, and perhaps he has not the capacity for it; so that it seems the business of the State to do it. You find the benefit of that course shown in England, which makes the mechanic feel that he is not disgraced by doing manual labor. A man told me that a respectable girl of his acquaintance would sooner marry a counter-jumper at $10 a week than a respectable mechanic who earned $18 a week; and that prejudice has much to do with persons going into the trades and staying in them.

The society of which Mr. Brace is at the head in this city—the Children's Aid Society—has fifteen schools for poor girls and boys, where education is largely industrial. That society finds that there is, through the instrumentality of the school, an immediate elevation in the condition of the boys and girls. A girl trained to sew and sweep is able to marry a man of much superior grade to those she would be apt to meet in her ordinary experience, and the boys get into a better class of occupations.

There is a great deal that might be said upon the questions of thrift, co-operation, machinery, &c. Those are largely matters of education, and workingmen are no more ignorant about them than anybody else. In fact I believe most of the savings in the savings banks come from the working classes, not from the professional men.

The CHAIRMAN. It is now a quarter past 1, and I wanted to have you state in a brief way the sanitary conditions which the builders of houses in new villages and new cities should apply. Perhaps you could return at 2 o'clock and state that to the committee in fifteen minutes,

Digitized by Google

or should you rather do it now?—A. I could do it in five minutes; you don't want anything technical.

Q. Nothing technical, but suggestive and instructive matter to the minds of plain people who have things of that kind to do throughout the country. They are building new houses and starting new villages everywhere?—A. Well, it is rather difficult to separate the sanitary problem of communities from its relation to individuals.

The CHAIRMAN. I am speaking of the sanitary conditions of cities.

### SANITARY REQUIREMENTS FOR NEW COMMUNITIES.

The WITNESS. If you have not got sewers you must supply them; if you have not got a water supply you must get it. So that I would have at once to deal with the individual house. I think if I make a statement which would apply to the average small town and show what would have to be done there and show what is being done in hundreds of cases that probably would be of use. From that I can speak of what is being done in individual dwellings. I have had considerable experience in answering such inquiries.

In the first place, as a farming community, we will say, becomes settled, the moment you get more than three persons on an acre you find that the first problem to deal with is the problem of drainage; in other words that the soil becomes so polluted with human filth of all kinds that the question of its removal comes up; for, as the effect of this saturation of the soil, we find certain diseases like consumption, typhoid fever, &c. So that the first thing is to deal with the soil itself.

### CESS-POOLS.

The united experience of all observers is that you cannot use cess-pools in any community, except where there are very few people. The very instant your population thickens you must abolish cess-pools; that is a cardinal principal. The second is, that you must drain the soil itself of its excess of moisture. That is a comparatively easy problem, and it is an interesting fact that if a man drains his own lot or the ground immediately adjacent to his house, he in that way may secure himself from the malarial influences of the ground at some little distance away from him. Or if he puts up a "wind-break" of trees it will have the same effect.

### EARTH CLOSETS.

As a substitute for cess-pools we have heard a great deal about earth closets. These are well adapted for small communities, with proper care and caution as to the emptying of them. It is easy to use dry soil or ashes, and the material can be used for agricultural purposes. But the dry-earth system will not do in any large community because of the expense of transportation of the material.

Furthermore, contrary to the popular idea and in spite of the eloquence of Victor Hugo about the enormous waste of our great cities, it is the simple fact that sewage has no value agriculturally, and that people must pay to get rid of it. You must look, therefore, at this thing not as a matter of profit but of outlay.

### THE WATER SYSTEM.

The third direct method is the water system, which is always preferable to any other in thickly-settled communities, provided you can get

Digitized by Google

a good point of outfall, provided the ground is not so very flat that you cannot get sufficient grade for your pipes to carry the matter off to a distance.

### THE IRRIGATION SYSTEM.

As an intermediate plan, where sewers cannot be used, there is for the householder what is called the irrigation system. That is simply as follows: Instead of depositing all the refuse from a house in one place, which gradually becomes polluted and has a tendency to soak through the soil and be carried by the ground currents of water and air so as to poison wells and pollute the atmosphere of cellars, instead of concentrating your poison in one place you diffuse it, you receive all the house drainage in a small receptacle called a flush-tank, with a grease trap to separate the grease from it, and then from this receptacle you carry small earthenware pipes about 3 inches in diameter, with open joints, and you diffuse these in the shape of a fan throughout your ground. These are carried so near the surface of the ground that the air to some extent penetrates down and oxydizes the material that oozes out. The roots of the grass soak up this material and the rest of it soaks away into the ground, so that there is no harm to anybody by this arrangement, and it takes care of itself. Once in two or three years it may be necessary to dig up these pipes, but they are very near the surface, and the ground need only be scratched away to get at them and remove all the grease or solid matter that is to be found in them. The pipes do not choke up anywhere, because the heat of the system keeps them from freezing and it has a very beneficial effect on the crops that grow over it. This system has been tried in a number of instances, and a piece of ground of half an acre or less—I have seen a piece no bigger than this room—will take care of the drainage of a single family.

### THE SEWAGE FARM.

In a community the same system could be tried by what is called a sewage farm—that is, instead of having irrigation for one family, have a sewer which will take off all and convey it to a farm beyond the town. That has been done at Princeton and at Pullman, a suburb of Chicago. It has been carried out very largely in England.

### THE CHEMICAL TREATMENT SYSTEM.

There is also what is called the chemical treatment system, in which the matter is treated with chemicals and deodorized, and the solids precipitated. That is not an expensive plan, but it is not settled as to how it is applicable to localities here.

The ashes and garbage of a community must be carried off somewhere and not mixed up with the sewage.

### STREET PAVING.

Where a community becomes thickly settled the streets must be paved so that the ground will not become polluted.

Provision should also be made for rain water.

### SEWERS SHOULD BE SMALL, NOT LARGE.

This covers about everything relating to the outside of the house. I might say, though, incidentally that where you have sewers, those sewers must be small, and not, as has been previously the practice, made big

Digitized by Google

enough to drive a wagon or a hay cart through. They must be thoroughly laid, smooth inside, not rough stone, as in the lower part of New York City so that they stagnate and become elongated cess-pools or gasometers. They must be thorougly ventilated by open gratings every few hundred feet, and they must discharge at some point where they will not cause offense, not as in New York at the bulkheads of the docks, so as to fill up the docks with putrefying matter, but somewhere where it will be carried off to sea. One of the things that New York needs is to have a sewer which will do that very thing. Then, having secured a dry soil, abolished cess-pools, paved your streets, provided for the removal of your garbage, and having some kind of sewer system, you have pretty well covered your outside problem.

### DRAIN-PIPES, THEIR TRAPS, AND VENTILATION.

Now for indoors. You want first to cut yourself off from every source of contamination. If you have a cess-pool or a sewer, you want a trap between the house and that receptacle; you want all your drain-pipes to be of material which will stand. If outside the house, they can be made of glazed earthenware properly laid, and with a good fall and properly flushed. If inside the house, in this city we require them to be made of cast iron. Then every pipe should be ventilated by carrying them full size through the roof. If the pipe be 2 inches it should be 2 inches through the roof; if 4 inches, then 4 inches through the roof. In fact, we rather incline now to enlarge the pipe through the roof rather than to reduce it.

Then, to secure circulation of air through these pipes, which would not otherwise occur if we had simply the top end open and the lower end closed with a trap, we find it necessary to have two openings, so we place an opening in the pipe just inside the trap, which we call the "ventilator." In that case as the house becomes warmer by the stoves, &c., and as the pipes receive hot water and other matter somewhat heated, the air in the pipe is somewhat warmer than that out of doors, and the natural balance between the outer air and the air in the pipes causes a circulation of air out at the top.

Secondly, every fixture in the house should be trapped. We began in olden times by having a trap at the front wall, and nothing else; then a trap for the water-closet and basins connected with it. Now we insist on every basin having traps, and as the traps are liable to be emptied by siphonage—the suction exercised on them—we have them siphoned by a pipe, which should also be carried to the outer air. Then we insist that all water-closets shall have an independent supply of water, not having the water-pipe connected with a tank so that the drinking water may be contaminated. We insist that all tanks shall be kept free from connection with the soil-pipe, and not have overflows connected with the soil-pipe as formerly, and that all refrigerators shall be connected with the drain, not with the sewer.

In other words, we require five essentials: good material, good workmanship, an abundance of flushing, an abundance of ventilation, and to have everything exposed to view as much as possible.

It is perfectly feasible to have in a home good plumbing and good health; and a curious fact illustrating the decline of workmanship is, that when going into a house built previous to the war in this city, while it may be deficient in some respects, and not up to our latest notions as to ventilation, yet the workmanship itself is good, and in many cases better than we find done to-day. I might say, without the repor-

Digitized by Google

ter putting down the names, that in Mr. Gould's house, at Irvington, and in the old Steven's mansion, at Steven's Point, two houses which are as old in point of plumbing as any we have, the work we found was better than in many of the best houses that have been built within the last few years.

CELLARS SHOULD BE DRY.

I should say that with these precautions with regard to plumbing, if cellars were made thoroughly dry by a cement foundation; if all sanitary fixtures were isolated from living rooms; if open windows were resorted to for ventilation; if people would have as little upholstering as possible, not too great an excess of curtains and carpets; and if they would provide some means of ventilation like open fire-places, a great deal would be accomplished.

FURNACE HEAT AND FOUL AIR.

I wish most emphatically to enter my protest against two of the most universal evils that I have met with; one is the manner of bringing air to furnaces; it is brought very often from the darkest, dampest, and vilest place that could be thought of; that is, usually from the areas in front of the cellar or from the cellar itself. The second is what I believe caused Herbert Spencer to say that we needed a new gospel of relaxation; that is, the pernicious practice of having steam-heating apparatus right in one's office or room, without any means of providing air, so that the same air is roasted over and over again, and the people with it. On that account I look on the general introduction of wholesale systems of steam heating as a very great risk to the community; and, in conclusion, if we do not have about thousand more sanitary missionaries to preach this new sanitary gospel, I don't know what will become of the community.

The CHAIRMAN. We will see that your sermon goes to a good many of the people.

The WITNESS. I have given this sermon a hundred times, perhaps five hundred times already.

By Mr. CALL:

Q. Speaking of steam heating; you say that there should be some access of fresh air into the same room?—A. Yes, precisely; and that can be provided, but I have not seen it provided; in fact, ventilation at any rate is one of the lost arts.

VENTILATION.

By the CHAIRMAN:

Q. Have you explained your ideas on systems of ventilation?—A. The most important method of ventilation in all houses is by the open fire-place, and the chief defect in most of the systems of ventilation is that the openings to allow the escape of four air are altogether too small; that the so-called flues are also too small, and have such rough surfaces as to impede the movement of the air; that there is not means of supplying heat to give an upward current to this air, and that in most cases there is an entire absence of a supply of pure air to take the place of the air that goes out, so that people either expect to blow air into the room as they would blow it into a bottle, without allowing it to escape, or they expect that the air in the room is going to lift itself and go up into the room without any means of its being replaced. So you often find that if you

Digitized by Google

open the door of a room where a chimney is smoking that the chimney ceases to smoke, because there is air, and a draft is obtained.

Q. Where does impure air escape, at the top or at the bottom?—A. I prefer to ventilate from the top; but it depends upon circumstances. If you have got to depend merely upon the heat of the air itself, you must naturally take it from the top; but if you have any propelling force, such as is supplied by putting in a steam-coil flue, you could then take the air from the bottom of the room.

Q. Which is the heavier, pure air or carbonized air, after breathing?—A. That makes no difference.

Q. But which is the heavier, as matter of fact?—A. The air which is foul, which carries the emanation from the skin and lungs, and the carbonic acid gas may probably sink to the floor; but if you have occasion to hang a picture, you will soon find that the heated foul air will ascend to the top of the room. That is the air that we want to get rid of.

The most successful system of ventilation may be seen in a school-building at Bridgeport, Conn. It has been adopted with great care. In that case the air is admitted at about the height of a person's face, or less, back of the teacher's seat, and is taken out through holes in the platform. This is at the inner side of the building. It was contended that the air would sink to the floor direct, and not get into contact with the other air in the room; but as a fact the air rises immediately to the upper part of the room, and flows in the form of strata, as shown by filling it with a powder, and on reaching the other wall it becomes chilled and gradually sinks to the floor, and then goes out.

Q. That same principle operates in winter as in summer, I suppose, so that the air that comes in is colder than the air within the room?—A. It is warmed somewhat before introduction.

Q. Is it as warm as the air in the room?—A. I suppose less.

Q. Now, it being colder, and therefore heavier, it nevertheless rises and floats over the air in the room, then falls and forces the air already in the room down through these outlets in the platform?—A. Precisely.

Q. That demonstrates that the air in the room is heavier, it is carbonized, poisoned air, and is heavier than pure air of the same temperature. There are those facts that if made plain to people would enable them to apply ventilation in dwellings more intelligently than they apply it now.—A. Well, here is the difficulty that most people contend with: If a room is overheated, as this room for instance, people instantly lower the window at the top. The hot air does not go out, but the cold air comes in and falls to the floor and goes to the feet.

Q. The current coming in and the current going out at the same aperture—but take two currents of air, one pure and the other impure, and each of the same temperature, the pure air is the lighter air; the poisoned air falls to the ground, while the common impression is that the foul air goes upward. It does not, assuming the temperature to be the same.—A. Is not that largely neutralized by the fact that air leaks in at the door and everywhere?

Q. That only adds to the proof that you have a good system of ventilation, accompanied by the liability to catch a bad cold by the draft which is occasioned.—A. I should make this general criticism against all ventilating systems, that chimneys are apt to be too small. In the most expensive private houses often the chimneys will not flow at all. The common sense of it is, first, a big hole to let air in; second, in the winter, some means of warming it so that it will not chill you; and, third, a big hole to let it out. Ordinarily you will find a big hole to let it in and a small hole to let it out; and, therefore, you have drafts.

Digitized by Google

Q. But the heavier air, which is the poisoned air, escapes at the lower point, as a rule, rather than at the upper one, and that idea should be understood.—A. Well, that depends upon the condition of things. I ought to say that an immense amount of relief might be found in ventilation by using the gas jets—by ventilating the gas jets.

Q. You mean by having a point of escape which is above the gas jet?—A. Yes; midway up by the ceiling.

Q. That is on the same principle as a fire in a fire-place?—A. Yes; only that it takes the air from a higher point.

Q. It creates a current, and the air goes with it?—A. Yes; the point I was going to make is this: there is a room in this city about as long as this railing, a basement room, and it is very difficult to get any air in it. In that room there is an average of two or three hundred visitors from the tenement houses—applicants for general relief. Those are striking examples of what you would call "the great unwashed," and the amount of human filth circulating in that air is beyond description. It is so bad that you may say that you are standing up to your neck in it; so bad is it that the people in charge of the place have to require the clerks to smoke. I removed all that by having a 2-inch pipe leading from the gas jet into the chimney breast. Only one of these gas jets usually is lighted, but no complaint has been made since it was done. The cost of that whole alteration has been only $13, and in a new building it might have been done for much less.

---

NEW YORK, *September* 27, 1883.

DANFORD KNOWLTON examined.

By the CHAIRMAN:

Question. You are a resident of this city?—Answer. I am, sir.

Q. Where were you born?—A. In Connecticut.

Q. Are you a connection of the Revolutionary family of the name of Knowlton?—A. I am.

Q. State what has been your pursuit in life, where you have followed it, and your opportunity for observation and experience.—A. I remained on the farm of my father until I was twenty-one years of age; then I commenced a mercantile career in Hartford, Conn., and after ten years I came to New York, which gives me forty years' experience.

Q. Have you been in business alone, or in a firm?—A. Sometimes alone and sometimes with partners; more generally with partners.

Q. If you have seen the resolution under which we are conducting our investigation and understand its scope, will you make to the committee such suggestions as you think pertinent to the object of our inquiry, doing it in your own way and making your observations as full as you please?—A. I appear before the committee in obedience to the request of the chairman to offer some considerations which I trust may be found to be practical in connection with the subject of inquiry with which the committee is charged. I do not propose to bring before you any list of statistics, which are very apt to be confusing, and sometimes in the way they are offered misleading to the honest inquirer. I propose, therefore, to offer more general considerations from which perhaps may be deduced some points of interest in your examination.

Digitized by Google

## WAGES BEST SETTLED BY ARRANGEMENT BETWEEN INDIVIDUAL EMPLOYERS AND EMPLOYÉS.

As a general remark I would say that the reward of labor is more satisfactorily determined between the employer and the employed by mutual agreement or arrangement between them than it can, in my opinion, be effected by legislation. The laborer has, and should always maintain, the right to sell his labor to the best advantage. And the employer has, and should always maintain, his right to employ labor as he pleases, under such agreements as he is able to make with the employed. Any combination of employers to depress the price of labor or combinations of laborers to increase beyond a proper limit the reward for their labor is fraught with injury to both parties, because it violates a general law on which society is based, namely, freedom of action, whether for employer or employed. There are periods, no doubt, of great prosperity, in which the laborer may not obtain the full reward of his labor, or the amount which the product he produces would warrant. There are, on the other hand, periods of great depression, in which the wages of the laborer may exceed his fair proportion of the value of the product which he turns out. And therefore it will be seen that any attempt by legislation to fix the price of labor is absurd and impracticable. The value, for instance, of cereals may be largely enhanced by a short crop; the value again may be very much depressed by a superabundant crop, and it would be just as absurd to attempt to regulate the prices of those cereals or other products of the earth by legislation as it would be to regulate the prices of the labor which produces them. Any class of laborers in this country who find the employment of the labor in which they are engaged unremunerative are at liberty to change to any other employment, or to seek homes on our vast territory presented to them by the Government for settlement, and make themselves happy homes there, so that no great hardship can come to the laborer from any misfortune in the circumstance of the times which reduces the price of labor for the moment.

Capital, we must all admit, gives great advantages to its possessor. It is generally the result of industry and economy—it may not always be—but these advantages inhere in ownership of capital. Now, when in addition to that you add to the power of capital by legislation in the creation of monopolies you are doing a very great injury to the laborer. Legislation should neither put the capitalist in a position to grind the face of the poor or the laborers in a position to overthrow all the just rights of the employers, and to thus disturb the regular course of business.

## SUPPLY AND DEMAND MUST GOVERN.

In other words, supply and demand is the unavoidable and inevitable rule which must govern all things in the end. You may throw things out of joint a little for the time being by legislation or by combinations of men as against capital in trades unions, &c., but ultimately you will come back to the fact that supply and demand must govern prices of products or of labor. So that if you are overburdened with products you must expect low prices. If you have for the time too much labor the price of the labor must suffer; but in this country there need be no great suffering, from the fact that I have before stated, that there are open to all men such varieties of employment and so much virgin soil on which to raise the necessaries of life. The power of capital being doubled, and sometimes more than doubled, by legislation, produces

Digitized by Google

monopolies which are becoming very odious to the people of this country. When the laborer finds that those monopolies are exercised not only by the power of capital but by the power of legislation to his injury he becomes discouraged and disgusted, and perhaps may resort to brute force to overcome his oppressors. That is one point which, in our country, should not be forgotten.

### NO ANTAGONISM BETWEEN CAPITAL AND LABOR.

There is no real antagonism between capital and labor rightly understood. The capital cannot build a house or a ship without a laborer. The laborer cannot build a house or a ship without capital. They are interdependent upon each other, and that interdependence is the great safety-valve of our political affairs.

### THE LEGITIMATE FUNCTIONS OF GOVERNMENT

Let us inquire for a moment what are the proper functions of government, and how far, if at all, it may interfere with the natural laws governing commerce, manufactures, and agriculture. The legitimate functions of government I conceive to be to maintain domestic tranquillity, defend the people from invasion, and protect them when traveling abroad, or upon the ocean, the great highway of nations, to which may be added a few other functions of kindred nature, leaving the individual enterprise untrammeled. For that purpose we maintain an Army, Navy, and civil courts. When these general functions are exceeded the result is generally injurious to the Government. It is better always to leave individual enterprise to do most that is to be done in the country.

### THE TARIFF.

Let us now inquire what is the effect upon the country of the methods of raising revenue for the support of the Government by the system of duty on imports. A duty of 50 per cent. on an article of necessity, for instance on blankets, would raise the price of those things say from $3 to $4.50, plus the increased commission which the seller would have an opportunity to charge as his profit—a commission upon $15 instead of $10, or on $4.50 instead of on $3; a duty of 50 per cent. on an article of the value of $10 would make it $15, or on an article of $3 would make it $4.50. The consumer must pay the increased price. The question comes up who is to be benefited? You put that duty on a blanket of the poor laborer who has a large family and he has to pay a very large amount for the support of the Government.

### EFFECT OF DUTY ON RAILS, ETC.

Look at the effect of high duties on imported metals with our vast system of railroads, of which the last report gives the mileage at 113,000 miles. The duty on steel rails has been $28 per ton, but now is reduced a little. The quantity required for each mile is one hundred tons. The duty on that would be $2,800. Multiply this by 113,000 (that being the number of miles of railroad track in the United States at present) and you have the sum of $316,400,000 as the enhanced cost of railroads by reason of the duty alone. It is generally estimated by engineers that the duty on the finer metals entering into the composition of the engines and rolling stock of the roads is equal to the duty on the rails in the

Digitized by Google

road-bed. So that we have to double the amount of enhanced cost on the mere rails, which make altogether an enhanced cost of $632,800,000 as the additional expense of rails, engines, and rolling stock over and above their cost if there were no duty on steel rails.

Add to this the enhanced cost by reason of the duty on the iron for the construction of bridges. Add this to the enhanced cost of grading the road by reason of the high duty on the imported articles used by the laborers, necessitating high wages, and you reach a result of nearly $1,000,000,000 as the enhanced cost of your railroads above what it would have been under a system of free trade, because the cost of the imported article, so long as any is imported, plus the duty, becomes the standard by which the domestic manufacturer regulates his price. There may be exceptions, and there probably are, as by depressed markets, or something of that kind; but it is the rule that the cost of importation, plus the duty, is the value which the competing manufacturer in our country establishes as the price of his product. This necessitates high freight and high passenger tariffs to give a fair return to the investors who have paid honest money for the construction of the road, and they are entitled to a fair return for their investment.

Nor does this enhanced capitalization rest where it begins, where it would only represent the loss of so much money; but the cost of the investment being unalterably fixed, it becomes a burden on the community, so far as we can see, to the latest possibility. Think of it a moment. We will suppose that these 113,000 miles of road have cost $50,000 a mile to construct. That capital is invested under the head of construction. If it has been invested under a false system, or a system by which too much labor or too much capital has been employed, we cannot change it now. It remains forever the capital of the road on which fair earnings must be made, and necessitating higher prices for freight, higher prices for passage, and everything connected with it must be graded on that same scale. Now, had these railroads instead of costing $50,000 per mile cost $25,000 per mile the investors of honest money in that same stock would receive a suitable compensation for their investment at rates of freight and passage one-third less.

### RIGHT OF USERS OF PUBLIC FRANCHISES TO IMPOSE OPPRESSIVE CHARGES.

Q. Do you think that the owners of any property, the foundation of which is a public franchise, are entitled forever to charge the public an annual income which will pay good dividends (under good management, of course) from the natural proceeds upon the actual original expenditure, and subsequent expenditures in the creation and the preservation of the property, or should the community have some advantage from the benefit of invention and improvement, and be able to get on by paying such charges as would be a fair remuneration upon the cost of replacing the road or other franchise at the given time?—A. I consider that an investment made under a franchise granted by the State is a partial or a moral agreement on the part of the State, an inducement on the part of the State to invest the capital in that plant for which the investors are legally and morally entitled to a fair remuneration. If the community have induced those capitalists to invest at any improper time or in an improper manner, so that the road has cost too much money, then the reason will hold good that they should be fairly remunerative, because they have been induced to put the capital there by the giving of the franchise by the State.

Digitized by Google

Q. That is in the case where the capitalist has been induced to invest his capital by the public, but, on the other hand, where the public has been solicited by the capitalist to grant the franchise—the privilege of constructing the road and becoming a common carrier—do you think that then the public should for all time bear the losses of a bad investment, or an injudicious expenditure in the creation of the road, and also be deprived of the benefit of improvements, in the way of inventions and greater and cheaper capacity to construct in the future?—A. I judge that when a franchise is asked by corporators, the State considers it advantageous to the public good to grant the franchise asked for. Therefore, whether it is asked by the corporators, or whether the State asks the company to perform that labor, I think the obligation is the same, and that the honest money invested in that way is entitled to a fair remuneration.

The CHAIRMAN. I merely wished to get at your idea. Capital invested in private enterprises is liable to the contingencies that I have been speaking of.

The WITNESS. It is; and in this I only claim a moral obligation on the part of the grantors of the privilege.

Q. Would it follow from that that in case some new invention should come in now, so that the transportation could be accomplished without the railroad, or that some new form of railroad should come in, based on some new invention of motive force discovered in nature, which would be an advantageous substitute for existing means of transportation, the public should continue to pay indemnity for the use of capital that had been invested in railroads formerly?—A. I think it should not, because we must admit that new inventions are constantly being offered to us by which labor is saved. Therefore the State can grant the privilege of another railroad to be operated under this new and more economic system, granting greater advantages and facilities to the public. But it must be remembered that the investors in that have lost their money by investing it under the patronage and inducement held out by the State, and injustice still remains to those investors who have lost their money because they were prompted to that by the franchise granted.

By Mr. PUGH:

Q. Is not the franchise granted subject to the discovery of other and cheaper means of transportation?—A. I believe all those laws are subject to amendment.

Q. I mean that the grant is always given to these investors subject to the right of individuals to make a discovery of cheaper modes of transportation, and it does not affect the moral obligation of the State that the value of the new investment is impaired by these discoveries or inventions?—A. I believe there has been a railroad chartered through Canada called the "Canadian Pacific Railroad," in which they obligate themselves that no other railroad shall be built within thirty miles of theirs. There they were protecting the capitalists in their investment, giving them thirty years' privilege of earning money to repay themselves for it. But ordinarily, unless some specification of that kind is made, the investor of a railroad, under the present system of operating it, might be liable to lose his money the next year by a more economical mode of procedure, in a parallel road chartered alongside of it.

In my remarks on this point I have intended to show more particularly the misfortune which comes to us by making a plant and machinery—by making a railroad or building a shop too expensively—more

Digitized by Google

expensively than could be done under any other system than that in which we now live.

That is the point I wanted to make before you. The system of taxes on the manufactures coming into our country increases prices on these manufactured articles, and the system in itself is contrary to the best principles of political economy, and should, in my opinion, in due time, be obliterated from our statute-books.

### THE RIGHT OF THE STATE TO RETAKE PUBLIC FRANCHISES.

Q. You know the courts have held that these grants of public franchise are always subject to the power of the State to grant to other persons if the grant can be exercised more beneficially to the public, and they give the power to the new inventor through the right of the State to seize this franchise or the public property that exists under it, and pay just compensation under the Constitution.—A. That seems to be right.

Q. But they cannot continue a monopoly in the use of a grant that is prejudicial to the public, because the State holds this grant in trust for the public, and the courts hold that the public can seize this property that has been created under the franchise and pay just compensation, and then allow the exercise of a similar grant for the public benefit.—A. That principle is recognized in the charters given to our ferry companies here. They contract, perhaps, for ten years, and if the contract be not renewed at the end of that time, the city has a right to take the property at a valuation. That seems to be right and just.

And now has the investor in a railroad costing $50,000 a mile any remedy of this kind when you charter another road which can be built for $25,000 a mile? I do not propose to push that question farther than you require me to do, but simply I desire to say that the reason for my bringing this point up is to show that under the protective system we are enhancing the price of everything we do in this country. We are enhancing the price of the manufactured goods that we are making. We want to send them abroad.

### OVER PRODUCTION.

We manufacture now more than the country requires. What is the result? Look at Massachusetts, during the summer shutting up her woolen mills and throwing her labor out of employment. No security or permanence is found for labor. The laborer is employed a few months in the year, and then the market becomes overstocked, and the mills shut down. Now, introduce your raw materials, more particularly, free of duty—but I would go further and say bring everything in free of duty—the raw materials, however, more urgently than anything else need to be brought in free of duty—materials that enter into the manufacture of goods—so as to give your manufacturers a chance to compete, and with Yankee ingenuity they will do it.

### REBATE OF DUTY ON IMPORTED MATERIAL IN ARTICLES INTENDED FOR EXPORT.

By the CHAIRMAN:

Q. Have you ever considered the principle which has been applied to some articles—that of granting a rebate on the raw material which enters into the manufacture of an article designed to be exported and

Digitized by Google

sold in foreign markets, so that the manufacturers of that article in this country stand upon the same ground as the manufacturer of the same article in the foreign country where it has to be sold?—A. I have considered that principle.

Q. What would you think of a provision of law, if nothing else could be done, that should apply the same principle to all articles with which we might reasonably expect to compete in foreign countries?—A. If the principle is good in its application to one branch, it would be to all.

The CHAIRMAN. I made an effort last year to get an amendment of that kind to the tariff bill, which I think would have been adopted if it had been presented in time to receive consideration.

The WITNESS. I remember seeing that question agitated.

The CHAIRMAN. That only reaches the evil which keeps us from the foreign market; but in the existing condition of the markets and the necessities of a revenue it seems almost impossible to apply the principle of free trade to articles to be supplied in the home market. But it seems to me that it could be, and would be, easily applied to every article that we sell abroad.

The WITNESS. I say, so far so good, but it does not reach the point fully.

The CHAIRMAN. It does not reach the increased cost of things at home.

The WITNESS. I can see that the manufacturer would be placed nearer on a level with his competitors abroad; but I am thinking of the effect on the 50,000,000 of consumers at home.

The CHAIRMAN. I understand the effect of your idea upon the main tariff, but have called attention to this incidentally.

By Mr. PUGH:

Q. Are you opposed to raising revenue for the support of the Government by duties on imports?—A. I am.

Q. How would you raise a revenue for the support of the Government?—A. In a few moments I will reach that point. Before leaving this branch of the subject I would say that, notwithstanding the increased cost of materials, some of which enter into the manufactured goods that we produce in this country, our laborers, by skill and perseverance, have overcome those difficulties, so that we can send the cotton-gin, the sewing-machine, and various other articles, such as axes, &c. (which one of our companies supplies to nearly all the world), abroad, notwithstanding the higher cost of materials and labor which enter into their construction. Now, if we can do it on some articles, I think that by the abrogation of the tariff we can do it on all, because I contend, perhaps egotistically, that my country can do all that any other country in the world can do under similar circumstances.

## DUTY ON SUGAR.

For example, look at the article of sugar, of which we import about 1,000,000 tons. The consumer pays about 3 cents per pound more for his sugar than he would pay if it were admitted free of duty. A friend of mine recently returned from Europe who was a grocer in sugar. Passing by a grocery store in Glasgow he noticed some beautiful cubes of sugar in the window. From curiosity he stepped in and asked the price. The grocer said 3½ pence per pound—about 7 cents. He said, "Will you sell me a pound at that price?" The grocer said "Yes," and so

Digitized by Google

my friend bought a pound of the sugar and brought it home to show people how, under free trade, the consumer of sugar would get it at 7 cents a pound, whereas under our present system he would pay 10 cents a pound. Now, who gets the benefit of that? Louisiana. Who gets the benefit of the increased duty on iron and steel? Pennsylvania and other favored localities. You are aware that very little revenue is produced from the importation of iron, notwithstanding the millions of tons required for our consumption—very little returns to the Government—but it enhances the price of all the iron consumed in this country by so much as the duty is that is placed on the iron. Who gets the benefit of it? We know that the farmer has to pay an enhanced price for every nail he drives in his barn and for every shoe he puts upon his horse. In consequence of that, is it right, is it just, that 50,000,000 of people should be taxed, first, to support a few manufacturers of iron in Pennsylvania and a few other places; and, second, to protect a few planters in Louisiana who happen to own the soil? Besides, Louisiana has not the soil or the climate to produce sugar to advantage. Every two years the planter there must plow up and replant his ground; whereas, in the tropics, sugar-cane once planted remain and grow from the same roots for fifteen or twenty years. I have myself seen beautiful cane fields that have been growing seventeen years from the same root.

Q. Was that in Cuba?—A. Yes. Look at the difference in producing the article in a soil and climate adapted to it and in one that is uncongenial. Besides, in Louisiana, as you are aware, the sugar crop is frequently reduced by frost. The planter has perhaps four to six weeks in which to grind his crop. In Cuba he may grind four months and is never afraid of frost. So that he applies his labor advantageously all the way along, while the Louisiana man must do it in a short time. You see that the economy of labor cannot be overcome except by legislation, and that we have got.

Q. The amount of revenue that these articles produce is but a small portion of what the consumer has to pay on account of the duty.—A. Undoubtedly.

By the CHAIRMAN:

Q. The revenue derived from sugar is about $40,000,000 to $50,000,000?—A. It is about one-third the revenue derived from customs.

Q. I suppose the duty is not over 40 per cent. of the cost to the consumer?—A. The duty is about 40 per cent., now, ad valorem; it has been as high as 60 to 65 per cent. The recent reduction brings it down to a little less than 40 per cent. Now, on this sugar imported the consumer has to pay the cost of production plus the duty on all that he consumes just to favor Louisiana in the production of less than 1,000 tons.

By Mr. CALL:

Q. How is that?—A. The price of the sugar of Louisiana is regulated by the cost of the importation of foreign sugar plus the duty; consequently, the consumer, in buying his sugar in Louisiana, has to pay the price which the foreign sugar costs with the duty added, and the benefit is all for that class of men.

By the CHAIRMAN:

Q. It is for the benefit of a class of men who manufacture about $5,000,000 worth of sugar, is it not?—A. Their crop before the war reached about 500,000 hogsheads.

Q. About $5,000,000 in actual value, is it not, now?

Digitized by Google

THE LOUISIANA SUGAR CROP.

Mr. PUGH. The crop of last year in Louisiana was estimated, according to my recollection, at $22,000,000.

The WITNESS. I think that was an excessive estimate, but I am not prepared to say.

Mr. PUGH. The sugar and molasses from the crop of Louisiana I think you will find to have an estimated value of over $20,000,000. I think I can hardly be mistaken about that. Last year $22,000,000 was the market value of Louisiana's crop from the sugar-cane, and the duties collected on sugar are about $47,000,000 per annum—over double the entire value of the sugar crop.

The WITNESS. I have no doubt you are correct in your figures, but I have not statistics before me with which to give any information. It seems to me very unfortunate that with the vast extension of territory which the United States have, from the Gulf of Mexico to the Great Lakes, and from the Atlantic to the Pacific, we do not embrace any territory within the tropics. We have a belt of the earth which produces all those things easily that are produced in the temperate zone. We require other things. We require sugar, India rubber, cocoa, indigo, and various other products that I could name which we cannot produce in the United States. If we had tropical territory we should undoubtedly legislate so as to make the burdens of our community less odious and favor those people; but, inasmuch as we have not got that, and inasmuch as we have to depend upon a foreign market, is it not better for us to allow our people to supply that want without paying that enormous duty for the benefit of a few men in Louisiana?

The CHAIRMAN. Does it cover the whole case to put it in just that way? Do we not impose this for the primary purpose of revenue; and is it not necessary to get the revenue from some source; and is there any article that would bear the taxation with such slight general injury to the public as sugar—though I suppose of course you would say that there is.

The WITNESS. No doubt we must raise our revenue from something, and sugar is a very easy article to raise it upon, and perhaps as little objectionable to the consumer as to place the same tax upon something else.

Q. Is it quite clear either that if we should remove the tariff from sugar, the result might not be as when removed from tea and coffee—that we should pay substantially the same price and fill the pocket of the foreign producer?—A. I do not think that would be the case, because the consumption of sugar in the world is ample for the production, and at the same price that the British importer buys his sugar in Cuba we could buy it, or his coffee in Java we could buy it—or in South America or wherever else he could buy it we could buy it.

Q. That is so as to tea and coffee also, is it not? We can buy in the home market where those products are raised as cheaply as anybody can buy, and yet we found that as a result of taking off the duty from tea and coffee those articles maintained substantially the same price, and that the profit went to the foreign producer?—A. But I do not think that they do maintain the same price. Tea was never lower than it is to-day, and coffee is very low. One thing to offset the idea that you suggest is that when the duty was taken off by us (which was procured to be taken off, they say, by some influences from Brazil), the Brazilians immediately put an export duty on coffee, and they are the principal producers of coffee.

Digitized by Google

By Mr. PUGH:

Q. The difference in the operation of the protective duties you mention upon iron and upon sugar is that in the case of iron the duty, by increasing the price of the whole consumption of this country, goes into the pocket of the manufacturer, and in the case of sugar it goes into the Treasury, with the exception of a small amount which goes into the pockets of the Louisiana planter?—A. Yes.

EFFECTS OF HOME COMPETITION IN REDUCING PRICES.

By the CHAIRMAN:

Q. Since this subject has been gone into, let me ask whether home competition arising from the manufacture of iron in this country, growing out of the fact that we have substantially a prohibitory tariff, has not resulted in iron and steel being furnished very much cheaper through that home competition than it would have been through foreign competition, or than it was furnished by foreign producers when they fed our market and we had no producers at home?—A. We could not have gone into the foreign markets if we had depended on them always for our supply; but we know, at present, that the value of iron in the market is largely, if not entirely, controlled by the cost of importation and the duty added to that.

Q. Are you quite safe in assuming that?—A. I think I am entirely safe.

Q. The home production finds great difficulty in getting a market, does it not?—A. Yes; as I once remarked during this conversation, at times of great depression prices fall below the cost of production.

Q. But is it not evident that this great depression results from the over-activity of the American producer of iron?—A. It does result from that.

Q. And that the American producer exists because the tariff enables him to gain a foothold?

FOREIGN MARKETS.

A. But if a manufacturer produces 1,000,000 tons of iron, and supplies 50,000,000 of people in this country, and then has 1,000,000 of surplus manufactured under free trade, he could ship it to any part of the world in competition with England, or any other country. That is the advantage. Some of our manufacturers begin to see this. I was talking a little while ago with a manufacturer in New England. He says we want foreign markets. We were very much pleased with the action of Secretary Evarts in endeavoring to open to us foreign markets. We want them because we over-produce for our own people, and there is a consequent stagnation and lowering of prices, and we are obliged to stop our mills, or run at a loss.

NEW ENGLAND AND THE TARIFF.

The CHAIRMAN. You are quite right in advancing the idea that so far as concerns the New England manufacturers by the protective tariff and the stimulation that they have heretofore received from it, their manufacturing systems have become localized and perfected, and they are now able to sell articles in the foreign market; but those sections of the country which are without manufactures will never be able to establish manufactures without this protection.

Digitized by Google

The WITNESS. There is no reason why we could not manufacture cotton and send it to any market in the world.

The CHAIRMAN. But the difficulty is not in the manufacture after the plant has been got and the skilled labor has been trained, but to induce the capital originally into it—to construct the factory and furnish and train the labor, which is a matter of years. New England is now in a position where she can sell some of her products under the shadow of the British factory; but she could not have done that if for the last fifty years there had been no tariff.

The WITNESS. That is a matter of opinion which I do not propose to antagonize.

The CHAIRMAN. There is a common impression in the country that the New England manufacturers are the people who are in favor of a high tariff. But they are really in a position where they can hold their own in the home market and are beginning to strike out for the foreign market, so that the New Englander now wants cheap labor and material and wants to manufacture as cheaply as possible; but the man who works for him is not so anxious for a reduction of wages.

The WITNESS. The man who works for him would, with the buying power of these cheap wages, be just as well off.

## COTTON MANUFACTURE IN THE SOUTHERN STATES.

Mr. PUGH. You are aware that in the Southern States, where the raw material is produced, they are making cotton goods and taking possession of the manufacture from the New England manufacturer?

The WITNESS. I am aware of that. I have a friend who is a manufacturer in Columbia, S. C. He came here and went through the mills in Massachusetts, and they showed him the cost of a pound of yarn, and he assured me and showed me from statistics taken there, and from the statistics taken from the work of his own mill, that he could produce yarn 5 cents cheaper in his own mill. He had the raw material there, and had the labor there cheaper than it could be got elsewhere.

Mr. PUGH. I understand there are $3,000,000 invested in manufactures in one of the leading Southern States.

The WITNESS. I might adduce figures to show that the duty which we impose upon them was preventive of the extension of manufacture, or the increase of that branch of business in our country, but I think I have said enough on that subject; and with your permission I will consider for a few moments the question of taxation.

## DISASTROUS EFFECTS OF ARTIFICIAL STIMULATION.

I would say that if you find my conclusions on the subject correct we have reached the true solution of the question of political economy, to raise what we can raise best, taking into consideration soil and climate and other advantages. It would be considered very bad economy for me to attempt to raise cotton in New Hampshire, or to put up a hot-house and go to raising oranges in Canada. I could, perhaps, produce oranges in Canada by the use of artificial heat and by protecting them from the weather. The labor and expense to produce them would, however, make the cost of the oranges to me perhaps $1 apiece, while the Canadian finds that he can import them for 2 cents apiece. Now is not the 98 cents excess expended on the production of that orange so much labor lost to the world? The laborer in that establishment for the production of oranges could have earned the same wages at something else.

Digitized by Google

He is employed by me to raise oranges under these disadvantages, and the 98 cents of loss to the world on each orange has accrued from attempting to produce an article out of its soil and climate. In other words, it is endeavoring to thwart the laws of Providence by human invention. That is the bottom line that we come to. Wherever you produce an article out of its proper sphere of production, where soil and climate do not favor it, you are wasting just so much soil and labor in its production as is the difference between its cost there and the cost in the most favored climate. I have no doubt that that point must have passed through your minds frequently. Raise things where you can raise them to most advantage. If I were to dispatch six sons to different parts of the world to settle—one to Canada, one to California, one to Louisiana, one, perhaps, to the West Indies, and one to South America, I would say to these boys on leaving home, "Wherever you locate, produce that which you can produce to the best advantage; don't waste your capital and your labor in endeavoring to force the production of a thing where nature says you shall not raise it." And on this point, if I am right, the true political economist will go for that result in all his calculations. Whenever, by legislation, you attempt to raise a thing out of its soil and climate you have injured the world; you have thrown away so much labor and capital.

A protective tariff proceeds on this principle: You want this thing; it is not produced here to advantage; you let it come in free of duty. There is another thing you can produce, and for which you have a competitor on the other side, and you put a duty on it. The result is that you encourage your people under this system to invest in the production of things which lose money to themselves and to the community.

Now, in any approach to the true principle of political economy we should at once remove the duty on all raw materials required for manufacture, and give our people a fair chance to compete with the world. That is the stepping-stone. If we must have a tariff on manufactured goods, let us exempt articles which enter into the composition of manufactured goods here.

### WHO SHOULD SUSTAIN THE BURDENS OF GOVERNMENT?

I am aware that we shall be met with the assertion that we must have revenue to defray the expenses of the Government and provide for the interest and the extinguishment of our national debt. Let us then consider for a moment the proper mode of taxation, and its effect upon labor and upon the various interests of the country.

As the legitimate province of the Government is to protect the persons and property of its people, it follows logically that the burden of sustaining government should be borne by that which is protected—or the thing protected should pay for its protection. If I wish to send a cargo of goods away on a trading voyage, I invest perhaps $50,000 in that cargo; I insure it; and I charge the premium of insurance to the venture—the venture must pay it. The thing protected, in other words, must pay for its protection. The laborer wants the protection of his person, and little more. The capitalist wants the protection of his person and his property. Now, then, the personal protection of the laborer should be paid by him, and no more. The protection of the capitalist should be paid for by him on both his person and property. The laborer in this city may perhaps have a family of twelve. He pays duty on the articles that himself and his family consume, that is, on sugar, clothing, &c., and that duty contributes to the support of the

Digitized by Google

General Government. The millionaire living near by pays no more than the duty on the articles which he consumes, and (as in two or three notable cases in the hotel where I live) there are bachelors worth their millions upon millions of money, who pay nothing to the support of the General Government, except the duty on the things which they consume and wear. Now, their millions of property are protected by your Army, your Navy, and your civil courts. Are they paying their share for the protection of that property, and are they bearing their share of the burdens of taxation in the United States for the support of the Army, the Navy, and the courts? The Army and Navy should protect the property of Mr. Vanderbilt from invasion and from civil commotion, and Mr. Vanderbilt should pay for it. The laborer does not require the protection of millions of property. He only requires the protection of his person, and he should therefore pay only for the protection of his person; and, if you wish to equalize the burdens of the community, you must have some such system, because by collecting on the consumption of every man in the United States, the poor and laboring people bear all the burden, and the capitalist escapes free or nearly free.

### DIRECT TAXATION.

Consider, then, for a moment your State system of taxation. There are thirty-five or forty States, with an almost innumerable number of counties, cities, and towns, collecting revenues for the support of their respective governments, from direct taxation. Why not the General Government as well? Is there any reason why that system which has worked so beautifully and satisfactorily among the States, counties, and towns should be ignored by the General Government? There is no other reason for it except the underlying principle that "we must be protected." People come to you in Washington, and say, "We are producing goods, and these goods cost a little too much, and we cannot sell them in Europe, or in South America, and we need protection;" that is just what it amounts to.

### EFFECTS OF PROTECTION ON SHIP-BUILDING.

A few years ago I was requested by a gentleman in Havana to build him a steamship of iron. It was during the time of our war, if I remember right. I told him that I would be very happy to execute the order, but that the duty on iron was so much per ton, and if I built him a steamship here with the increased price of labor, consequent on our high system of duties, it would cost him from one-third to one-half more than it would cost him to build that steamship on the Clyde. The gentleman was satisfied with this reasoning, and he ordered his ship on the Clyde, and has since ordered many more.

Two or three years ago I received an order for materials for a railroad in Cuba. I was directed to buy a special manufacture of locomotive in Pennsylvania. I bought it. I was required to buy a certain amount of steel rails, implements for turn-outs, and such things as are needed on a railroad. I sent to England, imported those rails in bond, shipped them from here in bond, and the gentleman whom I served gained $28 per ton by getting them in that way. Now you will see how we are cut off from doing a business with foreign countries in consequence of the high cost of the production which we have around us.

The world requires things that we can produce. The world produces things that we want. We can exchange with them; but if we prohibit

Digitized by Google

the introduction of their articles here, it is very natural that they should prohibit the introduction of our articles into their country.

The revenue of Government, so far as it is derived from customs, is contributed by consumers of the articles taxed. The poor laborer with his large family pays more than the millionaire—but I have already called your attention to those points, and I will not dwell upon them.

### CAPITALISTS ESCAPING TAXATION WHICH THE LABORER HAS TO PAY.

Now, is it right to continue a system of taxation which, if I am correct in what I have attempted to demonstrate before you, draws the support of the Government from the poor laborer of the soil and of the mill? Is it right that the capital of the country should escape taxation? It is true that principle was recognized during the war in an issue of bonds; but we know very well that the object to be attained was to give currency to the bonds to float them. The principle is unjust that Mr. Vanderbilt can own his $50,000,000 of Government bonds and escape taxation, while I own a small portion of other bonds, and I am subject to taxation in my State. However, the legislators of the time were in straits. They did not know what to do or how to get money. They adopted this system, and fortunately it has succeeded, and we have passed that crisis which made it necessary, and I hope that our legislators will never return to such a violation of principle, contrary to common right and justice.

### DECEIT INVOLVED IN INDIRECT TAXATION.

It will be claimed that the duty on imports is more easily collected and more cheerfully paid than the same amount of money could be collected by the direct taxation; that it, being unseen by the ordinary payer, is not objected to. This idea of taking a man's money because he does not know that you are taking it may be accepted by some, but I think no intelligent legislator will be influenced by such calculations. The result of my reflections on the subject of taxation leads me to the conclusion that the true system of taxation should be direct, and upon persons and property, the two things protected by the same Government which you pay to sustain. Abolish all taxes on imports, remove all custom-houses, revenue offices, &c., let the vast expense incident to collecting revenue from customs be saved. Let the corrupting influence exerted upon the politics of our country by that method of collecting duty be removed. Let the temptation to fraud and crime which to-day exists among our people, many of whom endeavor, by false invoices or by smuggling, to receive an article here which does not pay the Government duty, be removed. The Government is to a certain extent an educator of its people. Now, then, the Government holds out the inducement to people lacking, perhaps, the proper moral character, that if they can get a certain article in without the Government officers knowing the fact, they are going to save so much money. The captain of a vessel that I once had coming to this port emptied his water casks in a foreign port. He put into these water casks some rum. He would have got along very well but for a quarrel with his mate. Think of the inducement to that man to violate the law. The duty was $4 on spirits and the same on rum, and if he got nothing on the voyage he would still be well compensated. That is the inducement which you see is extended to people to do wrong. Every day you will notice announcements of

Digitized by Google

the seizure of trunks from people traveling abroad. They buy things which they want to get in free, and the Government holds out to them the temptation. If I were to adopt that system in the instruction of my children, I would be considered to be a very bad man. If I should say to them, "By the violation of a certain rule which I will lay down, you will gain $5," I think that would be hard upon the children.

### ABOLITION OF CUSTOM-HOUSES.

By removing all custom-houses, and abolishing all duties on imports you have saved the expense of collection in that direction, and you have saved the corrupting influences exerted upon the politics of your country by that same system of duties on imports. You have set the temptation to people to smuggle and to endeavor to defeat your law in some way or other for the purpose of gaining money to put in their own pockets. Now, then, if there is any other way to raise that money equally economically, and with less injury to the public morals, it should be adopted. And that is what I call the necessity for direct taxation, in addition to the fact which I have illustrated, that the taxation we already have falls unequally upon the people of the country, and that the poor pay for the rich.

### TAXING THE RIGHT OF SUFFRAGE.

I would say, Put a tax on every man who exercises the privilege of voting, say, $10, if that is the right sum. Put all the rest of your taxes on property. This man who pays $10 for the privilege of voting feels that he is supporting the Government and feels some interest in it, and wants to see how the money is expended; and the man who will not pay for the protection of his person in the sum of $10 need not vote for the affairs of the General Government. The States may let him do what he likes; but for the purposes of the General Government, let him pay. The other man pays for the protection of his property, and he has an interest in seeing how the Government is carried on. You therefore interest the people in the acts of their representatives in the legislature to see that they honestly administer the Government, to see that the money which is contributed from their hard earnings is properly spent, and that the objects of Government are secured and maintained.

### LABOR IN ENGLAND AND AMERICA.

If we were freed from the enhanced price of materials in consequence of the tariff, and freed from the enhanced price of labor consequent on those duties, we could manufacture anything and everything as cheaply as any portion of the world. I have been told on good authority, and I believe the statement has not been contradicted, that the labor paid in England for the production of a thousand yards of cloth was equal to the labor paid in the United States for the same work. If that is so, you will see the immense advantages which the English laborer has over our laborer by the cheaper price of articles of necessity which he buys for the support of his family. For instance, he avoids a duty of 3 cents a pound on sugar, and he avoids a duty on the suit of clothes and on everything else that he wants. He is saved the difference which the laborer here has to pay in consequence of duty. You see the advantage he has over us. You see why the English manufacturer can send his products anywhere in the world; and you see how we are shut out.

Digitized by Google

INJUSTICE OF ALL TARIFFS.

I consider that tariffs between countries are so many walls to prevent the free intercommunication of one nation with another. The separation of nations is either by ocean, by lake, by river, or by an imaginary line. The peoples on either side may be the same; they belong to the great brotherhood of men. Now, then, I would not, if I could, so legislate as to make every man in the United States a millionaire, and every man in other portions of the world a pauper, because once I learned from a good book this saying, "Do unto others as you would that others should do unto you." I cannot be satisfied to have these men legislate so as to make me a pauper, and I do not want them to legislate so as to make paupers of anybody else. So that below and underlying all the principles which I have advocated before you there remains the great Christian principle that you have no right so to legislate as to injure your neighbor.

I thank you, gentlemen, for the patience with which you have heard me in these disconnected remarks, and am very happy to have had the opportunity to say the few things that I have said, although I did not seek that opportunity, because I am not a public speaker. If you find my remarks worthy of consideration I shall feel amply repaid.

---

NEW YORK, *September* 27, 1883.

WILLIAM STEINWAY examined.

By Mr. CALL:

Question. Have you seen the resolution under which the committee is conducting this examination?—Answer. Yes, sir.

Mr. CALL. The committee will be glad to hear from you any facts or opinions you may have to present on the several subjects mentioned in the resolution, first stating your residence and occupation and your connection with labor in this country and abroad.

The WITNESS. I was born in Brunswick, Germany, in 1836, and came to the city of New York in the spring of 1850, when fourteen years of age, with my father, mother, and the rest of our family. We worked for three years in the factories here, learning the language and the customs of the people, and in March, 1853, started the business of Steinway & Sons—my father, my two brothers, and myself—which has now become the most extensive establishment of its kind in existence. We have three distinct establishments, manufactories rather, our New York factory, at Fourth avenue and Fifty-second and Fifty-third streets; a large establishment at Astoria, N. Y., opposite One hundred and twentieth street, where we employ over 400 men, and where we have carried out our ideas of improving the condition of the workingmen by giving them light and air and good houses to live in, building them public baths, and laying out a public park, keeping up at our own expense in the public school a teacher who teaches German and music free of charge, and various other advantages. We employ about 1,000 workmen, a great majority of whom are skilled workmen. I will remark that in the first three years when I worked as an apprentice and journeyman, and in the first few years when our business was small, I had ample opportunities of studying the lot of the workingman by actual experience, also the way that workingmen worked, and I can say that skilled artisans to-day are far

Digitized by Google

better off than they were a third of a century ago. At that time but very few people, even skilled laborers, were able to save money and put it in bank. To-day the skilled laborers, more especially in the piano-forte trade, and the wood-working establishments, have wages double what they were in those times; and from my experience also as director in savings banks, &c., I find that a great many skilled artisans, those blessed with health, have constituted a great portion of the depositors in banks. The wages in the piano-forte trade, that is to say, the skilled laborers, have averaged $20 per week (ranging from $15 to $30).

We ourselves have a branch establishment in Hamburg, and from my travels in Europe and my study of the condition of the workingmen in both hemispheres, especially in the piano-forte trade, I will say here that of my own personal knowledge the wages of skilled artisans in the piano-forte trade in the cities of New York, Boston, Baltimore, and Philadelphia, where they are most densely congregated, average precisely three times the amount that the skilled artisans of Europe do in the same trade.

The introduction of machinery in our business, and in the wood-working establishments, has been of great benefit by doing the hard work which formerly imperiled the health and lives of thes killed artisans. I will further state that of the about one hundred piano-forte manufacturers of the United States, which are chiefly concentrated in the four cities I have named, nearly all have been workingmen themselves.

## LABOR OUGHT TO ORGANIZE.

The relations between ourselves and our men have always been very good until lately disturbed by the entrance of the socialistic and the communistic element in the labor unions. I myself think that labor ought to organize, as it has organized. I am not opposed to labor unions, and any labor union that is carried on in a sensible way can do a great deal, not only toward bettering their own condition in the way of wages, but also in equalizing wages in the various cities, and in resisting in times of depression the great deterioration and fall of wages. We have gone through very hard strikes. We have been singled out. Our house being the strongest and largest, has been made the target of strikes. It is just about a year ago now that one of the most senseless strikes was inaugurated during my absence in Europe by the socialistic and communistic element inducing our men to strike against an honest, faithful bookkeeper, against whom they were unable to allege the slightest grievance, except that they did not want him, and that their union had so ordered. They were unsuccessful, however. The strike lasted over nine weeks, and inflicted a loss upon us of $75,000. Furthermore, of late years the labor union, especially the piano-forte maker's union, which claims three thousand members, in order to induce everybody to join strikes ordered by them, exercise over them a terror of the idea that unless they go with them they will be treated as "scabs" and be driven out of every shop in the city of New York, or in the United States. Many of our older men, who have, been with us twenty and twenty-five years, and quite a number of whom own houses, both in Astoria and New York, have come to me personally or written me letters about this terrorism exercised by members of the trades unions; but, as I said, with the exception of that, I am not opposed to labor unions; but on the contrary will here give it as my opinion that strikes are a necessity and should not be legislated against, and cannot be legislated against. The fierce competition of manufacturers, and especially in our trade, makes

Digitized by Google

it impossible that any manufacturer could arbitrarily raise his price unless he is forced to do so by a strike for higher wages. It would be simply impossible for him, and he would be laughed at by his customers if he attempted to do so.

### MANUFACTURERS MISCALLED CAPITALISTS.

A great mistake is also made by the workingmen and the professional agitators, who foment strikes, by calling manufacturers capitalists. Of about 100 piano-forte manufacturers in the United States known throughout the world to make the best pianos in existence, and conceded so by musical talent and authority in Europe, there are but four wealthy houses—about 20 to 25 people of moderate means—and the rest, that is, 60 or 70 manufacturers in the piano-forte trade, just manage to eke out a hand-to-mouth existence. These are hard words, but they are literally true.

### THE HORRORS OF THE TENEMENT HOUSE SYSTEM.

I consider that, with my close relations with workingmen, and meeting and conversing with them of evenings in tenement houses and elsewhere, and, as executor, investing in a fiduciary capacity, money for the estates I have represented, I have seen a great deal of the lives of the working people, and have seen much of their houses. I consider one of the greatest evils under which workingmen live, especially in the city of New York, is the horrors of the tenement houses—the terrible rents that they have to pay. The average workingman's family has one room in which they cook, wash, iron, and live, and one or two, or possibly three, bed rooms, of which generally one or two are dark rooms, without any windows, or without admitting God's pure air. This is a terrible evil, which is, however, chiefly caused by the insular position of the city of New York, where, in winter, in times of ice and fog, it is impossible that workingmen should come long distances and be in time for their work.

The horrors of the tenement houses are having a very baneful effect upon the morals and character of the coming generation; in fact, I may say a terrible effect. But I do not see what legislation can do. Capitalists consider tenement houses a poor investment, paying poor returns. The only thing that I can imagine is to do as *we* have done, remove the very large factories requiring much room and many men from out of the city of New York into the suburbs.

### WANT OF AN APPRENTICE LAW.

A second great evil under which we are suffering, and it seems to me it is an evil that has been increasing from year to year, is, that in no country of the wide world, as I have found during my experience and my extensive travels, are there so many young men growing up without learning a trade or any particular calling, as in the United States. We have no apprentice law. In our own business, as well as the wood-working business, everybody is unwilling to take an apprentice, for the simple reason that it is a well known fact that the first year or two when a boy is learning a trade he will produce nothing, and will spoil a great deal, and will take up the time of a skilled man to teach him, and yet the moment he has learned one little branch of the trade he leaves,

Digitized by Google

shifts for himself. He has not learned the business properly, and the consequence is that he is dependent, and, in times of great depression, cannot find employment. Hence we have no supply of skilled artisans growing up, and have to draw for our extra skilled labor on Europe. When I came to this country, in 1850, the majority, indeed I might say seven-eighths, of the journeymen piano makers were Americans, skilled workmen. Through our apprentice law, or rather through the total want of one, the entire native element has been thrown out of the piano business, and to-day seven-eighths of the workingmen in the piano shops, and over one-half in the New England States, are Germans.

By the CHAIRMAN:

Q. Is that for lack of an apprentice law as much as it is from the fact that skilled labor already trained has found its way here from abroad and has entered into competition, and made the employment of apprentices by employers a thing undesirable on their part?—A. No, sir; I attribute it entirely, or chiefly, to the lack of a proper apprentice law.

## INDUSTRIAL SCHOOLS.

The total want of industrial schools in this city is a very great evil. There ought to be industrial schools all over each city where boys can go and find for what business they have aptitude and talent. Then, under regular apprentice laws, under which a boy could be bound for, say, five years at rising wages, commencing at $3 a week for the first year, getting $3.50 the second year, $4 a week the third year, and so on, they would learn a trade well. During the last two or three years the employer could have the advantage, since during the first one or two years he lost.

Every now and then respectable men come to me—farmers, &c.—having boys of sixteen or seventeen years of age, and wanting them to learn the piano trade. We cannot take any apprentices, because the boy takes up the place of a man; but in smaller shops they could do so. Still, nobody will take the boy, because the moment he has learned one of the fifteen or eighteen branches of the trade, he shifts for himself. Although he has learned the business improperly, still he starts out, and thus it is that not only the piano trade, but most of the wood-work business is shut out from American boys. That is a great evil.

Q. Do the children of foreign parents, who are employed in the piano trade, learn the trade?—A. Yes; though not many of them. We sometimes take an apprentice to do a favor to our own skilled artisans, who wish their boys to learn the trade, and who are then allotted a place alongside of the father, and he teaches him. That, of course, sacrifices the bench place in the room; the father, however, teaches him, and he takes the first loss and trouble, and afterwards, of course, reaps the benefit; but that is only in a few isolated cases.

Q. When you first came here you found that seven-eighths of the piano-makers were Americans?—A. Yes.

Q. Was there an apprentice law then?—A. Yes; and I myself offered to bind myself for seven years in a factory, commencing at seventeen and rising yearly.

Q. That law has been abrogated?—A. Yes. After a few years I suddenly found nobody would take apprentices, and could not hold them if they did. That is a great evil. That is a subject on which I think legislation would do a great deal of good.

Digitized by Google

COMPULSORY EDUCATION.

I would also advocate a law compelling every child between the ages of six and fourteen to go to school. I have found in my experience as an employer and executor, and as worker in benevolent enterprises in which I have been engaged, that there is a great deal more ignorance in reading and writing among young men and women growing up in this city—mostly children of foreigners—than anybody has any idea of. During the war we raised a fund to assist the wives of men that went to the war, and I found that one-half of those who had grown up in this country, or had come here when they were little children, were unable to sign their names. I never would have believed it possible if I had not myself experienced it. Hence I think that a compulsory law compelling every child between the ages of six and fourteen years to be sent to school should be enacted, and that parents should be punished if they did not enforce it.

I am also in favor of giving every possible advantage of education to talented children who are poor—in the industrial schools especially. The industrial schools themselves would not cost very much, and they would do a world of good. By finding out what the talents of boys of fourteen to sixteen are, and then, together with an apprentice law, to give them a chance to become skilled artisans, see how much good could be done.

INDEPENDENCE OF SKILLED ARTISANS.

Having gone through the panics of 1861, 1867, and 1873, I know that skilled artisans are absolutely independent of bad times, for a skilled workman will always find employment. It is so in the piano-forte trade and in the kindred trades in wood. I repeat that artisans, especially those in the wood-working trades, have been found to be absolutely independent of bad times, even in the panics of 1857, 1861, 1867, and 1873. I found that all the skilled piano forte manufacturers and those in the wood-working trades readily retained and found employment at remunerative wages; whereas the half skilled men who knew only one little branch of a trade were thrown out of employment. Hence the necessity of educating our young men who wish to learn trades to make them thorough skilled workingmen. In other words, do away with the curse of the American mechanics—young men learning only one portion of a skilled trade, and being then absolutely dependent upon that because they do not know anything else. That is about all I believe that I can say of my own observation on the resolution as I read it, but I am ready to answer any questions.

RAILROAD CHARGES IN EUROPE AND AMERICA.

By Mr. CALL:

Q. You have traveled extensively abroad and are familiar with the operation of foreign railroads and their rates of fare and transportation, as compared with those of the United States, and their effect upon the industries of the people in the two hemispheres. I would like you to give us any observations and conclusions you may have come to on that subject.—A. In the years 1868, 1871, 1880, and 1882, four times, I have spent from five to six months in England, France, Belgium, Holland, Germany, and Austria, and have traveled very extensively, and being a good judge and having paid special attention to that matter, and inasmuch as we also ship, not only over the United States to every

Digitized by Google

little town and city, but also all over Europe, I must say that justice compels me to conclude that both the rates for freight and the rates for passengers are far lower in the United States than in any of those countries that I have traveled in. For instance, from Hamburg to Vienna, is a distance as far as from New York to Chicago. To ship a piano-forte from Hamburg to Vienna would cost at least three times as much as from New York to Chicago. There are classes over there for railroad passengers, first, second, and third class. They say there that the parties who travel in the first class are princes and fools; that the wealthy and cultivated classes use the second class, while the general public uses the third class. I found that rates of fare in the third class cars having cane seats, wooden seats, &c., are considerably dearer for the same distance than our American railroads. Upon the whole, the cost of travel is much greater there, and the rates of freight also.

RELATIVE CONDITION OF WORKINGMEN IN EUROPE AND AMERICA.

The CHAIRMAN. The resolution calls attention to the relative conditions of all working people abroad, and working people in America, specific and general classes. What is your observation in that respect?

A. I have paid a great deal of attention to the condition of the workingmen, and, as I before stated, in our own business and kindred trades I find that first-class skilled artisans in this country earn from double to three times as much as skilled artisans of the same rank do in Europe. In unskilled labor I find the proportion is not so favorable to the American laborer. It is true that they earn more money here, but the cost of living, especially rents, is so much enhanced that they are not much better off in a pecuniary way than the workingman in Europe. But their social position here is much higher than that in Europe, and they have a much better chance here to get along than they have in Europe where every thing is more limited. But the skilled artisans are far better off in this country; they wear better clothing, have better food, and have a chance to live better, move in better society, and in fact their condition is in every way far superior. Still there remains a great deal to be done, and a great deal could be done to improve their condition in this country in the way I have indicated.

Q. I should like to ask your observation in regard to other classes which you find abroad and in this country.

The WITNESS. In what way?

The CHAIRMAN. Well, have you observed the agricultural population?—A. Yes.

THE RELATIVE CONDITIONS OF THE AGRICULTURAL CLASSES IN EUROPE AND AMERICA.

Q. What would you say—what criticism would you pass upon the relative condition of the European agricultural population and the American agricultural population?—A. Our agricultural people are much better off than are the agricultural people of Europe. The wages there are less, and their hours of work much longer than those in America; and, setting aside times of depression, there is, in ordinary times, a much greater demand for agricultural laborers in this country than in the old country. Their condition is much better, from what I have observed. While I was in the German watering places in search of health I noticed, for weeks and weeks, how the people in the fields worked, and I made inquiries of the owners of large estates, &c., and I am also in intimate relations with my own friends here owning farms, &c., and

Digitized by Google

from my own personal observation, I have no hesitation in saying that the condition of the agricultural laborers in America is far superior to that of the same class in Europe.

MERCHANTS, MANUFACTURERS, ETC.—THEIR RELATIVE CONDITIONS IN EUROPE AND AMERICA.

Q. How in regard to the relative condition of merchants, of manufacturers, of the ordinary class of business men on this side of the ocean and the corresponding class on the other side of the ocean—those who manage the business affairs of communities?—A. The manufacturers of Europe do not work nearly as hard as our Americans do, who are on their feet from morning to night, and on whom the rack and tear of business wears very fast. The manufacturers in Europe have this advantage: they have much cheaper money than manufacturers in America, who have to depend upon outside help, and who have to borrow money for that purpose. And I think that, as a general thing, the European manufacturers are just as well off as our own.

Q. How as to the accumulation of estates?

The WITNESS. In the way of manufacturers, do you mean?

The CHAIRMAN. Yes; I mean those same classes—manufacturers, merchants, and the like.—A. I found that in Europe there are a great many more manufacturing establishments where the business has been handed down from father to son—they are long-established trades—whereas, in this country, manufacturers have generally worked their own way up from nothing, through their own energy, and have, after awhile, accumulated a competence.

Q. So far as the necessaries and comforts of life are concerned, who live the best, this class in this country or in the other countries?—A. Well, in the way of taking recreation, I think the Europeans have decidedly the advantage. I found dozens of times when I went to call upon bankers, manufacturers, and business men, that they were not to be found at their offices from half past eleven to two o'clock—they were taking dinner or taking a nap. You will find nothing of that sort here. No business man would think of taking a nap here in the daytime.

Q. How is it as to their food and dress, and their habitations relatively?

The WITNESS. Do you speak of the manufacturer or of the workingmen?

The CHAIRMAN. I am speaking now of those classes that we referred to a moment ago—the men who do the business of the community.

The WITNESS. As to those points I think there is not much difference. In the smaller cities of Europe, of course, the houses of those people are comfortable. In the city of New York, in which I know most of the manufacturers, the houses are, of course, smaller, but, under perfect sewage, and the general introduction of water, gas, &c., I think that the houses of American manufacturers are fully equal to those of the Germans, and they live just as comfortably. In their business dress, of course, I have not found any particular difference.

By Mr. PUGH:

Q. Do you export pianos of your own make from this country?—A. We do, very largely.

Q. You say you pay skilled laborers, who make your pianos, about two to three times as much as similar laborers are paid in Europe?—A. We do.

Q. How are you able to do that?

Digitized by Google

REPUTATION OF AMERICAN PIANOS.

A. Because our pianos are known all over Europe since the great exhibitions. The wealthy musical people buy them notwithstanding their comparatively high price.

Q. You are able to compete then with all the world in making your pianos, notwithstanding that you pay two or three times as much for your skilled labor?—A. We do compete with the first-class manufacturers of Europe.

OPERATIVE CLASSES—THEIR WAGES AND CONDITIONS IN EUROPE AND AMERICA CONTRASTED.

Q. Have you any general information as to the condition of the laboring classes employed in manufacturing—as to their food, and their dwelling places, as compared with the same classes in this country?—A. I made a special study of that. At Mulhausen, in Alsace, in the city of Crefeld, in Rhenish Prussia, a great silk center, and several other places, I found that they have wretched habitations, and are very poorly clad and ill-fed, not nearly so well as the operatives in this country.

Q. How is it as to the wages that those classes receive there and here?—A. From what I observed I found that the wages are considerably less in Europe than those paid here, even setting aside our own business.

Q. The skilled laborers are paid less there—how about the labor that is not so much skilled?—A. Unskilled labor is also paid less. In other words, it is very rare to see a workingman in Europe whose family can lay by anything, whereas here thrifty, skilled mechanics, blessed with health, and not meeting with sickness or other misfortune, have a chance to save money and do save money.

Q. Then you say that in this country the laborer is much better off in his social and pecuniary conditions, and in the means of enjoying the comforts of life?—A. Undoubtedly.

Mr. PUGH. That is one great reason why there is so much immigration to this country, I suppose.

The WITNESS. Certainly. I have been called upon while in Europe, my name being so well known, and my arrival being mentioned in the newspapers, by dozens of mechanics who wanted to come to America, and who would have done so if they had had the money. Of course there is great dissatisfaction with their condition there, especially in the industrial districts of Westphalia, Saxony, and Silicia.

EDUCATION OF THE WORKING CLASSES IN EUROPE AND AMERICA.

By the CHAIRMAN:

Q. How do they compare with our own working people in the matter of education?—A. In Germany, where, since 1818, school attendance has been compulsory, there is hardly a person to be found who cannot read and write. Every child between the age of five and fourteen must attend school, and if not attending school the parents would be punished. The result is, that a person unable to read and write, unless they are very old people, is unknown.

By Mr. CALL:

Q. That is true throughout Germany generally, is it?—A. Yes. In France and England it is not so favorable, nor in Belgium, because up to a few years ago there was no law compelling children to go to school.

Digitized by Google

By the CHAIRMAN:

Q. Do you think that education is improving the condition of the laboring people in those countries?—A. It undoubtedly has done so. It has given them greater intelligence and better knowledge of their trades.

INDUSTRIAL SCHOOLS IN GERMANY.

By Mr. CALL:

Q. How about industrial schools there?—Are they extensive?—A. Yes; they are. I have seen several myself.

Q. People are taught their trades in the public schools, are they?—A. Yes; boys of fourteen to fifteen years of age are taken, and it is ascertained what trades they have aptitudes for, thus preparing them for learning their trades. One of the greatest boons that education could bestow upon boys here would be to give them a similar opportunity.

Q. For that reason you find skilled labor far more abundant there than here?—A. Yes. Here, in good times, there is a great want of skilled labor, and there there is always a greater supply than demand. Hence the great immigration of skilled artisans to this country.

PURCHASING POWER OF MONEY, RELATIVELY, IN EUROPE AND AMERICA.

Q. How about the purchasing power of money in respect to the necessaries of life and general means of comfortable subsistence in England and on the continent of Europe, as compared with the United States?—A. I would say that rents and everything except provisions and meat are much cheaper in Europe than here. Meat goes from America to Europe, and it must be a little dearer there. But clothing, furniture, cooking apparatus, and all other things are much cheaper there than here.

Q. Have you any idea of the specific difference—about?—A. That I could not say without bringing my imagination to bear, which I do not wish to do.

Q. I understood you to say that you worked as a journeyman yourself in this country?—A. Yes.

Q. Had you greater opportunities outside your own knowledge and capacity for building up the vast business that you have built up—greater opportunities than many others who were your contemporaries?—A. To be just, I think that, being father and sons, we were possessed of some greater advantages when we came here—we had great advantages over one single individual. I am modest enough to say that I personally could not have done so but for the harmony and good management that prevailed in our firm by reason of our relationship.

Q. Any other family with the same advantages would have had the same results?—A. Yes.

Q. The point I wanted to get at was that it was not due to any adventitious aid of capital, but to yourselves as workingmen and economists?—A. Yes.

Q. You do not consider that you owe this success to anything outside of yourselves, do you?—A. No; I think not. But it was simply because we were all skilled artisans and had learned the trade thoroughly, and had special talents. We had no outside help at all. We worked our way up, and I know dozens of others who have done the same thing.

Q. Do you know anything in the relations of capital, as it is called (as a general name for an economical cause), anything in the relations of

Digitized by Google

capital and labor unfriendly to the success of the workingman in becoming a director of labor, and of a great combination of labor in this country?—A. Not at all. I think, under the institutions of our country, if an individual has the talent, the energy, and the industry he has as good a chance to-day as ever to work himself up.

LEGISLATIVE MEASURES; CHILD LABOR; INDUSTRIAL SCHOOLS, ETC.

Q. Is there anything in the shape of public legislation or voluntary action that you would suggest that will improve that opportunity?—A. I think that is one of the greatest problems, and I do not see that legislation can do much more than it has done now, with the exception of what I have indicated. There should be an apprentice law and a stringent law against child-labor, so as to give the children of the poor people a chance to perfect their education, and the industrial schools could be established and every effort made toward giving artisans and laboring people healthy, happy homes.

Q. With those things supplied, either by public law or voluntary action, would you consider the relations now existing under our institutions as favorable as they could be made?—A. As favorable as it is possible to make them, in my opinion. Anything further would simply help one class in opposition to another. In this country it must be left to individual talent and industry. I think in this country a young man has a better chance to work up in the world than anywhere else that I have seen.

REMOVAL OF CITY FACTORIES.

By Mr. PUGH:

Q. I understood you to condemn the presence of those large manufacturing establishments in our cities, and to charge the discomfort of the operatives in them to the fact largely of the presence of such establishments in cities?—A. Yes; I think every effort ought to be directed to having the large establishments go out to the suburbs of the city, in order to give the workingmen a change to live as human beings ought to live.

Q. What wages could a man live on in this city and pay the rents that he has to pay and meet the expenses of life in cities? Would improvement in the wages relieve him from these troubles and difficulties?—A. The improvements in wages have of course given a great many skilled artisans an opportunity to live in larger and better apartments, and in newer tenements where there is a through draft. I have been myself in dozens of tenement houses which were in fact fit for anybody to live in; and I have seen others where several were dwelling in the same room and with no lights in the bed-rooms, and that is a very baneful influence upon the health as well as the morals of the rising generation.

Q. How do the wages you pay to your employés compare with the wages paid by other industries of the country, if you are informed on that subject?—A. I am somewhat informed, and find that in all skilled trades, requiring years to learn, they are paying nearly the wages that we do—not quite, but still averaging pretty near—say between $15 and $30 a week.

Q. How are the unskilled laborers, who are employed in the manufacturing industries, paid as compared with those you employ?—A. I think they are not quite as well paid as in our employ. We have a great many men who of course are not skilled laborers, and require no special skill, who are being paid, say on an average, $12 a week—$12 to $14;

Digitized by Google

but they have the advantage of having steady work year in and year out; while in other trades, for instance, the building trades, they are dependent on the weather and the seasons; and, taking it all together, they probably have work only for about eight months in the year, which is a very sad state of affairs.

By Mr. CALL:

Q. How many hands do you employ in your factories?—A. About 1,000.

Q. Your factory, I understand you to say, is removed from New York?—A. We still have a large factory, which we call our "finishing" factory, in New York. It is the case-making factory. The iron and steel works for making the hardware, &c., has been removed over to Astoria, and one department after another has been added thereto, and within a few years the entire establishment will be removed from New York to Astoria.

Q. Do your artisans there live in rented houses?—A. Some of our artisans have already acquired homes of their own, but others of them live in rented houses, and not more than two families in one house, where they have gas, water, free baths, free schools, and every advantage. We have upwards of four hundred men there.

Q. At Astoria?—A. At Astoria.

Q. And you have found them able to improve their condition there?—A. Oh, yes; very much so. There is no sickness or anything of that kind there, and they are all feeling comfortable and happy, and I think the large wealthy manufacturers should also remove their factories from the cities and establish them somewhere in the suburbs, and do something for their workingmen in that way.

Q. You think that that would be a solution of a great part of the trouble arising between labor and capital?—A. Certainly a solution of the tenement-house trouble.

Q. And that, you think, is a large part of the cause of distress and dissatisfaction among the people?—A. Yes; I think it is a great cause of dissatisfaction among the workingmen—the bad places that they have to live in, and the high rents they have to pay. Yet tenement houses are considered a very poor investment by capitalists.

Q. If there is anything else that you would like to submit, we would be very glad to hear it.

THE TARIFF—ITS NECESSITY TO MANUFACTURING DEVELOPMENT.

A. If you wish to have my opinion on the tariff, I would say, in opposition to Mr. Knowlton, who has spoken before me (and who thinks that a total abolition of the tariff would improve the condition of the workingmen), that my experience and observation of upwards of a third of a century are directly the contrary of his. I think that we ought to have a reasonable protective tariff to make it possible for our manufacturers to live and pay their men the wages that they do—for our Americans will never be content to live on the starvation wages of Europe. It is an impossibility. A great many industries have been rendered possible only by the existence of a protective tariff. Take our silk business for example. Fifteen or twenty years ago nobody thought that the silk business of America would amount to anything; now it is a great industry. Take the duty off foreign silk to-morrow, and every silk factory in America would be closed. I do not speak from selfish motives in this matter, for no European pianos will ever be imported into America, because they cannot stand our climate. All first-class piano manufacturers in this country export pianos.

Digitized by Google

### RELATIVE COST OF PIANOS IN EUROPE AND AMERICA.

Q. What is the difference between the cost of European pianos and those which you manufacture?—A. You may say that ours are one-third higher, and that is all labor. Our material—American wood—is the best in the world. It is being largely exported to European manufacturers now. Material here is just as cheap, if not cheaper, than in Europe. The difference is caused by the enormous difference in the rate of wages paid. In the first-rate piano factories two-thirds of the cost of a piano-forte are wages.

Q. If you were to carry out your system, and establish those industrial schools, and have the same superfluity of skilled labor that you have in Europe, how would it be then in respect to the cost of labor?—A. I think our own trade is still in its infancy, and capable of expansion; and from the higher excellence of American first-class pianos, and their being able to stand any climate, dry or moist, I think there is a great deal of room for new manufacture, and for skilled artisans to be created in this country without any evil effects upon the trade itself.

Q. You say there is a very great field for demand yet?—A. Undoubtedly.

### OVERPRODUCTION.

By Mr. PUGH:

Q. What do you propose to do—have you thought on that subject—with the overproduction of several of our manufacturing industries—more than the market can consume—more than they can sell in the American market? For example, we have too many woolen goods, and the woolen manufacturers are failing; and we have too many cotton goods; we have too much iron; we have an overstock of many things; there is more produced than our markets will consume; what would be the effect of those over-productions upon the laborer?—A I think the present over production is due to extraneous and temporary causes. We have had three very good years, and there is a natural reaction now. I think the over production will be but temporary. Of course, America is the greatest market of the world from the fact of its greater wealth and recuperative power, and all those manufacturers who over-produce now ought to try to stock foreign markets. They are open to all the world, and, as I said before, I consider the present depression only temporary.

Q. How can they compete in the foreign market with other manufacturers?—A. They must endeavor to do so by greater excellence of goods.

Q. So as to command a higher price?—A. Yes; they cannot do it in cheapness. It is just like American piano-fortes. We can compete with the world, not because our piano-fortes are cheaper, but because they are better.

### REED-ORGANS.

Look at American reed-organs. Thousands and thousands are sent from America all over the world, and that business has been created within the last few years; and in that business the export is still greater than in the piano trade. Wherever you go in large cities, everywhere in the world, American pianos are advertised and sold; but they are higher priced than European pianos. They are of a better tone and greater durability.

Digitized by Google

By Mr. CALL:

Q. To what do you attribute that fact, while in Germany there is so much more skilled labor—what permanent causes are there for the superior excellence of American pianos?—A. It is largely due to the inventive skill of the American manufacturers. They have patented their improvements, and have thereby created a demand, and have the greater excellence. This reed-organ business that has especially grown to such enormous proportions has been built up within the last few years.

Q. Is that founded upon patents?—A. Yes.

Q. American patents?—A. Yes; and those improvements are also patented in Europe in the large countries; but it is less the patented features than the greater excellence of American reed organs that sells them.

INDUSTRIAL SCHOOLS AND OVERSTOCK OF SKILLED LABOR.

By Mr. PUGH:

Q. What about the supply of skilled labor in Europe, as compared with this country? You say there is a much greater supply in Europe, and you attribute that to the systems of industrial schools?—A. Yes.

Q. Then is there any overstock of skilled labor in Europe?—A. I think there is.

Q. Is there nothing due to that fact in the cheaper labor of Europe than this country?—A. I think not. The wages are handed down from year to year; and the way the people live there, and the cheapness of the ordinary articles of living, except provisions and meat, makes labor cheaper.

Q. You think, then, that the training of our people in industrial schools will not produce an overstock of skilled labor in this country, and reduce the wages of labor?—A. I think it will not. I think the country is taking such strides in population and wealth that the addition of the skilled laborer, who would become such by the establishment of apprentice laws and industrial schools, would simply go on without making any perceptible effect. But the principal thing is that our American boys, as they grow up, ought to be taught to learn a profession or trade, and be independent. That is what I find nowhere in the wide world so much neglected as here, nowhere are there so many young men who have not learned anything in particular as there are in this country, and yet they are the most intelligent in the world.

Q. You think the demand for that sort of labor in this country will keep up with the supply?—A. Undoubtedly; especially now where a great many trades and specimens of our art industry and handiwork have achieved and retained such a reputation in Europe. For instance, take our agricultural implements. They are readily bought in Europe. First-class pianos, reed organs, India-rubber shoes; I found to my astonishment that everywhere these American goods were sold and readily bought.

By Mr. CALL:

Q. Do you think there is any difference in the natural capacity of a German and an American? You do not think the Americans have any more natural aptitude and capacity, do you?—A. Well, without drawing any comparison, I think the American young men are as capable and as intelligent as the most favored nations; there is no doubt about that, and they have a great inventive genius, a natural aptitude for inventions.

Digitized by Google

Q. Greater than the Germans, you think?—A. Well, I cannot say greater than the Germans. I have been here since my childhood, and from my investigations during my travels I have found that it is at least equal to that of any other people.

THE PATENT LAWS OF GERMANY AND THE UNITED STATES.

Q. What is the difference in the patent laws of the two countries? Are you advised on that subject?—A. Yes. The patent laws of all European countries are wretchedly defective compared with our American patent laws, which, with a few trifling exceptions, are the best in the world, because they secure to the inventor the advantages of his invention. The patent law of Germany imposes a tax from year to year on the patents, which makes it impossible for the patentee to hold his patents, whereas the American law secures him for seventeen years.

Q. Well, how much of the success of the American inventive genius do you attribute to that good feature of our law and the bad feature of theirs?—A. I am decidedly of the opinion that industry has been greatly fostered by our wise American patent laws. I have no doubt of it at all.

Q. Do you think that if they had had the same laws there it would have been correspondingly so?—A. That is a hard question to answer.

Q. Have you any patents on you your manufactures?—A. We have as many as thirty United States patents.

Q. Do you not attribute something of your success to the superior excellence of your patents?—A. Certainly; but if it had not been for the wise patent laws, we would not have perfected these things and made them articles of trade, whereas now we have done so.

Q. They are your own inventions?—A. Yes.

PIANO-FORTE EXPORTATIONS.

By the CHAIRMAN:

Q. Have you any objection to stating the importance of this foreign trade in musical instruments by its amount?—A. Not at all. As I said before, the export of American reed organs is one of the most gratifying features of the business of this country, and is increasing from year to year. The piano-forte business is still in its infancy, but it is growing from year to year. We are ourselves exporting from 300 to 400 pianos annually, our capacity being 3,000 per annum.

By Mr. CALL:

Q. Have you much trade with Cuba in your pianos?—A. Not very much; the buying capacity seems to be pretty much extinguished there; but we sell a great deal to South America, and also to Canada.

Q. What countries of South America?—A. Buenos Ayres, Brazil, Valparaiso; in fact, everywhere.

Q. Do you sell to Mexico?—A. A great many to Mexico; yes.

Q. The Mexicans are a musical people?—A. Very.

Q. I should suppose you would have had very considerable trade with Cuba?—A. We have not had very much for several years. The duty is enormous there, and the money is depreciating.

Q. The duty is very large on American pianos?—A. Very large.

Q. How much?—A. I do not know how much it is, but I know it is prohibitory.

Q. That accounts for it, I suppose?—A. Yes; but it is also the depreciation of their money which acts very much against it.

### THE "TRUCK" SYSTEM OF PAY.

In my testimony relating to the state of affairs in 1850 and to-day, I omitted to say that it was at that time the general system in vogue in manufactories instead of paying wages in money, to give orders on grocers, on clothing firms, &c.—the so-called "truck" system in which, of course, the men were cheated—and they always paid their workmen a great deal in "wild-cat" money on which the men had to stand 5, 10 or 15 per cent. discount. All this has been done away with by the wise money system of the United States, on which there is no loss and no trouble, and the "truck" system has, to my knowledge, been entirely abandoned for a number of years.

---

NEW YORK, *September* 27, 1883.

REUBEN CARROLL recalled and further examined.

### REMEDY FOR OIL MONOPOLY.

The WITNESS. As regards the Standard Oil Company, you asked me what I would suggest as the remedy. I would suggest that the Government should intervene and say to the Standard people, "Hands off. You shall not throttle the men engaged in this industry. All shall have equal chance in the race of life; none shall be handicapped." This might be done by the institution of a suit by the Government. At least, whether successful or not, the facts might be revealed in this manner, and then if our laws are not adequate to deal with the matter others could be framed. The great difficulty in the way is that we are such short-sighted and selfish beings that we overlook the wrongs done our fellows. Could all realize that the great interests of humanity are identical, and that wrongs done to any portion of our people are wrongs done to all, then the wrongs done the oil men by the Standard Oil Company would raise a storm of indignation that would sweep that company out of existence. So with the oppression of other industries; so with the oppression of labor.

### SOCIAL SCIENCE IN SCHOOLS.

Then, to eradicate this short-sightedness and selfishness, I would have social science taught in our schools. Our young men, instead of wasting their time and wearing themselves out pouring over musty dead languages, learning the disgusting stories of the mythical gods, and all the barbarous stuff of the dead past, would be better engaged in having their attention directed to solving the problems of the living present, and they would be led to see and understand that their own happiness and welfare are inseparably joined to and identical with the happiness and welfare of their fellows. Then a Standard Oil Company would be impossible.

We must not pour our vials of wrath upon the managers of this Standard Oil Company. "How oft the sight of means to do ill deeds make ill deeds done." There men are simply using the means within their reach to enrich themselves. They are the result of false conditions. Let us not rail at them, but let us change conditions, so as to make Standard Oil Companies impossible.

What further questions have you to suggest with reference to the Standard Oil Company? I am sorry that I had not prepared myself a little more fully on that point, and persuaded others to come and testify.

Digitized by Google

There are some gentlemen of my acquaintance who have had considerable litigation with the company in endeavoring to obtain their rights through the law, and their testimony would be of great benefit to you. I have no doubt I could persuade them to come if the committee were going to sit long enough.

The CHAIRMAN. We could not at the present time sit longer. There may be an opportunity to take testimony in Washington in the early part of the session, and I am desirous of saving the Government all I can. Perhaps some of them may be there on business.

The WITNESS. Will you be so kind as to let me know if an opportunity of that kind is afforded, because I know a number that will undoubtedly willingly go.

The CHAIRMAN. I think that you can assume that before our report is made, we will hear some others. We should not care for a large number—two or three men could just as well state it all—or if *you* had the information I would as willingly take it from your testimony.

The WITNESS. I have many facts in my papers at home.

NATIONAL LEGISLATION FOR OIL MONOPOLY.

The CHAIRMAN. It is very difficult to see what national legislation could be devised. I suppose the remedy must be largely in the hands of the State; and yet it seems to me that the obvious difficulty is that the Standard Oil Company now has more capital concentrated and is in possession, and that nothing can bring about competition except the investment of something like a corresponding amount of capital, and that is attended, of course, with a great deal of delay and a great deal of difficulty, by reason of the Standard Oil Company being an obstacle in the way of a new line which did not exist when it was itself established.

The WITNESS. They have made a great deal of money. They have millions at their command, and it is simply nonsense for a few individuals to fight them. The only remedy is the strong arm of the Government. There is no doubt about that.

By the CHAIRMAN:

Q. What could the Government do?—A. I apprehend that the Attorney-General might institute a suit.

Q. The Attorney-General of the United States or of Pennsylvania, which?—A. Of the United States.

Q. This company and its operations are in more States than one?—A. Its operations are in all States.

Q. And its pipe lines lie in two States, do they not, New York and Pennsylvania?—A. Yes, and in New Jersey, too.

Q. Then they lie in three States.—A. Yes, and I am inclined to think that they are also in Maryland.

Q. Do you think the company can afford to transport the oil much cheaper than it does? Suppose it had fair pay for the transportation of the oil——

The WITNESS. [Interposing.] Allow me to say that the Standard Oil Company does not transport oil for others, except at a ruinous price.

Q. Has it facilities for any more than it needs itself?—A. Certainly.

Q. It is a common carrier that refuses to carry?—A. It does not refuse to carry.

Q. But it has control of the only practical means of transporting this oil to the factory?—A. Certainly.

Q. Because it has a cheaper method than any other?—A. Yes.

Q. And it refuses to transport for anybody but itself?—A. Except at an exorbitant price.

Digitized by Google

Q. It is a practical refusal?—A. Yes.

Q. You can see an analogy between what that company does and the course of a common carrier in possession of the field, who refuses to carry except at an exorbitant charge, because it owns the only method of conveyance that there is—or what is practically such by reason of its being so much cheaper than any other—and yet, having facilities for increased carriage beyond its own uses, it refuses to accommodate the public at a reasonable rate.—A. Yes.

Q. Is it an incorporated institution?—A. Yes, sir.

Q. Under what State law?—A. Under the laws of Ohio.

The CHAIRMAN. Right there is the point where the National Government or the State government would hook upon it, if anywhere—by the right to regulate common carriers in the matter of transportation. It is interstate commerce, and your remedy is in that direction, in my opinion, and I do not see any practical remedy in any other direction.

The WITNESS. You asked me before whether they were affording the refined article within reasonably moderate prices to the public. I told you they were. But under present conditions, there being a great deal of surplus oil above ground—oil being plenty—it makes it necessary for them to sell cheap in order to have sales. Supply and demand come in there. But we have no assurance that they will continue any great length of time, and of course the Standard Oil Company will take advantage of circumstances, and there is no telling when; whenever they can make money by it in their sales.

Q. What other light is there that can compete at all with kerosene?—A. There is not any that can compete with it in cheapness.

Q. Do you imagine that the electric light will ever develop into that?—A. No; the electric light costs more than gas.

Q. It does now, but is there not a prospective development of the electric light?—A. No; I do not think it is possible to bring it at all to bear so as to compete with petroleum, allowing that the crude oil should be sold within, say, $8 or $10 a barrel, whereas it is now selling at $1.16.

Q. You have not much hope in the direction of the development of oil wells elsewhere?—A. Well, I think not; no. I do not believe that outside of the United States or indeed outside of the present oil region much will be found. Although great efforts have been made, they do not seem to find very much oil elsewhere. They find it in limited quantities.

OIL REFINING AND REFINERIES.

Q. Would it be possible to establish refineries at the wells, and then transport the refined oil?—A. Certainly.

Q. The refined oil is, of course, of very much greater value in the same bulk?—A. Yes.

Q. How much does refining add to the value of a barrel?—A. A barrel of refined oil is worth a little over $4 at the present rate.

Q. That is, at wholesale?—A. Yes.

Q. That is adding about threefold to its value at the well? This transportation and refining give it three-quarters of its salable value at wholesale?—A. Yes; the residuum that is taken from the oil is now being very much employed in dyeing woolens and silks. The finest colors that we have now come from the residuum of petroleum, and is very extensively used. Consequently the cost of refining is not so great. This residuum sells at a pretty high rate, and therefore makes up for the shrinkage to a large extent.

Digitized by Google

The CHAIRMAN. It strikes me that such a figure as a dollar a barrel must be very high for transportation, when the transportation consists in letting the oil run down hill.

The WITNESS. Yes. There is no method that can compare with the pipe line.

Q. The cost of oil after it leaves the wells is simply the cost of transportation and refining, is not that all?—A. Yes; that is all.

Q. What, do you imagine, taking into account the value of the residuum, is the net cost of the refining?—A. I am not practical in that line.

Q. Do you know what refiners formerly obtained for their work?—A. Well, I think I can estimate pretty closely, but I have never been engaged in refining. The refining has been all taken pretty much from that section of country. Cleveland is a large refining center now.

Q. Do the Standard Oil pipes run to Cleveland?—A. Yes.

Q. And to the Atlantic seaboard?—A. Yes.

Q. What are the principal refining points?—A. New York is a pretty heavy refining place, so is Philadelphia. There is some refining done in Baltimore, but not so much as in Philadelphia. Pittsburgh is a pretty heavy refining place.

Q. Does the Standard Oil Company have pipes running to Baltimore?—A. Yes. Cleveland, I think, is the heaviest refining point.

Q. Pipes extend to all these great cities?—A. Yes.

Q. How large are these pipes? They are iron pipes, are they not?—A. Yes, they are iron pipes; 6 and 8 inches diameter.

Q. The expenditure in laying them is very large, I suppose, is it not?—A. Yes, it costs a good deal to lay a pipe line; but it costs comparatively a trifle to run oil to it after you have it laid.

Q. They will not sell oil to refiners at these various points?—A. Oh, a man may go there to the oil region—a man outside of the Standard—and he may get them to transport it, but the cost will eat up all his profits. They have so arranged that.

Q. How many buy it of them?—A. Why, they are absolutely the only dealers in oil there.

Q. But I mean can the refiner at Pittsburgh, Cleveland, Baltimore, Philadelphia or New York buy his oil so as to leave it at these various places where his refinery is?—A. No, sir; they have crushed out pretty much all independent refineries. There were some very heavy refiners engaged in Philadelphia, New York, Cleveland, and all around, in fact, but they have been crushed out and compelled to sell to the Standard at their own prices. They could not compete. The Standard Company has ruined a great many men in that way. Some of my friends have been ruined in that way.

Q. If they had had transportation as cheap as it is to the Standard Company, could they have lived?—A. Certainly they could have lived, and made money. The point was in the transportation.

The CHAIRMAN. If the Government can regulate fares and freights of railroads, or regulate the charges of the Western Union Telegraph Company, which Mr. Gould says they can do, I do not see any reason or principle why it could not regulate the transportation of oil through those lines.

The WITNESS. Most assuredly, I think they can.

The CHAIRMAN. It is an article of interstate commerce, and the lines themselves pass through several States.

The WITNESS. Yes.

Q. Is there anything further you wish to state?

Digitized by Google

GOVERNMENT REGULATION OF TRANSPORTATION AND TELEGRAPHY.

A. There is one little point here that I was going to notice. I notice the statement by some one made before your committee that Government control in telegraphy is contrary to the genius of our institutions. This is certainly true, if by our institutions is meant our great monopolies, but inasmuch as transportation and the transmission of all intelligence enters into the cost of the production of the country and must be paid by the people consuming that production, it certainly is just that the whole people through their Government should have the right to fix the prices or at least be consulted as to the prices they should pay.

PUBLIC PERIL FROM LARGE MONOPOLIES.

But the great cost of our present monopolistic system of railroads and telegraphs is not their worst evil. The power to oppress, ruin, and rob all who oppose their grasping avarice, the power to control elections, to dictate terms to politicians and political parties, is even greater. And that these things are done we have the testimony of living witnesses. Then, saying nothing about the cost, why should the people give away for nothing franchises worth billions of dollars? What have the great railroad magnates done for the people that they should have for nothing that which would sell for countless millions in open market? Competent experts assure us that the plant of the Western Union could be doubled for twenty or twenty-five million dollars, yet you have evidence before you showing that the plant and franchises of the Western Union are worth over a hundred millions. Then the franchises are worth over seventy-five millions. Why should the people give this for nothing?

The Government should exercise the right of eminent domain, and take these franchises from the corporations who abuse them. The public good is supreme; there can be no vested rights contravening the public welfare. There can be no vested rights in wrong.

It is said by somebody that the raising of wheat is something in which all are interested, and that therefore, if the Government should take control of railroads and telegraphs, it should also take control of the raising of wheat. This is false logic, and misleading. The cases are not parallel. In the first place the Government grants franchises for transportation and the transmission of intelligence for the public good, and therefore they should guard those franchises. This makes it a party in interest. They are creatures of the Government's creation, and the Government is responsible for their conduct. But it gives no franchise to the producers of wheat, and is not a party in interest. In the next place, the growers of wheat are scattered over the whole country and could not by any possibility assess a tax upon the whole product as railroad managers can do and have done. The cases are not analogous. But I will not trouble you any more this evening. If I do not get away to-morrow, there are other matters that I would like to be heard on.

The CHAIRMAN. There may be opportunity to-morrow. There are several witnesses that are to be here to-morrow, and if you do not get away, drop in.

Q. Has the Standard Oil Company any patent on its method of transportation?—A. Yes, it has innumerable patents. It has a patent on almost everything, and in fact almost patents on its men.

Adjourned.

Digitized by Google

NEW YORK, *September* 28, 1883.

The committee met at 10 a. m.

JOHN W. BRITTON sworn and examined.

By Mr. PUGH:

Question. You reside in this city?—Answer. Yes.

Q. You understand the subjects of inquiry before this committee, do you?—A. Yes, sir.

Q. We have called you before us to get your information and opinions on the subjects embraced in the resolution of the Senate under which we are acting. You have read the resolution, I suppose?—A. Yes.

Q. Please state what opportunities you have had to acquire information and to form your opinions.—A. If you ask me any questions on which I don't happen to know anything I want to have the privilege of expressing my ignorance; I do not want to talk about anything that I do not understand.

Mr. PUGH. Make such statement as you think proper, taking your own time, and doing it without regard to questions from the committee, at least for the present. Give us such information as is in your possession.

The WITNESS. I will say that I have been a worker for forty-eight years. I have been an employer for thirty-five years. I am a carriage-maker, and a member of the firm of Brewster & Co., Broadway and Forty-seventh street. In that connection I will also state that I am president of a savings bank. That only bears upon the question as showing the fact that I come in contact with a different class of labor from that employed in my own establishment. Having been a worker myself, I have mixed with working people, and I know them pretty thoroughly. The mechanical classes, however, I am better acquainted with, because all through my mature life I have been in constant communication with them, chiefly, however, as an employer. The common laboring classes, except through my observation at my bank and in other positions, I know very little about. We employ over five hundred hands, of whom perhaps four hundred may be called skilled workmen; the remainder may be safely put down as laborers. The four hundred are about, I fancy, of the average intelligence of the mechanical classes throughout the country engaged in the various industries. I would like to say that, while I do not believe that the laboring classes can be largely benefited by any legislation, I believe that this investigation is in the right direction. I believe that the time has arrived when the attention of the employing classes must be drawn to the condition of the laboring and mechanical classes. Public opinion, in my estimation, alone can reach this subject.

### EFFORTS TO HARMONIZE CAPITAL AND LABOR—AN INDUSTRIAL ASSOCIATION.

About a dozen years ago my attention was attracted by the efforts made in England to harmonize capital and labor, and I read up all the current literature relating to that subject. And it seemed to me that I had discovered the reason why these industrial associations, which are a species of co operation, were not successful, and I conceived the idea of trying it in our establishment. That was, I think, in 1868. I called

Digitized by Google

delegates from the different branches of our business and held several meetings, and discussed the propriety of adopting an industrial plan by which every man and boy in our business could share in some degree the profits of the firm.

When I found the proper committee I appointed them to meet me. We organized, and they elected me chairman. We spent the winter of 1868–'69 in devising a plan by which our business could be carried on with the assistance of our employés; that is, the hearty co-operation which always comes when a man is working for himself. In order to reach all the information that we could, a subcommittee was appointed to correspond with the leading men of England in this particular effort to harmonize labor and capital—among others, Mr. John Bright, Mr. John Stuart Mill, Mr. Thomas Hughes, Mr. Ludlow, and all the advanced men. Mr. John Bright wrote us a very interesting letter—very valuable in that it convinced me that he was all wrong and that that was the reason why the English efforts had failed of success. Unfortunately he marked the letter "private," but that letter would have done a great deal of good had it been published broadcast, because Mr. John Bright has a popularity in this country that is something marvelous. We finally treated all the letters as confidential, inasmuch as Mr. Bright had marked his letter "private." The committee had given him the idea of our plan, and Mr. Bright said that it was worthy of commendation except in one particular, and that was that we shared with the men before we gave to capital its fair interest. I think the English mind runs to that more than to any other notion—the matter of interest; that capital has some special right to be paid before anybody else. There was one other point that he criticised unfavorably; that is, that the firm were to do their work without salary, they taking their profits, and the interest on their capital after the men had shared in the net profits of the business. He said that skilled men and men who had the power of management and of conducting affairs should receive liberal salaries before the rank and file had received theirs—these men being owners of the capital.

We discussed that matter in committee; and I will tell you here, gentlemen, that a half dozen men from a force at that time numbering less than four hundred—a half dozen men picked out from the various branches of a business like ours will show you an amount of wisdom and intelligence that will surprise most employers. The difficulty is, that employers look upon men who work for their daily wages as inferior people. I have in my employ men who can teach me.

By the CHAIRMAN:

Q. What in?—A. In general knowledge of affairs, not in the particular business, but in the proper treatment of social questions—as to what a man working for a living is entitled to, and what he is not entitled to, &c.—men who study the subject—men of good habits, who spend their leisure hours in reading and study.

Q. Do you mean that they have a good understanding of the duties that appertain to an American citizen, generally?—A. Yes, sir, excellent. We have men in our establishment that can make themselves interesting to lovers of art, for example—who take up the subject of art and study it. We have men who have studied chemistry, who have studied physics, who have studied all branches which tend to make up an intelligent and useful man. These are, of course, among the better class. That is the class that I came in contact with in this committee,

Digitized by Google

and we formed a constitution and embodied in it what I believe was the very essential thing in order to make our scheme a success where the English had failed—that was, that capital should not receive its reward until the men had received their share of the profits of the business; let capital take its chances with the remaining portion; providing, of course, that the men did not get too large a share—that the chances for capital were fair and good.

I argued that people who received a share of their daily earnings above their labor would naturally take a greater interest in the affairs and success of the firm. I found that to be absolutely the fact. I found also, that in making a very liberal constitution to govern this association, no advantages were taken, in the three years of its existence, of these liberal provisions. I believe that men who have power given to them voluntarily—a power that is not given under threats of strikes and other things of that sort, would not, even among the mechanical classes, take advantage of the power placed in their hands. I believe that the average workman is striving harder for the thing that is hard to get than the thing that is easier to get, and that when he finds power placed in his hands he is satisfied to exercise it in a reasonable manner, but when he has to fight for it and gets it as the result of a fight, he is perhaps as dangerous then as are the higher classes when they get power. When this constitution was published in several of the papers of the city of New York and throughout the country we received letters from the capitalists and others, saying to us: "You are spoiling the working people; you are putting ideas into their heads that will make them hard to manage." Some of our customers ventured to come in and remonstrate with us. They said, "This is a danger to capital." We kept on, however, for three years, until June, 1872, when, if I remember aright, we had a great strike in New York, with a demand for eight hours as a day's labor. My partners were absent from the city, and I was president of this industrial association. I was lying on my back, unable to sit up even in bed, and the men were without leaders. They were crazed by the excitement out-of-doors. They finally held a meeting and appointed a committee, asking me to agree to make eight hours a day's work. I said to them, "Go back and vote eight hours a day and that will make it legal. I cannot make it eight hours a day, because I put these questions into your hand." They went back and would not take advantage of the position to vote eight hours a day. I stated to this committee my objections to it and that I did not believe in it. I was waited on by this committee three times in twenty-four hours, and finally they said that they could not prevent a strike unless the eight hours were given; that if not given there would be sure to be a strike. I said to them on the last of these occasions, "Your dividend, which will be $10,000, will be due within thirty days, and if there is a strike that dividend will be confiscated." They said, "We have considered it, and to-morrow the shop will strike." Four-fifths of them did strike, and were out four weeks. They then came back, having lost $9,000 in wages and forfeited their dividend, which, it was afterwards ascertained, would have given them $11,000—the dividend alone. That was after three years' experience in this industrial association. We had paid each year a little more; we had increased the profits of the business, and we had found in that three years' experience that there was hardly a decent man in our place who did not take hold and do his best to advance the interests of the firm. There was no power given to them that they abused; and it convinced me that the mechanical classes are just as reliable as any class of our citizens, no matter what

Digitized by Google

their social condition may be. I leave with the committee a copy of this constitution of the association. It is as follows:

*Constitution of the Brewster & Co. Industrial Association.*

Whereas Messrs. Brewster & Co., of Broome street, New York City, carriage builders, have proposed to their employés that at the end of each fiscal year, viz, on the 1st day of July, said firm will divide a sum of money equal to 10 per cent. of their net profits in their Broome street factory and Fifth avenue warerooms, during the year then ending, among certain of their employés, in proportion to the wages earned by them respectively, and in addition to such wages (the persons so to share in said sum to be determined by the employés of said firm); and have also proposed that, in determining the amount to be thus divided, the members of said firm shall make no charge for their services, nor for interest upon the capital invested in their business, and that the business of each year shall stand by itself and be independent of that of any other year.

And whereas the next fiscal year of said firm does not begin until July 1, 1870, but said firm have proposed to inaugurate the above plan as of the date of January 1, 1870, and in July, 1870, to divide a sum of money equal to 10 per cent. of their net profits in their said Broome street factory and Fifth avenue warerooms (to be determined as above mentioned), for the year then ending:

Now, we, the delegates elected by said employés to confer with the members of said firm, with a view to adopting measures suited to the above proposals and calculated to promote the general interests of said employés, and to insure greater harmony among them, do, on behalf of said employés, ordain and establish this constitution for the—

BREWSTER & CO. INDUSTRIAL ASSOCIATION.

ARTICLE I. There shall be a board of governors for the shop at large, and a board of control for each department.

ART. II. Said employés shall be divided into seven departments, as follows, viz:

Department No. 1 shall consist of the heavy smiths, light smiths, and finishers, each calling to be represented by one of its own members in the board of control.

Department No. 2 shall consist of wheelwrights and carriage-makers, each to be represented by at least one of its own members in the board of control.

Department No. 3 shall consist of the jobbers, cleaners-off, filers, and platers, and the first and second floors shall have two representatives, and the third and fourth floors one representative in the board of control.

Department No. 4 shall consist of the heavy trimmers, light trimmers, and stitchers, and each shall be represented by one of its own members in the board of control.

Department No. 5 shall consist of heavy body-makers and light body-makers, and each shall be represented by at least one of its own members in the board of control.

Department No. 6 shall comprise the body-painters alone.

Department No. 7 shall comprise the carriage-part painters alone.

ART. III. The boards of control shall have three members each, who shall be chosen by the members of their respective departments, one of whom shall be designated by the president of the association as chairman, who shall serve one year (but the persons who shall serve as chairmen of the several boards of control and as *ex officio* members of the board of governors for the year beginning on January 1, 1870, shall be designated by the chairman of the delegates who have ordained and established this constitution); the remaining members of the board of control shall determine by lot the duration of their respective terms of office; one shall serve three months and the other six months. In case of a vacancy, an election for the unexpired term shall be held within a week after its occurrence, on the order of the chairman of the board of governors.

ART. IV. The boards of control shall carry out and enforce in their respective departments all rules and regulations made by the board of governors; and at each monthly meeting of the latter the chairmen of the boards of control shall report in writing the working condition of their respective departments.

ART. V. The board of governors shall be composed of the chairmen of the boards of control and the representative of the shop at large, in article VIII mentioned, and, within one week after the board of governors have been designated, as provided for in article III, they shall elect one of their number as their chairman, who shall serve six months as such, and, while acting as chairman, shall have no vote except in case of a tie, and they shall choose their other officers, whose term of office shall be six months; also a chairman *pro tempore*, in the absence of their chairman. They shall also, within one week after their organization, elect a president of the association from among the members of the firm of Brewster & Co., and he shall serve one year until his successor is chosen.

Digitized by Google

ART. VI. The board of governors shall assemble once in each month, or oftener, if the president of the association or its chairman shall so direct or a majority of its members request it. Five shall constitute a quorum for the transaction of business. The secretary of the board shall receive a salary, the amount of which shall be fixed by the president and by him be paid quarterly.

ART. VII. The board of governors shall have power to make rules and regulations for the shop.

Every resolution or measure of any kind which shall have passed the board shall, before it becomes binding upon the association, be presented to the president; if he approve he shall sign it, if not he shall return it with his objections in writing, or with a verbal statement to the board at its next monthly meeting, and the board shall then proceed to reconsider it; if, after such reconsideration, two-thirds of all its members shall vote to pass it, it shall become binding notwithstanding the objections of the president; but in all such cases the vote shall be determined by yeas and nays, and the names of the members voting for as well as those voting against it shall be recorded in the journal.

ART. VIII. The board of governors shall, within one week after its organization, elect as a representative of the shop at large, a member of the association having a general knowledge of the business of the several departments, who shall serve six months as a member of the board, and have all the rights and privileges of any other member of the board.

ART. IX. All persons employed in the factory shall have the right to vote, except clerks, salesmen, boys, porters, apprentices, cartmen, and persons under instruction in any of the departments, and all questions as to the *status* of any person or persons not directly employed in mechanical labor, shall be referred to the firm of Brewster & Co., whose decision shall be binding on the association, and on all the boards.

ART. X. A member of the association to be eligible to any office therein must be twenty-one years old, a skilled mechanic, and have worked in the factory not less than six months; and any question as to whether an employé shall be ranked as a skilled mechanic, or a laborer shall be decided by Brewster & Co.

ART. XI. Neither this association nor any member thereof other than its president shall have any voice or authority in the management of the business of Brewster & Co., nor shall this association, nor any member thereof, have the right to bring suit against the firm of Brewster & Co., or any member of said firm, in any court of law or equity, to determine or recover the amount of any share or shares in the moneys mentioned in the preamble of this constitution; and it is expressly understood that the wages agreed to be paid by Brewster & Co. shall be a full compensation for all services rendered by any member of this association while an employé of Brewster & Co.

ART. XII. Any member who shall voluntarily leave the employment of Brewster & Co. (when full employment is offered by them), before the close of any fiscal year, without the written consent of said Brewster & Co., shall receive no share or portion of the moneys mentioned in the preamble of this constitution, but the share of such moneys proportioned to the wages earned by said member during said fiscal year shall be paid into the treasury of the benevolent fund, to be hereafter established by the members of this association.

ART. XIII. Any member who may be discharged from the employment of the firm shall, notwithstanding such discharge, at the end of the fiscal year, receive the share of the moneys, in said preamble mentioned, proportioned to the wages earned by him during said fiscal year, provided such wages amount to the sum of $200; and all shares in the moneys in said preamble mentioned, not called for within six months after they are declared shall be forfeited, and paid over to the benevolent fund.

ART. XIV. This association may be dissolved at the close of the fiscal year, after July, 1870, or within 30 days after such close, either by Brewster & Co. or by a two-thirds vote of the members thereof, taken by tellers appointed by the board of governors.

ART. XV. All persons employed in the factory and salesrooms of Messrs. Brewster & Co. shall share in the moneys mentioned in said preamble ratably, in proportion to the wages earned by them respectively, except heads of departments and contractors who realize a profit on other labor than their own, and such other persons as shall have an interest in their business through private contract with the firm, but these exceptions do not include smiths, who employ helpers and finishers to aid in the work of one fire; in such cases, the wages earned by their employés shall be deducted from the amount paid to them by the firm, and the balance shall be considered the wages of their individual labor.

ART. XVI. All fines imposed and collected under the by-laws of this association shall be paid over to the benevolent fund, in Article XII mentioned.

ART. XVII. All complaints against the working management of any department shall be made by the president to the chairman of its board of control; and, if such complaints are not properly heeded and a remedy applied, he shall then report the matter in writing to the board of governors for action.

Digitized by Google

ART. XVIII. All charges against officers of this association (except the president), of neglect of duty, or violation of any of the laws or regulations, must be made in writing to the president, who shall lay them before the board of governors, and within ten days thereafter (unless a regular meeting is to take place within fifteen days); the chairman shall order a special meeting of the board to investigate the charges, and the accused shall be summoned to appear before them in his defense. If adjudged guilty the board may remove him from office, or inflict such a fine as in their opinion would be just.

ART. XIX. Any member of this association, other than officers, who may violate any of the laws or regulations of the shop shall be complained of to the chairman of the board of control of his department, who shall investigate and report the facts as ascertained to the president, who shall take such action as the case may seem to demand or refer it to the board of governors, as he may elect.

ART. XX. Any member of this association who shall make a false and malicious charge against a fellow member affecting his standing as an employé of Brewster & Co. shall, upon good and sufficient proof, be fined or dismissed from employment by a vote of the board of governors.

ART. XXI. The terms of office of those first elected as officers either of this association or of any of its boards, and the official terms of the members of said boards, shall be deemed as beginning on the first day of January, one thousand eight hundred and seventy, and all officers and members of the board of governors and of the several boards of control, shall hold over and continue to serve as such officers and members until their successors are respectively appointed or chosen.

ART. XXII. The foremen shall exercise authority in their respective departments, in behalf of the firm, when no member of the firm is personally present.

ART. XXIII. A proposition to amend this constitution must be presented by the board of governors to the president; and, if he approves, a copy of the proposed article or articles shall be posted in each department for a period of ten days, after which the board shall proceed to vote upon it; if two-thirds of all the members thereof shall vote in favor of it, it shall then become a part of this instrument.

| JOHN D. GRIBBON. | THOS. SEDGEWICK. |
| ALPHEUS E. FERRIS. | SAMUEL LYON. |
| EDWARD ROWE. | HENRY S. WHITNEY. |
| JOSEPH F. SCANLON. | RICHARD COLEMAN. |
| JAMES HAGGERTY. | JACOB KRUMMENAUER. |

The WITNESS. By their own act the men broke up this association. They believed that we would eventually reinstate it; but we have never done so. If a large body of our men should ask for it we would do so, but having confiscated the money to redeem our losses, and having told them frankly in advance what we would do, it would not be becoming in us to offer the plan again. Of course there is no plan that, tried as that was for the first time, might not be improved upon. There may have been little weaknesses in the plan of organization which could be avoided in another. But I believe to-day that with the experience and observation had here and abroad, while ordinary co-operation is a failure, this species of co-operation, giving the management of the business entirely to the employer, but giving the shop-management up to the men, is one of the plans which, one of these days, will be adopted for harmonizing the interests between the shop and the office.

### MUTUAL BENEVOLENT ASSOCIATION.

After this we established a benevolent association, somewhat after the plan of a gentleman who was before you the other day, Mr. Storm, in order that the men might have some reliance in case of calamity—as of sickness or death. That association has been in existence for twelve years. The firm gave it, as a capital, $1,000, and they agreed to give to the association one dollar for every dollar that was put into the treasury of the association, in the shape of dues, by the men. I cannot say just how much balance there is to-day in the treasury, but I fancy that the amount is somewhere between $2,000 and $2,500. It has been a perfect success for a dozen years.

## THE CONDITION OF THE MECHANICAL CLASSES.

The condition of the mechanical classes is a subject which has received much attention and created much interest here. They are called the laboring class, generally, but I make a distinction between the mere laborer and the skilled mechanic.

By Mr. PUGH:

Q. Do you mean the skilled mechanic employed in your business, or do you mean the skilled mechanic generally?—A. I mean the skilled mechanic generally, but of course you understand that I have a better acquaintance with those in my own business than with other mechanics, but I have a general acquaintance with the condition of mechanics in other trades.

## RUM AND TOBACCO AS FACTORS IN THE LABOR PROBLEM.

A gentleman here within a few days has attributed most of the misery attending the life of the laborer in this country to rum and tobacco. While I think there can be no question that rum and tobacco are very serious detriments to the laboring and mechanical classes, it must also be said that they are detriments to the higher classes. In reading the testimony given before you it would be generally supposed that the only people who drink are the laboring and mechanical classes; and there has been an enormous sum named as the probable consumption.

Mr. PUGH. Four hundred millions of dollars per annum.

The WITNESS. Yes. When a man gets as deep in figures as that he is liable to make a mistake of a few cents. I do not believe that this is the prime and only cause. We have about five hundred men, and I do not think—although drunkenness is a crime in our place—that we discharge three men in a year for drunkenness, and I do not know that our force is of a better class than those in our trade generally. I think that, perhaps, it is a little above the average of the entire mechanical class as I have known it; but it is of fair average quality with our trade in this city and other cities. I think that that is some positive evidence to show that rum-drinking and tobacco-chewing is not a universal evil. Perhaps the employer can aid somewhat in inducing temperate habits among his men; he can give preference to the temperate man when he is hiring his men, and he can have such rules in his shop as will prevent constant drinking in working-hours. There is only one concession that we make in regard to drinking. The Germans are perhaps one-third of our force, and, with their meals, the Germans must have their beer. They have been brought up to regard it as a part of their food, and so we allow them in the noon hour to bring beer into the shops in kettles. But at no time are spirits allowed to be brought in, and to bring spirits in is a violation of rule which affords reason for discharge. I can remember twenty or twenty-five years ago when, in our trade, even in our shop, there was a constant sending out for beer and spirits, and it was universally permitted. There is a better plan now among employers. A great many men now look upon that as a great evil and have stopped it. We stopped it many years ago because in our minds it proved a great evil.

## THE DOMESTIC RELATIONS OF THE WORKING CLASSES.

Leaving out the question of rum, and it is debatable whether they do drink as much as Mr. Medill says they do, one of the chief reasons for

Digitized by Google

the misery of the working classes, both the mechanic and the laboring man, is the domestic relation. I have lived in New York and supported a family on a dollar a day; though, of course, a dollar then was equal to two dollars to-day. I know that a man on two dollars a day, if his family is not too large, and if he has a wife worthy to be a wife, can live decently; he cannot live luxuriously, but he can live decently on his income. But my observation is, that the poorer the man is the poorer the wife he gets, so far as her capacity is concerned as to her influence as a wife and mother; the poorer the man the poorer the wife, that follows almost as a general rule. Look at the mechanical and laboring men of to-day; and, under the condition of our social affairs, what sort of wife can he get? If he is a good mechanic he wants for a wife a woman that is not a servant. If he is an American he would like to marry a girl of American parentage, or at least one born here. As a class, however, among the American poor, when girls are twelve years of age they go to work in factories and in places where they are used as helpers and where they learn book-binding and tailoring and various other trades.

WANT OF TRAINING OF GIRLS FOR THEIR FUTURE DUTIES.

They have no opportunity whatever to have any domestic training, and when they are seventeen or eighteen years of age they marry some young mechanic and go to live in a tenement house, where they have but a very few rooms. She is utterly ignorant of all the duties of a wife, let alone the duties of a mother; and I do not care how good the tenement house is, that class of wife will destroy a home at any time; she is slovenly as a rule, she understands nothing of domestic economy. If her husband gets good wages, and she receives them on Saturday night, they are all spent by Tuesday or Wednesday then they have to get a little credit at the grocery store. If she has been to a public school in New York she is taught nothing that is really useful. If the teacher has influence enough she will get a piano and teach the girl music, and that girl leaves the school knowing just enough to read and write; that is, knowing enough to read dime novels and to write letters to beaux, that is all the education she gets; she then goes into a factory, and in five years after she leaves school she becomes a wife and perhaps a mother.

I can tell the condition of the majority of our workmen by standing at the door and seeing them come in on Monday morning; I can tell what their homes are by their general appearance. I can show you good workmen that will leave the shop on Saturday night and bring back with them on Monday morning upon their clothes and upon their persons the dirt they took away on Saturday night. I can tell, without seeing the wife, that the wife of such a man is a slatternly, shiftless woman. She is perhaps a very good woman, but she does not know what the duties of a wife and mother are, and the consequence is that she drags her husband down. Once in a while a woman will come to me on Monday morning and say: "John wants me to come and tell you that he cannot come to work to-day; he is sick." I can see exactly the relation between that woman and her husband. She is a slattern, and he is getting to be so more and more. They both get into the same rut; and the consequence is, misery. The remedy for that it seems to me comes in our school days; let us have less piano and more practical education of women and girls. Let a girl be taught—at the public expense if you please—how to darn a stocking and how to sew on a but-

Digitized by Google

ton; very few of them know how to do that. Let them learn to cook and to scrub—and to do those things well. The unskilled laborer is satisfied to marry a servant out of somebody's kitchen, who was perhaps a peasant's daughter in her own country, and who, after coming here, becomes a servant, and sees a large amount of food wasted every day. Of course, if she ever knew anything of economy she soon loses what she knew; she does not know how to economize food and consequently she makes a very poor wife. She has been in the kitchen all the time. She knows nothing of housekeeping or of sewing; she knows only how to waste food, and she knows that thoroughly. Such women I have had opportunity of observing for twenty years, and I know that they can destroy a great deal of good food, and that, if left to themselves, they will even destroy a good stomach. I know that I am now paying the penalty for bad cooks, yet I have an intelligent wife, too, who has watched over that department as well as others in our household. Who has this poor laboring man to watch the pot when it boils in his house, to see that it is not made destructive to his stomach? That is one of the most prolific sources from which misery comes.

We have nobody in this country to train our girls in these important matters of household economy. In London they are taking that subject up seriously, and are attaching to their public schools cooking schools and sewing schools, so that girls may have some knowledge of the duties of wives and mothers when they marry. I do not know how otherwise it is possible to make the homes of working people better than they are. Unless you can begin at the foundation you cannot make them better. I have known men that have had decent homes which a couple of years of this sort of house-keeping have destroyed. If girls have no early training themselves they do not know how to train their children. That is one of the most serious evils in all communities like large cities.

### THE GERMAN GIRLS.

The German is better off. The man who comes over here with a young German wife has, I think, a pretty big capital to start with as a workingman. She has learned economy from the beginning of her life; her earliest recollections of infancy are of the economies of the household. She grows up with intuitions of economy, and her disposition to save lasts all through her life. I can see people of that class come into the bank of which I am an officer, to make deposits of their savings, instead of their husbands coming there, and losing their time in order to do it. These women come in looking cleanly and tidy, wearing plain but wholesome clothing, and often bringing a baby in their arms. I regard the German women of this country with the highest respect. If they have opportunity they teach our women what the duties of a wife and mother are. And when I have wanted to take boys into my office I have almost invariably taken them from German parents, for they are brought up with respect, first for their parents, then with a respect for property; and they learn habits of economy and prudence, and are faithful in the discharge of their duties. I think all the boys that I have got in my office, and that I have taken from the public schools, are German-Americans. They have been well brought up, and are industrious and useful. I have one such now, a lad not over sixteen, I think, who, after three years' experience, does the work of a $1,200 clerk, and does it better and more reliably, and he is from what, I suppose, would be called the lower German class. His parents have done their duty toward that boy.

Digitized by Google

APPRENTICES.

Let me, right here, say a word of the difficulty we have in getting apprentices. The American is getting to look upon mechanical labor as somewhat detrimental to his liberty, and that spirit has made serious progress within the last ten years. If a boy has any ability, and is particularly bright, he looks upon a trade as so much lost time. He wants to be a merchant, a broker, a banker, or a railway man. The example of that class of men has been set before the boy for the last ten years, and it has set our working classes crazy.

Q. They want "rapid transit" to a fortune?—A. Yes; they won't wait.

One of the great troubles with the boys is their education. I was educated in a public school, and finished my education at twelve.

NEW YORK PUBLIC SCHOOLS.

By the CHAIRMAN:

Q. In the public schools of this city?—A. Yes; I was born within seven miles of New York and came here when I was nine years old, and what I learned I learned at the public school at the expense of the taxpayers.

By Mr. PUGH:

Q. Did you leave school at twelve years of age?—A. At twelve years of age. I was born in 1823 and went to business in 1835. Now, it is hardly modest in me to say it, but the fact is I knew more at twelve—I mean I had a better knowledge of my studies at that age—than the boy of to-day has at fifteen. Every distinguished foreigner that comes to this country is paraded around among our public schools, and we talk to these foreigners in fine English about the beauties of our schools, and we give "taffy" to our school principals, and everything looks glorious, but the fact is that it is disgusting to a man that knows anything about it. I am now talking of the city of New York.

The CHAIRMAN. The same thing is true of all the schools throughout the country. The common schools in my State were very much better thirty-five years ago than they are now. The teaching was better. A boy of fifteen then knew more than a boy does now at eighteen; and boys would remain at school until they were twenty-one, twenty-two, or twenty-three years old. Many boys from the "back woods" left school then knowing something of algebra and geometry and the higher and more difficult portions of arithmetic, and often with some knowledge of the languages. But that is all done away with now; the common school of the rural district is nothing compared with what it was years ago. The self-conceit and vanity of our Northern people over their common-school system, which is a sham as compared with what it was twenty years ago, is one of the most alarming features of the situation throughout the northern part of this country.

The WITNESS. I quite agree with you.

The CHAIRMAN. And the proposition to extend national aid to the public schools deserves serious consideration; for the North really needs it as well as the South. Unless there is some waking up among the Northern people, the schools of the South will, in ten years, surpass in usefulness those of the North.

The WITNESS. I have one son, and I educated him at the public school, believing that what was good enough for me was good enough for him; and at fifteen he did not know as much as I did at twelve.

THE COLLEGE OF THE CITY OF NEW YORK.

On looking into the matter I found that the chief of the school had a pride in stuffing a hundred boys just enough to enable them to pass an examination for entrance to the free college of the city of New York, an institution which is a curse to the city. Whatever else he might be ignorant of, a boy must know enough of certain particular branches to enable him to pass an examination for that college. Fortunately he failed to pass the examination, or else I should have been without a son—there would have been nothing of him by the time he passed through the New York College. He is a member of my firm now, and got most of his education in the office. He left school at fifteen. I gave him three more years schooling than I had, but he did not know as much when he left school as I did when I left at twelve. Yet this was the noted school of the city of New York, for every year it sends more students to the New York College than any other school in the city; it generally sends up about a hundred. The gentleman who managed that school is to-day at the head of the Normal School for Girls in the city of New York, a man of the highest intelligence and of the highest character, and yet, I am sorry to say that I believe he has never understood public education.

I know a public school in the central portion of the city where the principal had political influence enough to keep himself there ten years after he became a drunkard. It is true he was not drunk in his school, but he went to bed drunk at least five nights in a week. The assistant teacher was a man of extraordinary ability, and I suppose the only reason why he stayed there was, that he hoped this fellow would die in one of his debauches. But no one could remove him. Parents begged for his removal, but it was of no use; they couldn't touch him, he had so much political influence. That is a wretched state of affairs. There was a time when, if I wanted boys for my office, I could go to the public school and state my wants to a man that I had faith in, and ask him to pick me out a boy, and I could get one, but I can't do that any more. I can't get such boys; I have tried, and it wouldn't work.

DEMORALIZATION CAUSED BY FALSE EDUCATIONAL METHODS.

If they have any brightness in them they go to the New York College, and want to be lawyers and doctors and merchants and bankers and brokers. They want to live a life of elegant leisure. I know mechanics and others who have strained every nerve to educate their boys in the New York College, so that in their old age they might have some one to lean upon; but when these boys had been educated by the charity of their city and the kindness of their parents, and when they had graduated at the college they did not know their parents any longer, speaking figuratively. They were educated away from their parents, and had lost all sympathy with them. I know a woman who made great sacrifices to educate her girl at the Normal College. She was educated out of sight, and was lost to her parents and to her friends forever. These are serious things, Mr. Chairman. A man who is in active life and mixing with the people in a great city sees every day things that shock him.

With regard to these colleges in the city of New York, the college for boys, as well as the Normal College for Girls; I suppose it takes four or five years to graduate boys and girls out of them. The poor tax-payer who is willing to contribute every year a part of his property to sustain these institutions cannot avail himself, unless he happens to have but one child, of the advantages of the free college; while there are rich

Digitized by Google

people whom I know who send their boy for a year to a public school (which it is necessary to do), in order to entitle them to get a free education from the City College for five years. I think the law contemplates that in public education the children of the poor should receive sufficient education to make them intelligent citizens, to give them a starting-point in life. They should learn to read and write and know what is going on in the world; but to give them a classical education at the expense of the tax-payers is an outrage. I would make a free college a technical school, and I would graduate from that school, after proper instruction, all bright boys who showed an aptitude for mechanics or for useful scientific pursuits. I would have in New York City such a school as the Stevens' Institute, of Hoboken, N J. That is the kind of free college we want here. Then we would produce men prepared for useful callings, and would not be filling the already overcrowded professions; making consumers and not producers. But I suppose it will be the next generation before that can be accomplished.

And if it is necessary to prepare female teachers in our normal college, I would give them that education that is so much wanted, a practical one, so that they can take their places in the public schools of New York, and teach the girls of those schools useful things; things which will fit them to better perform the duties of wives and mothers of our mechanics.

## TECHNICAL EDUCATION.

While on the subject of education I would state that I was chairman of a committee appointed by the Carriage Builders' National Association of the United States, in 1882, on the subject of apprenticeships, and among the duties of that committee was the preparation of an address to the officials having connection with public free education in the United States. That address was issued in large numbers to these officials. With the permission of the committee I will read it:

*To officials and official bodies in the United States having the supervision of public education:*

The Carriage Builders' National Association of the United States, in behalf of the industry represented by them and of other mechanical industries of our country, beg leave to call your attention to the necessity of some change in the course of study in our public schools that will prepare those who intend to become apprentices in trades and mechanical pursuits requiring a high standard of taste and skill.

This association, having recently established in New York City a school for the advancement of technical knowledge among the apprentices and young mechanics of our trade, have at the outset been met with the serious obstacle that very few of the pupils, although they may have attended the public schools of this and other cities, have had any instruction in free-hand drawing and geometry, so necessary to all who wish to engage in the higher mechanical pursuits.

We are well aware that the studies above referred to are included in the ordinary school course in many of the cities and towns, but we beg leave to call your attention to the fact that boys intending to learn trades leave school earlier than those intending to follow the professions and other pursuits, and usually before reaching that part of the school course in which free-hand drawing and geometry are taught. Thus they are deprived of the very studies which they specially need to make them skilled and intelligent mechanics.

Your attention is further called to the fact that the advance already made in the mechanical arts in this country calls for a higher standard of taste and skill than heretofore, and there is every evidence that a still greater demand for skilled workmen will arise from year to year in order that in our rapidly increasing production we may successfully compete in the markets of the world with the manufacturers of other countries. At present we are dependent in a great measure upon artisans educated in their trades abroad; but the number of this class seeking our shores for employment is lessening every year, and has almost entirely ceased in many of the

Digitized by Google

trades calling for the highest skill. The lack, too, of any well established apprenticeship system in this country precludes any relief in the near future from that source.

We therefore deem it highly important to reinforce the ranks of the mechanics by a system of public-school education which shall earlier fit boys to enter into trades, with some assurance that their preparatory studies are likely to assist in making them intelligent and skilled workmen.

WILDER H. PRAY, *New York.*
GEO. W. W. HOUGHTON, *New York.*
JOHN W. BRITTON, *Chairman.*

*Committee of the Carriage Builders' Association on Technical Education,*
1581 *Broadway, New York City, March,* 1883.

That was the circular issued by this committee appointed by the Carriage Builders' Association, an association which has existed for some years. As I have remarked, a large number of these circulars were issued and addressed to people having charge of the educational interests of the country, and who ought to be interested in the subject-matter of the circular, because they are paid for their services as teachers; but we received, I think, only six or eight responses. No one seemed to take the slighest interest in the subject. It would probably have been very different if we had issued a prospectus of a new gold mine or a new railroad to be bonded for four times its value.

We have also issued circulars requesting information as to the laws of the several States and the customs in different parts of the country respecting apprentices. To these I think there were perhaps ten responses. There is one carriage-making center to which we wrote for information on this subject of apprentices—and I am only pointing out now the inattention of the employing class—from which a most intelligent manufacturer wrote us an answer saying, "We have no apprentice system in this State; we have no apprentices; if we want mechanics we draw them from other places." Yet in that very place they are building up a town devoted exclusively to carriage-making; at least, that is the chief industry of the town. The employers are indifferent to their future interests; as long as they are making money now, and for the present time, they are satisfied. I am engaged just now in writing a report on this apprenticeship system, to be presented to a convention that will meet next week in New Haven. I may devote a whole week to the preparation of such a report, and after presenting it, every man goes home and does nothing. You might have a Divine revelation to the effect that that paper contains wise and good suggestions for a law on that subject, but it would not have the slightest effect. The trouble is that we are becoming demoralized. I remember that in the early part of the war many good people were saying, when the men were marching to the front, "What shall we do when all these soldiers come home; they will be so demoralized in the army?" The fact was, however, that it was the people who remained at home that got demoralized. We had men from our shops who went into the army who came home infinitely better than when they went; common soldiers, too They had learned—what the average American needs more than anything else—they had learned discipline.

Our schools need discipline. We are the great American nation, but we don't seem to profit by what other people have learned and practiced for centuries.

When I want boys of peculiar skill of whom to make draftsmen, I have to go to a public school at College Point, Long Island, which is

Digitized by Google

under German teachers. These German boys have had, perhaps from their infancy, some ideas of art given to them in a rude way, and at this school in College Point they get free instruction under German teachers. Why, in the kindargarten school at that place, as soon as little children are able to toddle a slate and pencil are put into their hands, and they are taught the rudiments of drawing, and when a child—or, for that matter, a man—learns to draw a line of beauty he has elevated himself, and has more respect for himself. I know some mechanics—good mechanics, too—men who work well with their hands but have never learned to use their brains, have never learned to draw—who cannot take up a drawing and work from it in their own trade. Not having been taught drawing, they cannot understand it. I know a gentleman who built an elegant country house within 40 miles of New York City; he wanted a fire-place, to be built of brick, and he had working drawings for it, but he could not find a man in the county who could understand the drawing. They had never been taught even the simplest rudiments of that important branch of a mechanic's trade. I would make every boy and girl that received a public education learn to draw. In this country the mechanic is the superior in working power of the mechanic abroad. But compare him with the Frenchman. The Frenchman is instinctively an artist. He may only be a laborer, but he has the intuitions of an artist. Why is it that Paris supplies the world with things of beauty? Because for fifty years the French Government have seen that the people get the sort of education that will make them more efficient, and will make them earn more for themselves and for the nation. Of course, under our form of government we cannot do that, but what the Government do in France the people should do here. London is now waking up and following Paris. New York is doing but very little in that direction.

I know a technical school here that is now higgling as to whether they will pay $2 or $2.50 a night for the employment of a competent teacher, because they have not the money in their treasury. Yet New York is full of millionaires whose property is here and who have the highest interests in educating the masses of the people and making them feel better and more contented. They stand aloof and do not come to the aid of such institutions. When a subscription paper is presented with a request for a subscription, one man will say, "Certainly I will give you $25," instead of saying "$2,500." That would be enlightened self-interest, for these things enhance the value of men's property. But we have made money so rapidly—at least we think we have—that there is an indifference to everything but money-making. We have no parental government, of course, and so, when the citizen lets things go as they will, there is no help for it. In Germany the Government believe that it is under a moral obligation to look after the interests of the workingmen. In the absence of that spirit in government—and I do not want to see that sort of government established here—the citizens must be awakened, and every man must do his duty. At this public school at College Point they have a room set apart called the mechanical classroom, where, every day, boys learn the principles of drawing and of geometry. Why, if a boy understands something of the principles of geometry and has done something at free-hand drawing—even in a rude way—when he comes into our wood-shop to learn a trade it is equivalent to two years' experience to him. I can bring a hundred people of experience and intelligence who would be willing to come on the stand and tell you the same thing.

## CLASSICAL EDUCATION.

The kind of education our boys want is not classical education. I believe that the average boy who is sent to acquire a classical education is ruined by the time he gets through with it. If he has any good horse-sense in him it is educated out of him. If he is a boy of great genius, of course you can't educate him to death; he will grow under the pressure; but if he is an ordinary boy, "good-bye" to him. Look at the colleges all over the country. Whenever I find a rich man dying and leaving a large amount of money to found a college, I say to myself, "It is a pity he had not died while he was poor." When young men have applied to me for a situation, saying that they were educated at this or that college, I have had to say to them, "I don't want you, young man; you don't know anything." And when a man thinks that he immortalizes himself by leaving money enough at his death to build a dormitory or a wing to a college, he makes a mistake, for all the fools send their boys there—to their ruin. Of course, I would not destroy all the colleges. I would simply make them better.

By the CHAIRMAN:

Q. You would turn them to some useful purpose?—A. Yes; I would make them better than they are. The best of them now are doing better. Yale and Harvard are recognizing that there is something besides the classics that boys ought to know. When all the colleges recognize that there are modern things which boys should learn in order to fit them for life, the colleges will then be a blessing.

## TECHNICAL SCHOOL FOR THE CARRIAGE TRADE.

In the carriage builders' trade we have been doing something to meet the want of technical education among our young people. We have established a technical school for our own trade, which has been in operation for three years. I worked for several years at every convention of our carriage builders to awaken interest in that subject. Finally we got to Chicago; and I tell you that is the place to start, if you want to raise anything. There is something in the air there that lifts men right up out of their selfishness. As soon as I got on the platform and pleaded for the establishment of a technical school, we raised $7,000 or $8,000 right on the spot, and we started our school. But I will tell you what our trouble is now. There are just two or three people that have undertaken to look after it, and they are obliged to do it. They do their duty as far as they can, but the entire trade forgets that there is such a place. Over and over again we have asked they should send models to us. We send circulars to large manufacturers, saying that our school is established and that we want models for the purpose of teaching our young men by means of practical demonstration; and they put the circular in the waste basket, and we hear nothing more of it. That is the rule. To this, however, there are few notable exceptions. I only mention these facts to show you that we are all a little too indifferent as to our duties; we seem to be satisfied if we can put up a new wing to our shop every year, and increase our business so as to sell each year a little more than we sold last year, and so keep on making money.

Q. How much more intelligent are these men themselves? Do they understand these scientific matters?—A. Well, sir, it will hardly do for me on this stand to criticize my calling, with all these reporters here. I lack this scientific knowledge myself.

Digitized by Google

Q. But what makes this great difference between your attitude on this subject and the attitude of the others?—A. I cannot say that.

Q. What is the reason of the indifference of these men?—A. I cannot say that, without implying that I deserve more credit than others. I do not say that the entire trade is that way, but the great majority of them are; most men are interested first in making money. I am naturally proud of the advancement of my trade. I can remember when a carriage-maker did not amount to much. I can remember that within twenty years a small money-broker with whom I had been in the habit of trading moved into a house across the street from mine, and he was very cool for fear that he would have to associate with me and my family. The small money-broker, with one-quarter of the capital that we employ, feels himself much better than a carriage-maker, and the public recognizes that fact. I can remember that when on one occasion a carriage-maker was elected to a noted club founded by the "blue-bloods"—I don't know how he got in there—it was a matter of the greatest astonishment how he did get in.

ADVANTAGES OF ASSOCIATION.

Now you can understand why I am anxious that my trade should work up into a good condition. I worked for years to establish a national association. I know that in union there is strength. I know that when we established a national association representing seventeen States, and some of us went as a committee representing that association at Washington, the doors were open for us. Formerly when we protested against an injustice which had existed for twenty-five years in New York, our petition and protest was looked upon as nothing, but it was different when we went to Washington representing an important organization taking in the membership of seventeen States. And although the Treasury Department was very busy and could not see us when we went there individually, they managed to see us immediately when we went as representatives of this association. And when we called at the Patent Office, after 3 o'clock in the afternoon, and the office was closed, it made no difference; we went in and were accorded a respectful hearing; and not only that, but one of the committee got a patent on an application that had been rejected by all the former examiners before whom it had come. The examiner of that day, after hearing an examination, gave him a patent, so that the trip was advantageous to that committeeman in more ways than one. That is why I am anxious that our trade should occupy a first-class position. This position cannot be reached by "gas." There must be some good foundation for it. The people who are to come after us in our business—those who are to be the colleagues of my son, who is my partner—must be educated up to the point where they will thoroughly understand and appreciate their business.

CARRIAGE MAKING IN ENGLAND.

Why, the coach-makers of London had the export trade of the world until their heads grew so big that they thought there was nobody else coming, and they have lost that trade now. I was talking once with an intelligent man who sold supplies to the carriage trade of London. He went to the continent on one occasion, and on his return one of the London carriage-makers said to him: "You have seen the great carriage houses of the continent; now, what does London need?" And he said, "a few first-class funerals." Those old people who are stand-

Digitized by Google

ing on the heads of the younger ones, who won't do anything themselves, and won't let the young people do anything, let them get out of the way. When they are out there will not be so many prejudices to overcome. When an American wheel was presented to an English coach-maker, he said, "What do you claim for it?" and on being told "it will last twice as long as your wheel," he simply replied, "I don't want it." So London has lost its trade; France, with her technical schools, has taken it all away from them, because the carriage-makers of Paris are alive to the situation.

Speaking of the apprentice system: If we find an intelligent boy that wants to learn a trade, and he comes to arrange the matter with an employer, the chances are that the boy's mother will come along and say, "We don't get our breakfast until half-past seven, and you must make an exception in James' case." Well, we let her down easy, and simply say "no." A young fellow came into our office some time ago, and said he wanted a place. He was seventeen or eighteen years of age and well educated, and I was surprised to think that he was so willing to go into a mechanical pursuit. I told him he would have to work hard, and be on hand at 7 o'clock in the morning. He said: "I understand that; I will be here early. My mother is well enough off to keep a servant, and keeps one, and I will make the servant get my breakfast in time." He said he had been looking about in Wall street, and had got discouraged, trying to get into a broker's office. He worked with us until Friday night, and then left a polite message to say that he would not be able to come again, as the broker in Wall street who had promised that if he ever wanted a boy he would take him, had sent for him. That is a fair sample of the way things are going.

## HOURS OF LABOR.

I understand that one witness here has stated that the hours of labor should be shortened. I do not think that there is any need of shortening the hours of labor in any of the ordinary occupations of the mechanical classes. There are trades and callings that are very hard work, and exhausting work, and men are at their best when they first go into them, and deteriorate constantly while in them. If ten hours is a fair day's work for ordinary occupations, these men ought not to work over seven or eight. But I think that the general idea that men work too long is fallacious and has no foundation in fact.

Q. How many hour's work constitute a day's labor in your establishment?—A. Ten hours. We have made some voluntary concessions; for instance, on Saturday night we let the men off a little earlier, and in the extreme hot weather we give them a little longer time than usual at noons. That is done voluntarily.

## STRIKES.

Now I should like to say a few words on the subject of strikes. My observation proves that strikes originate generally in large shops and among large bodies of workmen. The question that naturally suggests itself is, why? I have looked into that subject and my answer is, that the man who employs twenty-five or fifty men becomes personally acquainted with them, and if a man in his employ has a grievance he comes to the employer directly and states his grievance. In large shops one man doesn't count, so the men organize a committee, and the committee come to the office. I went through this eight-hour strike in 1872. I was treasurer

Digitized by Google

then of the only employers' association that I ever joined, and the last; and I had an opportunity of getting a pretty thorough knowledge of the workingmen, as well as of the "bosses." And when Anna Dickenson came to me and said, "I want to talk to you about this strike, and you can talk to me freely, because I am on the side of the employers," I simply told her, "Well, I am on the side of the men." I saw the utmost selfishness displayed by the employers in that strike, and I saw workingmen in it that made the greatest of sacrifices for their fellows; and whether they were right or wrong, we must admire the spirit of sacrifice. We burnt gas for six weeks and issued documents by the barrel, and brought leading manufacturers to this end of the country; we had men come in there who used our gas, our paper, and our printing material, and when we assessed them $20 apiece I had to give a man $3.50 a day to collect the money. I was treasurer. Each member of the association was assessed $20 to pay expenses; some of them represented millions of money, and I came short on the collections about $200, which I had to pay out of my own pocket. Yet, another man collected $2,500 to prosecute the strikers. I don't believe that employers, taken as a class, are any better than mechanics.

HOW TO TREAT WORKINGMEN.

I have learned to respect working people, because I have seen so much in them which the people who only look at their dirty clothes do not see at all. I come in contact with the people. I do not hesitate to say to my men, as I did say to them last October, "We have never had but one strike in this shop and we will never have another. I would rather suffer any loss than have a strike. You may make demands on me that are unjust. If I cannot talk you out of them, show you that you are working in the wrong direction, and are killing the goose that lays the golden egg, I will yield rather than have a strike. I won't embitter the shop against the office for the sake of a few thousand dollars." I have a rule in my shop to the effect that if a man has a grievance he comes in and tells me of it, and I do not receive him as if I were the biggest Indian in the world and as if he were of no earthly account. The moment you take away a man's self-respect, he is hard to deal with. You will succeed very much better if you treat him as a man and an equal. In this country all men are equal before the law, and if a man comes to you about your own business, or any other business, for that matter, even if he is a little dirty, he is entitled to fair treatment. I am not in politics, and am not giving the working people any "taffy." I have practiced what I preach.

I can give you an instance of how things should be between employer and employé. Two years ago we were working all piece-work, and we were debating about the future, and so failed to give out the work, and some of the men were waiting for it a month or six weeks. The first thing I knew, we heard that the shop was agitated; that this delay was considered a plan to bring about a reduction of wages. I considered that a great misfortune. Perhaps some employers would say, "That is a good thing; they ought to be frightened once in awhile." I went right up to my men and said, "I have heard the rumor that is about, and I feel very much aggrieved by it. I supposed that the relation between the office and the shop was such that you would not think we would descend to a trick in order to lower wages. When we want to lower wages we will come to you and tell you the reason why we ask for the reduction. Don't ever believe that we are trying to fix things in the office so as to deceive our men." You must always carry out your promise to

Digitized by Google

men; even if you are foolish enough to make a thraet, carry it out; but you must give your men confidence in your honor and integrity; you must have proper relations with them. When there is one man on one side of the fence and five hundred on the other, and the one man has all the money and the others little or none, there is no use going around in grand style, making a loud noise, and getting their ill will. In the first place it is not right, and in the second place it is not profitable. I am not afraid to say publicly here, that I am not afraid of my men, nor afraid of ever having a strike in my shop. I believe in the justice of the workingmen if they are shown that their employer is not going to take any advantage of them.

There are some people who will come to men and tell them that they will have to take less wages or go, and the man says to himself, "I can't afford to be idle; and I will have to take it." We don't do that. There has been no change in the wages of our men since the spring of 1880–'81. Then trade was prosperous, and we raised wages 10 to 12 per cent. without their asking for it. That is the right way to raise wages. I have no doubt that when trade was dull and there was a general disposition throughout the country in our branch of business to stop production, our men have been ready to hear from the office as to a reduction of wages. But I said, "These men didn't take advantage of us when we were doing well; they must have seen that we were making money, and did not take advantage of it nor take snap judgment on us. They have treated us well and we will treat them well." That is perhaps a little bit of sentiment, but sentiment has its important place in any scheme for the harmonizing of capital and labor.

### TRADES UNIONS.

I tell my men I don't object to their joining trades unions. I do not believe in trades unions; I do not believe in giving up to any irresponsible man my right of private judgment. That is the reason I belong to no association. I would not join an employers' association under any conditions. If any among them is fool enough to quarrel with his men I am not going to help him. Let every tub stand on its own bottom. I say to a man that he can join any trade union or association or church or school that he pleases. It is his business.

Some time ago, at Newcastle-on-Tyne, the manufacturing business was prosperous and the workingmen were satisfied with their condition. They had no organization, however. The employers had an organization headed by Sir William Armstrong, the great manufacturer of guns. Ten miles off there was a competitive industry, the chief industry of both places being iron work. The men at the competing point had organized and asked that nine hours be made a day's labor. Their request was granted. When the news came to Newcastle the men there said, "We had better organize and ask our employers for the nine hours." So they appointed a committee and wrote an address to the employers' association, directed to "Sir William Armstrong, chairman." It was couched in respectful language, calling attention to the fact that in a neighboring city the employers had granted to the men the nine-hour regulation, and presenting their argument on the subject and asking that the employers' association would meet a committee of the men. They waited two or three days and then got a letter from the attorneys of the association, who wrote, that by order of Sir William Armstrong, chairman of the association of the employers, they begged to say that the association did not and would not recognize any organization of

Digitized by Google

employés. The men were astonished, and addressed another note beseeching them to grant them at least a hearing, but no answer came to that. Then they struck, and I should have hated every one of them if they hadn't struck. They were out on that strike for twenty-five weeks, until all of the other interests in the town took the matter in hand, and went to the employers' association and said to them, "You must do something to stop this strike; we are all going to ruin." After a good deal of delay and perturbation the employers yielded and met a committee of the men. Now, can you imagine any possible event that could have a worse influence than that upon workingmen? There was a large number of intelligent employers so stupid as to deny the right of their men to organize and do just what these employers had been doing undisturbed for years. That is what causes strikes.

### THE KIND OF EMPLOYER THAT CAUSES STRIKES.

In a strike that took place in 1872, an employer in the brown-stone business stood up in a meeting of the employers and told what indignities he had suffered from his men—and they certainly were great indignities. He and his partner were themselves practical stone-cutters. They had a contract which they were obliged to have completed by a certain day, and they could not get skill enough, in their estimation, to complete the contract in time; so one of the employers took his coat off and went to work with his own hands. Every man in the yard stopped work at once. They said it was taking the bread out of the poor men's mouths. It is hard for an employer to stand that. Another man at this meeting stood up and said that it was a terrible state of affairs, but that it was the employer's own fault to allow that sort of tyranny to grow up in his place. "If a man comes to my office" he said, "and says, 'I want 25 cents more a day,' I tell him, 'The first thing you do is to take off your hat,' he takes it off. The next thing I tell him is, 'Now, you leave; I don't propose to have any man talk to me like that.'" That, to my notion, is the kind of employer that causes strikes. I can show you some of the best employers in New York City who have had strikes in their establishments, but it is owing to the influence of other employers who have oppressed their men and forced them to combine. The just employers have had to pay the penalty of the bad work done by others.

### DISADVANTAGE OF DEALING WITH COMMITTEES OF WORKMEN.

One of the practical difficulties which I have seen in my intercourse with men is, that the business between the workshop and the office is generally done by a committee. That is a most unfortunate thing. The shop has a grievance; the men hold a meeting; it is all debated and rehearsed; a committee is appointed to wait on the "bosses" and protest against it and ask for a change of programme. This committee is naturally selected from among those who believe with the men and favor them. They go down to the office and it is debated there, *pro* and *con*.

Now, I do not care how correct and just the position of that employer may be, when that committee returns and reports to the full meeting what has been done in the interview with the employer, the committee have to garble the account. If they take up the side of the employer, there is a suspicion that they have been bought, and the question perhaps is asked, "How much did you get?" They have got to distort

Digitized by Google

the argument of the boss, whatever it may be. They cannot, and dare not, tell the whole truth. There is no man bold enough to stand up in a shop of 500 men and be under the suspicion of selling out the interest of his fellow men. That is a position that I have never seen any man bold enough to stand. And they are very careful that such a suspicion shall not be aroused. They would rather lie than be supposed to be false to the interests of their fellow men. When we had the strike of 1872, and saw the results, I made up my mind that I would never under any circumstances, make a reply to a committee on any important subject. If it were a question of general advance of wages, or of shorter hours, or or any question of similar supreme importance to both the men and ourselves, I should weigh every word of argument presented by the committee, and I should give it fair consideration, and then I should report direct to the men themselves, so that my position should be thoroughly understood, and not garbled.

By Mr. PUGH:

Q. You spoke of the skilled mechanics in your service who had reached a degree of knowledge and skill in their business that was surprising and exceptional.—A. Yes, sir.

Q. I would like to understand what sort of beginning those men made in your service from which they have reached the position that they now occupy?—A. Well, sometimes these men never advance; while they have an extraordinary intelligence, they are not ambitious; they are rather students, but their influence is good in a shop.

Q. How did they commence in your service—in what capacity?—A. One of the most intelligent men in our shop came first as a helper at a forge. He came from Richmond, Va.—although he was born in the North—and worked in the Tredegar Works. When the foreman in that department of our shop became dissatisfied with the business and left, I immediately put this man into his place; although he was not a full-fledged smith but only a helper. Some of our men left in consequence—because I had promoted this man. If they had all left, it would have made no difference. That man has been foreman of our smith-shop for a number of years; he is a man without any early education, but a good man. He studied some of the sciences and is a man of great intelligence. He attends strictly to seeing that the apprentices in his department get their lessons every day. In the smiths' department the boys are generally without education. The educated "pretty" boy does not want to be dirty. But I think the smith's work is one of the noblest of all occupations. No stupid or dull man can ever make a first-class smith, because a smith has largely to work from his own instincts, and with his eyes. He has not an exact pattern, as other mechanics have, to work by. There is a gentleman in this room listening to this testimony, who has been with us many years, and I think he was one of the committee that formed this industrial association. He was a journeyman before he came with us, and for some time afterward. He became superintendent by our promoting him from the bench, and he is now the chief of our technical school, and has been such for three years. That man has never had any of the advantages that people in a different position in life get from contact with higher classes of persons. He has been a steady worker, and is a natural gentleman, with all the instincts of a gentleman.

Q. What is the general condition of those persons who work for you, in respect to the houses they live in, the food they eat, and the clothing they wear—their general comforts in life?—A. Well, careless, indifferent people drop out from us; they do not become fixed. When business

Digitized by Google

slacks up and dull times come, the dull men drop out and go somewhere else; but our steady force—the men that have been with us for years—are comfortable. When they come to the shop in the morning they show that they are comfortable, and I have been to the living places of many of them, and I know that their condition is very good.

WAGES OF CARRIAGE MAKERS.

Q. Upon what rate of wages have they been able to live in that condition?—A. Well, a man can live in good condition for $3 a day. We have men that earn twice that—very fast and very skillful men, who work by the piece.

Q. Is the labor you employ graded or classified in any way?—A. Oh, yes; in the paint shop it is graded, but rather by ourselves than by the men. There is one branch in which all men are treated alike; it is an error and an evil, but we have never been able to rectify it. It came with us in our organization and it is with us yet. That is, that all body-makers get the same price for their work. I know men who are so conscientious that they are only making one-half what a faster man will make. He is not a better workman perhaps, but he takes great care not to slight anything, and he cannot therefore earn more than half wages. By reason of this man's reliability and steadiness I would give him willingly more than I would give to others; but once I offered to give such a man in the shop 25 per cent. more, but the men objected. They want all to be graded alike. There are a good many singular things that have popularity among workingmen that you cannot very well explain. The man who is entitled, by reason of the excellence of his work, to 25 per cent. more, never makes any effort to make up for his loss in a department like that; he is satisfied to put in his work at the same price as the inferior man. It is a marvel to me, and I have discussed the matter with the men, but they say it has been so long in vogue that it won't do to change.

Q. Do your men work by the piece?—A. Largely by the piece. I think that is the best way. I think that the man who works for himself and has no one to watch him to see whether he does a day's work in a day, or an hour's work in an hour, is a more manly man.

Q. What is the average pay per day of the workingmen in your establishment?—A. We employ men in the paint shop that are hardly more than laborers; they are "rubbers." I suppose the average of the fair mechanic is about $2.75 per day.

Q. Is that any higher or lower than other industries requiring the same grade of skill?—A. No; I think that in the mechanical trades similar ability gets about the same compensation.

Q. I have been so impressed by the extent of the knowledge which you have displayed to the committee, that if you have no objection to tell the committee how you acquired that knowledge I should be glad to know it, inasmuch as you say that you left school at twelve years of age. I am curious to know how you acquired so much information?—A. Well, sir, it was not a rare thing, when I was twelve years of age, for a boy of that age to know a little something. I can remember that there were three hundred scholars in public school No. 7, in Christie street; that was considered a large school in those days, and I was either second or third in ability in the writing class of that school at twelve. Nowadays a boy at twelve in the public school is hardly out of pot-hooks. I do not get a boy from the public school nowadays at fourteen who is much of a writer.

Digitized by Google

Q. A boy at fourteen to eighteen is not in a very mature condition intellectually. You must have acquired a vast amount of information after you left school; and I should like to inquire, therefore, what have been your habits in respect to reading books, and what has been your application to the work of gathering the thoughts of other people?—A. I have never been a student of books; I have taken it right from the fountain head. I have mixed with people, and talked with them and have been a constant reader of newspapers. My first experience with newspapers was with the old Courier, of James Watson Webb. I had an opportunity of reading that paper by accident, after the parties who had it were done with it. I read it faithfully, and I have read faithfully the newspapers of the country since. I have spent very little time upon books, but I devour newspapers. I have a general knowledge of literature, but I do not get it from reading books; I have not had time. I read all the criticisms. I have read the criticisms in the New York Tribune ever since it was published. I thus get a general knowledge of what is going on in New York.

Q. You endeavor to get a knowledge of the daily events of current history?—A. Yes. I would have the newspaper read in every public school if I were "boss" of it.

Q. You have acquired, then, your knowledge by association and personal observation and by reading of the newspapers?—A. Yes, by friction. I like to interest myself in anything that is going on near me.

Q. Could not a young man that had naturally the right sort of qualities make himself, as you have made yourself, without the aid of industrial schools?—A. Well, that is assuming that all men are about alike, but they are not.

Q. You think there is a great difference in men?—A. There is a great difference among men. One man may be without as much power of observation as another man. There are some men even of mature age who cannot cipher a man out in advance of their business with him. They have to wait until the end of the transaction to find out what he is. They cannot look at a man and cipher him up in advance, as other men can.

## SELF-MADE MEN.

Q. Are not our most successful merchants and traders and financial and manufacturing men, and even men in the professions, largely men who made themselves?—A. Yes, sir; I think there is hardly a question of the truth of that.

Q. The self-made men are the leading men in all these pursuits and industries?—A. In a country like this I think that follows generally; but you must understand that we are not now trying to elevate the leading men, it is the rank and file we are talking of. As I said to you, the boy that is taught to make a beautiful curved line is elevated by even that simple thing.

The CHAIRMAN. We are not trying to make the leading men, but common men?

The WITNESS. Yes.

Mr. PUGH. I mean by "leading" men the men that move the world; that give direction to the thought and energy of the country. I do not mean "bosses."

The WITNESS. I understand that. This is certainly a glorious country for opportunity. A man has no stone upon his head here unless he carries it voluntarily. He has a clear road if he wants to go up.

TRADES UNIONS.

I should like to say a few words more on the subject of trades unions. A man once asked me this question: "Do you think that trades unions have been a necessity in England?" I said, "Yes." "Well, why do you think they are not a necessity here?" "Well," I said, "the great choice of occupations in this country will prevent any class from becoming oppressed for any length of time. A man here may be a common day laborer, but if he has the right material in him there is no reason why he should not occupy the best place in the nation. My father was originally a shoemaker, and afterwards a public cartman in the city of New York. That was no reason why I should be a cartman or a shoemaker. But, if I had lived in England and my father had been a cartman or a shoemaker, the chances are that I would be one. When great bodies of men are born and brought up in cities and have not had any opportunities for outside observation, and employers combine to regulate the hours and prices of labor, I tell you that these men are justified in organizing against the employer. But in this country I do not see the necessity. The right is unquestionable, but the necessity does not exist. If a man is oppressed in one occupation, this whole wide country is open to him and he can change his occupation."

By the CHAIRMAN:

Q. The right, then, to so organize being conceded as unquestionable, if you were a legislator and were applied to by those who claim a chance to exercise that right and who ask the same privileges of co-operation that other men have in other directions, you would give them that legislation, would you not?—A. Yes, I would give them the right, certainly. I would not legislate against the right to combine, within the common law. Of course, these trades unions have done things that are illegal and encroach upon the rights of others.

Q. But the business corporations of the country have frequently done, and do, illegal things?—A. Yes.

Q. You would not for that reason deprive individuals of the right of organization on that account, having extended the right to corporations?—A. No, certainly not.

By Mr. CALL:

Q. I understood you to say that there were three hundred boys in the school with you when you were twelve years old?—A. Yes.

Q. How many of those boys have reached the same point of success that you have?—A. As I never reached the highest class of my school, I did not know them all, and I have lost sight of the smaller boys; but I know that some years ago there was a call for a meeting to form an association of the highest class of my school in my day, and I was astonished at the number of men that reached success in life who went to school at the same time that I did, and who were in the higher class.

Q. What was the number; was it very large?—A. Well, the period covered by the call would be perhaps eight or ten years, and would include graduates of the highest class for that number of years. I believe the association was about a hundred; of men in good positions in life.

Q. In a position of life equal to your own?—A. Well, yes; some away above mine. I believe there were some brokers among them.

Q. Do you consider a broker a better man than you?—A. Well, no; "hardly;" but we have had some discussion upon that subject and I have expressed my mind on it.

Digitized by Google

Q. How many of those men that you speak of have built up large businesses?—A. I do not know one that has reached an extraordinary success. I guess that school contained only the dead-levels.

Q. Out of three hundred then, you are the only one that has attained your degree of success?—A. Oh, no. I know one graduate of that school, for example, that is at the head of his business and has a large fortune to back it.

Q. He has a large business?—A. Yes.

Q. This fortune of his was made by him in his legitimate business, was it?—A. Yes, partially in manufacturing, or by skill in the management of his business.

Q. That is one. Do you know of others?—A. Well, I do not know of others that have become of great prominence.

Q. The same degree of success as your own?—A. Oh, I don't want to give these gentlemen of the committee, or the gentlemen of the press who are present, the idea that I am here as a leader. I am here as a worker and a business man. I have a moderately good appreciation of myself, I admit. I suppose you may call me a successful man in the sense that I try to know my own business, and think I know it.

Q. Of those two hundred or three hundred who were at school with you, they all had the same opportunities of reading the newspapers that you had?—A. Possibly not. Mine came, I think, by accident.

Mr. CALL. That is a pretty hard statement.

The WITNESS. Well, my early love for newspapers was gratified, I think, by accident. As a very young boy I was a natural reader, and found this newspaper, and it attracted me.

Q. Which have you learned the most from, from observation (the use of your own faculties) or what you read of other men's sayings in newspapers?—A. Well, I get my suggestions from newspapers.

Q. You do not accept them as established facts?—A. No, sir; I can't agree with the paper that I have taken from the day of its publication, but I can't do without it.

Q. You use your own faculties after reading the newspaper?—A. Oh, yes, of course.

### NEWSPAPERS IN THE PUBLIC SCHOOLS.

In public schools, if I had my way, I would use the daily newspaper as a text-book. The principal should use such parts as are proper, and should read them to the school, and then he should discuss the topic briefly, and if he sees any error in the treatment of the subject he should point that out to the pupils. I think there is no such educator as the press of this country, although I know all its short-comings and wish they were fewer, but there is so much good in the press that I put it very high up.

Q. In the word "press" you mean to include the publication or republication of the best thought and opinion of the world?—A. Yes.

By the CHAIRMAN:

Q. I suppose you recognize that the main objects of inquiries like this should be to fit the mass of men to earn a livelihood by the labor of their hands, and not to become employers and conductors of business on an extensive scale?—A. Yes.

Q. You think that class of men will make their way at all events?—A. Yes; the point is, to better the condition of the working classes of the people.

Q. It is an impossible state of society that the workers should be em-

Digitized by Google

ployers?—A. Yes. For example, one man said to me, "Why do you want a technical school?" I said, "because if I want a draftsman or foreman I want a well-equipped man, and I can't get him in the ordinary workman, unless he has had some opportunities of acquiring knowledge that he cannot get in a shop." "Well, is that the only reason? You could send abroad and get all that in men who have been trained in technical schools already established." But I said, "No; I want the example here. If you turn out from a school a thoroughly-equipped man he elevates the trade. He makes the trade more profitable and important; and the journeyman, the common man, must of necessity share in the general success, because it creates a demand for the goods which he produces by his labor."

AMBITION AS A SPUR TO WORK.

By Mr. PUGH:

Q. There are very few men that have not the ambition to become employers; that is a great incentive to the general worker, is it not, the ambition to become an employer?—A. Yes; when he ceases to have his ambition he is not so good a workman, as a rule. Now, the opening up of new communities—the enlargement, for instance, of our trade—drains us of a lot of our best people. They see opportunities to go into new communities where they will get more rapid advancement. The journeyman that leaves us and goes to a growing Western city is apt to come back four or five years hence as the head of a great establishment. Out there, I think, they rate a man a little differently from here. In a Western city it is not the quality of his clothes, or even the amount of money that he has, that they measure him by. If he is an industrious, pushing man, there is somebody there who will take hold of him. I remember presiding at the convention held in Chicago in 1880, and one of the liveliest debaters on the floor, who gave more real entertainment to the debate than any one else, was a young fellow whose countenance was familiar to me, but I didn't know his name. He was from Oshkosh. After the meeting was over he introduced himself to me and said, "You don't remember me; I used to work for you four years ago." He had gone out there, and having more than average ability was taken right hold of. That is the advantage that new settlements have for ambitious young men. A man goes out there who is a little better equipped than his fellows and he soon goes to the top. There are so many at the top here that there is no opportunity.

Q. The top is very much the bottom here?—A. Yes.

---

NEW YORK, *September* 28, 1883.

JOHN D. GRIBBON examined.

By the CHAIRMAN:

Question. You are in the employ of the firm of Brewster & Co., of Forty-seventh street, New York, with which the gentleman who has just testified—Mr. Britton—is connected?—Answer. I am employed in the technical school.

THE CARRIAGE-MAKERS' TECHNICAL SCHOOL.

Q. I would like to have you give the committee a description of that organization and of the character of the instruction and the practical methods pursued in that school; what you do, who the students are,

Digitized by Google

and in what way you make the institution beneficial to them, and what are its relations to the general work of the firm?—A. The school was established by the Carriage-makers' Association of the United States.

Q. Where is it located?—A. In Thirty-fourth street, near Third avenue, in the school of the Metropolitan Museum of Art. It is in one of the apartments of that association. We instruct young men—apprentices chiefly, it is intended for, but any workman is eligible to be received there. We only charge them $5 entrance fee. They supply their own drawing instruments and drawing boards, and I instruct them in the method of making a working drawing or plan of a carriage with a mode of construction. Generally some young men will be enabled to make a drawing of a carriage complete in perhaps two terms, the term lasting from October until the end of May. Then we exhibit the drawings of those young men at the convention of the carriage manufacturers once a year. We generally have about forty to forty-five students. They come from different States in the Union; Massachusetts, Connecticut, and others. We have one from Wisconsin, a young blacksmith, and one from Dubuque, Iowa. We find that we have made quite a success of the school as far as those young men are concerned.

Q. It is carried on in connection with the business of Brewster & Co., is it?—A. No; it is perfectly independent.

Q. Do you make a carriage?—A. No; we only make the drawings of a carriage; we teach the boys how to make the plans of a carriage.

Q. Like the work of an architect?—A. Yes.

Q. You do not teach the manual use of tools at all?—A. No.

Q. Have the pupils been instructed in that respect at all before you receive them?—A. They must come from a workshop—they must be either apprentices or journeymen.

Q. For how long a time must they have worked in a shop?—A. We receive them after they are eighteen years old. They are generally there for a year or two before they come to the school.

Q. Do you think it better to begin practically at first or theoretically?—A. Well, we can begin with them theoretically at first, and it makes them more intelligent in the use of the tools.

Q. But you do not begin with them until they are actually employed in a shop?—A. Not until they are apprentices.

Q. How many have you there?—A. Forty-four this term.

Q. How long has the school existed?—A. About three years.

Q. Are its numbers increasing?—A. Yes; we first had eighteen, and it is increasing every year and is becoming more interesting.

Q. Do you find any growing inclination among practical employers of workingmen to encourage this sort of education?—A. Yes; they feel the want of it very much, and are very anxious now that I should hurry up these young men in this sort of instruction so that they may take charge of their factories.

Q. I mean any other persons in the country.—A. Yes, sir.

Q. You find a waenking up of employers generally?—A. Yes; all over the country.

Q. How expensive is your school?—A. It pays $1,200 a year, I think, for the use of the room and teachers, and there are certain other expenses that I can't enumerate just now.

Q. One or two thousand dollars, then, enables you to support a school of that kind, I suppose, in the city of New York, having forty-four students?—A. Yes, sir.

Q. It would be a very easy thing to establish schools of that kind throughout the country, would it not?—A. Oh, yes.

Q. There is no intricacy or mystery about it?—A. No, sir.

Digitized by Google

Q. How long did it take you to get your school in good operation?—A. Well, the second year we had it in good operation. We were getting some models and drawings.

Q. You could undoubtedly be useful in the way of suggestion and perhaps in other ways to those who would establish schools elsewhere?—A. Yes, I think so.

Q. Would not these pupils of yours be better utilized in the establishment of like schools than in their employment of actual business?—A. Yes; decidedly.

Q. Is there not, then, an opportunity for them to be so employed—as teachers?—A. I think so.

Q. They may become the nuclei of a diffused instruction of that kind?—A. Yes, sir; one of these young men at his home in Massachusetts is talking of opening a school this winter. From the instruction he has received he feels competent to teach.

Q. Would you not think that in this way industrial schools for the teaching of occupations might be more wisely established than by a public system?—A. Yes; decidedly. I prefer this system.

Q. Each trade feels its necessity?—A. Yes, sir; and each trade could establish its own schools for its own wants.

Q. I suppose if the public proposed to contribute a little it would do no harm?—A. No.

Q. Your teaching is with special reference to the architectural features of carriage building?—A. Yes; the mode of construction.

Q. You do not give special instruction to a man who wishes to be a carpenter, for instance?—A. No, sir; but it would tend to that, because it is instruction that may be said to be common to all such trades—the making of geometrical designs, &c. In fact we have to expect them to understand something of solid geometry in order to enable them to make drawings of carriages.

Q. In what occupations could institutions of this kind be established to advantage?—A. In the carpenters, engineers, and cabinet-makers' trades particularly—trades requiring some nice drawings to work with in order to compete with European work. In the ship-builders' trade, too, it would be particularly useful. I believe that Mr. Scott Russell, of England, was the first who thought of these schools originally. He found the great want of his men was a knowledge which such schools could supply, and previously to that time he had been obliged to send to Germany for all his draftsmen. Since then the Kensington people have taken up the subject, and apprentices in several trades have got their instruction in drawing there.

---

NEW YORK, *September* 28, 1883.

EDWARD H. AMMIDOWN examined.

By the CHAIRMAN:

Question. Please state your residence, business, and the name of the firm with which you are connected.—Answer. I reside in New York City; my business is that of a commission merchant in dry goods, and I am interested in the manufacture of goods.

Q. I suppose you have a general idea of the subject-matter of our inquiry here. We would be glad if you would state to us such views and make such suggestions as you may think useful to the committee or to the country upon the subjects which we have under investigation, giving such items of fact from your experience and observation as you

Digitized by Google

think proper. I will first inquire how large a number of workingmen you have in your employ?—A. I have directly in my employ about five-hundred, and indirectly I have twice as many more, perhaps.

Q. You have been in business about how many years?—A. About thirty years. With regard to the special subjects which the committee have for consideration, I would say—

WHO IS A CAPITALIST—WHO A LABORER?

The expressions "relation between labor and capital" and "between capitalists and laborers," used in the resolution, implies the existence in this country of two classes of persons hostile to each other, and whose relations it is important to harmonize. I doubt whether such classes can be defined by any lines sufficiently marked to permit of legislation concerning them. The laborer is the man who works for daily wages, not subject to or dependent on fluctuations of the value of the product of his labor. The capitalist is the man who employs others to work, and depends for his own living upon the profit he may realize from the results of the labor of others combined with his own. It is evident that these distinctions are not fixed or regular, and that they are more hypothetical than real. The man who employs is himself often employed by others. He is the laborer who by experience or skill is able to combine the inexperienced and less skillful, so as to secure the effect of combination; or who by prudence and intelligence through a series of years has accumulated means to acquire the tools or machines with which he supplies the younger and less intelligent men, to enable them to perform the work for which he desires their service.

The man who receives daily wages may often himself be a proprietor in other enterprises as well as in the business from which he receives his wages. He is then as well a capitalist as a laborer. He may to-day be an owner of the implements of labor and an employer of others, and to-morrow, by accident or preference, be a laborer and work for daily wages. The men assumed to be to-day in one class are to-morrow in the other, and they pass so freely from one to the other, and their relations are so constantly changing that any classification of them seems too uncertain and indefinite to form a ground for practical legislation.

The men of this country may be said to be all laborers, differing in the degree of success which has attended their labors. They are a homogeneous mass with one purpose, advancement in the power to have the pleasures and comforts of life, and security against the distresses of poverty, sickness, and age. For this purpose, and rightly, the laborer who is an employer seeks to employ his men at such wages and under such conditions as will enable him to earn his own living and his industry to prosper. If he fails to do this the men who work for him must soon suffer the loss of employment. The man who is employed, on the other hand, rightly strives to secure the highest rate of wages which his personal qualities and services will command, to enable him not only to get his living, but to advance himself and his family to a higher condition and eventually to secure the advantages which may come from the combination of men under his own direction as an employer.

WHAT REGULATES WAGES.

As the conditions under which this mass of laborers work are constantly changing, as well as their relations to each other, and as the personal qualities of the individuals in the mass differ widely, I do not see how any *direct* legislation can be had respecting wages and the hours of labor which would do more than trammel and hinder the free action of each individual who is best qualified to judge and to protect

Digitized by Google

his own interests under the circumstances in which he may be at any special time. It may be of vital importance that a man should work ten, twelve, or twenty hours per day to keep his family from starvation and pay doctor's bills, or that an employer should seek to keep his men at their work beyond the usual hours for a time to save his business from ruin and the men themselves from the consequences of loss of employment. It is possible that excessive competition will compel the employer to lower the rate of wages, or discharge his men, or on the other hand that the demand for labor in any occupation or at some particular time will enable the men to get increased wages. The more thrifty men may themselves desire to work longer hours if thereby they may avail themselves of the opportunity so afforded for increasing their earnings and achieving a higher position. Direct legislation to determine wages or limit the hours of labor would only prevent the industrious and intelligent from reaping the rewards justly due to their industry and intelligence, and thereby encourage idleness and ignorance. The law, if one could be framed, must be general. It could not be applicable to the infinitely varied conditions of labor and qualities of men, and therefore would inevitably be injurious, and would augment rather than diminish the evils it is brought to remove.

### WAGES IN EUROPE AND AMERICA CONTRASTED.

Respecting the condition of the laboring classes of the United States and their wages as compared with those of other countries, the testimony is accumulating daily and seems conclusive to the effect that on the average the wages here are about twice those of Europe, while the cost of living here—in a corresponding style—is not materially higher. In an intelligent report from one of our consuls in Germany it is stated that in that country "four persons are expected to get a month's food supply for $9.50," and he adds, "the chances of the workingman saving any part of his earnings in this country are very limited indeed." It will not be denied that the American workman who should limit his food supply to $2.38 per month, and his other expenses in the same proportion, would save more than two-thirds his wages. The truth is, the people of this country earn more, spend more for personal comfort and education, and save more than any other people in the world. To deny this is to disregard positive and indisputable testimony from all directions, at home and abroad. Witness the deposits in our saving institutions; but what is even more emphatic, the testimony of our own eyes as we go among the people everywhere about us and contrast their wholesome and contented look and comfortable dress with what you see everywhere in Europe. In England especially we find the greatest distress. Her own writers admit that one in thirty-five of her people is a pauper. The discontent and despair of the workmen is evinced by the continual occurrence of strikes, more than three thousand having occurred since 1870, as compared with three hundred in this country in the same time. Bonamy Price, an eminent authority, tells the workingmen their troubles arise from overproduction. Frederic Harrison, another eminent English authority, says, "What do we all gain if in covering our land with factories and steam engines we are also covering it with want and wretchedness?" The testimony from the continental countries of Europe has been of similar tenor, though of late it is evident that the condition of the people is improving—in other words, that the rate of earnings as compared with the cost of living is increasing. The workingmen of England attribute their growing miseries to free trade. "The signs of a dark and difficult future for England," says an intelligent English writer, "are too numerous and too apparent to be ignored.

Digitized by Google

The sooner we return to protection the sooner England will see her working people once more fully employed." The working people of Germany, on the other hand, attribute the recent improvements in their condition to the policy of protection which has, within a few years, been adopted by the German Government. In this view the greater number of German economists concur.

LEGISLATION CANNOT REGULATE THE DIVISION OF JOINT PRODUCT.

It is difficult to see how legislation can be fairly and effectively applied to determine the division of the products of labor among those who have shared in creating them. It is the same problem as that of regulating wages. The circumstances surrounding production are so diverse and so unstable that a rule for the distribution of the product which would be good to-day would be bad or impracticable to-morrow. At one time an employer might be earning large profits; at another and for long periods together he would earn little or nothing. It is impossible to foresee the results of any business, and the workman cannot wait for results. It has been found that laws fixing the rate of interest are of no advantage to borrowers, and are a disadvantage to the community in which they exist. In the most intelligent communities such laws have been repealed or so modified as practically to leave the rate to be determined by the parties concerned. If, in so plain a matter as this, legislation has been found impracticable, how can we hope to apply it to the infinitely complicated relations of labor and capital, or, I should say, the employer and the employed. We are met by the infinite diversity of human qualities, and this is multiplied by the infinite variety of the conditions under which the employer and the employed are brought together. No direct legislation can reach and cover these conditions or this diversity of qualities.

STRIKES.

"Strikes" have, as regards both their frequency and importance, been very much exaggerated. During an experience of many years, in the employment of labor, in Delaware, Pennsylvania, New Jersey, New York, and New England, I have never had any serious trouble or annoyance from strikes. Sometimes, though very rarely, a group of operative has combined to demand higher wages, but such combinations have always been met by frank investigation of the merits of the demand, and the difficulty usually adjusted without delay and to the satisfaction of all. Occasionally, but not more than three or four times, within my experience, have the combinations been resisted as unjust and unwarranted; but in these cases the strikes were only of a day or two duration, and terminated by the return of the operatives, generally with an expression of regret and the statement that they had been misled.

Strikes would be of very rare occurence but for the mischievous influence of certain discontented persons who are never satisfied themselves, and have pleasure in making their associates dissatisfied. They are of the class known as agitators and demagogues, and are to be found in every community. Their importance and self-satisfaction depend on the extent of their following, regardless of the justice of their cause or the consequences to their followers. In my experience these strike-leaders have almost always been Englishmen, who have left their own country for their country's good, and hoped to thrive here in an occupation in which they had had too much competition at home. They have uniformly been bad workmen, and upon their discharge the disturbances which had previously occurred have ceased. I have found no serious difficulty with fair-minded and intelligent workingmen, or

Digitized by Google

with those who seemed to be willing or able to understand their own interests, or to consider their future as well as their present advantage. From the intercourse I have had with workmen and their representative men I believe they are coming to the conclusion that strikes are, in this country, of no advantage, and that in the long run the interest of the employed is identical with that of their employers, and is not promoted by interruptions of work. I do not therefore believe that any special legislation is needed to prevent or control strikes, and am confident that the existing laws protecting "individual rights," with such amendments as time will suggest, are all that are required to meet every probable emergency growing out of disagreements between employers and the employed.

Strikes, trades unions, and all similar combinations among the employed to raise their wages or dictate to their employers, on the average, do no good, and do not accomplish the purpose proposed. They do not increase wages. They encourage idleness. They also tend to level down the workmen to uniform grades, thereby removing incentives to effort and the rewards of superior skill and talent.

There is rarely any reason in this country for combinations of this kind, either on the part of employers or employed. The natural law of supply and demand will inevitably regulate wages, and no amount of combination will prevent the operation of this law.

As a substitute for such combinations, it would be practicable and much better for workmen and others to combine for the purpose of overcoming the consequences of poor crops, high prices, undue profits of middlemen, and high rents, thereby avoiding unfavorable changes in the cost of living and promoting the comfort and security of their families. The money lost and unprofitably spent in strikes or trades unions might, if wisely directed, do much good in alleviating distress growing out of a temporary rise in prices of provisions, and in securing better lodgings and lower rents.

But the greatest obstacle to the success of such combinations is their tendency to fall under the control of the worst men of the class they are intended to serve—men generally worthless in their business, and conspicuous only for their skill with the tongue. There seems to be no way to avoid this, and so long as it cannot be avoided the usefulness of labor associations is problematical.

## EDUCATION.

In conclusion, I believe that all we require, by way of legislation, to improve the condition of the industrial classes of the United States is the adoption of such measures as will promote the increase of intelligence among them. With increasing knowledge the difficulties and disagreements between employers and employed would be greatly lessened. Their extent is now, I am convinced, much exaggerated, but to hope by any process to remove them altogether is Utopian. The highest authority has said, "The poor ye have always with you." And with extreme poverty often comes, unfortunately, all the long train of human distresses and perversities which all deplore.

The law may provide facilities for education, but how will it make those avail of it who will not? The law may remove obstacles, but many will refuse to improve themselves, though even a penalty were attached to their refusal. The differences in human nature, which begin to appear at the earliest periods of life, will, in spite of legislation and opportunity, continue to exist, and produce the same results as they have always produced; modified, it is true, but never wholly removed by the influences of education, example, and public opinion.

Digitized by Google

### THE FUNCTION OF LEGISLATION.

The success of any legislation to promote the improvement of our industrial classes will largely, if not wholly, depend on the encouragement to improve afforded by the certainty that intelligence and worth will have their reward in the esteem of men, and in augmented comforts of life. So long as men feel that by energy, persistency, skill, probity, knowledge, faithful service, no special advantage is to be had; no more of the pleasures of life, no greater security against the perils of age; no more luxuries and enjoyments for their wives and children, no higher social esteem than those may have who have never exerted these qualities, or never denied themselves the present pleasure for the future good, you cannot look for improvement in any quarter. Legislation, then, must not only facilitate education and remove the obstacles to it, but it must so far as possible make certain the advantages of it. To this end it should discountenance the endless variety of communistic schemes by which a few impracticable and many vicious and idle men seek to appropriate the rewards of the provident and industrious. And as the distresses of extreme poverty dominate all the laborer's physical and mental power, and are an insurmountable obstacle to education, legislation should aim to remove the causes of poverty by encouraging industrial pursuits, and affording to all men an opportunity to use their special talents to the best advantage for themselves and the whole community. It is no more practicable to prevent poverty than to prevent sickness; but legislation may aid in either increasing or diminishing it and thus in diminishing or increasing the general intelligence and well-being of a people.

This it has to some extent done in the patent laws. Our laws in defense of individual rights to property answer the same purpose. These laws protect the deserving against mischievous assaults within our own borders. Men generally concur in the wisdom of such legislation, and while in theory advocating the greatest freedom of thought and action, admit that it must be limited by due respect for the rights of individuals and the public welfare.

### PROTECTION NECESSARY TO THE AMERICAN STANDARD OF WAGES.

But in regard to the protection of our national industries against competition from people in foreign countries working under widely different and inferior conditions, there is a difference of opinion. It seems to me, however, that the most effectual way to promote the improvement of our industrial classes is by so legislating that the American standard of wages may be maintained, and, so far as possible, its superiority increased. That such legislation will unfairly favor the few is disproved by the experience of the past. The advantages of it accrue to labor. Competition at home will limit the profits of every product and prevent monopolies.

The opponents of such legislation object that, by maintaining a high rate of wages, a high cost of product is also maintained, so that American products cannot be exported, and our markets are thereby limited, with overproduction as a necessary consequence. With respect to the difficulty of overproduction the condition of England to-day shows that free access to the world's markets does not prevent it. This objection need not therefore receive further consideration. That a high rate of wages does not necessarily involve greater cost of the product is proved by comparing the cost of labor and products now with the cost of labor and products twenty-five years ago. Labor is now about twice as high

Digitized by Google

and the product costs considerably less. The fact is that highly-paid labor develops higher intelligence in the laborer, permits his education, and stimulates his ambition by offering a chance for improvement. The consequence is the application of greater ingenuity and effort to increase the product and cheapen its cost, so as to secure a greater reward for the work done. The ultimate effect of this application of intelligence to labor is the reduction of the cost of product to a point were it can compete with the product of uneducated labor.

An illustration of this truth is seen in cost of producing cotton cloth in this country, as compared with the cost in England. The plant of machinery and buildings cost more here, but labor per yard costs less, although the wages of labor here are largely in excess of labor in England. The committee of English manufacturers who examined this question a short time since, reported this result, stating that while the English weaver, for instance, tended three to four looms, the American weaver tended twice the number with corresponding increase of product.

Similar illustrations may be found in the watch manufacture, in cutlery, and, if you will refer to the list of our exports, you will find many others, all illustrating the effect of high wages in stimulating the laborer, leading to cheaper processes of production, and thereby enabling the product to compete in foreign markets with corresponding articles made with cheap labor. The cost of labor is every year becoming a less important factor in the cost of the product, and the intelligence of the laborer becoming more important.

During the past one hundred years the labor of civilized man has increased in productive power through the introduction and improvements of machinery probably twenty-fold. Comparisons of the products of labor at different periods show this, and we may fairly conclude that with the application of greater intelligence to the discovery of new and better methods, labor will become more productive and continually diminish in importance as a part of the cost of production. Past experience proves that as labor is more productive its value rises. This is natural, as it yields greater results, but this rise in the value of labor is expressed not only in increased wages, but also in their enlarged purchasing power, due to the decreasing cost of all products in which it is employed.

There is nothing, then, inconsistent in the assertion that wages may continue to advance and the cost of production diminish at the same time, in all those products, whether agricultural, mechanical, mining, or manufacturing, in which mechanical appliances or the inventions of men have any part. And who shall venture to limit the sphere within which the ingenuity of man shall have its effect, or predict what form of industry it will never benefit? We may then find here a field for legislation to improve the condition of our industrial classes. By protecting their pursuits, sustaining the wages of their labor, permitting them the enjoyment of an intelligent existence, and to devote their thoughts to something beyond the earning of daily bread, legislation will enable the workmen of America to apply their intelligence and ingenuity to still further inventions, until the superiority of their methods will be seen not only in cotton, watches, cutlery, and agricultural implements, already exported to lands of cheap labor, but in every other variety of the products of human skill and ingenuity.

That our progress is rapid in this direction, is manifest on an inspection of the tables of our annual exports in manufactures as well as agricultural products. In both the element of labor as part of cost has rapidly diminished. In both, scientific and mechanical appliances are in-

Digitized by Google

creasing the product of labor and diminishing the cost of the product. Witness the growing exports of flour instead of wheat, and, in other manufactures, the steadily increasing list of exports shows that we are gradually approaching in all descriptions of products the point of cost at which we can successfully compete with the products of low-paid labor.

## EXPORTS OF MANUFACTURED ARTICLES INCREASING.

The impression is sometimes conveyed that our manufactures are not holding their own with agricultural products in the list of exports.

That this is incorrect is known by the tables of annual exports since 1850. Of our total exports, the average proportion for thirty years of manufactures exported was 25 per cent., and, in spite of the vast increase of our agricultural exports the proportion in 1882 was still 25 per cent. This fact is substantiated by the detailed tables of exports, in which it appears that our export of manufactured products has been increasing during the past three years at the rate of over 25 per cent. per annum.

Here is a list of fifty of the most important manufactured articles exported in 1881 and 1882. You will note an increase in nearly all.

| Exports. | 1881. | 1882. |
|---|---|---|
| Agricultural implements | $2,400,000 | $2,976,000 |
| Bells and bronze metal | 25,000 | 26,000 |
| Billiard tables | 17,000 | 42,000 |
| Blacking | 180,000 | 187,000 |
| Books, pamphlets, &c | 890,000 | 831,000 |
| Brass, manufactures of | 216,000 | 322,000 |
| Bricks | 27,000 | 50,000 |
| Brooms | 153,000 | 241,000 |
| Candles | 210,000 | 226,000 |
| Carriages | 1,013,000 | 1,439,000 |
| Cars, railroad | 544,000 | 1,393,000 |
| Clocks | 1,147,000 | 1,402,000 |
| Coal | 2,800,000 | 3,700,000 |
| Cordage | 422,000 | 629,000 |
| Cotton, manufactures of | 13,571,000 | 13,213,000 |
| Drugs, &c | 3,045,000 | 3,517,000 |
| Dye stuffs | 627,000 | 921,000 |
| Earthen ware | 123,000 | 181,000 |
| Fancy articles | 653,000 | 852,000 |
| Glass and ware | 756,000 | 864,000 |
| Cables (hemp) | 125,000 | 191,000 |
| Hides and skins | 903,000 | 1,449,000 |
| Rubber articles | 363,000 | 433,000 |
| Manufactures of iron | 11,370,000 | 14,732,000 |
| Manufactures of steel | 2,800,000 | 2,818,000 |
| Jewelry | 279,000 | 393,000 |
| Lamps | 280,000 | 350,000 |
| Lead, and manufactures of | 40,000 | 179,000 |
| Leather, and manufactures of | 8,090,000 | 9,000,000 |
| Lime and cement | 83,000 | 100,000 |
| Substances used as manure | 583,000 | 997,000 |
| Manufactures of marble | 409,000 | 433,000 |
| Matches | 112,000 | 161,000 |
| Mathematical and philosophical instruments | 154,000 | 599,000 |
| Musical instruments | 974,000 | 1,267,000 |
| Naval stores | 2,639,000 | 3,369,000 |
| Mineral oils (manufactured) | 37,065,000 | 47,889,000 |
| Paints and colors | 287,000 | 425,000 |
| Paintings and engravings | 254,000 | 406,000 |
| Paper and stationery | 1,348,000 | 1,619,000 |
| Plated ware | 310,000 | 396,000 |
| Printing presses and type | 185,000 | 211,000 |
| Scales and balances | 263,000 | 304,000 |
| Sewing machines | 1,982,000 | 2,647,000 |
| Varnish | 156,000 | 187,000 |
| Spirits turpentine | 3,798,000 | 3,798,000 |
| Watches and parts of | 100,000 | 121,000 |
| Wearing apparel | 534,000 | 605,000 |
| Wood, and manufactures of | 18,600,000 | 24,011,000 |
| Wool, manufactures of | 321,000 | 408,000 |
| | 121,642,000 | 152,560,000 |

Digitized by Google

But no stronger proof of the effect of intelligent labor in reducing the cost of production can be had than is furnished by the growth and success of American agriculture. The products of high-paid labor in the field and on the farm are transported thousands of miles over roads built and equipped by high-priced labor, and sold at a profit in Europe in competition with the products of low-priced labor.

It is, then, not inconsistent with the general welfare to legislate so as to maintain high wages as a means to improve the condition of our workmen, thereby enabling them to go forward in their prosperous career, and though high wages and cheap production ultimately secure the permanent control of the commerce of the world, it will be the triumph of *intelligence* and *high wages* over low wages and ignorance.

### IMPORTANCE OF THE HOME MARKET.

The value of foreign markets as compared with our own as fields for successful business for our manufacturers is vastly overestimated. Our 50,000,000 people consume more than 500,000,000 of the semi-barbarian nations with which it is so much sought to open trade, at the sacrifice of our own. No doubt European manufacturers would gladly give us the whole field would we permit them a foothold in ours. But we shall win their fields and still hold ours, and if our legislators will wisely study our national advantages and protect our people in their enjoyment this result will soon be realized.

### THE SURPLUS REVENUE.

The disposal of the revenue which is now collected upon imports is a subject which alarms some persons, and leads them to urge a reduction of the duties so as to reduce the revenue. It is evident, however, that any other than an extreme reduction of duties will only increase the amount collected, in consequence of the increased amount of imports. An extreme reduction would ruin our industries and degrade our people. The only way to reduce our revenue is to gradually increase the duty on such things as we can produce advantageously here, until the home demand shall be supplied by the home product and the import ceases. In connection with this let the duties be removed from such articles as we do not or may not produce with advantage, and you will gradually reduce the revenue, without injury to our people, and with the additional effect of increasing our productions, advancing the national power and wealth, and promoting the welfare and improving the condition of our industrial classes.

To resume: The condition of the industrial classes of the United States may be improved—

First. By legislation which will secure to the greatest possible degree to the individual the results of his talents and labor, and protect him and his family in their enjoyment. Under this head, I include such legislation as will protect and diversify our national industries and thereby maintain the American standard of wages.

The effect of such legislation will be to give leisure for thought and self-improvement, and encourage personal effort to improve.

Second, by legislation which will afford facilities and opportunities for free education in every part of the country, limited to those branches of education which fit men for the duties of American citizenship, *i. e.*, teach them to think wisely, and live soberly, industriously, and healthfully.

Under this head I include such legislation as will secure to all children the benefits of primary education.

By the CHAIRMAN:

Q. I do not wish to be understood as controverting your position, but the result of what you state with reference to the revenue is that it cannot be reduced essentially—that our revenues must continue substantially as they are—unless there should be some action taken in reference to internal revenue. Assuming that to remain—which it may, probably—in what way would you recommend the expenditure of that surplus beyond the necessary and ordinary expenditures of the Government?—A. I think you do not state my point in regard to the revenue correctly. My idea in regard to that is that the revenue should be rather reduced by increasing the rate of duty and permitting the production of articles here—that in proportion as we increase the rate of duty, we do exclude foreign products, and we do reduce the revenue by keeping the article out and stimulating production here.

Q. I did not understand you to really recommend an increase of the tariff—though I have long thought that that was the most sensible way of reaching the reduction of the revenue and at the same time promoting the industrial interests of the country, but there is a pretty strong sentiment averse to the increase of the tariff, as you are aware.—A. Yes.

Q. And it would seem quite probable, whatever may occur theoretically, that the tariff will not be increased essentially, and, therefore, that the public revenues will remain as large as or larger than at present, unless diminished by the removal of internal taxation. If that is to continue, and the revenue from customs to continue the same, or to increase, as it would be increased by the reduction of the tariff, in what way would you suggest, if you have given thought to it, the expenditure by the nation of this surplus income?—A. I think that there is a very singular view taken by most people of the effect of the increase of the revenue or of our having a very large revenue. I do not quite understand why the government which has a very large revenue is not more fortunate than the government which has a very small revenue, and why the law and principle are not the same with the government as with the individual.

Q. Now, if an individual receives a large revenue, he is enabled thereby to secure to himself and to his children and family very great advantages over those who have not had a large revenue. I cannot comprehend why a government that is in the receipt of a large revenue should not expend it for the advantage of those over which this government presides—the people. And it is only on the assumption that the administrators of government are corrupt that an excessive or very large revenue can be assumed to be injurious. But, yet, if the revenue were obtained by a process not itself beneficial or productive, if it was merely taxation in the ordinary sense of the term, it might be bad, for the government would then have what would otherwise have remained in the hands of individuals for private and general expenditure among the people at large, might it not?—A. Very possibly.

Q. But your position is that the process which keeps the revenue as it now is, or increases it, will be beneficial to the country, and therefore it is not taxation in the sense which diminishes the wealth of the people.—A. On the contrary, it rapidly increases it.

Q. Now, assuming that we have the revenue, and that it is well that we should have the revenue, in what way would you suggest the expenditure of the surplus? If any methods of its expenditure occur to you, we would like to have your suggestions—in what way should this be expended for the good of the "family?"

Digitized by Google

INTERNAL IMPROVEMENTS.

A. I have a very clear idea about that, although my view would not, perhaps, commend itself to people generally, but that is that the surplus of the government should be invested so as to produce permanent advantages to the people. A farmer having a surplus revenue, ditches his farm, fences it, and otherwise improves his place and its buildings. He puts up better barns, buys good horses, cattle, &c. The government similarly situated should devote itself to the improvement of facilities among its people—anything which improves the general condition of the country, supplies better facilities for intercourse between the different parts of the country, and binds the people together into a more harmonious people.

Q. You look on this as a new farm, and the people as a new tenant?—A. We have only begun to realize the advantages of what are popularly termed internal improvements.

Q. You would do something for the great water courses of the country?—A. Yes.

Q. For example, the Mississippi River?—A. Yes.

Q. You would construct canals wherever they would offer cheaper means of communication between the important sections of the country?—A. I would spend the money so as to develop the resources of the country in every way, and I think money spent by the Government that way would redound to the advantage of the people.

Q. Do you not think that the country is likely to overlook the fact that there is a vast difference in the amount spent in this country compared to the amount spent in public improvements in the older countries?—A. Yes.

Q. Will it not require many generations of large expenditures to make this continent such as the European continent has become in that regard?—A. I think it is very striking to one who travels in Europe to contrast the way of getting around there compared to what we have here – the manner of constructing their railroads, for example, is so very different, and so much more substantial than ours that it excites wonder in an American; but there are other ways in which a surplus revenue might be expended.

The CHAIRMAN. Mention some.

NATIONAL AID TO EDUCATION.

The WITNESS. I think there should be some general system of education of a very simple character, but it should secure, under the control of the General Government, a simple system of education for everybody. I do not think that uniformity of education, which is so desirable in this country, can be depended upon in the several States. Some seem to entirely neglect the education of children as well as of those more advanced, while others do their utmost to educate all their people. But to make it equal, I think the Government should insist upon some degree of education for all.

Q. If the citizen who is a citizen of the State is also a citizen of the United States, why is there not an obligation as well on the nation as on the State to see that the individual is educated?—A. I think the nation should be responsible for a certain degree of education.

Q. Is there any other way in which the nation can secure to itself a republican form of government, let alone the guaranteeing of it to the several States?—A. I think the neglect of education up to a certain

Digitized by Google

degree is one of the most dangerous things that exists in this country, and the nation is bound to see to it.

Q. I suppose you would hold that this duty is doubly imperative in the Territories, because there are already laws about it in the different States?—A. Well, it seems to me that the laws are so different in that respect among the States that the General Government should have general supervision over the education of all the States. Every citizen is subject to the operation of general laws and held by the Government to certain duties, and I do not see why the Government should not see that that citizen was qualified to perform these duties and render that service.

Q. If, however, there were an efficient and sufficient school system maintained in any locality by the local power, so that the necessary education was actually received, you would not think it then incumbent upon the Government actively to interfere, I suppose?—A. No, sir; I should simply consider that the Government should exercise a supervision.

Q. And should know whether it was done or not?—A. Yes, and if not done, or properly done, to see that it was.

Q. You would make appropriations, then, from this surplus in the direction of education?—A. Yes.

Q. If now you were to attack the evil of illiteracy as a national evil, upon what basis would you make your appropriation—that of numbers, or would you direct it where the evil is greatest, as a commander disposes of his military forces, sending them where the enemy is?—A. I think the principle of spending money for education should be to spend it in proportion to illiteracy. I think that is the correct principle.

Q. Have you had occasion to examine the figures of the census or to examine the subject in any other way with reference to education in our Northern cities, or the larger cities of the North, and of the illiteracy in those cities?—A. I have read whatever has come before me on that subject.

The CHAIRMAN. I think there is a very general misapprehension among the Northern people themselves with regard to the extent of this evil.

The WITNESS. I have no doubt of it.

The CHAIRMAN. And when we consider that the principal Northern States are practically controlled by the populations of the large cities that may be in those States, I think the danger from illiteracy is much greater in the North than is reasonably apprehended, and not the large cities alone, but extending even to smaller places.

### THE DANGER FROM ILLITERACY.

The WITNESS. The greatest danger from illiteracy arises in the most thickly-settled communities, where people are so congregated that there is no sense of responsibility. As you go into a country town with a limited population, every individual is to a certain degree under the inspection of his neighbors and the whole community, and he cannot hide either his qualities or conduct from public criticism. So that in smaller communities education to a degree takes care of itself. But go into a community like this in New York. Men may there live side by side and not know one another; one may not know what his neighbor is about or whether he is doing his duty as a citizen or as a private individual. He is under no inspection whatever, so that ignorance may increase and become a most malignant poison in such a community, and

Digitized by Google

yet the community may be wholly unaware of it until its effects show themselves in political agitation or otherwise, so that it seems to me that some of the surplus money should be distributed where the evil is most apparent, in large communities like this.

The CHAIRMAN. That is a very valuable idea.

The WITNESS. Another idea is that in consequence of the fact that persons are not under the inspection of the community in the large cities, all those persons who have qualities or characteristics which they wish concealed avoid small places and congregate in large places. Of course everybody has observed the fact that the greater amount of crime and misery is to be found in the large cities, and I do not think that that is simply because they are large cities or that large numbers of people live together, but that people who wish their qualities concealed leave the little places and come to the large cities, where there are greater numbers.

Q. You believe in turning on the light?—A. Yes; my method would be to bring the light to bear upon all the people. That would be the best thing, I think.

The CHAIRMAN. In the same direction as your thought, it is a fact that the lights of the great cities have reformed the cities.

The WITNESS. No doubt of it.

The CHAIRMAN. And the electric light probably is going to do a great deal in the way of moral reform?

The WITNESS. I have no doubt of it. Every man is susceptible to a desire to be well thought of, or if he is doing anything that he is ashamed of he desires to have it concealed, and there can be no greater corrector of morals and character than to have the life and character of every man open to the people. If you could secure that you would secure a virtuous community right away.

## THE NATIONAL DEBT.

Q. There is another point upon which I would like your opinion. I would like to know whether you look upon a national debt as "a national blessing," to use a common expression, or whether you think that nations, like individuals, should get out of debt as soon as they reasonably can?—A. There are ways in which our national debt is a national blessing.

Q. Are those ways so important, in your judgment, as to justify the nation remaining permanently in debt? Take, for instance, the security of the national banking currency——. A. (Interposing.) There are two ways in which I think the national debt is a national blessing. One is peculiar to this country, in the fact that the currency is based on the security of the Government bond, and that there does not seem to be anything as good as a Government bond as a basis of currency. The other is that the distribution of obligations among the people has a tendency, perhaps, to make the people more interested in their own Government, and keep themselves familiar with what is doing and what has been done.

## SUBSTITUTE FOR GOVERNMENT BONDS AS A BASIS FOR BANK CIRCULATION.

Q. Assuming that some time we are to pay that debt, of course in that case the national bonds can remain only temporarily as a security for the currency, do you think that the application of that surplus

Digitized by Google

revenue to the payment of the debt should be materially delayed for the sake of giving security to that currency of the national banks? Why not, in other words, if another form of securing a national currency must sooner or later be adopted, as it must be if the debts are to be paid, why not let the surplus go as it reasonably may upon the national debt, and immediately begin to find some form of State security—bonds of States, or otherwise, known to the national Government, and which may be, if necessary, guaranteed by it, and set about paying the debt and placing the currency upon the basis of some other security immediately, because we have got this surplus already?—A. This question is evidently coming forward, and the point will soon be what is to be substituted for the national debt as security for the currency. If you remove it altogether you will remove that security which comes to the Government from having its debt held by the people.

Q. But there are, throughout the country, bonds and other forms of security of many of the States, which are entirely above suspicion, and an inspection of them could be required by the general Government so that nothing should be permitted to be made the basis of banking which was not as secure as the everlasting hills. If that is ever to be done, why not apply this surplus to so much of the national debt as is now within reach, being the greenback, for instance, and perhaps establishing a sinking fund (now that we have this surplus), which might wipe out the balance of that debt when it becomes due in 1907, or about there?—A. I don't see why a substitute for the national debt could not be found in the State debts, particularly if guaranteed by the nation. That would make our currency as secure as it is by the national debt.

The CHAIRMAN. I only ask this not with the view of discussing the question of the national currency, but with the view of asking your idea of the application of this surplus which we are inevitably to have, and while we have this surplus, letting other portions of it go in the direction of education and internal improvements also.

The WITNESS. It is inevitable, of course, that we have a surplus income and that it must be applied somewhere, and after applying all that the people require for education and internal improvements, the surplus must be applied to the payment of the debt.

The CHAIRMAN. Yes, it is evident that the increasing surplus in the Treasury must in time become a great evil unless its proper application be provided for.

The WITNESS. I meet that at the outset by the idea that we should go to work to reduce the revenue.

Q. By an increase of the tariff?—A. By preventing imports and stimulating the products of our own people.

Q. But as I understand you, you would rather lessen the tariff on whatever we cannot produce with advantage—that is, raw material?—A. I would take off the duty on products which we do not or may not produce with advantage and raise it upon articles that we may produce and which perhaps we do not produce to-day, and stimulate it by putting enough duty on it until we do produce it.

### THE TARIFF—HOW IT AFFECTS WAGES.

By Mr. PUGH:

Q. You say that the wages paid to operatives in manufacturing industries is about double here what they are in England?—A. In Europe, I believe, I said.

Q. Of the higher wages paid to the American operatives over the

Digitized by Google

European operatives, what per cent. is due to a protective tariff, in your judgment, if you have had any occasion to make an estimate?—A. I think nearly the whole of it.

Q. Nearly the 100 per cent.?—A. Yes.

Q. They get 100 per cent. more on account of the tariff than what they would get without the protection?—A. I think they do.

Q. Then you say that this 100 per cent. increase in the price of labor paid by the manufacturer is not added to the manufactured product?—A. No, sir; I don't say that quite. If you will allow me, I will give you my ideas about that.

Q. Just state what portion of the 100 per cent. increase of wages in this country is added to the manufactured article.—A. The value of labor, speaking now of textile manufactures, is perhaps about 25 per cent. of the cost—the labor that is directly employed—at the point of completing the manufactured article. There has been labor employed in the making of the brick that goes into the factory perhaps, and so you can go away back to the cutting of the timber, &c., so that the cost of the plant itself has been enhanced by this increase of labor, and the interest upon investment is thereby enhanced and made nearly double what it would be if the plant and machinery therein had been constructed at a place where labor was at half the price; but the cost of labor in ordinary manufactured articles or textile fabrics where the final process is gone through with, is about 25 per cent. of the total cost.

Q. And half of that is added on account of the increased wages to the American operatives?—A. Whatever the labor costs in this country is of course a part of the product, and therefore whatever the price of labor is here as compared with the price of labor on the other side, is included in the cost of the fabric; but the point I make is that by greater intelligence, though we pay twice as much, the cost of production is not proportionately enhanced.

Q. Not incorporated in the manufactured article?—A. No, because the greater degree of intelligence——

The CHAIRMAN. And the use of the machinery which is also the result of that increased intelligence.

The WITNESS. [Continuing.] Make the result of labor that much more, so that while making the wages double, it does not involve a proportionate increase in the cost of the fabric.

Q. Then the increased price of labor is not added to the manufactured article?

The CHAIRMAN. In the form of a better quality of article.

Mr. PUGH. Let the witness answer.

The WITNESS. Let me try to illustrate what I mean. If the labor is $10 a week here and $5 a week in another country, of course whatever is paid by the manufacturer here goes to make up an element of the cost of his fabric, whatever that is, but it does not enhance the cost of his fabric in the same proportion, because the product of the labor is so much greater.

Q. Then the cost of it is reduced by the superior intelligence and the use of the machinery?—A. Precisely; yes.

### EFFECT OF THE TARIFF ON PRICES OF GOODS.

Q. Now, what is the difference in European markets in the price of these protected articles of manufacture—what is the difference in the market price in Europe and in America?—A. There is a wide diversity of articles.

Digitized by Google

Q. I know that, but I am asking only for a general estimate?—A. In the article of cotton cloth, for instance, the prices here and there are about the same.

Q. Well, in woolens?—A. In woolens, prices are materially higher here, but not as much higher as would be involved by the difference in the price of labor, from the fact that we turn out our goods by cheaper processes. In Europe there still prevails to a large extent the system of working on hand looms, as it is called, where an operative takes the yarn to his house, and at odd hours weaves, &c., so that by that crude method of manufacture the article costs more than if woven here in a power loom and with all the facilities of a mill.

Q. How much does the protective tariff add to the price in the American markets of the protected article?—A. It does not add any fixed ratio. The price does not depend at all upon the tariff.

Q. The price to the manufacturer does not depend at all upon it?—A. No.

Q. He is not affected by it?—A. Well, he is removed from the effects of competition with the other side and left to compete with his own people at home, and then his price depends on the severity of the competition at home.

Q. I understand you to say that the American manufacturer exports 25 per cent. per annum to European markets, and that that proportion is on the increase?—A. Yes; to foreign markets.

Q. Well, how are you able to go to foreign markets and compete with the cheap labor that you have described which is employed by European manufacturers?—A. We are able to export in consequence of the very thing that I have been endeavoring to explain to you—the greater result of labor in this country in consequence of its superior intelligence. Within a few days I have seen the manufacture of what is known as the "vulcanite emery wheel." A combination of emery is imported, and a combination of rubber is also imported, and they are put together by American skill combined with American machinery—I have seen that sent to Glasgow, where the manufacture of vulcanite emery wheels was first started, and where the business of such manufacture has been the most important; and there in Glasgow has been found the best market for the American article, notwithstanding the fact that the American workmen are paid double what the English workmen are paid. You see we can make that vulcanite emery wheel and transport it to Glasgow and sell it under the eaves of the factory which was the first to begin to make that very article.

Q. What is the price you get for these exports in European markets? Do you get any higher price than the same article manufactured in the European market brings? Does not the European article sell in the European market for about the same as yours?—A. It does as a general thing, but of late years there has been a growing partiality for American products all over the world.

Q. The price, you say, is generally about the same?—A. About the same. All over the world for the past fifteen or twenty years there has been an increasing partiality for the American products, on the ground that they are believed to be the best article of the kind. That is, I believe, another result of the superior intelligence of our people.

INDUCEMENT TO EXPORT MANUFACTURED ARTICLES.

Q. Then, owing to the superior intelligence of our people, of the labor of this country, and the use of machinery, you are able to export 25 per cent. of the manufactured articles and sell them abroad at the same rate as European manufactured articles?—A. Yes.

Digitized by Google

Q. What is the inducement that the American manufacturer has to go to foreign markets and get only the same price that he could have received at home? Why do you ship this 25 per cent. of our manufactures to European markets when you only get the same price that those European manufacturers get for the same articles?—A. I suppose there is very rarely a time when a manufacturer has not goods to sell. He very rarely is sold out, so that he has not goods to spare, and if a consumer comes along, whether from Europe or from America, it is immaterial to the manufacturer provided he gets his price for the goods.

Q. That export of 25 per cent. of our manufactured articles is in excess of the American demand when you do not get any better price in Europe than you do here. Why do you sell there if you could sell them all at home?—A. Well, there may be reasons that do not involve an insufficiency of American demand. For instance, we have our seasons in trade, and during a dull season we might be glad to avail ourselves of European demand, and if we diminished our stock we would increase our product to correspond.

Q. If you are able to ship 25 per cent. to European markets, and compete with European cheap labor as to 25 per cent. of the whole manufacture, what prevents you from doing it as to the whole 100 per cent.?—A. Nothing but the farther development of American skill. We have got to overcome the fact of higher wages, and we overcome that by improved processes and greater intelligence, and as rapidly as we can overcome the effects of higher wages we are enabled to compete with the products of lower wages abroad.

Q. If you can do it with the superior intelligence of our labor, and the fact that it produces more by reason of this intelligence, and of the machinery employed in the product, what benefit do you derive from a protective tariff?

EFFECT OF THE TARIFF IN SECURING THE HOME MARKET.

A. It is necessary as a preliminary step to success in foreign markets that we should be protected in our own. In other words, it is necessary that we should develop our processes of manufacture and so improve them that we can consistently with the payment of American wages compete with foreign wages. Of course, it would be perfectly practicable to remove the tariff altogether, and reduce the rate of American wages to the rate of European wages, and the manufacturer would then compete on the same level—on the level of cheap labor and nothing else, and we would then interchange our articles—European with American, and *vice versa*—all on the basis of cheap labor. But it seems to me that that is not the American system. The American people will never be satisfied to get down to the basis of European labor. They are not accustomed to living as European workmen are, and they never will consent to do it, and the moment the pressure begins, which would be involved by removing the tariff, that moment you will find the American people rise up and protest against it and insist upon the tariff being put back.

THE TARIFF DOES NOT ADD TO THE PRICE OF COMMODITIES.

Q. I understand your opinions on that subject, but I inquire how is it that if the price of labor is not added to the fabric, and if you can export the fabric to European markets and compete in those markets with the European fabric, what benefit is the protective tariff to the employer?—A. Let me now return to the illustration of the production of cotton cloths. The wages we pay the operative are double what are

Digitized by Google

paid in England. The manufacturer, of course, includes his wages as part of the cost of the product, but his production is so much greater that, divided into the amount he pays for wages, the actual cost per yard of cloth is no greater than is paid at the other side; therefore it is not necessary that we should add anything.

Q. Suppose the tariff were removed, how would that affect the ability of the manufacturer to continue this rate of wages when it is not added to the cost and does not interfere with your shipping abroad?—A. If the tariff were removed, the first thing that would happen would be that this country would be flooded with foreign goods.

Q. How is that, when you take possession of the foreign markets to the extent of 25 per cent. of your manufactures, and pay the cost of transportation from here to Europe?

THE HOME MARKET BETTER THAN ALL THE MARKETS OF THE WORLD.

A. The success of the American manufacturer depends upon his being limited to competition at home. If you give permission to the foreign manufacturer to compete with us, we lose the benefit of our home market. Our home market is better than all the markets of the world, and upon our own market depends the prosperity of the people. You open the doors and let other people come in and share with us—although perhaps in the manufacture of cotton cloth we could hold our own in this country (in respect to some articles of it which we export)—still we should have to divide the markets of this country with the people and give them the cloth as low as it could be got anywhere else, and we are at the same time maintaining a high rate of wages.

But cotton cloth is not the only thing. There are articles which we cannot produce at present as cheaply as it can be done abroad. In respect to those articles, the business of this country would be ruined by free trade. Now, you are aware how it is that we could not maintain the high rate of wages, though we are able to export many of those articles to foreign countries. The reason is this: that by reason of the ruin or overthrow of the industries in which two-thirds of our people, perhaps, are employed, or even one-fourth of our people, the number of people finding employment in this country would be greatly diminished, and, by competition among people seeking work, the rate of wages in this country would be inevitably lowered to the lowest point consistent with existence. For instance, if I have a factory of 500 people, and it is the only factory in the town, and the town has a population of 5,000, and I am obliged in consequence of the importation of articles which I manufacture to shut down and close my factory, I tell the men, "I cannot employ you any longer." They seek employment elsewhere, and in proportion as that kind of operation is broadened, there results, first, greater competition among those in the same trade or employment; that is, they compete with one another; then they compete with agriculturists, and so on. The final result is the grinding down of everything until the people can barely subsist. Then the manufacturer can open his factory again, because he can open it at low wages—as low as anywhere in the world.

Q. What difference is there in the price here of articles imported from abroad and the same class of articles manufactured here?—A. Many articles are produced and sold here as cheaply as they are produced abroad.

Q. How are you affected by the importation from abroad, if you can sell all you can make here and ship 25 per cent. of your product abroad?

Digitized by Google

THE TARIFF NOT MATERIAL TO THE MANUFACTURER, BUT TO THE LABORER.

A. Speaking as a manufacturer, I do not think the tariff is material to the manufacturers, but to the people it is, and to them it goes.

Q. The tariff is of no value to the manufacturer?—A. Well, I state that perhaps a little too broadly. The first effect, of course, of the tariff would be the closing of the mills until the rate of wages here would fall to the low rate of other countries, and then they would start again.

Q. I understand you to say that the law of supply and demand regulates labor and everything else, in which I fully agree; we cannot control, against natural laws and their operations, this matter of supply and demand. Tariffs cannot affect that law, can they?—A. The only effect of a tariff, and the only value to the effect of it, is to limit competition to our own people, who are working under corresponding or similar conditions. That is the only effect, and the only legitimate effect, of a tariff.

Q. How do you explain in these prosperous times, when the crops and the currency are good, and have been so for some time—we have had many years of fine crops, and have had no complaint of the currency—how do you explain the failures of these manufacturing industries under the operation of a protective tariff?—A. Well, the usual explanation is overproduction, but in that I do not agree. I think that the present condition of things is not, after all, very serious. It appears, perhaps, to be serious from the fact that all the more important difficulties become very prominent.

In point of fact, the industries of this country are in a healthy state to-day, and although there are here and there disasters, yet as compared with the aggregate business of the country they are insignificant. As I said before, the disasters which occur and the apparent stagnation of things which has existed recently is not, in my opinion, due to overproduction, but to a change in the methods of distribution of merchandise which has taken place since last fall. Before that, merchants in all parts of the country were in the habit of buying freely, in anticipation of their wants, and carrying considerable stock on their shelves. When the agitation of the tariff question began last summer, and continued through the fall, there was a spirit of hesitation as to the continued prosperity of the country manifested in every quarter, and the dealers and distributers of merchandise became very conservative. Each man said, "Well, I don't know what will be done with these things; perhaps the duties on merchandise will be cut down, and I had better get out." So that every man in the country was trying to see how little he could buy and how low a stock he could carry. The consequence was an accumulation of stock in "first hands" as we say—the hands to whom it first comes from the manufacturers, the primary distributers. That condition of things existed through the winter, the owners of goods found their stocks accumulating, and their warehouses filling up and overflowing. The first effect of that was an urgency on the part of owners and manufacturers to sell. They went among the buyers of goods and sought to dispose of their products and were very urgent. The natural result of it was to make these buyers draw back in the hope that this would result favorably for them, as in fact it did until within a very short time. I think within three weeks there has been a turn in the tide; in other words the consumption of the country has reached a point where the distributers of goods have been obliged to

Digitized by Google

come to market and buy. In consequence, the goods in the cities have been moving very rapidly during the last three weeks. I do not think there has been a better business in New York City for many years, if ever, than there has been during the last three or four weeks.

By the CHAIRMAN:

Q. You think it is a healthy change?—A. Yes; a healthy, natural demand for goods that had accumulated here. It appeared to me that there was a retardation of consumption, as I would say—that the distributers all over the country had held back.

EFFECT OF A PROHIBITORY TARIFF.

Q. What do you think would be the effect upon the manufacturing industries of this country of a tariff that prohibited, or had the effect of preventing, foreign imports from coming into our markets; in other words, what you call a prohibitory tariff? Would the effect of it be to confine the manufacturing industries of this country to American markets?—A. I think that an absolute prohibitory tariff of such things as we do not produce in sufficient amount to meet the wants of the people would be bad. I would not favor anything of that kind.

By Mr. PUGH:

Q. Of silks, for instance; we manufacture about one third of the quantity that we consume while about two-thirds of it comes from abroad.—A. We manufacture now a little more than one-third, I think. The duties on silk goods, I think, might be increased without any disadvantage to the people, and for this reason, that while an increase of the duties on silk goods would enhance the prices to the American people for fine goods, such as go into the consumption of the wealthy and luxurious, it would not enhance the prices of the cheaper goods, because those goods are produced in the country already to such an extent as to be sold here now at as low price as they can be produced under our system of production and labor. There is very little profit at the present day in the manufacture of silk goods in this country.

DUTY ON WOOLEN GOODS.

Q. Then we could increase the tariff on silks and lessen it upon woolen goods, could we not?—A. Well, on woolen goods at the present time there is very little profit. On fine goods manufacturers are making some money in this country at the present time. On low goods and medium goods, such as the people generally use, manufacturers are making little or no profit—I mean woolens. The profits of manufacture of woolens that go into wide general distribution to-day are about nothing, and this is in consequence of the competition among sellers and stagnation among buyers, as I say. The woolen mills of the country are not making any money.

Q. What is the reason of that, in your judgment?—A. There are several reasons, one of which is the backwardness among buyers in taking the goods off the market; the other is a change which has been taking place lately, or within a year or two, in favor of finer fabrics. That is, for a number of years prior to 1882 there was a great demand for fabrics made of coarse wools. Since that time—and perhaps the movement began a little before—there has been an increased demand for fabrics made of finer wools—not that those fabrics made of finer wools would cost any more—because finer wools, in consequence of the great demand for coarser wools, had been selling down in this country at the same

Digitized by Google

price about as coarse goods; but the change of fashion has now brought about the wearing here of finer woolens, and that throws back the fabrics made of coarse materials, although coarse materials have been the fashion, you may say, for a number of years. A large number of American mills are engaged on that sort of fabric, and until they can get on to finer classes they will not make much profit.

Q. These finer goods will be used by the classes that are able to buy?—A. No, sir; they do not cost any more.

Q. Not necessarily?—A. No.

Q. Why? Is it because the price of the raw material of the fine wool and coarse wool is about the same?—A. Yes; in consequence of the greater demand for coarser wools. Coarser wools are about as high as other wools.

Q. Do we not make about as much wool in this country as we want?—A. We produce in this country all kinds of wool required for the manufacture of woolens in this country, except certain carpet woolens, such as Angora goods, &c., which may be produced in Asia and elsewhere. With that exception, there is no other country that can raise any better wool than America.

Mr. PUGH. I was up at Woonsocket the other day, and they said there that the American wool was stronger than the foreign wool, but that the foreign was finer, and that they had to import the foreign to work up with the American.

The WITNESS. We raise all the fine wools in this country, but in consequence of the greater demand for coarse woolens, the business in the finer wools has been rather neglected; but in some parts of Pennsylvania and West Virginia we are raising fine wool.

Q. And in Illinois?—A. Well, the wool-growers say there is no profit in that; but there is now a better demand; the coarse wools that I have spoken of are used for carpets, &c., and do not go into clothing at all; those are not produced in this country at all.

Q. What reasons would you give for the change from the coarser to the finer wool?—A. Well, I don't know that there is any more reason for it than there is for a woman wearing a big bonnet this year and a small one next year. Everybody a few years ago wore broadcloth. After that came a time when men wore fancy fabrics of all sorts, or mixed goods—goods with a great variety of fabrics in them all of the broadcloth pattern; but now we seem to be getting back to the fashion of wearing fine-face goods, for no special reason except that people want to change. That change is going to involve an increase in the price of American fine wools, because, instead of being neglected, as they have been for a number of years, they will be sought for, and the result of that will be that in a few years you will see the common American fleece wools, say, 15½ cents below the price of fine wools, whereas for a number of years they have been about on a par. That would permit the growth of fine wools for which some of our Western Territories seem to me to be well adapted. And I have never seen any better wools than are brought here from the northern part of Texas. They will rival the wools of any part of the world.

Q. In the price of the coarser woolens made in this country and Europe, what is the difference in the cost—how much is added to the price of the coarser woolens in this country on account of the tariff—on account of the duties upon wool?—A. I think at the present time the wools in this country are selling lower than foreign wools of corresponding quality can be imported and duty paid, and, as I said, we are not producing as many fine wools, perhaps, as the demand requires. For that reason some foreign wools are imported.

NEW YORK, *September* 28, 1883.

CHARLES SIEDLER examined.

By Mr. CALL:

Question. What is your occupation?—Answer. I am a tobacco manufacturer, a member of the firm of P. Lorillard & Co., whose factory is at Jersey City.

Q. You have been largely engaged in the manufacture of tobacco?—A. My firm is one of the largest of the kind in the United States. We are employing in the neighborhood of four thousand people directly. I have not enumerated them lately, but I judge that that number is pretty nearly correct.

Q. You pay a very large internal-revenue tax to the Government, I suppose?—A. Yes; the largest of any house in our line. During the present year our tax will amount to about two millions and a half of dollars. In former years, when the rate of tax was higher than it is at present, of course our payment was very much larger.

Q. What is the highest amount you have paid?—A. About $4,000,000 for a year.

Q. What do you make in the tobacco trade?—A. Everything in the nature of smoking tobacco, chewing tobacco, and snuff. Cigars or cigarettes we do not manufacture or deal in.

Mr. CALL. We would be glad to hear from you any facts or suggestions which you may have to present to the committee with regard to the relations between labor and capital.

The WITNESS. I do not know that I have anything new to offer to your committee under the head of labor. Labor questions have not given us a great deal of trouble in connection with our works. While we employ a very large number of people, yet peace and quietness exists with us from one end of the year to the other, usually. Our people are paid very excellent wages, and the piece system prevails almost exclusively; that is to say, the people are paid in accordance with the amount of work performed by them; consequently we find that in various departments the wages for men will range from $10 a week, which is about the lowest, to as high as $30 and even $40 a week. They usually have an allotted task assigned them. Those who see fit to do more than their task are paid in proportion; consequently we have no strikes among them.

The principle we work on is "no work, no pay." Our girls, of which we have a very large number, earn from $4, which is about the very lowest, to as high as $15, and in some exceptional cases $20 per week. Those who are the most diligent, the most energetic, and the most skillful receive the largest wages. Then we endeavor, in all our intercourse with our work-people, to treat them as human beings—with kindness; and consequently it is very seldom indeed that we ever have any labor disturbances. The latest instance of the kind happened about one year ago, when in one of the departments one morning I found that the girls refused to work. Upon investigating the cause I found that the superintendent of the factory had dismissed an incompetent foreman, who proved, however, to have been a great favorite with the working girls—perhaps because he was lax for his employer's interest—and in consequence of his removal the girls concluded that they would go on strike and insist on his being reinstated. I told the superintendent to go and talk to the girls and state the case to them plainly, and endeavor to reason with them. It was useless, however. They insisted on calling for their late foreman, and they would not have anybody

Digitized by Google

else. I waited a little while, thinking that time would bring them to their senses, but finding that they did not resume work, I called them together in the factory and spoke with them myself; told them that if they had any grievances at any time we were always prepared to listen to them, and to remedy them if they were just. They appointed a committee, but that committee, before they waited upon us, had received an ultimatum from their numbers that they would not have any one to preside over them except their favorite foreman. Finding that they were obstinate and obdurate, I immediately set about to accomplish their work without their help. That I did by telegraphing instructions to the far West to have the work performed there. As soon as that information leaked out, they were very glad to come back into the factory and resume their places.

On one or two other occasions we have had slight irregularities in certain of the departments, but they were quickly overcome by our substitution of new workmen. In one particular branch the men struck in a body, because the superintendent endeavored to carry out what he considered fair treatment towards the workmen in another department by shifting the labor from one place to another. The men in charge of department No. 1 were receiving, in the opinion of the superintendent, too large an amount of money for weekly wages, while those in No. 2 were not earning quite as much, and the work was about the same. He endeavored to equalize matters by shifting the men. One department of the men struck in a body and refused to work and threatened to waylay all those who would not do as they did. We telegraphed to Virginia for a large number of men to take their places, and as they came up in a body the strikers did not molest them.

A few years ago we had a number of foreign workmen, they were chiefly Bohemians, Russians, Austrians, and Polish Jews, who had been engaged to make cigarettes. They were very fractious and unruly and would not submit to discipline; they insisted on doing their work in their own way and according to their own wishes, coming and going as they pleased, and we told them that they had to submit to our orders, otherwise their places would be vacant. The result was that they went out; and having mentioned that case, I think I have named about all the strikes that we have encountered.

As a rule we have no trouble with our working people; the firm treats them, as I stated before, with kindness and forbearance. We frequently give them a holiday or an excursion at the expense of the firm, we provide them with medical attendance free of charge, and the senior member of the firm has lately given instructions to engage a suitable and competent building for a library, and to supply it with a large number of volumes for the benefit of the factory hands without any cost to them. He has also under contemplation the propriety of giving them the benefit of free schools at night, or at some time in the evening, if they wish to become better educated.

By Mr. CALL:

Q. Their rate of wages is sufficient to enable them to live comfortably?—A. Yes, they cannot only live comfortably, but they can save a very considerable sum every year. But unfortunately our labor is drawn from the masses, and the greater number are improvident, they lay by nothing, and whenever we have any period of dullness, as for instance, the dullness caused in consequence of the tax agitation before Congress, which is almost an annual affair in its recurrence, then these poor working people having work only about half-time, sometimes even

Digitized by Google

less, and having saved nothing during the time of plenty, it follows often that they are subject to great inconvenience and sometimes are obliged to look for work elsewhere.

Q. You say your rate of wages ranges from $10 to $40 a week for workmen?—A. Yes.

Q. What class of persons do you pay $40 a week to; for what kind of work is that price paid?—A. They are skilled workmen who are engaged in the press room. Their work involves considerable rapidity, dexterity, and some considerable muscle, for they have more or less heavy machinery to manage.

Q. What proportion of your working people are women or girls?—A. About 40 per cent.

Q. What kind of work are they engaged in?—A. At "stemming" tobacco; also in making the lumps; also in weighing and adjusting them each to a uniform size and weight, and putting upon them the ultimate wrappers; and the various other details connected with the manufacture.

Q. Is the work in your factory such as requires any great degree of skill or previous experience?—A. No, sir. Our system is such that the labor is subdivided, and each branch can readily be taught to a person of any ordinary intelligence within a few hours. There are certain departments which involve a greater or less amount of technical knowledge, but the number of people employed in those departments is comparatively limited. They are chiefly men of a superior order of intelligence.

Q. What proportion of your workmen would you say received $10 a week—girls and boys, or people of that description?—A. When I speak of workmen receiving from $10 to $40 a week, I refer, of course, to men. We have another class—boys—and their wages will range from $5 to $10 per week. The men's wages will range from $10 to $40. The women's and girls' will range from $5 to $15, and in some exceptional cases $20 a week.

Q. In which class would be the larger number; in the class of $10, or the class of $20, or the class of $40; the forties, I suppose, comprising only a few very skilled workmen?—A. No, sir; there are a considerable number who will run up to that figure. I have not enumerated, of course, superintendents, foremen, or subforemen.

Q. Your enumeration is confined to workmen entirely?—A. Yes.

Q. That is a considerably higher rate of wages than is usually paid in other employments, is it not?—A. Yes, sir; I believe it is, and I think the wages paid in our factory are higher than they are in tobacco factories generally, particularly Southern tobacco factories. Nevertheless our labor is performed at about as low a figure as any other factories where the rate of wages paid is less, for the reason that by our system of piece-work, each person having an allotted task, it is considered the equivalent of a day's wages, and each having the privilege of working faster, or doing more than a task in a day, they are thus enabled to increase their wages.

Q. What is the average number of working hours in your place?—A. From 7 in the morning until 12 noon; then we give fifty minutes for dinner; then they commence work at 10 minutes of 1 and work until 6. The ten minutes saved each day at noon is given to them at the end of the week on Saturday when they stop work at 5. That gives them an opportunity to go home early on Saturday and clean up and do their chores and marketing for Sunday.

Digitized by Google

Q. It is ten hours a day for work?—A. Ten hours is a regular day's work—with ten minutes over each day to make up for Saturday.

Q. The piece is such as they can accomplish in less than that time?—A. Very much less than that time. Everything in the factory is reduced to piece-work that it is possible to reduce. Of course there is still a large number of hands that are employed by the day or week.

Q. And a large portion of that ten hours or some portion of it, I suppose, men are working in their own time for extra wages?—A. Yes.

Q. The general condition of your working people then is that of contentment and comparative comfort?—A. yes.

Q. Where are your factories located?—A. In Jersey City.

Q. In respect to rents, what kind of houses and what sort of rents have they to pay?—A. Rents in Jersey City are very much cheaper than they are in New York. It would be very difficult to make a comparison between them. A small neat brick tenement of three stories in height can be had in Jersey City for $30 to $40 a month, while in New York City a house of equal quality would cost in some sections twice as much, and in others three or four times a much.

Q. Do your workmen occupy generally houses rented by themselves, or do they live in tenement houses?—A. Most of them unfortunately live in tenement houses. As before stated, they are improvident. They are not apt to save their money. There are many exceptional cases of course among the large number of people that we employ, but the rule is to spend about as much as they earn. They rarely have anything laid by in the saving banks or otherwise.

Q. Do the workmen in the tobacco factories generally approximate the condition of those in yours, or are the workmen in your factory in a better condition than those in others? I think you said that yours are better paid.—A. Yes; I think that is the case. I come in contact with manufacturers in all parts of the United States, and have visited their factories, and looked into the condition of the laboring people in factories in Virginia and North Carolina as well as in Ohio, Kentucky, Missouri, and other places, and I have always observed by comparison that our people earned a great deal more money than the people did in other factories.

Q. What is the number of laboring people who are engaged in the manufacture of tobacco in the same forms in which you manufacture it?—A. Commissioner Raum's annual report for the fiscal year ending June 30, 1882, sets forth that there are eight hundred and twenty-four tobacco factories in the United States. Of course very many of them are small factories in interior country places that do a comparatively limited business. The number of laborers engaged in the business I am unable to state positively, but reference to the Commissioner's report or a letter addressed to Mr. Kimball of the Internal Revenue Department will give you the figures exactly.

Q. Does it state the number of persons?—A. Yes; also the number of pounds of tobacco of each kind manufactured in the United States. I think it shows that the annual consumption of plug tobacco in this country is about 80,000,000 pounds, while that of snuff is about 4,000,000 pounds. Fine cut chewing tobacco about 18,000,000 pounds.

Q. Have you given much thought to the means for improving the condition of the laboring people in respect to education, and in respect to their domestic economies, and the improvement of the kind of dwellings they occupy?—A. I have given it but very little thought, Senator, for the reason that I cannot see any practical means at my disposal whereby I might help them. I have given the matter, perhaps, some

Digitized by Google

little thought, but unfortunately no way or avenue beyond those I have mentioned that are under contemplation by the firm has suggested itself to me.

COMPULSORY EDUCATION.

I am of the opinion that compulsory education is eminently desirable. The State of New Jersey, at the last session of its legislature, passed an act preventing the employment of children under fourteen years of age in factories, and another act obliging attendance upon schools. The law, however, is a new one and has not been thoroughly enforced yet, but I think that both measures are eminently wise.

Q. Are there any suggestions which occur to you which would be beneficial in the shape of legislative remedies, in the relations of the employer to the employed, or capital to labor?—A. No, sir; I have no suggestions to offer. That is a very troublesome problem, and requires the best thought of the best minds we have, if any legislation on the subject is desirable.

SUBDIVISION OF LABOR REDUCES DEMAND FOR SKILL.

Q. I understand from your statement that in your business the necessity for skilled and trained labor does not exist to so great an extent as in others, that unskilled labor will answer your purposes with a comparatively small amount of training?—A. Yes.

Q. That question, therefore, does not embarrass you so much as it does other departments of business?—A. That is owing to our subdivision of labor. In former years, a greater amount of skill was necessary, but by dividing the process of manufacture into a number of different branches, and teaching each individual that simple, separate, particular branch, it follows that very little skill, very little thought, very little ingenuity on the part of the laborer is required. Then, again, the perfection of labor-saving machinery of various kinds as adjuncts of our business has simplified the business in some respects very much.

INDUSTRIAL EDUCATION.

Q. In the schools which you are proposing to establish, have you given any consideration to the subject that has been discussed here so much, the subject of industrial education? What do you think of that as a public measure, schools for training boys in different arts and trades, and fitting them for the mechanical employments of life? That subject is one that has been presented here and discussed very largely.—A. I have not given the matter sufficient thought to entitle my opinion to any weight or respect. I have turned the matter over in my mind on a number of occasions for a good many years. I am heartily in favor of industrial schools. The technical school founded by Peter Cooper, in my opinion, has been one of the greatest blessings that has ever been conferred upon the youth of both sexes who can avail themselves of its benefits and privileges. My only regret is that we have not a thousand benefactors such as Peter Cooper proved himself to be in the establishment of that one school. Industrial schools for the purpose of imparting knowledge relating to the various industries and sciences would be among the very best aids and helps that our young people could have. Nothing, I think, would tend to advance our people so much as that. We are suffering in this country from a lack of proper stimulus to the youth to induce them to enter the mechanical arts. If we should

Digitized by Google

look among our large manufactories, we should find that very few young men of the present day, especially those who have come within my range of observation, have any desire to learn a trade. They prefer to go into offices or salesrooms, or engage in some light cleanly occupation which seems advantageous in their eyes.

TRADES UNIONS.

Furthermore, perhaps a large part of the fault lies with the workpeople in the factories. In very many lines of business we have trades unions. They prohibit and limit the number of apprentices that shall be employed. That is a tendency also to keep young men out of mechanical arts, and if that condition of things continues to grow, unless something is done to arrest it, it will be very bad for the next generation. We may be able to pass over the crisis during the remainder of our brief histories, but it portends trouble for the future, in my opinion.

Q. You think, then, that such a system of public education would be a great benefit to the country?—A. Undoubtedly.

Q. Do you understand that there is a general opinion among the people interested in labor and the employment of labor favorable to some public action on the part of the General Government in that direction in the shape of aid in money to assist in the establishment of institutions of learning of that and other character?—A. I think so.

Mr. CALL. If you have any further suggestions, we would be glad to hear them.

The WITNESS. I have no suggestions, sir. I think there is an abundance of people in the city of New York far better informed than I am and more capable of giving an opinion and information.

Mr. CALL. We want to hear from laboring men and employers of labor.

The WITNESS. We have done quite a good deal for the working people, but our intention is to do a great deal more. We have been busily occupied with a great many matters since we have removed to Jersey City. In former years our factories were located either in South Brooklyn, Westchester County, or New York City. We had factories in each of those places, and within the last six or seven years we have established our works across the river for the sake of the economic questions involved, and we have been very busily engaged in erecting works and making additions, changes, and alterations—systematizing our work—and consequently have not been able perhaps to give that amount of time and attention to the special questions involved that we would like to, but our intentions in that respect are good.

HUMANITARIAN DUTY OF EMPLOYERS.

Q. You recognize the fact that the better the condition of labor, the more profitable the work is to the employer as well as the employé?—A. Yes, and then we think that from humanitarian reasons, the employer who profits from the labor of his employés should return them a *quid pro quo* if he can afford to do so, in addition to the wages that he pays them. He recognizes that justice is due those people, and motives of humanity should induce him to ameliorate their condition to the extent of his power.

Q. In the shape of improved houses, lower rents, and provision for sickness or against accident, I suppose you mean?—A. Yes, sir. We provide for all accidents and all cases of sickness. They are always treated free of charge by us.

Digitized by Google

Q. Do you understand that practice and feeling to be growing among the employers of labor in the country?—A. I think so. I hear more and more of it every day, not only with reference to our own factory but others. I might say a good deal more in that direction but will forbear lest I might be accused of egotism, but I hear that in various large factories in the vicinity of New York employers are continually improving the condition of their people. They are constantly on the alert to aid and befriend them, to make better work people of them. Instances are coming to my knowledge constantly of manufacturers who look after the general welfare of their people.

### PROBABLE EFFECTS OF INDUSTRIAL EDUCATION.

By the CHAIRMAN:

Q I see that you have thought much more on this matter of industrial education than the modest way in which you express yourself would lead one to imagine. You have established the principle yourselves—at least applied it to a considerable extent—but in regard to the establishment of such schools by the public, do you think that the effect of the establishment of such schools would be to lessen the competition for employment in mechanical pursuits, or would it simply qualify a much larger number for employment in them so that the competition and the reduced wages resulting therefrom might be increased by the increase of qualification to undertake such labor; and, further, might not the result of it be to still further drain the agricultural population in the direction of mechanical pursuits?—A. I think there is no danger in that direction for the reason that our country youth as it is gravitate toward the cities.

### ANTIPATHY OF BOYS TO FARMING AND MECHANICAL PURSUITS.

Very many of our young lads, in contemplating the future and making choice of an occupation for life, look upon farm work as toilsome drudgery—that once a farmer always a farmer. They observe and they read through the popular literature of the day that very many of the self-made men were born on farms, stayed there for a few years, and then went to the city and, perhaps, engaged in merchandising, or in the law, or clerking in a bank, or otherwise occupied themselves in some genteel employment, and thereafter readily rose to positions of affluence. Such glittering pictures lead the boys into the large cities. Consequently, if you insert an advertisement in one of our daily papers asking for a lad or a young man, you will find that you will have anywhere from one hundred and fifty to two hundred and fifty answers. That class of labor is always superabundant in this city. I can at any time hire such people in endless quantity. But on the other hand, if I advertise in a paper that I want boys to work in a tobacco factory, the result will be that the applicants will consist almost entirely of the children of the poor from the tenement-house population, who are glad to get any kind of work at any kind of a price. The boys who rush to the cities because they do not like the toil and drudgery of a farm desire to wear nice clothes, and they want to occupy nice, easy positions as clerks, and want to engage in some kind of occupation or profession which they imagine will lead to quick and rapid advancement.

The establishment of industrial schools, whether generally under the patronage of the Government or by private benefaction, would not, in my opinion, have a tendency to interfere with the working people al-

Digitized by Google

ready engaged in those branches to their prejudice or interest, by a reduction of their wages. There is no danger that in a country like ours too many of them would rush into those schools to the detriment of our people generally. We must recognize the fact that we are living in a Republic where all men are born equal, as Jefferson says; that in this country we have no caste system; that it does not follow because a lad here has been born the son of a shoemaker he must necessarily remain a shoemaker all his life-time, as is the case to a greater or less extent in the Old World. Every young man here knows that he has an opportunity to rise, and ambition shows and develops itself in our youth to a greater extent perhaps than we find it abroad. The strict social lines that divide the people of Europe into classes, as they have their railroad cars divided into compartments of first, second, third, fourth, and even fifth, are not found in this country, and consequently our young people are not fond of engaging in the industrial branches. I mean particularly the mechanical branches. They neglect them. They prefer merchandising as a rule, or professions, such as law, physic, or science.

Q. As to those of our youth who now have this tendency to what they think is a higher sort of life, such as the life of clerks, lawyers, and professional men, and I suppose some of the enjoyments of political life—do you think that that class of youth having this tendency, if instructed in the principles of industrial education, would be more likely to resort to mechanical pursuits—in other words, would it do that class any benefit to be educated in industrial schools?—A. I think it would, sir; and I think that many excellent reasons can be shown why it would. I mentioned awhile ago that there is a tendency on the part of mechanics, especially of union men, to exclude apprentices from the workshops. It is a comparatively difficult matter for a young man who desires to learn the trade of machinist, for instance, to obtain work or employment in the machine shop. He may be unsuccessful after making application to many places, and when he does succeed and enters a shop, there is a constant tendency on the part of the workmen engaged there to make his lot as hard and as difficult as possible by throwing hindrances and obstacles in his way and making him do all sorts of menial work. Instead of making the occupation or trade an attractive one for him, they make it as repulsive as possible.

### MAKING TRADES ATTRACTIVE TO BOYS.

If industrial schools were established and every facility afforded to young men to learn trades, and it were endeavored to make those trades as pleasant and agreeable as possible, there would be far less desire on the part of young men either to escape farm work on the one hand, or to bridge over the difficulty by leaping into the large cities and endeavoring to get positions as clerks, &c. I think that the easier we make it for our youth to acquire trades and callings the greater will be the tendency to draw them in that direction. It is undeniable that the establishment of the Cooper Union school has been the means of educating thousands of our young people in the arts and sciences there taught who, but for that school, never would have had the facilities.

Q. You speak of the facility of acquiring a trade being an inducement to a great many to make it a means of livelihood. What would be your opinion as to the effect upon our coming laboring population, of that sort of instruction that you speak of, by reason of its giving them a sort of intellectual pastime—on the principle that one who understands the scientific basis on which his occupation rests becomes more interested

Digitized by Google

than he otherwise would, because of the effort of his intellect—that pleasing action of the mental powers which is a source of satisfaction to all who exercise the mind, especially in connection with their ordinary avocations? In that way, may it not induce those more intellectually inclined among our youth to find occupation for their powers in the ordinary mechanical pursuits?—A. I think there can be no doubt about it. I think that your assertion is equivalent to a truism.

SCIENTIFIC INSTRUCTION IN AGRICULTURE.

Q. Then what would be your idea of the effect of better instruction than they now have—instruction, for example, as to the principles underlying the farming occupation itself—as to the chemistry of the soil and of the crops, so that in addition to the practical knowledge necessary for farming, the farmer's boy would understand the scientific foundation of his business and so find his avocation elevated?—A. If the science of chemistry in its relation to the soil were taught in something like an agricultural school where competent instructors were employed, and if every facility were afforded boys for acquiring the requisite scientific knowledge to improve their farms—such an industrial school would unquestionably make the profession of farming very much more attractive, as well as more lucrative to the farming masses.

By Mr. CALL:

Q. It would put practical farming on an elevated scientific basis?—A. Yes, sir.

By the CHAIRMAN:

Q. Perhaps it might be found that the most practical farming was the most intelligent farming, might it not?—A. There is no question about it, in my opinion.

The CHAIRMAN. I imagine that much of the tendency of these farming boys to go to the cities grows out of the fact that so little is known of the true science of farming itself?

The WITNESS. That is true.

The CHAIRMAN. I think an intellectual person can find all the occupation for his intellect that he can want on a farm if he knows how to occupy his intellect with the science underlying his work.

The WITNESS. Unfortunately, many of the farmers of the country have received little education, and, like the products of their farm, they vegetate; they do not live. Perhaps the children have been sent a little to school, and the youth learns more than his father ever knew. The result is that when the youth contemplates leading a life such as his father led before him, he is repulsed by his observation of the barrenness of the farmer's life, as he has seen it, and he is apt to look down upon that class of work with disdain. Hence that tendency of which I spoke a little while ago.

HOW FAR SHOULD THE MASSES BE EDUCATED.

Speaking of the extent to which the masses might be educated, I think there is much room for a difference of opinion. Very many of our people think that the Government should afford every possible facility for the masses, not only in the rudimentary, but also in the superficial—the elegant branches, as they call them—of a high education. If my opinion were asked in that respect, I should say that I think that compulsory

Digitized by Google

education should be the law of the land, but whether it is possible to bring that about through the General Government is, of course, a constitutional question which only a lawyer could answer. It would be eminently wise, I think, on the part of each and every one of the States to enforce education upon the masses so as to wipe out illiteracy altogether—the same as prevails in Prussia, for instance. But I think that the education which is to be furnished by the State should be limited to the rudimentary branches. Even if the parent has the means of giving his child a still better education, I think it to be the duty of that parent to stand the expense involved rather than to ask his neighbors to share that expense with him.

Q. Does not that become quite evident when we reflect that such education—the education of what we call a liberal sort—can never be extended to the large masses of the people?—A. In the first place, they are not prepared, intellectually, to receive it in a very large number of cases. It is undeniable, I think, that the great mass of mankind must, necessarily, be hewers of wood and drawers of water; that it is impossible to take and make a Daniel Webster or a Rufus Choate out of every poor boy that walks the street. Consequently, expensive education might be wasted. A great deal of money might be spent training youth, or attempting to train them, beyond what they were able to bear intellectually, or beyond the station in life for which they are evidently fitted.

Q. And, also, in the nature of things, I suppose there is no use for many Daniel Websters in this world. Somebody must dig the earth, must they not?—A. That is true, sir.

Adjourned.

---

NEW YORK, *October* 1, 1883.

The committee met at 10 a. m.

CHARLES PARTRIDGE recalled and further examined.

EDUCATION.

The WITNESS. I should like to add a few words under the head of education.

I have spoken about the deficiency of education relative to the duties and work of life among the people. I wish now to say that I think there is much lack of duty among those who assume to teach—I mean the ministers in the pulpits. They seem to entertain their audiences with such minute particulars, intentions, and acts of Moses and the prophets that it would seem as if they lived and slept with them and had not yet opened their eyes to the great world in which they are now existing and the increasing sins and sinners who are members and contributers to their churches.

This thought brings to my mind an incident of my own early childhood. The minister came to see my father, and said to him, "Deacon Partridge, I see that you are interesting yourself in this temperance question." The temperance question was then comparatively new. My father said, "Yes;" he thought that the drinking of liquor was doing much harm, and that it ought to be limited or stopped." The minister replied, "I fear your taking an active interest that way will be injurious to our church. You know Deacon Wyman has his toddy in haytime, and Deacon Stone and Colonel Lee sell liquor, and they are large

Digitized by Google

contributers to our church." I fear there is too much of that spirit still among the ministers—not so much perhaps with regard to temperance as to other subjects. If gamblers and other sinners pay well, nothing is said about their sins.

### CHICAGO CHURCHES AND LIQUOR SALOONS.

I cut from a paper recently an item which shows the sources of education in comparison with the sources of sin and misery. It says:

Chicago has 300 churches against 5,242 liquor saloons; 400 clergymen, evangelists and lay-leaders, and 5,500 bar-tenders; only half a dozen art galleries, and 350 variety theaters. Out of 100,000 buildings 8,000 are used for immoral purposes; $1,500,000 are spent for schools, and $15,000,000 for liquor; $800,000 (perhaps $1,000,000) for religious worship, and $15,000,000 for that which destroys both soul and body. Yet that city is no worse than other cities, and not so bad as some. Let religionists expend their zeal in moral reform at home rather than in the pretense of saving the heathen from hell.

They should preach upon the sins and sinners before them and urge the young to acquire knowledge of the work of life. I consider that one of the greatest evils in society now is that our young men and women are not being instructed in any of the duties and work of life. Consequently they seek methods of living without labor—rendering themselves useless to society and the boys float as a consequence into these gambling saloons, pool-rooms, billiard-rooms, and the business of gambling in the necessaries of life, the products of our country, in our produce exchanges all over the United States. It is a system by which those engaged in it are enabled to charge the expenses of their useless lives to the necessaries of life.

### GAMBLING IN THE NECESSARIES OF LIFE.

I wish to give some indication of the extent to which gambling is carried on in the New York Produce Exchange. I am a member of that exchange, and there is not done there one-twentieth, I suppose, of the amount of gambling done in Chicago, and there are besides these the exchanges of Milwaukee, Cincinnati, Toledo, Saint Louis, and other markets.

In the New York Produce Exchange this gambling in the necessaries of life is done in this way: They sell what they call "futures," options, &c. Now, a sale "future" may be proper and right. If a farmer wants to sell his grain, and it is not yet thrashed, let him sell it. That is not improper. But of these sales of futures and options on the Produce Exchange, ninety-nine out of every hundred of them are simply pieces of paper which men of little or no responsibility make, purporting to sell, say, 8,000 bushels of wheat. The first man sells it to the second, and the second to a third, and so it goes on through ten or hundred hands, and one delivery settles the whole. But each person through whose hands it has passed has paid a brokerage and commission, and the person who buys expects to make something. If he does make anything, that broker's commission and what he makes is charged to the article not sold, but represented to be sold; it is charged to the price of actual wheat. There is so much of this thing done that it is alarming. The tendency of it is to keep our wheat market from 10 to 50 cents a bushel higher than the laws of supply and demand would make it, and that difference is to pay these brokers and these gamblers, and it has to be paid by the consumer. For instance, in Keene's corners, when the wheat went up

Digitized by Google

from $1.09 to $1.65 in this city, it could be bought in Liverpool a good deal cheaper, but we could not bring wheat from Liverpool. We had to pay the price charged here or starve. That is the manner in which every corner is carried on, whether in wheat or anything else. They buy up the article and hold it at an arbitrary price out of the market to squeeze the "shorts," and in this manner rob the consumer. The language of the corner is, "pay the price or starve;" and the language of these futures and of this gambling in wheat and other articles is, "pay us this extra 10 or 15 cents a bushel, or we hold it and you starve."

By the CHAIRMAN:

Q. What does the flour cost to the consumer by the bushel—what do the laboring people have to pay for it?—A. It depends upon the price per bushel.

Q. I want to know something of what it costs when it gets here. The point is whether the laboring people actually pay, by reason of the speculation here, more than they would have paid otherwise?—A. Why, yes; and the speculation is all over the country; and whatever is put on to it in any section, increases the price all over the country.

Q. Does it come back to the farmer himself?—A. The farmer does not get the benefit of it, because most of them want to sell before they have thrashed their wheat or soon after so as to pay off their debts, and they do it; and that is the lowest price for wheat in the season, when it is being gathered and comes into the market.

Q. Can you give instances showing what the farmer got, and what the consumer paid?—A. No; I could not give any specific instances. The farmer gets the price of wheat in Chicago or New York, less freight and expenses.

Q. But is it not necessary to show that the farmers are injured by those intermediate processes?—A. The farmer is injured by their getting his wheat at a low price without his knowing of the intended corner. I can show you on this point the evidence taken before the senate committee of the State of New York.

Q. You have made an abstract of that evidence, have you?—A. Yes; and I can show you by sixty or more witnesses the facts in this matter; and they are the dealers and know all about it.

The CHAIRMAN. Well, if it is so we can be made to see all about it.

## EFFECTS OF "CORNERS" ON PRICES.

The WITNESS. I will suppose a case. Suppose I buy wheat of a farmer for 75 cents a bushel, and I sell it to these people that are making a corner. It has cost them we will say $1 here in New York, including freight. Now, if it is a corner, they hold it out of the market; if not, it is substantially the same thing, because there are "shorts" sold against it, and they are able to put on anywhere from 10 to 40 cents a bushel right here in New York, because of these differences in contracts for "futures" which have to be filled, or the price of the wheat paid. When there is a corner the clique arbitrarily dictate the price. They will sell to go out of the market at less price than they will sell to the "shorts" to fill their contracts or for use in this country; their purpose is to squeeze the "shorts," and they do it; and not only the "shorts," but the consumers all over the country—hence wheat is sometimes lower in Liverpool than in New York.

Q. Even if there is no corner?—A. As I say, options and futures put anywhere from 10 to 40 cents a bushel on wheat; and if it does that,

Digitized by Google

and it take 5 bushels to make a barrel of flour, it makes the flour considerably more expensive (50 cents to $2 per barrel).

Q. I suppose the profit depends on the number of times the contract has been transferred from one party to another, does it not?—A. This system raises the price without much regard to the number of hands it goes through. The price is arbitrarily made by the "corners" or the gamblers.

Q. If those futures were not assigned at all, then there would be no harm?—A. No; and there would not be one hundredth part of the futures that there are now, and consequently less harm.

Q. Then the number of times that assignments are made determines the extent of the evil, does it?—A. Yes, largely; but the cornering clique can arbitrarily put up the price any day 5, 10, 15 or more cents per bushel above what supply and demand would warrant. Everybody knows it. Millers all over the country are seriously injured by it, and I have a petition here signed by something like a thousand farmers and millers in the country, all objecting to this system of cornering and gambling in wheat and other produce.

Q. You say you have arranged the testimony on this subject that was taken before the New York legislative committee, have you not?—A. Somewhat, though not as much as I would like to.

The CHAIRMAN. Go on then with any further explanation you desire to make of the evil itself.

### MARGINS ON NEW YORK PRODUCE EXCHANGE.

The WITNESS. Grading is essential to this gambling in grain, as it signifies the quality. For instance, if I buy 8,000 bushels of No. 2 wheat of you to be delivered one, two, or three months in the future we are required to go to the margin desk in the Produce Exchange and put up a margin, each of us, of 10 per cent. perhaps. If it goes lower in price the Exchange calls on me for further margin, and if it goes higher you must put up further margin to secure the payment of the difference in the price of wheat at maturity of the contract. The amount of the margins put up in the New York Produce Exchange on this class of business in 1876 was $271,776; in 1877 it was $673,925; in 1878 it was $726,007; in 1878 (the Keene corner), $2,783,854; in 1880 it was $6,652,360. These are simply the margins on these fictitious sales. I wish to explain now how that is, so that you will understand it. For instance, a regular dealer here, say David Dow or men of known means that deal regularly, do not have to put up a margin. It is only these men of small means that go in there to get a living by this method that have to put up a margin. In 1881 the amount of margins put up was $10,716,838; in 1882 it was $17,120,887.50; and for the first six months of 1883 it has been $5,827,730.

Q. What becomes of these margins?—A. These margins are paid into the Produce Exchange, which is the stakeholder for the gamblers.

Q. These are moneys paid on deposit with the Exchange?—A. They are so paid as margins into the Produce Exchange, and are held subject to a settlement of the deal. On the maturity of the contract, the margin of the losing party is paid by the Produce Exchange to the gaining party to the extent of the difference between the contract price and the then selling price, and the balance of either margin to the party it belongs to.

Q. Now, on the same transaction, which has been a great many times assigned, with the market going up and down, many margins have been

Digitized by Google

put up, and all that is lost in the end is the difference?—A. Each person who sells or purchases the contract puts up margins, as above stated, and is settled with as above stated.

Q. Is there a settlement every time the contract is assigned from one to another?—A. No; all margins are kept for final settlement and are then paid over to the party to whom they should go.

Q. The last year, you say, the margins were $17,000,000 and over. Who got that $17,000,000?—A. The "bulls" and "bears," so called; sometimes one side and sometimes the other.

Q. The whole $17,000,000 was not lost to any one?—A. The whole was lost and the whole was gained.

Q. Now, in what way has the farmer lost in that transaction, or in what way has the consumer of the wheat lost?—A. The consumers have lost the $17,000,000, which is shown to be the fictitious price put on the wheat, which they were obliged to pay or starve, and the farmers who sold early or at harvesting time certainly received no benefit, and the farmers who held their wheat did so to realize the $2 or $2.50 per bushel which they were deceived into expecting, and when the corner broke they sold at about the price of the early sellers.

Q. But these fluctuations on the Produce Exchange from day to day cannot possibly be repeated from day to day in the retail market, can they?—A. Not from day to day. For instance, I am in the flour business, and if there is a fluctuation of half a cent per bushel higher on wheat, it does not change the price of flour that day, but if it continues it is reported that flour is stronger, or the price is higher, and the price gradually goes higher.

Q. The retail dealer takes advantage of it, does he?—A. Yes.

Q. He is the man that makes the money?—A. No; for he often gets caught. There is no possibility of telling what the price of wheat will be to-morrow any more than you can tell which way the wind is going to blow, or whether the weather will be cloudy or otherwise. It is in the hands of these gamblers who control it, and they can turn it up or down at will at any hour of the day. If you go on the Produce Exchange you will find them calling, and during that call the man whose interest it is to have it go up or down will put in a bid to make it go up or down, and then operate on it. It is a monstrous evil. You can hardly estimate the amount that the consumers of this country have to pay to support this horde of gamblers. They do support them, and they are of no use to the community.

Q. How many of these gamblers are there?—A. Well, we have three thousand members in the Produce Exchange, and two thousand of them, at least, or more, deal in this class of business. And not only that, but when they get out at 2 o'clock they can hardly get through Moore street because of the crowds of the outside gamblers who cannot afford to be members of the exchange, and who are dealers outside in this very same business, which is not reported.

ARTICLES AFFECTED BY CORNERS.

Q. This speculation goes on with wheat and corn?—A. Yes; wheat and other grains, petroleum and pork, cotton, lard and other products.

Q. Those are the special articles which form the basis of that class of speculation?—A. Yes.

Q. Is the price of cotton enhanced in the same way?—A. Yes. Now take pork. The commission on a sale of pork is, I think, 25 cents per barrel, 12½ cents to each party, the purchaser and the seller. That is added to the price, of course, in every sale.

Digitized by Google

Q. Whether they collect it or not depends on the state of the market, does it?—A. No; this has to be paid when the contract is signed; these dealers have to pay that at once.

Q. They get it out of the speculators?—A. Yes; and so with grain. They have to put up the commission and the brokerage every time.

### THE LAW OF SUPPLY AND DEMAND AS RELATED TO PRICES OF FOOD PRODUCTS.

Q. Take the full year together, do you not think that the natural relations between the law of supply and demand actually control the average price for the year?—A. Not one hour in the year.

The CHAIRMAN. I do not mean any particular hour, but taking the year together.—A. No; they do not.

Q. Do you mean that those prices, taking the average price for the year through, are higher than they would naturally be?—A. I do; and I mean to say that the law of supply and demand has nothing whatever to do with the prices. Certain men in the market can put it up or down a half a cent or more in one minute.

Q. But suppose he does, there will come some other minute in the year when it will go down another half cent?—A. It may be, but he will make his money out of it.

Q. But, taking the whole year together, how will it be?—A. Taking the whole year together, this illegitimate trade in the commodity keeps it advanced fictitiously.

Q. You mean this uncertainty of what the price will be from day to day operates like the uncertainty of railroad rates—they being frequently changed?—A. Yes; just like the uncertainty of a game at cards or a game of pool.

Q. There is an effort to obtain an assurance against uncertainties and fluctuations in price; the increase comes in the way of the effort of the general public or the dealers to assure themselves against loss by fluctuation, just as a man insures his life against accident?—A. Yes. Now, for instance, when I was getting signers to this petition I went to a man in Milwaukee and asked him to sign it. He is one of the largest millers and one of the largest speculators there. "Why," said he, "I can't sign that petition." I said, "Why not?" "Why," said he, "I do more than all the rest of them here in that line." I said to him, "Why do you do it?" He said, "The trade puts me in a position where I have to do it. The prices are changed every day and I have to hedge." I said, "Sign this and if the petition accomplishes what it calls for it will help you to get rid of that trouble;" and he did sign it. The millers all signed it.

### CROP REPORTS.

Q. Is not the effect of this felt in wheat and corn and other crops in the matter of the amount? Is not the effect of it to stimulate a large number of men who collect the most accurate and reliable information so that the general public comes to comprehend the real supply much more readily and accurately than it otherwise would?—A. Well, reports as to what the crops are in the country are gathered in Washington and they publish them every little while. They send out inquiries to all parts of the country, but not as to the crops in foreign countries.

Q. Yes, I know there are the returns of the Agricultural Department; but is there not a system organized by these speculators or general dealers that perhaps would not exist but for this gambling performance

Digitized by Google

that you speak of?—A. There is, and they organize it for the purpose of gambling and make it promote their schemes and interest whether for higher or lower prices.

Q. Suppose that may be their purpose; but the information that each man is seeking is the truth.—A. He seeks to get the truth and thinks he has it, and he may have it, but if he is a cornerer or gambler he will not inform the seller; he will use it for his own purposes.

Q. But there are two classes, the bulls and the bears, and the falsehood of one must be exposed by the other, and it is, is it not?—A. Well, the "bulls" agree with the "bears" when they are buying wheat to control the market, and then they defy the bears.

Q. And it may be that they do each other a great deal of damage.—A. Well, what one loses in money another makes; but then you might ask how it is sustained. I will tell you, for I have had a little experience. A young man in Lewis County, whose father died, had a large sum of money which had been left to him by his father. Previous to his father's death the young man was made acquainted with all his business. He was a clerk and did the business for his father——

The CHAIRMAN. [Interposing.] We would be willing to concede—because we know it is so—that these men ruin each other and carry a great deal of misery to honest people, and that the system by which they work is a great evil as among themselves; but the real point involved is whether the masses of the people suffer so much from it—at least that is what I am trying to get at. I know you say that wheat averages 20 or 25 cents a bushel more by reason of this speculation—this gambling in wheat.

The WITNESS. It does.

The CHAIRMAN. Well, now, whether that is so is the question in my mind.

The WITNESS. That is what I want to convince you of. I have given my testimony.

The CHAIRMAN. It would not convince me a particle if five hundred men swore to it, unless they could explain it to me so that I could see how it is done, because that is a problem which must certainly be capable of demonstration, if the assertion is true. The uncertainty as to what the supply may be I can see would be a very great evil; and if that uncertainty can be dissipated in the general public mind in any way, no matter whether by fair or foul means, if the result is that that uncertainty *is* dissipated, and honest dealers—buyers and sellers—all over the country come to know just what the supply is, then they are able to understand (knowing what the demand is likely to be) what they can afford to give and how they can afford to sell. They get their information by reason of the attrition of the bulls and bears plus the information coming from the Agricultural Department, which comes from an honest source. Now, it seems to me that what the general public wants is the truth, and the truth surely can be evolved from the efforts of these speculators pitted against each other to ascertain it, and honest people can take advantage of the truth when ascertained.

The WITNESS. The Agricultural Department under the law reports what they get and what they believe to be true, and it is as accurate probably as can be got. We have two reporters who have been on the Produce Exchange several years, and they report what the supply and the demand are, but they do not agree, or they seldom agree, and when one of them is elected by the Produce Exchange as the official reporter, he is elected by these gamblers and they own him in a certain sense.

Q. I do not suppose it can be claimed that this speculation that you speak of makes things any cheaper?—A. No, it makes them always dearer, and the consumers have to pay the fictitious price.

Digitized by Google

Q. Nobody has ever claimed that this dealing in futures did any good?—A. No, and the testimony on that point from all the millers and the people is the same thing; they all admit that it makes the goods dearer; all admit that the consumer has to pay the extra price, and all admit that it is an evil to society and breaks up legitimate trade. That is the universal testimony of men that know anything about it. It is a demoralizing system. Why, a man that will resort to that for a living, how can he have any morals?

Q. How is it about the remedy now?—A. Well, I think that this petition——

The CHAIRMAN. [Interposing.] You may give us your idea of it now in a few words. You can file the petition afterward.

LEGISLATIVE PROHIBITION OF "CORNERS."

The WITNESS. I would make it a penal offense for anybody to sell that which he does not own or control; and I would make it a penal offense for anybody to buy up any of the necessaries of life and hold them out of use for the purpose of extorting a fictitious price, punishable with fine and imprisonment. If he holds the necessaries of life at a price above the natural price of supply and demand with the intent of forcing the people to pay a fictitious price, I would have him adjudged a conspirator against life and have the laws of theft applied to him and punished as a thief.

Q. That is, you would prohibit the organization, of corners?—A. I would most decidedly prohibit them.

Q. You would aim directly at that evil?—A. Yes.

Q. You would make a provision that would prevent this speculation in futures—that is, this hurtful speculation in futures?—A. Yes.

Q. But futures are sold a great deal when there is no corner?—A. Yes.

Q. You would make a specific provision against the organization of corners in the necessaries of life?—A. Yes.

Q. Then you are speaking of dealing in these futures fictitiously?—A. Yes.

Q. Not for honest purposes, but for gambling?—A. Yes.

Q. Could you frame such a provision in language that would be apt to reach the evil without going too far and preventing beneficial and honest dealings?—A. I think so.

Q. How would it be in a case where the farmer pledges his crop?—A. I would make that an exception; he has it and owns it, and it is his right to sell.

INSUFFICIENCY OF STATE LAWS AGAINST "CORNERS."

Q. Cannot those provisions of law, whatever they may be, be enacted by the State authorities as well as by the national authorities?—A. No; and I will tell you why; which is the reason why nothing was done by our legislature, after collecting such a mass of testimony of this great evil. They say that if you stop these things in New York, they will be carried on in Jersey City; and some of these gamblers will go to Baltimore or some other place and carry on the business there, and that it will curtail or demolish our commerce; gamblers have the impudence to call gambling commerce.

Q. Under what power of the General Government do you think it could legislate on the subject at all?—A. The General Government, as I under-

Digitized by Google

stand it, has authority to regulate commerce between the States, and between this country and foreign countries. When I testified about the grain corner, I showed you how much the country lost by holding grain over. They could have got $1.50 a bushel; they held for $2, while it went down to $1 a bushel, and the difference was lost to the country. I do not mean to say that it would go into the Treasury of the United States, but it would have come into the hands of the citizens of the country, and the country therefore lost what I have previously stated.

Q. Would you apply such a national law to any provisions which might have been raised in a given State, and the speculation in which should be conducted within the limits of that State? Do you think the nation would have a right to assert its power over commodities raised in a certain State and speculated upon in the same State? Suppose these men should confine their operations to wheat grown in the State of New York?—A. Different States produce different articles of the necessities of life and no State should be permitted to withhold its product from the people or enter into a conspiracy to starve them; besides, since the United States made war on the States which attempted to establish a government for themselves it would seem that the United States would have equal right to protect the *lives* of the people against a State which should conspire to withhold any necessary of life from the people.

Q. Is there anything else relating to this subject that you would suggest? You have suggested a law strking at corners and at gambling and speculation by dealing in futures, and at the effect upon commodities by the influence of corners, so as to make it impossible to transfer the speculation from one State to another, or from one State to a foreign country. Is there anything else?—A. I want to present to you this petition, and in the manner which it will be considered by Congress, and to add something of the Keene "corner" and the "ringing out" process, so called.

## PETITION AGAINST "CORNERS" AND GAMBLING IN FOOD PRODUCTS.

*Iniquities of commerce! Speculators in human suffering.*

It is customary in the month of September for experts to make up from the most reliable data the surplus and deficiency of wheat in the several countries, and the result in September, 1879, was as follows:

SURPLUS.

| | | |
|---|---|---|
| Russia | 35,000,000 | |
| Austria-Hungary | 12,000,000 | |
| Chili | 4,000,000 | |
| Canada and Manitoba | 13,000,000 | |
| British India | 8,000,000 | |
| Egypt | 2,000,000 | |
| Australia | 8,000,000 | |
| United States | 185,000,000 | |
| | | 267,000,000 |

DEFICIENCIES.

| | | |
|---|---|---|
| Switzerland, Spain, and Portugal | 8,000,000 | |
| Italy | 12,000,000 | |
| Germany, Holland, and Belgium | 18,000,000 | |
| England | 137,000,000 | |
| France | 55,000,000 | |
| | | 230,000,000 |
| Surplus | | 37,000,000 |

Digitized by Google

This showing drew together moneyed men (some of whom had never dealt in wheat or flour) to form a syndicate for the purpose of securing to themselves a profit of 50 cents per bushel on our immense wheat crop. To accomplish this purpose they sent out agents into all the grain-growing States to buy wheat, and they continued this business until their purchases had raised the price of wheat 65 cents per bushel, and exhausted the storage capacity in the interior and Atlantic markets, and had pressed into this service numerous lake boats in the West, and hundreds of canal boats in New York and other Atlantic markets. The railroads were compelled to order their agents west not to accept grain consigned for storage, as there was no room for further deposits. Thus a complete blockade of the grain crop of the United States was formed early in January, 1880.

It was estimated then that 120,000,000 bushels of the crop of wheat remained in the farmers' hands, and the syndicate owned and controlled 60,000,000 bushels, which they held during January and February 12 cents per bushel above the price at which the deficient foreign countries were obtaining their supplies from Russia, Hungary, Australia, and elsewhere, which materially diminished exports.

The syndicate found they could not put down the price and sell freely for export without carrying down prices of wheat in all the markets of the world. Hence they arbitrarily held their wheat at high prices, in the faith that the surplus in other countries would be used up, and the necessities of the people would aid their purpose to extort their tribute of 50 cents per bushel.

In this dilemma the syndicate commenced coining money by demanding high prices, and reporting fictitious sales of wheat among themselves, or otherwise, for export, future, long, short, &c., at fabulous figures, for the purpose of inveigling novices into buying or selling wheat, whereupon the old sinners at the crank turned prices in the opposite direction, creating what are called "corners," and thus swindling the unwary out of their money. They abrogated the laws of supply and demand, and disregarded the relative prices of wheat in the different States and in all the markets of the world.

For example, they created a "corner" in Chicago, whereupon this gambling ring arbitrarily put the price of wheat in that city 12 cents per bushel higher relatively than in New York, and 5 cents per bushel higher than in Milwaukee, at which place legitimate trade prices are the same as at Chicago, showing that the absolute control of prices was possessed and exercised by the syndicate to swindle the victims of their duplicity, and to break up legitimate trade.

The millers throughout the country have been obliged to pay gamblers' prices for wheat to grind. They have consigned their flour to the interior and Atlantic markets, and drawn advances on the same, with instructions generally to have the flour stored, unless the cost price of it could be obtained. The quantity so shipped and stored exceeded the requirements of the people by 2,000,000 barrels, which has been held at $2 per barrel above its real value, which $2 our people are obliged to pay for permitting gambling in wheat. This flour cannot be sold to foreign countries in need of it without a loss of $2 per barrel, which has already ruined many millers, and has seriously injured all of them; and it is now—the 1st of April, 1880—estimated that three-fourths of the mills have remained idle two months, and must so remain until this nefarious syndicate is deprived of its power for mischief.

The same estimate of the surplus and deficiences of wheat in the several countries, in September last—which inspired our rich men to combine for the purpose of preventing people, at home and abroad, from getting bread without paying tribute to them—naturally inspired honest and generous men to bring their ships to our shores to take away our surplus products to the countries which need them, and the result was 500 ships laid at the New York docks for months, the owners pleading for wheat even at ruinously low freights—2 and 3 pence per bushel, and some even as ballast; but the greedy gamblers, steeled against every plea, all human sympathy and honorable dealing, sent the ships away empty—the owners declaring they would not bring ships to our markets so long as unprincipled gamblers are permitted to arbitrarily control the products of the country.

It has been expected that the opening of the lakes and canals, with the usual reduction in prices of freights, would enable farmers and merchants not connected with the ring to get their products to the Atlantic and foreign markets, and realize cost; but it is made known that the trunk lines of railroads have united with the ring to keep up freights and save the gamblers. To effect this they have chartered and otherwise got control of the steamboats and other grain-carrying vessels on the lakes.

The New York Central and Erie have lines to Buffalo, and the Pennsylvania to Erie; the Baltimore and Ohio to Sandusky, and the Wabash from Toledo to Buffalo. And now, having obtained control of lake, canal, and rail freights, of the products of our country, we may expect they will exercise it in their combined interest, irrespective of either the people's needs or rights.

The end of this nefarious business is foreshadowed by the failure of the ring clique in Grand Rapids, Mich. involving the banks in the sum of $300,000. Thus it is shown that the institutions which the people have chartered—banks and railroads—

Digitized by Google

for the people's benefit, are combined and organized in this most wicked scheme to extort money from all consumers, and to starve the poorer classes of our people. It is estimated that the Jim Keene syndicate, so called, has caused a loss to the United States by not selling wheat to foreign countries before prices declined, and to those whom they have inveigled into dealing with them—the millers, the shipping interest, legitimate dealers and consumers of flour in the United States—which amounts to $300,000,000. They have abrogated the laws of trade—supply and demand—and the relative prices in different markets, and interdicted commerce between the States and foreign countries; they have broken up legitimate trade, and generally demoralized a most important branch of commerce, thus bringing sorrow and suffering upon our people.

We are in favor of enacting laws by Congress, and in all the States, making it a penal offense, punishable by fine and imprisonment, for any person to sell that which they do not possess, or to purchase merchandise which they do not expect to receive and pay for. All contracts which are to be settled by the one paying and the other receiving the difference between the contract price and the value of the article at some future day, and all species of luck or chance trade, dealing or gambling, of whatever description, should be declared illegitimate, and punishable under the law.

Persons receiving this circular will confer a favor on the undersigned and the public by circulating the petition for signatures, and then forwarding the same to the member of Congress from your district, or others, within one month. It will be appreciated if your local newspaper will publish the substance of this, or otherwise say something in furtherance of the object, which I shall be pleased to see.

Please inform me the number of signatures, and oblige, yours, respectfully,

CHARLES PARTRIDGE,
129 *Broad street, New York.*

*To the honorable the Senate and House of Representatives of the United States, in Congress assembled:*

Your petitioners beg leave respectfully to call the attention of your honorable body to a serious and widespread evil, which has long been allowed to exist in the community over which the law-making power of Congress extends, an evil whose ill consequences are felt by all classes in this and other countries.

Your petitioners have especial reference to the accumulation of immense quantities of the cereal products of the soil in the hands of a few capitalists, combining for objects of speculation.

It is the custom for these speculators to form pools or syndicates for the purpose of buying and storing grain and flour in such large quantities as to arbitrarily dictate prices and control sales, without regard to the natural laws of trade, which regulate values in the ratio of supply and demand.

As only men of large means or extensive credit are capable of engaging in these enterprises, they become essentially an array of capital against the industrial classes, wherein the banks and moneyed institutions are almost invariably drawn to the support of the former against the latter, and are measurably dependent upon the success of their schemes.

Some of the more prominent evils resulting from these combined operations may be briefly summarized as follows:

1. An unhealthy and feverish state in the produce market, wherein quoted rates furnish no criterion of actual values.

2. The utter paralyzation of one of the leading industries of the land, in the instance of very many of our great flouring mills, in which large amounts of capital are employed.

3. The almost utter suspension, for indefinite periods, of cereal exports, which give employment to our shipping, and meet at fair rates the demands of foreign nations, more or less dependent upon ours for the necessities of life.

4. The imposition of heavy and unnecessary burdens upon a numerous class of our citizens, whose immediate necessities compel them to accede to the exorbitant demands of venal and selfish monopolists.

To illustrate what has been said, we subjoin the following carefully prepared estimate of surplus and deficiency in the single article of wheat in some of the leading countries:

SURPLUS.

| | | |
|---|---|---|
| Russia | 35,000,000 | |
| Austria-Hungary | 12,000,000 | |
| Chili | 4,000,000 | |
| Canada and Manitoba | 13,000,000 | |
| British India | 8,000,000 | |
| Egypt | 2,000,000 | |
| Australia | 8,000,000 | |
| United States | 185,000,000 | |
| | | 267,000,000 |

Digitized by Google

| | DEFICIENCY. | |
|---|---|---|
| Switzerland, Spain, and Portugal | 8,000,000 | |
| Italy | 12,000,000 | |
| Germany, Holland, and Belgium | 18,000,000 | |
| England | 137,000,000 | |
| France | 55,000,000 | |
| | | 230,000 000 |
| Surplus over all | | 37,000,000 |

It is concluded by a fair estimate that a single one of the so-called syndicates has owned and controlled, since September last, upwards of 70,000,000 bushels of wheat, hoarded and held at prices above the rates at which foreign markets are able to obtain their supplies from other countries.

Hence it is that foreign shipments are arrested, and the gold which would naturally flow into our treasury is diverted to others. Nor is this all. The "break" which is sure to follow comes too late, and the commodity which was refused at fair rates to other markets becomes a glut in ours, to the detriment of the producing districts, over which the back-setting wave spreads and stagnates.

Your petitioners therefore pray that your honorable body may see fit to devise some means, not inconsistent with the utmost freedom of legitimate trade, to effectually put an end to the evils herein complained of."

## ENORMOUS LANDED ESTATES IN AMERICA.

The WITNESS. On another point I desire to say I think it is a wrong against our country and especially to laborers, that our country is selling large quantities of lands to persons who do not intend to use them, but for mere speculation. I hold that no person should be allowed to own more land than he cultivates and uses.

The CHAIRMAN. We have had that matter brought to our attention by others also.

The WITNESS. I have a paragraph here, which I cut from a newspaper, on the subject.

The CHAIRMAN. We have had that same paragraph which has been quoted in the newspapers.

The WITNESS. This is in relation to Sir Edward Reed, a member of the British Parliament, and others, owning enormous quantities of our lands, Sir Edward Reed owning 2,000,000 acres in this country.

Q. Do you know where that information comes from?—A. Yes; from the New York Evening Telegram, under date of the 3d of September of this year, 1883. The items are as follsws:

Sir Edward Reed, M. P., owns no less than 2,000,000 acres in America; the Duke of Sutherland, 400,000; Lord Dunmore 100,000, and Lord Dunraven, 60,000 acres. Messrs. Phillips, Marshall & Co. own a farm of 1,300,000 acres; the heirs of Colonel Murphy, 1,100,000 acres, H. Diston, 12,000,000 and the Standard Oil Company, 1,000,000 acres. It appears that nine men own a territory equal to that of New Hampshire, Massachusetts, and Rhode Island combined. Then there are the great railroad corporations whose free gifts of land from lavish Congresses amount to upwards of 200,000,000 acres. Eleven of these corporations have received 120,000,000 acres. The Northern Pacific road had grants amounting to 47,000,000 acres, and other grants made ranged from 1,000,000 acres upwards.

Q. Have you got that abstract of the testimony of the New York legislative investigation?—A. I have not got it quite completed, but will have it in a few days.

The CHAIRMAN. You may transmit it to us, and you can incorporate with it such observations as may be pertinent.

## EXORBITANT RAILROAD AND TELEGRAPH RATES.

The WITNESS. I wish to say, regarding railroad and telegraph rates of charge (to pay dividends on fraudulent and watered stock), and the

Digitized by Google

increased price of commodities created by gambling in the necessaries of life, that such increase amounts, in my opinion, to 25 per cent. of the present cost of the necessaries of life. This is paid by the consumer, and becomes a part of the burden of labor and is one of the things that produces strikes and causes thefts, and brings much suffering to the poor people, sometimes resulting in death, either by suicide or otherwise.

### THE "KEENE" CORNER.

In or about September, 1879, Mr. Keene, in connection with other moneyed men in Chicago, Milwaukee, New York, and elsewhere, combined to "corner" the crop of wheat in the United States, and for this purpose sent agents into the cities, villages, milling points, and where ever there was an elevator or storage house for wheat, to buy the wheat offered, and also contract for sale of wheat for future delivery. They commenced buying wheat at $1 to $1.09 per bushel, less freight and expenses to New York. Prices improved slowly until they had filled the elevators and ships in Chicago, and the elevators and canal boats in New York, and the Atlantic markets, so as to blockade further shipments and to cause the railroads to decline to take wheat from the West because there was no place to store it. At this juncture the controlling combination circulated statements that the wheat crop in Europe was a failure, and that American wheat would probably go up in price to $2 or $2.50 per bushel, which induced the farmers who had not sold to hold it, expecting these extreme prices; and in December they had arbitrarily run the price of wheat up to $1.65 per bushel and kept the price from 10 to 40 cents per bushel above that which foreign countries would pay, but they squeezed the "shorts" (those who had contracts for future delivery) out of the difference between the price named in the contracts and the arbitrary price they put upon wheat at the time of maturity of contracts, and in this way scooped money into their pockets. These futures, options, &c., together with actual sales, probably amount to our whole annual crop of wheat every week in the year. Notwithstanding that these gambling contracts call for the delivery of the article mentioned, it is perfectly understood by the seller and purchaser that the property is not to be delivered, but the difference between the price named in the contract and the price made at the call and bid for the article on change the day of maturity of contract is to be paid in settlement.

### "RINGING OUT" CONTRACTS.

Connected with this gambling business is what they call the "ringing out of contracts," as follows:

Each day, about 9 a. m., the managers of our Produce Exchange inclose with a chain a portion of the first floor, with a door opening from the street into this kennel, through which the bulls and bears are let in. The chain prevents them from reaching, goring, and devouring the human beings outside. Here we see every day from fifty to one hundred young cubs, from fifteen to twenty-two years of age, representing the old "bulls" and "bears," holding these future contracts on which the names are written of the seller and each purchaser (generally numbering from six to sixty), with the price paid by each, showing that what one makes another loses. These are called together and a memorandum

Digitized by Google

showing who has lost and who has gained, and if the losers pay the gainers, the parties indorse the contract "settled." Then it is taken to the margin clerk, and each receives the margin belonging to him, and the contract is thus ended and torn up. The large dealers generally employ one clerk to attend to each article dealt in, and it is said that David Dows & Co. employ eighteen clerks, Franklin Edson a larger number; Lane & Son, Husted, Hazeltine & Co., and others employ large numbers of clerks. I here give a blank used for grain contracts.

"SOLD" CONTRACT.

NEW YORK PRODUCE EXCHANGE.

*Grain contract.*

NEW YORK, ———, 188—.

In consideration of one dollar in hand paid, the receipt of which is hereby acknowledged, —— have this day sold to ——— ———, ——— bushels of ———, New York inspection, at ——— cents per bushel, deliverable at seller's option during ———, 188—.

This contract is made in view of, and in all respects subject to, the by-laws and rules established by the New York Produce Exchange in force at this date.

——— ———.

"BOUGHT" CONTRACT.

NEW YORK PRODUCE EXCHANGE.

*Grain contract.*

NEW YORK, ———, 188—.

In consideration of one dollar in hand paid, the receipt of which is hereby acknowledged, —— have this day bought from———————, ——— bushels of ———, New York inspection, at ——— cents per bushel, deliverable at seller's option during ———, 188—.

This contract is made in view of, and in all respects subject to, the by-laws and rules established by the New York Produce Exchange in force at this date.

——— ———.

CALL OF MARGINS.

The following is a blank form used for the call of margins:

NEW YORK, ——— 188—, — o'clock — m.

M———:

You are hereby notified to send to the superintendent of the New York Produce Exchange your certified check for $———, drawn to the order of the Central Trust Company of New York, or the Fourth National Bank, or the Corn Exchange Bank, or the New York Produce Exchange Bank (the depositories designated by the finance committee of the exchange), being margin on our contract dated ———, 188—, for ———, in accordance with the rules regulating the deposit of margins among members of the New York Produce Exchange.

——— ———.

The following are copies of profits and losses for ringing out contracts, which contracts mature one, two, or three months future, and are thus rung out some one, two, three or more days after their birth, which explains the gamblers, meaning of the *right* to call for the actual delivery of the property named, and also explains how our whole annual crop of wheat is sold as often as every week in the year, and how such fraudulent sales and contracts are settled.

## THE DAMAGE OF THE KEENE CORNERS TO THE PEOPLE OF THE UNITED STATES.

The wheat crop of the United States in 1879, which was cornered by the gambling clique, amounted to 448,756,630 bushels. Reserved for seed, 56,926,065 bushels. Leaving a balance of 391,830,565 to dispose of. Consumed by our people during ten months of the corner, 186,000,000, which, at the fictitious amount of at least 25 cents per bushel put on the price of wheat by the cornering clique, amounts to a loss to the people of $46,500,000. Farmers held back 150,000,000 bushels wheat to realise the price indicated by the false reports circulated by the clique ($2 or $2.50 per bushel) until the corner collapsed, when they sold it for 25 cents per bushel less than they could have sold for if the corner had not existed. Loss, $37,500,000.

The amount which the cornering clique is reported to have lost by holding wheat at fictitious prices when it was wanted, and having finally to ship it abroad, realising only about $1 per bushel, is $30,000,000; showing that the Keene corner damaged the people of our country $114,000,000.

I will present to the committee brief extracts of the printed testimony taken in 1882 by the senate committee of the State of New York, relative to the whole system of making corners and dealings in futures, with reference to its effect upon commerce and its influence upon the public welfare.

Digitized by Google

NEW YORK, *October* 1, 1883.

CLINTON FURBISH examined.

By the CHAIRMAN:

Question. To what subject does the statement which you desire to make to the committee relate?—Answer. To the cause of strikes and the complaints of the workingmen.

The CHAIRMAN. I did not understand it so. You remember what passed between us. I wish you would state now to what points your testimony is to be confined.

The WITNESS. I understood it was to be confined to the causes of complaint of the laboring men; or, really, the causes of strikes, upon which I only want to speak of two points.

Q. What are those points?—A. One is in connection with taxation, and the other with class legislation—the accumulation of wealth caused by class legislation.

By Mr. CALL:

Q. Have you heard read the resolution of the Senate under which the committee is acting?—A. Yes, sir; I have read it.

Mr. CALL. We are able to give you a little time this morning to present the points that you desire to present.

The CHAIRMAN. Will half an hour do?

The WITNESS. It will not require so much time as that.

MR. CALL. You may proceed to state your points, as briefly as possible, please.

The WITNESS. As I understand it, you desire to find out that which is a cause of strikes. It seems to me that tracing the cause of dissatisfaction among the workingmen would answer that inquiry, and possibly lead to a conclusion in regard to some laws that are necessary. The laboring people of this country, by which I mean the producing classes of the country———

Q. [Interposing.] Let me inquire first, whether you have any connection with labor as an employer?—A. I have been engaged in the manufacturing business since 1858; all of that time, excepting the few years during the war and two or three subsequent years, I have been an employer of labor. I am to-day engaged in the manufacturing business, and have from forty to fifty persons, men and women, under my charge.

By the CHAIRMAN:

Q. What is the business?—A. The manufacture of rubber goods; the business having its establishment in Brooklyn, as well as having an office in New York. Before that I had been engaged in the manufacture of sugar, having built the first house ever built in this country for the manufacture of sugar from starch, and employed seventy-five to one hundred men for several years. During all that time I have had more or less intimate relations with workingmen, and have had some means of finding out what I considered to be their cause of complaint. I will state here that I have never had a strike among any men in my employ, although I have been employing men while strikes were on in other places.

### DISSATISFACTION OF THE LABORING MASSES.

The laboring people of this country, as I understand, believe that this Government was established with the idea that there should be no class legislation, that all classes should have an equal right and equal protection under the law. One of the theories of the Government was that

Digitized by Google

there should be no accumulation of vast estates. As I read Jefferson's letters, it was considered one of his greatest glories that he prevented the passage of laws of primogeniture and entail, and that he stated distinctly that his reason for fighting those laws was that he deprecated the establishment of large estates; the increase of wealth in the hands of the few, and the increase of poverty among the laboring classes. We find this morning in the New York World a list of over four hundred residents of New York whose wealth is known to be upward of a million of dollars, and many of them forty or fifty millions, and to my knowledge a large number of the millionaires of New York are left off the list.

You have had much testimony before your committee that we have increased very rapidly in our national wealth. You also know that there is a large increase of pauperism. I stand every morning in my factory and am obliged to refuse the applications of men who want to come to work for a dollar a day—and I believe I could discharge every hand in my factory to-day, and that to-morrow morning I could fill their places with men anxious to work at a dollar a day—and women begging for the opportunity to work for 50 cents a day. Every car-driver in New York could be discharged from their places, and those places be filled to-morrow morning by men anxious to work eighteen hours a day for $1,75. It is evident to the committee that there are a large number of men who desire to be employed at the low rates of wages now prevailing, and who cannot find employment. Two weeks ago I advertised for a book-keeper for our concern. I received a large waste-basket full of replies asking for a situation, and every man to whom an invitation was given to call offered to come at $10 a week—skilled book-keepers. One of the men who offered to come at $10 a week we hired at $12. That shows that there is not that demand which has been stated before the committee for the graduates of business colleges for immediate positions at $10 a week.

In this country fortunes have been piled up rapidly, and they must have come from the produce of labor. This aggregation of wealth in the hands of a few must have come from something besides a natural law. In looking the ground over we find that one class in this community is afforded exceptional benefits—and if I trespass now——

The CHAIRMAN. Interposing. Go right on there was only one matter that you mentioned that we do not want to have brought in.

The WITNESS. I understand. If I can show before this committee that one class in this country is granted by law exceptional benefits it is fair to assume that the working people of this country, who understand that fact, have a just cause of complaint—that the theory of the Government has not been followed.

### BANKING AND BANK CIRCULATION.

When I give a note I am obliged to pay interest upon it. When every other manufacturer gives a note he is obliged to pay interest on it, in some way or other. All classes in this country, with a single exception, pay interest on what they owe. There is one class, however, in the country who have a law provided for them by which when they shall have made promissory notes those notes they shall be allowed to issue as money, and have them guaranteed by the Government, and that then they shall be receivable, not only by the Government for all debts and demands, (except duties on imports), but that they shall be payable by the Government as money to every person to whom the Government owes an obligation with a single exception—the holders of the Government bonds.

Digitized by Google

The national banking act as originally passed, and as it stands to-day, provides that when the notes of the national banks shall have been signed by the president and cashier, and made promissory notes, then those notes shall be received as stated, and shall be payable by the Government to every person in this country to whom the Government owes a dollar; to every pensioner and every person in its employ. It will not do to answer that those privileges are open to every one; they are not. They are open simply to a class. It is true that they are so, theoretically, to every citizen in the United States, and therefore to every laborer, but practically it is not so, for the reason that the laborer must cease his business, the merchant must give up his business and come into the favored class in order to take advantage of it.

By Mr. CALL:

Q. Suppose the law required the national banks to pay interest on notes that the Government allowed them to issue; who would have to pay the interest?—A. The working people of this country.

Q. Do you want, then, to make them pay the interest?—A. Perhaps I did not understand your question.

Q. You seem to object in your remarks to the law as it stands. I am not undertaking to advocate it at all, but we are discussing it. You object to the banking law as it stands, that the Government does not make the bank pay interest on its notes.—A. No; I do not object to that at all, but I say that one class is allowed to draw interest on what they owe, and no other class can do it.

Q. Suppose the Government were to issue the notes themselves, and the bankers were to get them together and bank upon them. How much better would that be?—A. Then they would be drawing interest on the money they own.

Q. They would not draw any interest. Suppose it were practicable under your scheme, that the Government should issue all currency, would not these people get together and bank upon it?—A. Yes; and there would be no interest to pay.

Q. Would they not charge interest on it?—A. Yes; but it would not be interest on their notes, but interest on money.

Q. It does not make any difference whose it would be, if the people had to pay interest.—A. We will see if it is so. The law says that those are promissory notes. A national bank note is simply an evidence that the national bank owes a debt of, say, $5.

Mr. CALL. Of course, and so with the Government note.

The WITNESS. Very good. A national bank note is an evidence that the national bank owes a debt, and the national banker is the only person in America who can live on the interest of his debts. Now, if we are seeking a remedy for the existing evils of labor, or protection to American industry, it would seem that if you could devise and follow out this wise scheme of the banking law, and let all people draw interest on what they owe, there would not be any more strikes.

Q. I am not attempting to advocate the system, but talking about your proposition. How is it true that because the Government allows a man to deposit its bond, which the Government owes, and gives him a certificate that that bond should be responsible for so many of his private obligations—how does that enable him to live on the interest of what he owes, by requiring what the Government owes him to be a security for his obligation? How do you make it out of that proposition—that a man is able to live on the interest of what he owes?—A. Take the instance of the first organization of a national bank, and we will see.

Digitized by Google

Mr. CALL. That is all that the Government does. You take a bond to the Government and the Government says that you owe so much.

The WITNESS. Will the Government do that with a rubber manufacturer?

Mr. CALL. Yes; if you get together $100,000.

The WITNESS. No; not as to a rubber manufacturer. We have got to call ourselves national bankers. We have got to be national bankers in order to come within the provisions of the act.

Q. What you object to, then, is the name?—A. No; but the fact that they can draw interest on their notes.

By the CHAIRMAN:

Q. Do you not entirely overlook the natural differences between the various kinds of business carried on in a community?—A. No, sir; I do not consider that the issuance of money or currency is a matter of banking.

By Mr. CALL:

Q. But the note does not draw interest on its face.—A. No; but the bank draws interest on the face of its bond.

Mr. CALL. Yes; that is another thing altogether.

The WITNESS. Now, the banker draws interest on his capital, and the people are paying it; then he certainly is drawing interest on his note.

Mr. CALL. The Government issued a bond a long time ago and made a contract—it might have been a good or a bad contract—at all events, it made a contract recognized as valid, and to be continued valid, in the shape of a bond.

The WITNESS. That is true.

Mr. CALL. It agreed to pay interest.

The WITNESS. Yes.

Mr. CALL. Then the Government afterwards held that the men that should hold bonds of that character might issue so many of their own obligations, as a corporation or national bank, and that those bonds, when deposited, should be held as security to make those notes good to anybody that held them.

The WITNESS. That is true; but is not the national banker drawing double interest on his capital?

Mr. CALL. Not unless he uses his notes. He says: "I have deposited with Mr. Call this bond, which he is to hold as trustee, and I am going to issue my promissory notes to A, B, or C, and you are to understand that I never use my notes."

The WITNESS. Yes, it is true that I can do that with Senator Call; but I cannot do it with the Secretary of the Treasury backed by the United States Government. If I could do that I should have no complaint. I cannot get the General Government to indorse my note. The national bank can.

Q. Do you want a law to have the National Government become the trustee of every man who has got a bond?—A. No, sir; on the contrary, I do not want the Government to go on the bond of any man.

Q. Well, what do you want?—A. I want to stop that for one thing. I show you that the bank has given us no benefit for this privilege it gets. Take the case of the first national bank that was established—for I claim that the national banks have never rendered, directly or indirectly, any aid to the Government—but before they were national banks they were a stumbling block to the Government during the war,

Digitized by Google

and have been so since the war, and there has never been an act affecting the finances passed by Congress which the national banks, before they were national, did not oppose, and which some of them have not absolutely nullified. Now, the national banking act was passed in 1863, and no bank was organized in 1863. In 1864 the first national bank was established. At that time coin was worth 250 or 260. A banker went to Washington from Philadelphia with $100,000 and bought $100,000 of bonds of the Government. Assuming that he had only $100,000 when he went from Philadelphia, how did the transaction affect him? He bought $100,000 of bonds and paid for them, and received back, under the provisions of the act, $90,000 of the best money the world ever saw—according to the advocates of the banking system. If he did so, it must have been as good money as he paid to the Government. Now he has $90,000 in his pocket. But he does not stop there. The Government, under the law, gives him one year's advance interest upon his bond; and I have a letter in my pocket from Comptroller Knox in which he states that this interest has been paid uniformly to the national banks—one year's interest—upon depositing their bonds.

Q. You think that was a very bad law?—A. I am not going to state that, but will state the facts. He took 6 per cent. interest; that was $6,000 in coin. That was worth $15,000 in greenbacks. The man therefore has $15,000 of interest and $90,000 of notes, so that he now has $105,000 in money, and the Government owes him $100,000 on the transaction.

Q. What conclusion do you draw from all that?—A. That that man took in his pocket $5,000 more back to Philadelphia than he carried to Washington; and that the Government has been paying him 5 per cent. ever since on what it does not owe him, and that that comes out of the laboring people of this country, and that the people have a right to strike against this. They are now obliged to work for a dollar a day, while the national bankers parade their millions.

Q. You think those men who passed that law in 1864, made a bad law?—A. I think it was entirely unjustifiable.

Q. Suppose we grant that argument. It is a long time since that law was passed.—A. It is a long time, and we now find that Congress has continued those men in power, not only after having no benefit from this transaction, but that Congress passed an act containing what is known as the Carlisle amendment, and then they found that the little finger of the national banks was stronger than the whole United States Congress, because they threatened the President——

Mr. CALL. [Interposing.] You are aware that all that argument has been made before the American people time and time again; but that they persist in adhering to this very improper system.

The WITNESS. I am perfectly well aware of it; and I am aware, also, that in 1840 Birney was nominated for President by the same element that nominated Fremont in 1856; that Frémont was defeated for President, and that Lincoln was elected on the same principles upon which Frémont was defeated. The minority of Frémont became the majority of Lincoln. And my idea is that although defeated, Frémont's minority was right.

ABOLITION OF NATIONAL BANKS.

Q. Your idea is that there should be a law abolishing the national banks?—A. Yes; or that the same privileges should be given to everybody in the country, and that then there would not be any necessity for strikes.

Digitized by Google

Q. Your idea is that there should be a law enabling anybody to live on the interest of what he owes?—A. No, sir; I would not have that law passed, you understand. But if it is right for one class to live on the interest of what they owe, the other classes would have as good right as they to do it.

Mr. CALL. That would not be a bad idea if it were practicable.

The WITNESS. I do not think it is practicable for all and it is not right for one. I will agree with you that it is not practicable, but I think it follows very conclusively that it is not right. If I can't have it, my neighbor should not have it.

### LIFE HELD LESS SACRED THAN PROPERTY.

I want to call your attention to one more thing which the laboring people of this country complain of. These taxes are laid on them, although it is notorious that they have added to the wealth of the country, and have done their share in promoting the prosperity of the country. These very men know that under our laws human life is held less sacred than man's property.

Q. How do you make that out?—A. I make it out because in 1860, when we required men to suppress the rebellion and money to pay them for their services, and to provide arms and munitions of war, the people of this country saw Congress *take* the men and *borrow* the money.

Q. Is that recognizing by law the fact that life is not so valuable as money?—A. It by law recognizes the fact that when they needed men to sacrifice their lives they took them; they did not borrow them; while, at the same time, although they needed money, they did not take it, but borrowed it. That certainly establishes the idea that human life was not sacred, but that property was.

Q. How would you remedy that?—A. By applying to property the same law that you apply to life—that there should not exist now, or at any other time, an emergency for the Government to borrow a dollar of money unless it could borrow a man's life—unless it borrowed the arms.

Q. Your scheme would be to take the property without borrowing?—A. I would not take a man's son and leave his cousin's money.

Q. How would you do about the money?—A. I would take it the same as I took the man; unless I left the man I would not borrow the money; I would not consider a government worth saving that would do otherwise.

Q. The Government, I thought, took what it could afford to take at that time, and only borrowed because it could not afford to take any more. Were not the taxes high enough during the war?—A. It is not a question of taxes being high enough; they were not equitably laid.

Q. How are they now? Are they equitably laid?—A. No, sir.

Q. How would you fix them?—A. I would fix them first by taking away all legislation and privileges from the national banks to issue their notes as money.

Q. That does not affect the taxes, does it?—A. Does it not? There are $360,000,000 of national bank notes in circulation. If the Government should now do what it could have done at the time—if, instead of issuing these notes through the national banks, it had issued these notes directly, there would have been $360,000,000 of bonds less in circulation. When the national bank I spoke of was organized in Philadelphia, if you had increased the volume of circulation it would have made no difference whether they were national bank notes or private notes; they were currency. Now, when the banker went to Washington the

Digitized by Google

Secretary of the Treasury would have had $100,000 to pay off his soldiers and to pay his debts.

Q. Without any taxes?—A. I am speaking now about the bonds alone—taking them as a fact at that time and since. If the Secretary of the Treasury had issued $100,000 in notes there would have been no more inflation of currency than there was in his giving a banker the same amount.

Q. But did they not follow your idea and issue notes without limit until they conceived the idea of funding them in a bond?—A. They followed my plan for a few months.

Q. Until they got too many notes out?—A. No, not at all. They only really followed my plan for a few months during the war. They issued $60,000,000 of what I call money, because it was received by the Government and the people of this country whenever tendered. That money never depreciated during the war, and when Lee was in Pennsylvania it was quoted at one-quarter per cent. above par in the markets of Europe.

Q. You want the Government to issue its notes for the amount outstanding, do you?—A. Yes.

Q. What then?—A. By that issue of notes I would reduce the bonds. That would take away $360,000,000 of indebtedness, and a sinking fund established on that plan would abolish the national debt.

Q. Your remedy, then, is the old greenback idea again as a remedy for this trouble?—A. I am reiterating, I suppose, what you call the "old greenback idea" again in the same way exactly that my father and myself reiterated the Birney idea from 1848 to 1860.

Mr. CALL. That may all be true; I am not questioning it.

The WITNESS. To that extent, I am.

## DIRECT TAXATION.

Q. What other remedy would you suggest for these troubles?—A. That all taxation should be laid equitably; that there should be no indirect taxation by which the wealthy manufacturer escapes the taxation which falls upon his employés.

Q. How would you lay taxation equitably?—A. To let it go equally upon all persons and property that are protected. For instance, I am a manufacturer of articles that are heavily protected; we manufacture some articles which would cost to import $40 a gross; we can manufacture them for about $11 a gross; we could sell them at a profit for $12 a gross; we do sell them for $27 or $28.

Q. Then you want the tariff all taken off?—A. I want every indirect tax taken off.

Q. You want free trade?—A. If by that you mean free trade, yes. I believe that the time is coming when the custom-house will be looked upon as a relic of barbarism. I can see no reason why a man should be compelled to pay $27 or $30 a gross for articles in this country which can be exported and sold abroad for less money.

Q. Free trade in money and in merchandise; is that what you want?—A. I do not know what you mean by "free trade in money;" but that the Government should issue all the money is what I want, and it can be demonstrated that you thus save to the people millions of dollars which are now laid out by them and do no good to anybody.

Q. What other remedy would you suggest?—A. If you abolish all class legislation in this country, and restore the issuance of money to the Government, to whom it belongs; if you levy your taxes equitably

Digitized by Google

and stop the accumulation of large fortunes and increase the wealth of the producing classes of this country, who ought to enjoy what they produce, you will stop all cause of complaint.

The CHAIRMAN. I would like you to mention some instances that are specially strong in your mind of class legislation; all the instances that occur to you.

Mr. CALL. Other than the national bank and the tariff.

The WITNESS. Those are the only two instances that occur to me, and those two are certainly class legislation.

---

NEW YORK, *October* 1, 1883.

OSMOND H. SCHREINER examined.

By the CHAIRMAN:

Question. Please state your residence and occupation.—Answer. My residence is No. 51 Cambridge Place, Brooklyn; I am at present out of business.

The CHAIRMAN. You may proceed to make to the committee such statement as you desire touching the subjects under investigation.

## FAULTY LEGISLATION REGARDING THE CURRENCY.

The WITNESS. There is scarcely any subject so all-important, and so intimately related to the interests of every individual, as that of the currency, and yet scarcely any which people generally know so little about. Though handled and used daily, it is to them simply "money," without regard to its value or purchasing power as affected by legislation. They understand fully that a gallon or a peck are measures of quantity, a pound a measure of weight, and a yard a measure of length and distance, and they demand full measure for the price agreed upon. Were laws made diminishing these measures one-half, they would readily understand why prices should be less in proportion. But they do not comprehend that dollars are measures as truly as the gallon, peck, pound, or yard, and that legislation arbitrarily increasing their number or volume inevitably increases prices and makes dearer living. The masses of the people—all those dependent upon their daily earnings—would receive less injury in the one case, however, than the other, because a law reducing quantities would be immediate and universal in its effect, and prices would be adjusted at once, while an increase of currency by Government agency is gradual, and does not produce uniform effects nor become equally and uniformly distributed—especially when a large percentage is continuously directed by legislation into special channels, as has been the case in this country, as hereinafter shown, ever since the enactment in 1862 of the national bank act.

The effect of an increased currency is always felt by the working classes in advanced prices of daily necessities and everything that enters into the cost of living disproportionate to wages of daily labor, until the strain compels a demand or "strikes" for adjustment of wages thereto. And this experience is repeated periodically until the currency ceases to be further increased and prices to advance. A forced increase of the currency by legal paper issues gradually reduces the value or "purchasing power" of every dollar, as surely as any cause produces a known effect. And though it may be pleasing, in some sense, for mechanics or laborers to know that they earn twice as many dollars

Digitized by Google

as formerly, yet if their dollars will only go half as far or buy half as much as in the olden time, it is a barren result, and "costs more than it comes to."

In order to convey a clear understanding of the subject as related to the condition of things in this country at present, it is necessary, briefly, to state some leading facts regarding the currency and legislation relating thereto.

### CURRENCY BEFORE THE WAR.

Previous to the outbreak of the great rebellion, in 1861, the total currency in the country, including gold, silver, and bank notes, was not over $400,000,000, about one-half being coin and the remainder bank notes. The latter, however, were in many States imperfectly secured, and circulated only under heavy discounts, without any system of redemption, so that the $200,000,000 was not equal in usefulness to $150,000,000 of our present currency.

### CURRENCY LEGISLATION DURING THE WAR.

To afford the Government means to prosecute the war, Congress authorized the issue of United States notes, to be "legal tender" in payment of all debts. Specie payments were suspended. Gold and silver became merchandise, and continued to be bought and sold until January 1, 1879. Laws were also enacted by Congress in 1862 organizing the present national bank system, authorizing the issue of national bank notes, and prohibiting issues by State institutions. Fractional paper currency was also issued and made a legal tender up to $5. Owing to the continuous issue of immense sums of these various forms of currency, gold and silver gradually rose in price, the greatest depreciation of the paper currency having occurred when $100 of gold sold for $280 paper.

### CURRENCY LEGISLATION SINCE THE WAR.

After the surrender of General Lee and the close of the war in 1865, the price of gold gradually tended downward, until by act of January 14, 1875, Congress directed the coinage of silver to take the place of fractional paper currency, repealed the limit ($354,000,000) previously fixed for total issues of national bank notes, but directed the Secretary of the Treasury to redeem outstanding legal tenders in excess of $300,000,000, to the extent of 80 per cent. of any increase of national bank notes, and on and after January 1, 1879, to redeem in coin the legal tenders then outstanding.

Had legislation to that point, and looking only to a sound resumption of specie payments by gradually withdrawing the legal tenders from circulation and substituting coin, been adhered to the country would have been spared the evils which have resulted from the unsound resumption of January 1, 1879, viz, vastly increased expansion of the currency, which, coupled with its direction into special channels, and the concentration thereby of the surplus moneys of the country largely at one point, viz, New York, has produced the wildest era of gambling speculation, of unsound and illegitimate enterprise (notably railroad building for the profits of stock and bond watering), of stimulated trade, industry, and manufactures, and of doubtful and unenduring financial prosperity the country has ever yet seen, and the inevitable reaction from which, with its compensatory effects, must yet be experienced. But under the act of January 14, 1875, referred to, national bank circula-

Digitized by Google

tion gradually increased, and legal tenders to the amount of 80 per cent. of the increase were, in conformity with law, withdrawn and redeemed. The New York banks, being, under the law, largely depositaries and reserve agents for banks of the whole country, began to sensibly feel their diminution. Having formed part of the legal bank reserves, which diminished by their withdrawal, money became less abundant in New York, and, by consequence, throughout the country. Apprehensions arose, especially in Wall street, that a continued withdrawal of legal tenders down to the limit of $300,000,000, as fixed, would entail continuous scarcity of money and reduction of loans, from which a cessation of Wall street prosperity and even disaster might ensue. A pressure was accordingly brought to bear upon the Secretary of the Treasury and Congress favoring repeal of that requirement of the law; and by act of May 31, 1878, only seven months previous to the date fixed for resumption, a law was enacted forbidding further retirement of legal tenders, and fixing their future limit at the amount then outstanding, $346,681,016.

### RESUMPTION OF SPECIE PAYMENTS.

Under the force of this latter enactment, "resumption," so-called, took place January 1, 1879. Instead of, as contemplated by the original law, redemption in coin and retirement of the legal tenders, their entire volume is yet continued in circulation. Instead of a return to a sound volume of currency, sufficient for all healthy industries, expansion is piled upon inflation. To the great volume of paper issues for circulation, which were only justified by the exigencies of war, and which of themselves constituted a greatly inflated currency, have been added all the gold in the country, which before was only merchandise, the gold and silver since received from our mines and coined, and the immense excess over coin exports received from abroad for balance of trade. The act of May 31, 1878, could not have been better devised to foster and create "booms," "corners," and kindred evils of all kinds, for they are the natural progeny of this great parent "boom" in the currency. And this vast "resumption" expansion has, by express permission given in the national bank act, poured a continually augmented volume of surplus money into New York banks, under the law regulating bank reserves, to be loaned mainly upon Wall street "securities" for the speculative, illegitimate, and unscrupulous uses already stated.

### INCREASE OF THE CIRCULATING MEDIUM.

The circulating medium has been increased from time to time as follows, most of the figures being from reports of the Comptroller of the Currency: Amount at outbreak of the war, including all bank notes and coin, about $400,000,000; but as compared with national currency, not over $350,000,000. Amount after close of the war (August 31, 1865), $635,515,574. Amount thirteen years afterwards, and just previous to resumption (December, 1878), (including $50,000,000 silver as already circulating), $720,472,690. On January 1, 1879, the date of resumption, the entire gold in the country, estimated at $278,310,126, and the remainder of silver, $56,573,803, became again money, and augmented the volume at a bound to $1,055,356,619. By imports of coin for balance of foreign trade, coinage of gold and silver from our mines, and increase of national bank notes, the great volume has gradually swollen to—on November 1, 1879, $1,165,553,503; on November 1, 1880, $1,302,718,726; on November 1, 1881, $1,455,631,602; on November 1,

Digitized by Google

1882, $1,488,838,554; and a compilation by the First Comptroller of the Treasury, dated September 13, 1883, makes the total $1,575,104,642.

Q. That is the amount of currency of all descriptions?—A. Yes; but I think the First Comptroller's is an overestimate. I think he includes the coin held for outstanding gold and silver certificates, and also the certificates themselves. I do not think the total volume has increased much during the last year.

Q. What do you consider the actual amount available for circulation?

The WITNESS. For circulation? Outside the Treasury and the banks?

The CHAIRMAN. No; I mean the whole amount of currency available to the American people in actual circulation?

A. That was about the total currency—$1,488,838,554—last year; I do not think it varies much from $1,500,000,000 at present.

Q. Do you think it is too much or too little?—A. I think it is a vast inflation, through failure to retire the legal tender paper circulation.

## SPECULATION IN RAILROAD BUILDING.

This wild and ever-increasing flood of money, so vastly in excess of sound business needs, was largely and quickly availed of to build and manipulate railroads, because the idle millions seeking investment readily "floated" the great volume of watered securities to the enrichment of the projectors. The excessive railroad building and general speculation brought about by the release of the currency from the uses of the war, and to which the panic of 1873 was due, has been altogether eclipsed since "resumption." Miles of railroad built in 1870, '71, and '72, 19,327; miles of railroad built in 1880, '81, and '82, 28,019. Previous to the war the construction of railroads was not as of late years, carried on by Wall street "financiers," as a means of gigantic public swindling, but in obedience to a healthy demand to supply the growing needs of population. During the ten years, 1851 to 1860 inclusive, but 21,779 miles were completed, or little over 2,000 per annum, against over 9,000 per annum the past three years, a tremendous disparity after making all due allowance for increased population and natural requirements. The country has become burdened and cursed within fifteen years with fictitious railroad issues, amounting to thousands of millions of dollars, and the outcome therefrom, as by magic, of many fabulous fortunes, ranging from $20,000,000 to $200,000,000, which constantly exact tribute from the mass of the people and encroach upon their liberties. These vast fortunes, with scarcely any exceptions, have directly or indirectly grown out of railroad abuses and projects, requiring millions of financial aid for their accomplishment, which the undue aggregation of money at New York rendered easily obtainable. As a consequence of these monstrous abuses and manipulations, thus aided and facilitated by the enginery of the bank system, many of the principal railroad highways of the country are now under the supreme control of a few New York railroad kings.

## CURRENCY LEGISLATION SINCE RESUMPTION.

Since the "resumption" Wall street, with its railroad projects and vastly increased volume of railroad securities, the commerciale xchanges dealing in the necessities of life, manufactures, real estate, &c., all in turn have become the theaters or objects of unlimited speculation under the stimulus of the increased idle millions constantly seeking employment at low rates.

Digitized by Google

The act of May 31, 1878, would have received an appropriate designation had it been finally entitled "An act to further increase the currency and reduce its purchasing power."

Q. You would not have resumed specie payment?—A. I would; but I would not have resumed specie payment and continued the whole volume of paper currency out as it was, and kept it undiminished on a specie basis.

Q. Would you have redeemed the greenbacks?—A. I would, sir.

Q. And retired them at the same time?—A. Yes.

Q. That would have made $340,000,000, or whatever the amount is?—A. Yes; and the gold as it flowed into circulation should have been permitted to take the place of the greenbacks.

Q. And now you would have something about a billion of dollars currency instead of something over $1,400,000,000?—A. Yes; something over $1,100,000,000, against $700,000,000 previous to resumption.

Q. That would have left us just about as badly off, would it not?—A. No, sir.

Q. But this inflation of thousands of millions you speak of would have gone on just the same?—A. I did not speak of currency inflation of thousands of millions, but of the issue of such amount of watered securities as an effect or outgrowth of currency expansion. That and other evil results, would have been restricted to much narrower limits with but $1,100,000,000 currency.

The CHAIRMAN. I thought you spoke of the inflation of thousands of millions.

The WITNESS. No, sir.

Under the operation of the act of May 31, 1878, the volume of currency has doubled within four years; and it is noticeable that the voices of those who appear most concerned at the prospect of some contraction in bank circulation now were unheard in opposition to the enormous expansion.

The evils which would have resulted therefrom, had the laws encouraged only a natural flow and an even distribution of the bank reserves, have been greatly increased by the operations of those portions of the national-bank act known as sections 5191, 5192, and 5195, U. S. Revised Statutes. Section 5191 provides that banks in Albany, Baltimore, Boston, Cincinnati, Chicago, Cleveland, Detroit, Louisville, Milwaukee, New Orleans, New York, Philadelphia, Pittsburgh, Saint Louis, San Francisco, and Washington, shall keep a reserve in lawful money of 25 per cent. of their deposits. All others, wherever located, 15 per cent. Section 5192 provides that three-fifths of every 15 per cent. reserve required by section 5191 may consist of balances available for *redemption of its circulating notes* from national banks located in above cities and Charleston and Richmond. Section 5195 provides that each bank located in the cities named in section 5191, as above, "may keep one-half of its lawful money reserve in cash deposits in the city of New York." The permission given in these sections was quickly and universally availed of, for the sake of the interest to be obtained on such balances.

Q. Do you draw any hurtful inference from that?—A. Yes.

Q. How?—A. I say that two-thirds at least of the total clearings of the New York banks are for speculative transactions, or the results of such transactions—mainly on the Stock Exchange.

Q. Wherein does that hurt, or perhaps you go into that subject later on?—A. I think I do.

The CHAIRMAN. Very well, proceed.

Digitized by Google

The WITNESS Owing to these sections of the law, over 2,000 national banks are required to keep on hand but 6 per cent. instead of 15 per cent. of their liabilities, and 193 banks in all principal cities except New York but 12½ instead of 25 per cent. One-half of the reserves of the entire system outside of New York are permitted by the law to stand as deposits on the books of the New York banks. Upon the condition and reserves of the New York banks, therefore, if made to depend the condition and reserves of the entire system. And as the New York banks use their surplus over the required 25 per cent. mainly by loaning on "call" on Wall street securities, the stability of the entire banking system hinges largely upon the ability of the Wall street borrowers to repay in a general emergency, or of the New York banks to realize upon the immense volume of collateral securities in case of failure to do so in time of panic or monetary distress. Such loans have, at such times, proven an unreliable and delusive resource, and always will. This element of weakness should be cured by so amending the law as to compel not alone the New York banks, but all national banks alike, to keep their entire cash reserves, required by law, in lawful money, in their own vaults. Periodical financial panics would then be fewer, the ability of the banks to meet any general emergency and their own sense of security be greatly increased, every business and industry rest upon a surer and steadier basis, and the opportunities for unscrupulous and quick acquirement of great fortunes be thereby lessened.

## BANK CLEARINGS.

Some striking effects, in addition to those mentioned, of this evil of currency discrimination, together with the great resumption inflation, are as follows:

*Average daily clearings of New York City banks during the following periods:*

| Years. | |
|---|---|
| 1855 to 1859, inclusive | $20,584,000 |
| 1860 to 1864, " (during the war) | 38,264,000 |
| 1865 to 1869, " | 97,014,000 |
| 1870 to 1874, " | 97,174,000 |
| 1875 to 1878, " | 75,541,000 |
| 1879 to 1882, " (since resumption) | 134,000,000 |

The vast increase in daily transactions after the war, and since resumption, occurred mainly among a dozen banks in Wall street and vicinity, by increased deposits and checks of stock brokers.

The following are the average daily New York bank clearings (currency) for three years before resumption and four years after:

| | |
|---|---|
| 1876 | $63,000,000 |
| 1877 | 68,000,000 |
| 1878 | 65,000,000 |
| 1879 | 96,000,000 |
| 1880 | 126,000,000 |
| 1881 | 162,000,000 |
| 1882 | 154,000,000 |
| Total clearings New York city banks one year to October 1, 1882 | 46,552,000,000 |
| Total clearings banks of twenty-two other largest cities | 14,501,000,000 |

The largest proportion in New York being for speculative transactions.

Q. How is the calculation made—on the business days, I suppose?—A. Yes; it is of the business days in every week.

Digitized by Google

### AMOUNTS OF CERTIFIED CHECKS.

The outstanding certified checks, New York national banks, per quarterly reports at about the same date in each year, for four years before resumption and four years after:

| | |
|---|---|
| 1875 | $31,000,000 |
| 1876 | 34,000,000 |
| 1877 | 28,000,000 |
| 1878 | 30,000,000 |
| 1879 | 64,000,000 |
| 1880 | 137,000,000 |
| 1881 | 129,000,000 |
| 1882 | 137,000,000 |

The increase being mainly for stock-exchange transactions.

Q. That is the number of millions daily?—A. That was the amount outstanding on the one day when they made their reports to the Comptroller of the Currency, and it is not far from an average daily amount for each year. The increase is almost entirely attributable to speculative transactions.

The general rate of interest on call loans in Wall street has for years been lower than London rates.

### NEW YORK COTTON EXCHANGE.

The transactions of the New York Cotton Exchange for the year just previous to resumption, the year ending September, 1878, were, "spot," or for delivery, 330,935 bales; futures, 12,973,300 bales. For the year ending September, 1882, the spot transactions were 381,078 bales; while the speculative transactions, or futures, were 32,200,300 bales.

### PRODUCE EXCHANGE TRANSACTIONS.

I noticed that Mr. Partridge, in his testimony, stated to you a point in this connection, that the amount of margins deposited at the Produce Exchange on speculative transactions was, in 1878, about $3,000,000 to about $17,000,000 last year; which is a clear demonstration of the increase of speculative transactions on the Produce Exchange.

The transactions in wheat at the New York Produce Exchange for four and a half months of 1883 were, spot, 34,956,000 bushels; futures, 493,041,500 bushels.

Q. Is there any way of dividing those futures into those that are legitimate and useful and the other or merely speculative class?—A. Well, I think nineteen twentieths of them, without question, are entirely speculative. That is my opinion. I have no way of dividing them, but I know the increase has been vast for the past few years.

### RATIO OF INCREASE OF CURRENCY TO POPULATION IN THE UNITED STATES.

Statistics show the increase in population of the United States from 1860 to 1883 to have been 70 per cent., while the increase of currency in the same period was over 400 per cent.; more than one-half of the latter being since January 1, 1879.

The currency per capita of population during that period was: For 1860, $11; for 1865, $18, at close of the war; for 1878, $15; for 1883, $28 or $29.

Digitized by Google

Q. When you speak of the increase of circulation per capita, do you mean of actual circulation or only what would be considered legal tender?—A. No, sir; all classes of currency; they are all based on the legal-tender volume. The national-bank notes are at least based on that legal-tender volume, because they are all redemed in legal tender.

Q. What increase has there been of legal tender?—A. None latterly, except of gold.

Q. I mean between 1860 and the present time?—A. There was no legal tender in 1860 except gold and silver.

The CHAIRMAN. I understand that.

The WITNESS. There were about $200,000,000 of gold in the country in 1860.

Q. What amount of other currency was there?—A. None.

Q. There were the State banks.—A. The State-bank currency was $200,000,000, but, owing to the various laws and defective securing of the same in the different States, much of it circulated only under heavy discount, and it was not worth over $150,000,000 of the present currency; so that I estimate that at the outside the whole amount in the country in 1860 was $350,000,000.

Q. That amount, then, did the same business for the population just before the war that the $1,500,000,000 does now?—A. Yes; allowing for the difference of population.

Q. I say the $350,000,000 did then for the population the same office that $1,500,000,000 does for the 53,000,000 of our present population?—A. Yes; in other words, we have gone from $12 per capita in 1860 to $29; and from $15 per capita in 1878 to $29 in 1883, only four or five years.

Q. Right on that point, what hurt do you infer to the public interests or to the interests of business and of the working people from this fact of a great increase in the actual circulation in the country beyond the increase of population; do you not recognize an almost corresponding increase in the volume of business transactions of the whole country?—A. If you include speculative transactions and excessive railroad building and everything of that kind growing out of the increase of volume of the currency, I recognize a corresponding increase; but that stimulated increase would never have taken place but for the increase in the currency, and it has taken place largely since the resumption of specie payments, owing to the carrying of the legal tenders upon a specie basis without redeeming or withdrawing them.

## THE PACIFIC RAILROADS.

Q. In other words, but for this increase there would have been no Pacific Railroad and none of the great enterprises developed since 1860?—A. The Union and Central Pacific were not built owing to inflation of the currency, but by Government aid.

Q. Yes; but the increase you speak of took place before the inflation, and the improvements have gone on with greater rapidity than before.—A. They have; owing to the fact that the currency has been increased by law.

Q. Do you think there has been any occasion for an increased amount of circulation, per capita, in this country since 1860? Do the people need more, in proportion to the number of people that there are, by reason of a greater volume of business per capita?—A. Well, whether they need any more or not, per capita, is a question that at present I am not pre-

Digitized by Google

pared to answer; but I am prepared to state as my opinion that the increase per capita is altogether out of proportion to the legitimate needs of the people and of trade and industry.

Now, to continue with my figures:

BANK DEPOSITS IN THE UNITED STATES.

The increase in deposits throughout the United States since resumption, has been as follows:

| | 1878. | 1882. | Increase. |
|---|---|---|---|
| National banks | $677, 000, 000 | $1, 187, 000, 000 | $510, 000, 000 |
| State banks | 413, 000, 000 | 747, 000, 000 | 334, 000, 000 |
| Savings banks | 829, 000, 000 | 971, 000, 000 | 142, 000, 000 |
| Total | 1, 919, 000, 000 | 2, 905, 000, 000 | 986, 000, 000 |

The increase in savings banks is here seen to be less than 15 per cent. of the total increase, showing that the savings banks deposits have increased in a far less ratio than the increase in other institutions, notwithstanding that they are used to a great extent by people of means. There are many people who divide thousands of dollars among the savings banks in order to get the interest. Trade and manufactures have been so stimulated that overproduction has occurred in all branches during the past few years, as is evidenced in many ways. No statistics are at hand, however, with regard to most of the productions of the country, simply because there are no official reports, but regarding whisky in bond, on which the Government collects a tax, the increase has been in four years from fifteen million gallons to ninety million gallons.

LEGAL-TENDER NOTES.

Had the legal tenders been gradually withdrawn after January 1, 1879, and gold and silver been permitted to fill their place, and presuming the coin importations, &c., would have been in that case the same, there would still have occurred an increase over the amount of currency in circulation previous to that date of over 50 per cent., or upwards of $400,000,000. But some faint idea of what have been the effects of continuing the legal tenders in circulation may be pictured by the universal financial distress which would be caused by their withdrawal now. Out of these great errors of legislation have sprung, in greater measure than all other causes combined, the evils which afflict the great body of the people. Discontent, the spread of communistic ideas, dearer living, strikes, the continued increase of great fortunes while the many thereby become poorer, the increase and abuse of corporate power, huge stock waterings, vast and general speculation, overproduction, and excessive railroad building, with the after result of general business depression and "hard times" are all attributable and traceable thereto. In other words, they could not be carried out, or would not have occurred without the use or misuse of vast sums of money.

An increase, by arbitrary legislation, of the circulating medium or money of any country, always has produced such effects, and always will. The few rich are enabled thereby to become richer, and the many poor inevitably become poorer.

The occurrence of unusually deficient crops in Great Britain and

Digitized by Google

Europe, during several successive years, has caused a greatly increased production of grains, provisions, &c., to meet the demand for export. The enlarged export of these, together with the hundreds of millions of new railroad securities marketed abroad during the same period, have kept the balance of trade in our favor, and enabled the importation of many millions of gold. This conjunction of merely abnormal circumstances has been overlooked or forgotten, and the belief has become prevalent that the world must remain permanently tributary to us. The great law of supply and demand, whose workings no legislation can permanently change or impede, will, however, sooner or later assert itself, as a retributive regulator of evils resulting from unwise currency legislation, as of all other departures from sound and healthy general conditions. The penalty of hardships is already being endured, and will continue and doubtless increase, whether corrective legislation be had or not.

A country may be rich in its area and its immense productions, but the continuous safety and stability of its financial and banking system and of every property and business interest and vocation, including the wages of daily labor, should rest upon a circulating medium, which like other things, should be left to find its level and natural flow unaffected by legislation, according to the law of demand and supply.

### GOLD THE CHIEF MEASURE OF VALUE.

Gold is the only means of settlement accepted by the citizens of leading nations for balances of international trade. It is the chief measure of value by universal consent. Since trade with foreign countries must continue, it is folly to expect a sound or continuing prosperity upon any other basis, among ourselves. The attempt has been continued for years to popularize and circulate the so-called "dollar of our fathers." The result has been a large increase of the Government paper issues, while the mass of the coins lay discarded in the Treasury, only a basis for additional inflation. Gold, as before the war, should be the only legal tender for sums over $5. The volume of the currency would then be limited by the demands and results of industry and trade, and the legitimate needs of the people for its use. The result would be the increased value or purchasing power of the hard earnings of labor throughout the land. The spirit of speculation, overproduction, excessive railroad building, the quick acquirement of great wealth by unscrupulous means, tendencies to "panics," and kindred evils, would be checked. A true measure of value, and a sound volume of currency, with impartial banking laws, would thus ultimately promote the "greatest good of the greatest number," and tend to a more even and just distribution of the wealth of the country.

### SILVER FOR FRACTIONAL CURRENCY.

Q. What would you do with silver?—A. I would simply use it as a fractional currency, as it was before the war, for coins not over 50 cents. Let the surplus be sold at its bullion value. The idea of two metals of different market values being made of equal worth and use in a country is to my mind absurd, and can never be carried out; especially as long as we have to deal with foreign countries where one of them—silver—is not recognized. The result in the end, if we went on to fill our vaults with silver dollars, would be to export the gold from the country and leave us the silver.

Digitized by Google

TOO MUCH RAILROAD BUILDING.

By Mr. CALL:

Q. You think there has been too much railroad building?—A. Yes, sir.

Q. Which one of the railroads do you think have been built that ought not to have been?—A. That is not for me to say. There has been railroad building all over the land in every direction. I think the building of railroads has been far in excess of the actual needs of the population.

Q. Well, that must be so of some one railroad, if it be true. Which one or more do you think superfluous?—A. Well, I am not a railroad man, but I know there have been railroads built from here to Chicago, where we had already two or three lines, we have now five or six, but they manage to keep up their traffic rates by means of a pool, in which they all harmonize and stifle competition. Whether that will always remain so, I do not know, but I think there will be an end to it one of these days. There will be a pretty general fight among the roads for the business to be had. Where there was one Pacific road there are now three lines of roads completed to the Pacific.

Q. They run through different countries, do they not?—A. They do; and, so far as they are concerned, they tend, doubtless, to develop the country, and attract population there.

Q. Well, then, you would not do away with either of them, would you?—A. Well, now that we have them built, I should not do away with them; no, sir.

Q. But is it not necessary to your proposition to assert that some one of them that has been built ought not to have been built?—A. Well, I am not prepared to accede to that idea, because the single line was a great monopoly.

Q. Your proposition is that the excess, or superfluity of money, has led to its use in unnecessary enterprises?—A. Yes.

Q. And that railroad building has been one of those uses. Therefore there must be some roads that have been built somewhere that ought not to have been built?—A. Unquestionably the main spur to building railroads has been to reap an immense harvest in the building of them.

Q. That may be, and still the other proposition may not be. It may be that there have been evil effects from a good thing, but it may not follow because of that, that a good thing ought not to be done?—A. Well, the proof of the pudding is in the eating, and I apprehend that we shall have a return tide some day in this country, from the present position of things, and whether these roads will be able to pay their way, or prove of the use that they seemingly are now to the country, and will serve to continue to attract population and develop and settle the regions out West to the extent that they are now doing, and are expected to do in the near future, is a matter of time to find out. I am unable to point out any particular road, but I am sure that where the disparity is so great as from 2,000 miles a year in 1860 to upwards of 9,000 miles a year for the past three years, and when it is very apparent that these roads have not been constructed in obedience to the demands of population, but far in advance of population, and mainly for the profits of excessive issues of bonds and stock, as far as I can judge, it is clear that there has been a great excess.

By the CHAIRMAN:

Q. I should like you to explain what harm it does to working people to have work to do. Here are all these railroads built, as you say, by

Digitized by Google

reason of the fact that there was currency or some circulating medium through which they could be built. The construction of these roads is the only evil that can be complained of up to this date. The construction of a railroad means work, and the currency has been used, if used at all, in making that work possible, in the mines, in the mills, in the construction of the road-bed, and of the road itself, its depots, rolling stock, &c. These roads are just barely done. Now, what harm, up to this date, has been done to labor by the fact that there has been probably twice as much labor to be done in the country than there otherwise would have been done?—A. If, by reason of an unnecessary increase in the volume of the currency there has been a stimulated and an unusual demand for labor for the time, so that men are drawn from agricultural pursuits to work upon railroads, in factories, &c., for speculative ends, there sooner or later comes an end to that stimulated demand, and the result is distress to individuals— what many are beginning to feel now. The stimulated demand is now decreasing, and there is not the same call for men that there was two or three years ago, which grew out of the immense expansion of the currency. The masses are beginning to find it difficult to find employment, while two or three years ago there was employment for everybody. Owing to increased demand of production, manufactures were all humming; stocks were being accumulated in the stores, and prices were tending up constantly; railroads were built for the same reason, and now we are crying a halt. The overconstruction of railroads was only one of the resulting evils.

Q. But there were four or five years when there was something for everybody to do, and a chance to save something if they could ever save anything; while, but for the fact that you are now complaining of, it would have continued dull all those years, would it not?—A. No, sir; I think not.

Q. Those same workmen still exist?—A. Yes.

Q. They are going to have a blue time now; but they would have had it all the while if it had not been for that building?—A. No; I do not think we would have had so much immigration. The unusual demand for labor from this country has called laborers from the old countries.

The CHAIRMAN. But we have stopped the Chinese from coming in.

The WITNESS. Yes, but European laborers have come here by hundreds of thousands owing to the prospect of work here. Large numbers of young men have in like manner been attracted to the great cities, manufacturing towns, &c., who otherwise would have remained at agricultural pursuits, but now, having grown older, they are unwilling to go back to agricultural pursuits. Anything which interferes with the even and stable processes of labor, manufactures and trade, which, during one decade, sends them up, only to fall in the next decade, is unhealthy, and for the worst interests of the people at large.

## CIRCULATION OF MONEY IN FRANCE.

Q. Do you know the per capita of circulation in France to the population of that country?—A. I am not informed.

Q. Is it nearly as much as it is here?—A. It is not anything like the per capita here.

Q. I understand that is so, but it is much larger in France than in England, is it not?—A. I think it is.

Q. Which nation is the most prosperous—among the masses of the people?—A. Well, Mr. Chairman, I suppose you will say that the French people are the most prosperous.

Digitized by Google

Q. Well, do you not say so?—A. I am not prepared to say that they are not, but I do not think it grows at all out of the volume of their currency.

Q. Is it not necessary that that should be so. The point is whether, notwithstanding that volume of currency, they may be so prosperous as with a less volume, and whether the large volume, per capita, is necessarily an evil?—A. I do not think they have any issue of paper money made a legal tender.

Q. We have none that is not redeemable in gold if any man chooses to ask it, and it is a good fault to find with the currency that people prefer it to gold, is it not?—A. But if the tendency of the laws is to create an unusual and excessive volume of legal tender money—as is evidently the case by the figures I have adduced—since 1878, then it certainly is unwise legislation.

CONSTITUTIONALITY OF PAPER-MONEY ISSUED IN TIME OF PEACE.

In my judgment the Government has no constitutional right to issue paper money and make it legal tender in time of peace. There is a case coming before the Supreme Court this very month on that point; and, so far as I have read the decisions of the Supreme Court, which have heretofore borne on that point, I am of opinion that the court can only decide one way in the case I allude to, that the Government has not that constitutional right in time of peace.

Q. Do you not think the court will probably hold that it depends on the public necessity, whether that necessity arises in time of peace or from the fact of war?—A. No, sir; I do not think it will find justification for such interference with the exigencies of a time of peace.

Q. Suppose as great a necessity for the issuance of currency should occur in a time of peace as during a war, do you not think the condition of the country should be, after all, the criterion for the issuance of the currency?—A. I cannot imagine that any such deduction can be drawn.

The CHAIRMAN. I do not know what the court will decide, but I know what the country will decide; when the time comes the country will continue to live.

The WITNESS. Then all I can say is that the country will suffer dearly for it, because there is a great law above that—the law of supply and demand, and that is the supreme law.

The CHAIRMAN. "All that a man hath will he give for his life."

---

NEW YORK, *October* 1, 1883.

DANIEL HARRIS examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. At No. 105 East Fourteenth street. My business address is No. 12 East Fourteenth street. I represent Price Brothers, of Bristol, England, stone-ware potters.

THE DUTY ON STONE-WARE.

The statement which I have to make to the committee is in reference to stone-ware. The existing duty of 55 per cent. on glazed stone-ware is almost prohibitory. The words "ornamental work" seem to imply figure, color, or design. The regular duty on unglazed ware is 25 per

Digitized by Google

cent. ad valorem, and 30 per cent. additional duty is imposed when the same article is glazed, whereas the simple glazing is not intended for ornament, because without it the ware for most purposes is useless. I have a letter here from one of your New York merchants and manufacturers who uses our stone-ware to a small extent, but he says he would greatly increase his own business by being able to import it at a fair tariff of say 25 per cent. A second gentleman, in the same line of business, tells me that he has recently been a great loser by having to put up all goods in American-made vessels, not glazed, and therefore porous and worse than useless.

Representing English manufacturers, and while admitting the necessity of your Government imposing a fair protective tariff on all goods which could be produced in your country, I am equally certain that it cannot be their intention to levy such a duty on an article which is in great requisition, and which is not and cannot be made in your country, and that it is prejudicial to very many of your manufacturers, who are either compelled to pay an excessive and disproportionate duty, or use inferior home-made goods prejudicial to their interests. This is the sentiment of many business men who have urged me to bring this matter to your special notice.

I have a letter from a well known firm in this city who use our goods, and that firm has asked me to bring this matter before you. Here, for instance, is an ink bottle, which I show you and which we make. Of necessity that bottle has to be glazed. We do not put that glazing on for ornament.

Your tariff makes your merchants pay 30 per cent. more for glazed ware than for the same goods not glazed. But if this ink bottle were not glazed it would be utterly useless. The tariff upon brown earthen ware is 25 per cent. ad valorem, and that would be the duty on a bottle of this kind if unglazed. But if the bottle be glazed there is an additional duty of 30 per cent. put on. Yet the fact is that without the glazing it would be useless. The glazing is not put on, as I have said, for ornament; but the fact of its being glazed is interpreted to mean that it is intended for ornament, which makes it apparently liable, under that interpretation, to the additional duty.

While the subject is up I might as well say that I have seen about thirty of your large manufacturers, and quite half of them are wanting our goods; they cannot put up their own manufactured material for want of something like this.

Q. Why cannot the article be used without the glazing?—A. We have been making these for one hundred and fifty years, and without glazing they would be useless.

Q. Does that bring them in conflict with any American manufacture?—A. No, sir.

Q. But there are American ink bottles?—A. Yes; but they are so porous or very inferior that they do not come in conflict with us My point is not one of any objection to the regular duty, but to the 30 per cent. additional duty on the glazed article. We want that 30 per cent. removed, not so much for us, but because your own manufacturers want it removed.

The CHAIRMAN. That is a matter that you would need to call the attention of the Finance Committee of the Senate to, or the proper committee of the House, but your statement here to-day will serve, perhaps, to call public attention to it.

Digitized by Google

NEW YORK, *October* 1, 1883.

GEORGE F. STEARNS examined.

By the CHAIRMAN:

Question. Please state your residence and occupation.—Answer. I am engaged in railroad enterprises, and reside in New York.

Q. What have been your opportunities of becoming acquainted with the relations of corporate capital and management of business enterprises, and the interests of the laboring people of this country?—A. A large acquaintance with the active managers of corporations, the study of those corporations, and my personal relations with corporations.

The CHAIRMAN. You may state to the committee the opinions you have formed upon those matters from your observation and experience.

The WITNESS. I have been in some respects a student of the working of corporations; their relations to labor, and their general welfare. I am not a decrier of corporations, because I recognize the vast work that they have been the means of performing in the development of this country; but it seems to me, from my observation and reflection, that the working out of the instrumentalities which are given to these corporations by the managers thereof have been perverted largely from their general intent, and have become very arbitrary and very onerous in their exactions from the general public.

## CORPORATIONS ESTABLISHED FOR THE GENERAL GOOD.

I suppose it is a well established principle which every person knows, or should know, that corporations are established for the general good, and not for individual benefit. While admitting the great work that they have accomplished, they have been instrumental in building up in this country, to my mind, what is expressly prohibited by our Constitution; that is, a caste in society.

We must recognize that the great corporations of this country have been given their charters for the purpose of railroad building, very largely, that being the greatest interest of the country. We must recognize also the fact that vast as the railroad interests of the country are they have all been developed within the life time of him who is not an old man. Every steam railroad in this country, every locomotive in the country, has been put upon a railway since I came into existence, and I am not a very old man. It seems to me that the power which has been given, or rather usurped (for I do not admit that it was given), has been perverted, and that excessive returns have been exacted thereby, the public, of course, paying the bill which has inured to individuals in a very restricted sphere.

It certainly seems to me that if the best fruit of our corporations is to furnish men who are jockies upon the race-course, or who are held up to execration in the public press, or denounced by name as rascals and thieves, which is the case, as everybody who reads knows, it is time to call a halt and take our bearings and ascertain where we are.

It is a question of vexed moment as to how the corporations shall be controlled. It seems to me, however, that that is not the intricate question which it is generally supposed to be. Individuals seek corporate power for the reason that thereby they are exempted from individual liability, and thereby, as the practical working has shown, they are enabled to receive or exact returns from capital the like of which has never before been received from any business which was under the protection of the law. The original principle upon which railway corpora-

Digitized by Google

tions were granted corporate powers restricted the return to capital to a sum not in excess of 10 per cent. upon the amount of capital absolutely invested.

### A RAILROAD PAYING 20 TO 25 PER CENT. PER ANNUM ON THE AMOUNT INVESTED.

Now, we are forced to draw our illustrations from existing facts. The Boston and Albany Railway, of Massachusetts, which is pre-eminently a well-managed corporation, a corporation which has shown itself free from scandal, whose officers have stood high in the community, and have been beyond reproach in the public press, pays from 20 to 25 per cent. per annum upon every dollar of capital which was originally invested. I mention that corporation because it is a prominent corporation of Massachusetts.

Q. Do you mean 25 per cent. on its nominal capital?—A. No, sir. I mean to say that the return which is being exacted from the public pays a sum not less than 20 to 25 per cent. per annum upon the entire sum which has, out of the pockets of the stockholders, now or originally, been put into that work.

Q. The stockholders now, or the original stockholders?—A. Yes. I mean what has been paid out of the stockholders' pockets into the corporation fund for purposes of construction.

Q. Do you mean that it could be replaced for that?—A. No; I do not mean that by any means. I mean to say that this corporation pays 8 per cent. per annum, and I mean to say that the excess of earnings over 8 per cent. per annum, which has been divided in dividends among the stockholders year by year, is very largely augmented in value over the institution, which was built by the money of the stockholders.

Q. That is, they have used their surplus from year to year to increase the value of their property?—A. Yes; exactly that, and, as was so ably shown in the Windom report (I am merely illustrating), they are exacting—to use the spirit of the language if not the identical language of the Windom report—from the public these annual sums. I think the word "stolen" is used in the report, and the public are then made to pay interest on that which has been taken from them for the benefit of the stockholders of the corporation.

### RAILROADS CAPITALIZED FOR THREE TIMES THEIR COST.

A similar state of facts exists, and in citing instances or names I do not desire to be considered as making any invidious comparisons, but we are obliged to make illustrations—it is known that a similar state of facts exists with regard to the Vanderbilt line between New York and Chicago—the New York Central and Hudson River, Lake Shore and Michigan Southern—which is the great artery of communication of this country from Chicago to New York. These are not new facts that I am citing. That line stands capitalized in its stock and bonds upon a sum three times its cost.

Q. Its original cost?—A. Its original cost; three times the amount of money which has been taken out of the stockholders' pockets to pay for the stock of the road. The road to-day stands capitalized for three times, or thereabouts, that amount. Now, it seems to me that that is eminently unjust to the public weal, because it builds up great fortunes in the hands of the few, and lays a continuous tax upon the public and enriches these individuals.

I might bring forward other illustrations, but I know the time of the committee is limited, and I merely touch on leading points.

Digitized by Google

### DECREASE OF RAILROAD RATES.

It is argued that rates have largely decreased, and that the railway system of the United States is the best system in the world. I am prepared to admit that with all its faults, but I do claim that in the interest of the general good these creatures of the public should be made subservient to the interests of the public. In no instance can the creature be greater than the creator. I have no doubt whatever in my own mind that the ultimate decision of all our courts and highest tribunals will center upon the point that in every case, no matter what the special grant in the charter may have been, the corporation is subservient to the public weal; because, illustrating by the principle of eminent domain, that is held by the people as an inalienable right. The people create corporations for the purpose of doing a special work, and for the accomplishment of that special work they grant them that power, but they do not grant them that power that it may be abused, nor do they grant that power that the creature may exact a tax from the creator greater than the creator itself would exact. My theory is—and it is no new theory with me—that every railway is a public highway in a modified form.

### THE RAILROAD A PUBLIC HIGHWAY.

We have gone through a series of developments in this country whereby, at the first, communication was over the Indian trail; it was then over the wagon-road; it was then over the turnpike; it then became necessary to increase communication, and the canal was established, and all those instrumentalities have now become obsolete. The necessities of the times demand the steam railway. The railway has taken the place of the public road; and I maintain that in granting the franchise to the steam railway the public never divested themselves of a power which the steam railway at the present day assumes. Take, for instance, the construction of roads. It has always been the theory of civilized governments that the state was bound to furnish the road, and the state would tax the community for the maintenance of that road, but who ever heard of any state or municipality establishing a tax upon a people for the construction and maintenance of that road in excess of the cost and maintenance of the road.

### GOVERNMENT REGULATION—NOT CONTROL.

I am not an advocate of the Government assuming control of the corporations. I believe that principle is fraught with great peril. But I am in favor of the Government assuming such control of the corporations as that their earnings shall be restricted to a fair return upon the capital invested, and that any excess which may be derived from the earnings over and above a fair percentage to reimburse the legitimate capital invested, should in some form or shape go to the public benefit.

Q. How would you accomplish that?—A. Those who legislated in the early days when corporations were first established—think I mentioned the fact—if not, I mention it now—said they should exact not in excess of 10 per cent., and 10 per cent. was a fair return in those days for capital. The nations of the world have grown rich on a percentage very much less than that. The spirit of the times is adverse to a sum even so large as that. The decrease in the rates of interest in the last twenty years (since our war) is known to every man. It is now hard work to invest money safely at 3 or 3½ per cent. I believe a restriction might

Digitized by Google

be established, and that the effect would be to break down the building at the public expense of enormous fortunes, fortunes the like of which have never been known to be amassed by individuals. I make no war upon individuals. I do not envy certain men who stand pre-eminent as railway kings, as they are denominated. I rather pity them and commiserate them. The fact is believed by many that one who stands pre-eminent——

The CHAIRMAN. [Interposing.] I do not know that it is worth while to aim, whether covertly or directly, at any particular individual.

The WITNESS. I have no disposition to do so. But I speak of the system and the outlook of the system.

The CHAIRMAN. Well, we will look at the individuals who represent the system, as its representatives.

### DECREASE OF TRANSPORTATION RATES.

The WITNESS. Very well. A point comes to me that is made much of, that by the present operation of corporation, rates of transportation have been largely decreased, and that the corporations are to be credited with having yielded to the public demands. That I claim is fallacious. I believe that the reduction in the rates of transportation are due to natural causes, and I believe that great as has been the reduction, yet, if the strong hand of the Government were brought in, as I believe it should in all justice be brought in, to prohibit corporations from combining and "pooling" their interests and their earnings, we should see a vast decrease, and that the public weal would be largely the gainer. It is a notorious fact that the trunk lines of this country have combined, and every month the number is being added to of those who are newly admitted into the combination. The general principle that competition is the life of trade is entirely nullified by these combinations. This subject has been largely discussed before you, and I only propose to allude to it, and not to discuss it. The principle which the railways work upon seems to be to charge all that the business will bear. That seems to me is a most pernicious principle, and it is in the power of the Government to prevent it.

The CHAIRMAN. Mr. Fink explained that to the committee. He says it is a misapprehension, and that the railroads do not act on that principle, that its enunciation is only a partial enunciation of the principle on which they act, which is, to burden the traffic with such charges of transportation as it will bear consistently with the most successful development of the business, furnishing the material of transportation, &c.

### ILLUSTRATIONS OF UNJUST RAILROAD CHARGES.

The WITNESS. Well, sir, as an illustration, you may start live stock from Chicago and send it through to New York at a certain rate per car. I am speaking now generally, not specifically; I am merely illustrating. If you start that car load of cattle midway between Chicago and New York I think you will find the transportation charge just about the same as it would be to New York from Chicago. Or if you feed these cattle on the hills of West Virginia until they fatten, and then send them to tide, you will find that under the system of transportation which exists another charge equal in amount is made to bring them to the seaboard. That is done under a system of combination which, to say the least, is very onerous.

Digitized by Google

I have been somewhat familiar with Mr. Fink's view. It is not new to me. He argues from his stand-point—a very proper one for him—but I look at it from a different stand-point. Hardly a month goes by but what we see in some large center agents of the different lines of one type or another meeting in convention and there fixing arbitrary rates for transportation. If that is not a combination, if that is not a pooling, I do not know what combinations or pooling are.

DIVIDENDS ON CAPITALIZED SURPLUS EARNINGS.

Q. I want to call your attention to one point: You say you would not prevent the stockholders from receiving returns which should be a fair dividend—4, 5, 6, or 8 per cent., whatever is a fair remuneration, for money invested upon the existing capital stock of these roads, where that capital stock is in excess of the money actually invested originally by stockholders, the existing value having been given to the roads beyond that original investment by the surplus earnings of the roads, taken from the public, and used in enlarging the property itself. Now, when that process has been allowed to go on year after year, the public remaining quiescent and acquiescent, the stock having been watered, but not beyond the actual value of the plant itself, and the public having dealt in it, or individuals having dealt in it, having bought and sold and invested, not according to the original investment by the stockholders, but according to the present value of the plant itself, so that they have bought the watered stock at par, or above, or below par, as the case may be, according to the quotations—now, do you think it would be just to the public to step in at this time to deny these recent investors in the stock of the corporation a fair return upon the money which they have invested in this stock?—A. My belief is that all these excessive gains which have been taken from the public are illicit. It seemes to me that the Government can afford to be magnanimous to even an excessive degree; but it is never too late to repair a wrong. The people of this country tolerated and protected the institution of slavery for a great many years. It took a great many years to educate the public conscience of this country to the degree where they felt it to be so great a wrong that it should be done away with, and the question of dollars and cents did not come into the settlement at all.

The CHAIRMAN. But this is a settlement purely of dollars and cents, and of what is just to be done with those people who, by the acquiescence of the Government, both State and national, have been encouraged to invest dollar for dollar according to the par or quotable value of the stock.

The WITNESS. I would have the Government do no wrong and exercise no hardship.

Q. Would it or would it not be a wrong or a hardship to these people?—A. That is a matter on which much may be said on both sides.

The CHAIRMAN. That is the very point. That criticism is not just unless you say that these people should not receive according to their actual investment.

The WITNESS. If we have permitted it in the past we can prohibit it for the future.

Q. What would you be understood as recommending to the committee or to the country—that such action be taken as will protect in the future while we acquiesce in what has already been done?—A. I would recommend that, because I would have the Government liberal to an excess.

Digitized by Google

Q. Well, would it be liberality, or simple justice. Is the Government estopped or not estopped, having acquiesced thus far while the investment was being made and repeated over and over again?—A. The community have given a tacit consent heretofore, undoubtedly.

Q. And you would establish the correct principle for the future?—A. Yes.

---

NEW YORK, *Monday, October* 1, 1883.

WILSON MCDONALD examined.

By the CHAIRMAN:

Question. Please state your residence and occupation.—Answer. My residence is No. 221 West Forty-second street, New York City; I am by profession a sculptor.

Q. State, if you will, to the committee some of the works of art which you have produced, for the purpose of explaining to us your knowledge of the subject that you are about to present.—A. I did not know that that was exactly my business here.

The CHAIRMAN. It is not; but, as I have asked the question, and it is a proper one, you may as well give us the answer.

The WITNESS. My public works are: A colossal bust of Washington Irving, in Prospect Park, Brooklyn; a colossal statue of Fitz-Greene Halleck, in Central Park; a colossal statue of Edward Bates, in Saint Louis, and a colossal statue of General Custer, at the Military Academy, West Point. I have also executed a large number of individual busts of distinguished, notorious, and other men in this country.

Q. Will you state to what extent, if at all, your attention has been turned toward industrial or technical education.—A. About nine years ago I delivered a lecture in New York before the American Institute, upon that subject, which I believe was the first lecture of any note, or in fact of any kind, delivered in the city of New York on that subject. Since that time I have written and talked a great deal upon the subject in this city and in Washington City, endeavoring to attract the attention of those in power and of gentlemen who would be liable to take the matter up.

Q. Will you then proceed and give us your views, in your own way, and at such length as you choose.—A. I beg to say that I had no hint at all that I would be called before the committee. If I had had a little time I could have prepared statistics and other matters of interest which would probably have been of use to the committee.

### ART EDUCATION IN ENGLAND.

Fifty years ago large armies, the well-drilled soldier, and the caliber of cannon settled the affairs and determined the course of European countries; but the time is near at hand when the skilled workman, the educated farmer and mechanic, will be the arbiters of the destinies of empires and republics.

The governments of Europe fully realize that henceforth national supremacy must rest upon industrial supremacy, and they are now arming themselves for the coming conflict with the best weapons that art and science can furnish.

For the last ten or twelve years England has been improving her means for art-industrial education; that is, the education of her young

Digitized by Google

mechanics and apprentices of both sexes. Hundreds of schools have been established by the Government of Great Britain, the principal one being the National Art Training School, at South Kensington.

The effect of these schools upon the manufacture of English goods, machinery, implements, &c., has been within the last few years marvelous. Indeed it was so marked that at the London Exhibition, in 1862, the French, who have always claimed art and mechanical supremacy, and justly too, became alarmed, and in 1865 the emperor of the French appointed an able commission to investigate the subject of "technical and art-industrial education."

This commission submitted an elaborate report, showing what the situation was in France, and also in all parts of Europe. They declared that "Drawing, with all its applications to the different industrial arts, should be considered as the *principal means* to be employed in technical instruction."

## ART-INDUSTRIAL EDUCATION.

The plain meaning of art-industrial education is the education of young men and young women in the direction of the various trades and avocations they have chosen for the purpose of earning a living. There are now over four hundred of these art-industrial schools in France supported almost entirely by the Government.

For example, a boy who intends to be either a cabinet-maker, civil engineer, or tailor, is taught all that may be necessary to make him, with practice, a first-class man in any of these occupations.

If a young woman wishes to take up designing, mantua-making, or millinery, or any other occupation, she has every advantage that can be given her by the best teachers that can be procured. The scholars are taken to establishments and practically taught the various trades, and all free.

The effects of these schools are plainly seen in French productions of every class. They are also seen in our American products, which are mostly taken from French designs.

The decorations of our public buildings and dwelling-houses, the carpets, chandeliers, wall paper, articles of vertu, furniture, tapestries, &c., are nearly all copied from the designs of the skilled designers and workmen who have been educated in the art-industrial schools of France.

Indeed, many of the foremen and master-mechanics of our great manufacturing establishments, especially in those where fine articles are produced, are imported foreign mechanics. This should not be. We should educate our own foremen and master-workmen. There is not a country in all Europe but has provided schools for the education of her workmen and artisans.

The great industrial conflict is going on in the Old World. America is doing little or nothing in comparison with other governments.

We have a few schools in Massachusetts, one in New York, and one or two in Connecticut, and one in Cincinnati, and it may be, some others.

Even the apprentice system in our country seems to have been abandoned.

Notwithstanding the plain facts that good plasterers, bricklayers, carpenters, tailors, cabinet-makers, and other mechanics earn from $70 to $100 per month, the fathers and mothers of to-day appear to think that their sons should all become professional men, or perhaps clerks or salesmen, at $50 or $60 per month, and the facts and conditions now are, that the country is overstocked with briefless lawyers, bad doctors, worse preachers, half-educated engineers, untrained business men, speculators;

Digitized by Google

and the large crop of the new specimen of the *genus homo*, the "Dude," the out-put of our rich society families, is becoming alarmingly prevalent.

Let us look at the Cooper Institute. This was, and is to-day, the successful attempt of that grand old man, Peter Cooper, to establish an art-industrial and technical school in this city. He has educated over seven thousand young men and women, and sent them forth into the world with the means of making an honest living.

The example of Peter Cooper should be followed by the Government of the United States and by the government of every State in this Union.

With three hundred or four hundred industrial schools in the great manufacturing centers of our country we would in less than one generation take our place in the front rank of the art and manufacturing nations of the earth. This, in my judgment, humble as it may be, is the biggest political, moral, and wealth-producing idea now before the American people. It looks to the success of our country and the perpetuity of republican institutions.

It is folly to assume that we can compete now with the millions of trained, skilled workmen of Europe. We are now within ten days of nearly all the exporting ports of Europe. Take down your barriers of the tariff, and the products of 20,000,000 of skilled artisans of Europe will bear down and break up nearly all of our infant industries. Our great hope is in the common mechanical and agricultural education of those who are to take the place of this present generation.

I beg to say that if the committee would receive from me at a future time a paper that I will prepare with statistics, and the experience of the art industrial schools of Europe, I would like to make up such a paper and present it to the committee, if it be a proper thing to do.

The CHAIRMAN. We would be very glad to receive it. But while you are now on the stand, as you are very familiar with the subject, I would like you to explain minutely and specifically, if you will, just what art-industrial education, or technical education, is—how you would carry it out and the special peculiar benefits that you think would result from it.

The WITNESS. Of course, to answer that fully, would take a very long time, and I do not think I would be prepared to give such an explanation as would be of much benefit at the present time. I would say, however, that art-industrial education is, as I have stated, the preparation and education of young mechanics for the various trades and vocations they intend to follow.

In the State of Massachusetts they have a number of art-industrial schools, and the boys and girls, especially boys, are taken and are taught the rudiments of the various trades or professions they intend to undertake, and they are taught more especially the use of the pencil and modeling tools. They draw from designs of all kinds, from the simplest up to the human form. This educates the eye and the taste; and, instead of having a common box-maker or an ordinary half-soler of shoes, or a man who can simply shove a plane, and who would get probably from $1 to $1.50 a day, they propose to make skilled mechanics, who would get from $3 to $4 a day. And in this way, by the establishment of these schools in the various manufacturing centers of our country, it is contended that thousands of young men and young women could learn to draw, carve, engrave, and model with good taste, and, by this means of art-education, be more fully prepared to learn and practice their trade.

A gentleman of this city, well known now as a builder and architect, Mr. Cornelius O'Reilly, told me that many years ago, as a student here

Digitized by Google

in the schools, while learning his trade, he went to a night school where a teacher taught him drawing, and he said he drew simple forms, and that he found such knowledge to be of the very greatest benefit to him in his trade afterwards. In time he became, as he thinks through that kind of education, foreman in the establishment in which he was employed, and finally he has become one of the largest builders in the city of New York. There are hundreds of instances of foremen and master workmen in our manufacturing establishments here who have been educated in the schools of the old country and come here to teach our people and to direct our mechanics. They get very large wages, and are men wonderfully skilled in their profession. In a talk that I had with President Hayes upon this subject, in which I endeavored to make known the importance of it, he asked me why it was so important. I said that I believed the American youth would surpass all others in the great mechanical race. I told him that our form of government, and the courage and daring of our young men, and the fact that they were not narrowed down by class distinctions, gave them more energy and desire to take hold of things and to try to do more and better than they have seen done. They are not hampered by what their fathers did or what was the usage in the countries of monarchical forms of government. I would undertake to say that when our country fills up with another generation or two, when the great empire on the other side of the Mississippi River becomes pretty well populated, and we shall have become a nation of probably 100,000,000 of people, the people that live then will look back and see how negligent we were in not educating the masses of the younger part of our people.

Q. You speak of our own country somewhat disparagingly in this respect, as compared with European nations, even at the present time.—A. Yes. I speak of mechanism and manufacturing.

RELATIVE SKILL OF WORKMEN IN EUROPE AND AMERICA.

Q. Do you think the laborer of France or Germany or of England, as a whole, possesses more skill in the various avocations of life than ours?—A. The genius of the American mechanic is equal, and, I think, superior, to that of any other, but he has not got the facilities or the machinery or the experience in production of goods which the European workman has. When American mechanics shall have had the same advantages that the European mechanics have, my judgment is that they will outstrip the European nations in all mechanical endeavors as far as they have done in nearly all the conflicts that we have had lately with them.

Q. You refer to industrial conflicts?—A. Well, not so much that. I think that in ship-building, in railroads, in the production of machinery to produce necessary articles, and in all matters where intellect and courage and skill of the Americans have been tried, we have excelled them. I think that we have out-yachted them, out-trotted them, out-shot them, and out-rowed them, out-chessed them, out done them in a great many other ways that need not now be mentioned.

Q. I have no doubt we are a bright lot, but I want to get your idea as to the relative degrees of skill existing in the various avocations. Do you think that the laboring Frenchmen, as a whole, surpass the laboring population of this country in their capacity to produce valuable commodities in the markets of the world?—A. Yes, they do. I have not got the statistics now fully, but I think I have here something to show what France has done. It may be interesting perhaps, and it

Digitized by Google

may perhaps answer your question better than I can. I will read you a few sentences from a work entitled "Modern Art Education, its practical and aesthetic character educationally considered; by Professor Joseph Langl, of Vienna, being part of the Austrian official report on the Vienna World's Fair of 1873, translated with notes by S. R. Koehler, with an introduction by Charles B. Stetson," published by Prang & Co., of Boston:

It is just here in the application of skill and taste and industry that we find one of the main causes of that vast wealth of France, which is indeed a marvel, when we consider that she has been engaged in so many costly wars; that her national debt is unequaled, and that her subjects are not excessively over-worked; but, on the other hand, are the gayest in the world. Her manufactures have long been renowned for the skill and taste which they embody: and it is these manufactures, not as with us, bread-stuffs and raw materials, that compose the great bulk of her exports. Her textile manufactures alone amount to some $700,000,000 annually, nearly double the textile manufactures of the United States. Her exports of all kinds of manufactured products in 1874 amounted to $434,513,800. As was to be expected, agriculture flourishes no less than manufactures. In 1869 France, with a domain smaller than that of Texas, produced 297,000,000 bushels of wheat, that being 67,000,000 bushels more than the product of the United States, as given in the census of 1870.

Q. You infer from that that they surpass us in agricultural skill as well as mechanical?—A. Yes. They also surpass us just as far in the production of mechanical wealth. The textile fabrics exported to other countries clearly show that she has unsurpassed facilities for making goods of that kind, and the taste and education of her people, through these schools of which I speak, that excel the whole world besides. England supposed in 1852, when she gave her first exhibition, that she would entirely outdo France; but she found out her mistake before that exhibition was over. England to-day has some three hundred of these art industrial schools, and is making every exertion to equal any country in the world.

Q. What led her to establish these schools?—A. It is supposed that her jealousy of other nations did it, and the fact that she was going behind in many of her industrial manufactures.

Q. Was the contrast which she found in her own skill as compared with that of France in that exhibition the suggesting cause?

THE SOUTH KENSINGTON ART SCHOOLS.

A. I suppose that was one of the suggesting causes; at least it was shortly after that that she began the establishment of these schools of which South Kensington is the main training school. I would say here that the South Kensington school is a training school for teachers, and they send those teachers out into the smaller cities and the manufacturing districts, and they become teachers in those rural schools after having been trained in South Kensington.

Q. Do you know about the number of students that are now instructed at that place?—A. I could not put my hand on the number at present. Some ten years ago there was one school to every 210,000 inhabitants.

Q. In the kingdom?—A. In England alone.

SIMILAR SCHOOLS NEEDED IN AMERICA.

Q. How extensive do you think such a system of schools should be in this country to answer the public wants?—A. Well, I think that as we are now 50,000,000 of people, and have every opportunity—have brain and wealth to compete with other nations in all mechanical productions—if we should establish one hundred or two hundred art industrial

Digitized by Google

schools in this country within the next three or four years, they would "fill the bill." I think that the man or the public officer who would be instrumental in doing such a thing would be the greatest benefactor of modern times.

Q. How much do you think the establishment of those schools would cost?—A. I could not form any idea of that. I am not much of a judge as to the cost of anything. I would like to say, though, that I went at one time to the late Mr. A. T. Stewart in his lifetime, and, after a good deal of waiting and talking with him in his store on Chamber street, I put this matter of art-educational schools to him. He listened carefully to what I had to say. I told him that if he would establish one hundred art-industrial schools, such as I had just explained to him, he would become the greatest benefactor that America has had, at least within the half century. He did not say anything, but he looked at me with great surprise, and then turning up his face with his very queer, but intelligent expression, he said, "How much would it cost?" I told him that I supposed if he would appropriate, to start with, say, $4,000,000, it would set things going, and would probably run one hundred schools and permanently establish them. He laid his pen quickly down, gave me a significant glance, and said: "I do not think I have got any money to invest in that way, sir." So I said "good morning." I had the gratification of knowing that I gave him a very excellent opportunity to get immortality at a low price. He did not take it. As to the establishment of those schools, I think I can inform the committee later on as to the probable cost.

By Mr. PUGH:

Q. Have you ever examined the provisions of law in France and England under which these art-industrial schools were established?—A. I have not, sir. France generally appoints commissions and committees to report upon the condition of these schools, and the Government makes the appropriations generally upon the report of these committees. I could not say how it is in England.

Q. You do not understand the details of legislation in England and France?—A. No, sir. I see that New York has passed a statutory law, however, making it obligatory upon the public schools of a higher grade in this State to teach drawing. In Boston, where it was first commenced in America, the children of even seven and eight years of age have shown wonderful skill in combining and making ordinary designs.

Mr. PUGH. If you could get the law of France and England, and make suggestions as to any improvements suited to this country, it would be a very valuable contribution to the members of Congress and to the State legislators.

The WITNESS. I will undertake to do that, sir, later on—shall be glad to do it.

By the CHAIRMAN:

Q. Is there any other matter or any other branch of this subject that you would like to allude to?

ART AND ART EDUCATION THE BASIS OF SUCCESSFUL MECHANISM.

A. Well, I would like to say, in a general way, that art and art education is the basis of all successful mechanism in any country, and that the combined fine arts is the surest standard by which to judge the status of any nation in the scale of civilization.

Digitized by Google

Q. You mean the masses of the people at large?—A. The tastes of the people at large. It is said that the fine arts are luxuries. I contend that they are a necessity as well, and that they are necessary to the continuation of civilization; and without fine arts no country can expect to continue its civilization. In other words, I cannot see how a nation can exist as a civilized people without poetry, painting, sculpture, drama, architecture, and, last and greatest, music.

Q. Do you look upon the fine arts as the cause or as the consequence of civilization?—A. I think they go hand in hand with the advance guard of civilization, and assist in civilization. They have done more to civilize mankind and more to continue civilization than anything else.

Q. In what really does civilization exist, unless it may be proficiency in these arts?—A. Civilization, as I understand it, consists in the morality and intellect of a people—their proficiency in art, science, mechanics, and agriculture.

Q. Would you mean by that to suggest that you think Government ought to patronize the fine arts in their higher aspects?

NATIONAL SCHOOL OF DESIGN.

A. I do; and I think that this Government makes a very great mistake in that it does not follow in the footsteps of other nations and establish a great academy and school of design in the city of Washington. That city would be peculiarly adapted to an institution of that kind. As long as nine years ago I petitioned Congress, like any other silly fellow—none but idiots petition Congress—to appropriate three or four million dollars for this purpose. I say a "silly fellow," because a petition is no way to get anything done by Congress. The only way to do anything is to go there and advocate a measure before the proper committee, and keep it before the committee until something is done. I asked them to appropriate $3,000,000 or $4,000,000 to establish a building for a school academy of design. Part of the plan was for each Congressional district or the Representative thereof to propose, say, four young men or young women, or both, to be educated at Government expense as artists in a great school of design, like the schools of England, France, and Germany; that they should purchase all the celebrated models of the Old World that were valuable, and place them in a gallery, and make this gallery the nucleus of a national collection of paintings and sculptures which would illustrate, as far as it could, the pictorial history of our country that would reach back to the beginning. We are young enough to go back to the beginning. I proposed that the pupils of the national school should have four years' instruction under the best masters and professors that could be obtained; that every four years we should have a great exhibition, for instance, at the inauguration of some lucky President, or some citizen elected, lucky or unlucky, as the case may be, and that large premiums should be given to the best artists. This would call out the artistic activity of the entire nation. In this way we would call out thousands of young men and young women who might become famous and distinguish themselves, who, under the present state of things, would never be heard of.

DIFFICULTIES OF ART EDUCATION IN AMERICA.

The tough experience of our early artists, many of whom I could name, would form a very interesting and instructive history. While the artists of the Old World have had galleries, schools, and teachers

Digitized by Google

from their babyhood—and often a palette and brush have been placed in the hands of a boy in Europe at four or five years of age, before he could reach up to the easel—many of our distinguished artists of to-day were plowing in the fields or digging potatoes or hoeing corn in Ohio or Kentucky, or cradling wheat in Massachusetts or New York. These other young gentlemen across the ocean had the best teachers that they could possibly have, while our struggling young artists had no advantages at all. Now, if you will take the productions of many of our older artists and compare them with European educated artists, and take advantages and disadvantages, you will find that we have shown enough ability to induce the Government to recognize the fine arts, which it has never done. Every other civilized Government in the world has recognized the fine arts and their importance as a factor, but no branch of our Government has yet done so. I think that it is time that some action should be taken in the direction of the cultivation of the fine arts in America. In music we are going forward very fast. We import the best artists and singers in the world, and we pay them higher prices than they can get in any other country. The taste of our people in music is equal to that of almost any other country—the few, not the many. I do not see why the intelligence of this country should not be capable of judging of art and the productions of artists as well as the people of any other country.

### THE TARIFF AND WORKS OF ART.

I would like to say in closing that there has been a good deal said of late about the tariff in works of art. Having been a high-tariff man all my life, and in favor of American industries and American education, I am in favor of increasing the tariff on works of art from 30 per cent. to 50 per cent. when the importations are for private parties or for sale. The laws of the United States say that all works of art imported for the benefit of the people shall be absolutely free. All philosophical instruments, paintings, statuary, and models of all kinds for public institutions, or museums, or for the benefit of the public are free. But the free traders and dealers and painters, some of them—younger ones in this country—say that we keep the sunlight of art out, and that we should allow everything in the way of art to come in free. This proposition is advocated chiefly by the dealers in pictures in this country and on the other side. My idea is that this country will be the home of art at some future day, and the thing to do is to offer an inducement for the great artists—the mighty artists of Europe—to come over here and settle and to add their wealth and their skill to our great country.

---

NEW YORK, *October* 1, 1883.

Dr. AGRIPPA N. BELL examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. I reside in Brooklyn, and have an office in this city.

Q. You have been, or are now, connected with the Army?—A. I have never been connected with the Army, but was formerly a medical officer in the Navy.

The CHAIRMAN. Will you proceed to make a statement on the subject-matter you have in your mind, and then we may, perhaps, ask you some questions.

Digitized by Google

The WITNESS. My reflections on the subject which I am about to present have been almost entirely confined to its bearings on the state from a pecuniary point of view, of the cost of disease and of the shortening of life, taking into account the pecuniary considerations, or what might be called the money burdens, involved in disease and the shortening of the lives of the industrial classes of society.

The CHAIRMAN. We shall be very glad indeed to hear you fully on that subject.

The WITNESS. It is a subject to which I have been devoted for a great many years—sanitary subjects generally, more especially for the last ten or a dozen years.

The CHAIRMAN. I look upon that as one of the most important topics which can occupy the attention of the committee.

### PREVENTABLE DEATHS IN NEW YORK CITY.

The WITNESS. I have made some investigations and can give some illustrations near home rather than of foreign nations. For example, in the city of New York, probably twenty thousand preventable deaths occur every year. That is to say, over one-half the deaths of New York city each year are preventable.

The CHAIRMAN. That is as though they fought the battle of Gettysburg here each year?

The WITNESS. Yes. A very large proportion of these deaths—one-half of them nearly—are infants under five years of age. I suppose that is one reason why their value is not estimated as it should be. People in what you may call the industrial classes of life are too much in the habit of taking no account of these losses to their own or the public wealth, because the deaths occur before the productive period.

### PECUNIARY OR ECONOMIC VALUE OF HUMAN LIVES TO A NATION.

In England, with whose mortality we can compare the mortality here better than with any other country, and where it is only about half as great in their large cities as it is in the city of New York, they place a value on every birth. A child at birth has an estimated value of $12.50. At the age of five, its probabilities of life have so much increased, that its estimated value is $130; at ten, $260; and at twenty years of age it is worth about $2,000, if we take this country in the aggregate. That is based upon the estimates of the best statisticians. But Dr. Farr estimated that a person twenty years of age in England was worth $600 a year.

Q. That is the amount of income from him a year?—A. He supposed he was worth to the community or the state in one way or another $600 a year until about forty years of age.

### RATIO OF DEATHS TO CASES OF SICKNESS.

Estimating each death as an index of prevailing sickness in the community, it represents about twenty-eight cases of disease. Sickness, we all know, is very costly. If we estimate, then, the cost of that sickness, suppose each person averages only five days' sickness, and that it costs $1 a day, we estimate this loss at $2,800,000 a year. Then the cost of the burials, &c., would bring the amount up (estimating 20,000 unnecessary deaths in the city) to the large amount of over $14,000,000 for the city alone. If we apply the same reasoning to the whole United States upon the same estimates, there would be about 200,000 lives

Digitized by Google

wasted—in other words, there are 200,000 deaths more than there should be, or than there would be by the adoption of proper preventive measures and legal restrictions. These estimates are based, as I have said, on the same proportion as for New York—assuming 800,000 deaths in the United States in round numbers—the actual number of deaths is very nearly that number.

### NUMBER OF DEATHS ANNUALLY FROM INTEMPERANCE IN ENGLAND AND AMERICA.

Perhaps it would be worth while to consider briefly some of the causes of these premature deaths. As already stated, a very large proportion of them occur in infancy, but of what we may call preventable causes connected with education, the first thing that would come up perhaps, would be intemperance, directly and indirectly. I hardly need say that we have no correct statistics of the number of deaths in the United States brought about by intemperance. The best statisticians on the subject in England give a number so enormously large that I should be inclined to think it at least twice as great as for the United States. They have estimated that about 200,000 persons die annually from intemperance, directly and indirectly, in England.

Q. From the use of alcoholic liquors?—A. Yes; that is to say, from intemperance, inebriety—including the acute and chronic affections due to alcoholic stimulants. Some of the best statisticians in England make that estimate—some of the most prominent men in the kingdom. If we should take the same proportion for the United States, we should have about 322,000 deaths per annum from intemperance directly and indirectly. I do not believe that we have half that many—even if we were to estimate it with all its out-lying connections—with imbecility and insanity, of which it is a very productive cause. The reason particularly why I do not believe it, is because that is not very far short of one-half of our whole number of deaths. We have about 800,000 deaths in the United States per annum, and when we come to consider that nearly 40 per cent. of those deaths are of children before they get to the age of voluntary or practical intemperance, and could only be affected by intemperance in so far as they may have inherited some of its consequences, we must come to the conclusion that the number would be altogether too large. From my own reflections and reading on this subject—of the causes of deaths, and the number resulting from intemperance, I should say that it does not certainly exceed more than one-sixth of the whole number, counting all causes, direct and indirect.

Now if I am expected to make suggestions as I go along as to any remedies for these fatal effects and causes——

Q. [Interposing.] How many do you make the actual number of deaths from intemperance in this country—you reckon it at about one-sixth of the total number of deaths?—A. About one-sixth of the mortality, I think, would be a very large estimate.

Q. What is the total mortality in the whole country, from all causes?—A. By the last census the total mortality from all causes was 755,893.

Q. Then you would have about 100,000 deaths or more from intemperance?—A. Yes; I think it is 100,000 and upwards from intemperance; that is, if we count it in all its relations.

### PUNISHMENT AS A REMEDY FOR DRUNKENNESS.

As I said, if remedial measures are suggested in connection with this, I should possibly be deemed harsh in some of my conclusions, compared

Digitized by Google

with some students and sanitarians who are disposed to consider all cases of inebriety, as they choose to name it, a "disease." I am not one of those by any means. I believe that at the first more than nine-tenths of it is voluntary, and should be made criminal and odious and punishable, as the most effective of all measures. So long as apologists exist in the community and say that a drunkard inherits his vice and he must be taken care of at public expense, we are giving more or less encouragement to intemperance. If it were made odious and punishable as other crimes, crimes not so great when we come to consider that not only is this a voluntary act, by which a man puts himself in a condition to commit crimes, even to debase his race and to have a progeny of insane and imbecile children, we can hardly think with any patience of the propriety of always treating such cases as diseased conditions, when, as we have all observed, for certainly we have observed it in young inebriates, how easily they are cured. During my service in the Navy the punishment by the lash was abolished, but I was in the Navy long enough to see that under that punishment a good many drunkards were cured. A good many young men who were shipped and were drunkards in the early part of their service, became sober men from one single punishment; not that I would advocate a return to that by any means, but I only wanted to illustrate the effect of punishment.

### OCCUPATIONS INJURIOUS TO HEALTH.

Take another class that has a bearing on education especially—the troubles resulting from ignorance and neglect of protective measures in various occupations. To undertake to go over these with any detail would, of course, cover a very large ground. The occupation, for example, of persons employed in chemical manufactories, in lead, in mercury, in phosphorus, and those engaged as grinders and in india-rubber factories, and similar employments—not only all I have named, but a good many more could be gone over, where the protective measures depend wholly upon what you may call the caprice, generosity, or meanness, as the case may be, of the employers in these various pursuits. We have very few, if any at all, preventive measures of disease and death in these cases, and when we take into consideration that some lives during their working period are shortened more than one-half, it is certainly suggestive of severe legal measures and restrictions in such cases, and those ought to be imposed.

The CHAIRMAN. While you are upon this subject, I may remark that we would prefer that you should not treat it quite so briefly. You may make some suggestions as to abuses that you know to exist in various trades and employments.

### EXPLOSIONS OF STEAM-BOILERS AND LOSS OF LIFE THEREBY.

The WITNESS. Well, I shall come to one right away that is palpable to us all. We have every-day occurrences of explosions of steam-boilers in boats, factories, and in the running of machinery all over the country. These are before us in every point of view as very great abuses. Unfortunately, in the United States, we have no thorough statistics of the amount of injury, of the cost, or even of the loss of life by these machines. But if we take them as they occur from day to day we might almost say, as matter of fact, there is an explosion of a steam-boiler in the United States for every day in the year. Since I received your request a few days ago, I have tried to see if I could find

Digitized by Google

any record of the explosions of steam-boilers, and the loss of life therefrom, in the United States, other than such as I have myself been able to make or record, as it were, from the daily papers from day to day. I am inclined to think there is no record made of them that is systematic. I have a record that I went over, though I do not believe it is at all full, but it shows fifty-eight persons killed by explosions upon what you might call inland travel in the United States, between the 1st of January and 1st of July in the current year. French statistics are fuller than those of any other nation in regard to steamboat and ship explosions. They have an organized bureau especially with reference not only to explosions, but to steamships, and all accidents and similar occurrences that take place. They estimate that of the losses and disasters to steam vessels and to machinery run by steam, the enormous amount of 85 per cent. is due to either defective boilers, ignorance on the part of the person who runs the engine, or some neglect of duty in that direction. The enormous amount of 85 per cent. of the accidents in the working of steam machinery are, in other words, connected with the boilers and the explosions that occur in that way.

If we apply these laws to the steamships and steam boilers and take this same class of statistics as far as I have been able to gather from ocean navigation, there are about one hundred and seventy lives lost per annum in ocean steam vessels, taking a long series of years. I ran back to, I think, somewhere about 1840, and came down to the present time, and the result of my examination was to indicate that something like one hundred and seventy lives a year of ocean losses are due to engine and boiler derangements, giving 85 per cent. of all explosions referred to in the country, inland, or otherwise, wherever they could get hold of the figures. Comparatively few occur on railroads, as we all know. Most of them occur in inland factories.

It is probably known to every one of you that there are measures very effective for preventing these disasters. We have before us one reported in yesterday's papers in this city, one I think the day before, and one that is exciting a great deal of interest, which lately occurred on the North River in the city of New York, the explosion of the steamboat Riverdale. It is true that as to the bursting of that boiler we have, in one point of view, no measure of the strength of the boiler, excepting what could be ascertained after the bursting, but according to the inspector's own testimony there was no inspection of it worth taking. Still it would be of value to know how much pressure of steam it withstood up to the time and at the time of explosion. That would have been ascertained had they had on it a test of its pressure.

### STEAM-RECORDING GAUGES—THEIR NECESSITY.

To my own knowledge, there has been in use by careful persons who run steam-engines over their boilers in boats, factories, and other places, a gauge of the steam pressure in boilers, by which a captain in his cabin may see the amount of pressure on a boiler at any time. The foreman of a factory or of a printing-press, as the case may be, can read in his office by a register, as carefully as he can the height of his thermometer, the amount of pressure that is on a boiler. Now, when we put the two things together and say that 85 per cent. of these death disasters are due to this machinery and explosion of boilers, we see the importance of having a check upon the man who tends the boiler whose education has been neglected. There is room for a very great improvement in the instruction of the stoker or fireman, so that he should know when

Digitized by Google

he has fuel enough in to raise the steam to a certain height. Very experienced men, no doubt, after a time acquire that knowledge, but for economical purposes, and, above all, in the economy of life, this is a most important question.

The commanding mind should have means of ascertaining at any given instant the pressure upon the boiler, whether it be on shipboard or elsewhere. All our republicanism comes to naught, as we all know, when we are on board ship. Everything is autocratic there. One brain only has to acknowledge the responsibility, and to him everything ought to be known with regard to the safety of the vessel and the condition of its running-gear, and all persons who are under him should be thoroughly instructed in their duties. Now, if it should be, as it certainly is, practicable for him to know at any moment of time, whether it be in the factory, in the river boat, or in the steamship crossing the ocean, the exact pressure on the boiler—having previously ascertained the strength of the boiler by such inspection as will make it criminal if it fails—he will know the safety-valve, so to speak, by which to control it; he would only have to call down his tube to say when the steam must be reduced in order that the boiler may not explode.

These gauges, I ought to have said, have also alarms connected with them. Take, for example, a boiler that will sustain a pressure of 60 pounds. Put a proper test-gauge on that boiler which will also have an alarm attached to it. That alarm will tinkle or ring out when it has reached a pressure of 50 or 55 pounds, showing the time when it may be checked with safety. For those employments that take care of such works I confess that I think the education must chiefly be practical. With the uncertainty of apprenticeship, we require some such mechanism as will be automatic to guide us.

### A BRAKEMAN'S WORKING PERIOD.

Take the collateral service—railroads. The brakeman's life, according to the best estimates, for his period of working capacity is the shortest that exists among laboring people. A brakeman's life is estimated to average during his working periods only about ten years. That is two years short of the liquor-seller and bar-keeper, which averages about twelve years.

### DUST DISEASES AND LONGEVITY.

If we take other employments we then take a jump, as it were, before we reach some of those dust diseases to which I have referred—as where people grind forks, needles, &c.—they live now about twelve years before they die, provided the work be not dry work. There is a difference between the dry and the wet work, for the wet work curtails the dust to some extent. Then in some factories they are by law compelled to wear masks. In France and Germany they are compelled to wear masks to protect them from the dust. Yet some of these people that we read of in Birmingham will pride themselves upon their business being short-lived, and they prefer not to wear masks, so that too many persons will not go into that line of duty and make the wages too low.

### HEALTH EXAMINATIONS FOR RAILROAD SERVICE.

But to recur again to the brakemen and to the precautions that ought to be made by law for railroads. I suppose it is now generally recognized,

Digitized by Google

although very recently, that there ought to be some physical examination of all persons employed on railroads, as conductors are in most cases now examined with reference to color blindness and defects of that sort. Brakemen are not usually examined at all. Certainly for the protection of life every employé on a railroad ought to be subjected to a physical examination. We should know with reference to his sight and hearing. We should know of the brakeman's physical strength above that of all others. If a person engages as a brakeman who is affected with lung or heart disease, or any disease that affects the blood vessels, he may place the whole train, no matter how many passengers it may contain, in a position of the most dangerous jeopardy, simply because of his own already impaired physical strength, which may give out at any moment. Hence I should say that every person employed on a railroad train should have a physical examination.

### TREATMENT OF LIVE STOCK ON RAILROADS.

Then there are other things bearing on health and life that are important in connection with railroads. The condition of the cars, for example, in reference to their occupation, their cleanliness; the condition of buildings and depots; the carriage of live stock and the considerations growing out of its care—these are very important considerations as affecting the public health. The ox that comes from Chicago to New York, and is only given food and water once by the way, never makes wholesome beef; and not only oxen, but lambs, calves, and pigs are sometimes carried even greater distances. Other live animals, such as poultry, are rendered exceedingly unwholesome by the cramming and starving that they are frequently subjected to on their way to market. A great deal of this preventible mortality and sickness, to which I have already referred, is doubtless due to conditions of that kind, which ought to be prevented by law.

### OCEAN VESSELS: RISK OF LIVES BY FALSE ECONOMY.

Take now steam passenger vessels, which concern the United States amazingly, as they come in here bringing over a thousand persons a day, many of them. Steamers have gone from this port in the broad light of day and of a disarmed intelligence, frequently with defective machinery. They have calculated their distances in fair weather, and have taken their crews and cleared from this port, knowing that they were not in condition to withstand severe weather, but, because they could get repairs done at a lower price on the Clyde than they could in New York, they would risk the lives of all persons on board; in other words, they would do this because of the difference between the pounds, shillings, and pence of the dock-yard on the Clyde and the dollars and cents of the dock-yard in New York. A large ship went from this port a very few months ago under just those circumstances.

### THEIR INSUFFICIENCY OF LIFE-BOAT ACCOMMODATIONS.

But the great danger is in their coming here. Ships frequently come here with one thousand or more passengers, but with boat room for only two or three hundred in case of disaster. They take from eight to twelve boats. These boats in a sea-way of anything approaching bad weather would not carry more than twenty persons each.

Digitized by Google

### THEIR INCOMPETENT MEDICAL OFFICERS.

Moreover, in their appointments on board these ships, the sanitarian medical officer is ranked with the cook. He has no grade or rank. He is paid rarely more than £10 per month, and frequently less. He has no quarters assigned him for the care of the sick. He has no voice and no influence—no status in the ship—no authority as to the cleanliness of the ship. Ships come here with more deaths on board than the average deaths of the city of New York.

### MORTALITY STATISTICS ON OCEAN VESSELS.

Some have come to this port within a year whose deaths have averaged twenty to forty per thousand—taking the average method of measuring the mortality rates—when there should not have been more than two or three at the outside.

Q. On the single voyage, do you mean?—A. Yes. If you ascertain the number of deaths per thousand on the different lines they will frequently give rates equal to the highest mortality on shore; that is due in a great measure to there being no sanitary regulations—no properly regulated sanitary officer having any status on board. The services of such an officer are liable to terminate at the end of any voyage, while other officers on shipboard are engaged and paid at so much per annum. They are given quarters and proper assistants to take charge of all the persons on board, but the medical officer on emigrant ships crossing the Atlantic, has literally no status at this day. A ship may come in here with twelve hundred persons having a medical officer on board, but he has no status and no competency even before he starts. Ten pounds a month will not get a proper man. Yet he is appointed on such pay and under such conditions and accommodations on board ship, so that if an epidemic breaks out, with all his incompetency, he has not even a servant that he could call on to assist him, and aid has to be called in and improvised on board if any cases of disease occur.

Q. Does this apply to the emigrant ships from all countries coming to New York?—A. They are all pretty much the same. The English ships are as bad as any. The worst ships that have been brought into port have been some of the North German ships—I forget the particular line now, but the line to which the *Nemesis* and some others belong.

Q. The ships of what nations bring our immigrants generally?—A. The German and English. The English bring most even of the German emigrants.

Q. Do the French and Italian bring any?—A. They bring nothing like as large a number of emigrants, but they are none of them well provided with sanitary officers.

Q. Do English ships bring in any Italian emigrants?—A. Not often. They bring very few Italian emigrants. They frequently bring German emigrants—a very large proportion of them.

Q. The Scandinavians come on their own vessels, I suppose?—A. Chiefly.

### NEED OF REGISTRATION LAW FOR BIRTHS, MARRIAGES, AND DEATHS.

With reference to the subject with which my remarks opened, I suggested no special remedy in its national aspect. Possibly it may seem far-fetched, but I look upon a registration law for the United States which will have such lines as to take in eventually not all the deaths that occur,

Digitized by Google

with all the causes that are reported, throughout the country, but of all births and marriages as well.

But if we were to take a registration law alone as a remedy which should make it a special point of inquiry to ascertain the causes of death and hold as criminal such preventable causes as I have named in regard to these explosions, where the proper precautions were not taken, I should look upon it as a very valuable measure indeed for the prevention of deaths and the lessening of mortality generally. In other words, where the causes are made to see the light, the victory is about half gained. Of the great utility of such a law in other respects as recording marriages and births, every intelligent person can appreciate.

Q. Have you given attention to the subject of sanitary precautions in the construction of dwellings among the poor?—A. Yes, sir.

Q. And to the existence of abuses in that regard?—A. Yes. I am somewhat familiar with the abuses of that character in New York City and other places. They have relations, indirectly, to some other causes of ill health that I have gone over.

### THE NEW YORK TENEMENT HOUSES.

Take for instance our tenement houses in New York; they are probably the worst in the world, and in proportion to the population they are larger—I mean they house a larger number of persons. You doubtless know that more than one-half the births in the city of New York take place in tenement houses. In the mortality statistics of this city, as to the ratio of mortality among the population, if we divide the population into houses of four families or more, and those of four and less, we should find the mortality about one-half greater in the closely packed tenement houses than in those that are not so packed. The plan of stowing the families of New York in large numbers into houses is, of course, very objectionable. If we take them all on an average, the number of persons to the house is fourteen.

Q. Fourteen individuals to each house of the city?—A. Fourteen individuals to each house in the city, which is nearly twice as great as that of any other city in the world.

Q. Will that cover the entire city?—A. Yes; it will average altogether about fourteen persons to the house, and that, as I have said, is nearly twice as great as in any other city.

Q. Any other city in this country?—A. In this country—and there are no foreign cities that excel New York in that respect.

### "FLATS" UNHEALTHY.

Take this matter in another aspect. It is increasing in a fashionable way; they are building tenement houses for well-to-do people—houses which they call "flats." The construction of very high houses, no matter how well they may be constructed, shuts out the light from the occupants, and in so far as they do that, they are injurious to the health of the people.

Q. In regard to these flats—for they are getting to be very numerous—do you consider them, from a sanitary point of view, to be healthy?—A. I do not.

Q. What objections are there to the flats in the way that they are constructed?—A. Many of them have sleeping rooms without any windows, and in many of those which have windows, the windows are over what you may very properly call wells—that is to say, sunless air spaces,

Digitized by Google

and, too frequently, dirt holes. A great deal of the house dirt is thrown into these places. They are not kept clean.

Q. You mean they are being constructed now in that way in the upper part of the city?—A. A good many are, and many of them are being constructed of all sizes and classes, so that it is hard to tell where the line comes in between what you call a tenement house and what you call a flat. There are some of the tenement houses certainly that I have been in myself, and that are occupied by what you call the lower working classes, that are superior to some of the flats. They build flats in whole blocks now—great big places of five and six stories that they call flats, and that are so arranged all through as to make them not a particle better than some smaller houses in other places that are called tenement houses.

Q. They are called flats because they are supposed to be better and will rent better under that designation?—A. That is it.

### INSPECTION OF BUILDINGS IN NEW YORK.

Q. Is there not some system of inspection—some method of regulating the construction of these dwellings by law?—A. Yes, and a very deficient one, too. The inspector of buildings has charge of it. Almost every week we hear something about it. He cannot take hold of certain things because they are supposed to belong to the health department. The lines of the health department and of the inspector of buildings are not very well defined—and with reference, above all, to the extraordinary height of the buildings and the fire-proof regulations. What really constitutes a fire-proof building in the city of New York is very uncertain. I have sometimes thought, I and I have heard some other gentlemen interested in these matters say, that in any good law there would be clear definitions as to what constitutes a fire-proof building, and that no building should be built more than, say, four stories high, unless it were strictly fire-proof. I think that would be one protective measure against some of the buildings that have been put up in New York during the last five or ten years. True, they are building now some of the mercantile buildings in this city as nearly fire-proof probably as it is possible to have them, and some of them I imagine absolutely so.

Q. These observations you are making in regard to the tenement houses and flats of New York City, are they true to a greater or lesser extent of other large places in this country?—A. To a small extent. It is true that tenement houses do exist elsewhere. There are a few in Brooklyn, and a few in some other cities that I have visited, but I have not paid nearly so much attention to them. But I have no reason to think that any other city in this country approaches even at a great distance the city of New York in that respect. The conditions started here a few years ago with the view of the improvement (so called) of tenement houses were very defective. They undertook to limit a house to, say, 25 feet front and 80 feet deep out of the 100 feet of depth of which the city lot is composed, so that it should contain only four families to the floor, and leaving one-fifth of the ground bare, so that the building would be 80 feet deep. With such a building, having four families to a floor, and the building four stories high—those are what we may call the best conditions yet obtained in New York for tenement houses. Now, it must strike any one that, considering the ordinary families, that is very close packing. That gives you sixteen families to a house; and these were considered great improvements.

STEAM RECORDING GAUGES.

Q. Some one in the audience desires me to ask you this question: As to the records made by the steam-gauges to which you have referred, so far as they contribute toward correcting carelessness on the part of firemen and engineers——A. [Interposing.] If I have not already covered that, I want to say that the one I had reference to is one that makes amends to some extent for what I conceive to be want of education. As there is no elementary instruction given to the people who deal with those things in actual life, such as firemen, &c., it necessarily follows that their knowledge must come from actual experience, because they are ignorant persons, to begin with. The importance of a gauge under such circumstances is certainly very great. It would strike any of us so.

Q. Are they not universally provided?—A. Why, I do not believe, sir, that if we omit fine tug-boats and the like, where we may say that less than a dozen, or perhaps less than six persons are aboard—I doubt whether they are employed in one of one hundred of the factories and steam-boilers in the United States.

Q. Any gauge whatever?—A. Any gauge whatever. They depend wholly upon what they call the intelligence of firemen and engineers.

Q. How expensive are gauges?—A. I have never bought one in my life, and I therefore know little about their cost. I believe they cost less than $100, somewhere from $60 to $100, perhaps. I cannot speak with any degree of accuracy.

Q. You do not believe that there is one used in one hundred boilers?—A. I do not believe there is one to be found in one hundred of the steam-boilers of the United States, even omitting those that have less than six lives at stake.

Q. You mean that those having less than six lives have none, as a matter of course?—A. Yes. I say that as a matter almost of course they have none, and taking those above that class, I do not believe one in one hundred has a gauge.

Q. It is assumed that they will get through all safe even though there is some danger of their killing themselves?—A. Yes.

Q. You think there is not one in one hundred provided?—A. I think not.

Q. Well, would you say there is one in two hundred?—A. I would not like to make even an approximate estimate. I should even doubt, though, that there is one in two hundred that have these gauges, taking all the boilers to be found in all the factories and steamboats of the United States, and all the boilers that are used for other purposes. If you were to take this city and look through all the places that have boilers, you might go along for hours without finding a gauge.

Q. I suppose the gauge would be valuable to a captain?—A. Exceedingly so. It would have been valuable in this Riverdale disaster, where the inspector himself was guilty of a crime in not examining the boiler at all, and it would have been of value to know of what strength this boiler was; it was a mere shell, anyhow, and had not been inspected; but even if it had been inspected, the gauge would have been most valuable. I am reminded that when I said steam-gauge I ought to have said *recording* gauge, a gauge that records its indications so that you can intelligently know what these indications are or have been.

Q. You do not think that to be a good gauge that does not make a record of its indications?—A. Certainly; I do not think it to be a gauge unless it gives you an automatic record. The gauge that they have is

Digitized by Google

a blow-off, or something of that kind; but I would not call that a gauge. Take a large steamship, the chief engineer is not what is called a watch officer, he depends upon his junior officers to report to him the condition of the steam, &c.; he is in the office or cabin. A recording steam gauge in his office would be an exceedingly valuable instrument to him to let him know whether he had a faithful stoker, or whether the junior engineers were properly attending to their business in keeping a regular fire or keeping up steam at a certain rate. The same would be the case in a factory. It is important to an employer there to have a regular supply of steam, not only in keeping the factory comfortably heated, but in keeping the people most judiciously at work, and keeping the fuel and pressure right. If he should know, for instance, that at one time the pressure was 30 pounds, and that at another time 60 pounds, he might take it for granted, and I think justly, that his fireman had had a nap. When we take into account the great amount of disaster due to boilers and their neglect, I think we see the importance of a proper and regular supply of steam.

Q. Is there anything else that occurs to you as bearing on this subject?—A. Nothing else.

---

NEW YORK, *October* 1, 1883.

MARCUS HANLON examined.

By the CHAIRMAN:

Question. Please state your residence and occupation.—Answer. My residence is in this city; I am publisher of the American Protectionist.

The CHAIRMAN. You have read the resolution of the committee and understand the subject-matter upon which we are engaged. You may state to the committee anything which you think pertinent bearing on the subjects covered by the resolution.

The WITNESS. I have some idea of what the committee is working for. They want, as I understand it, to benefit labor. I have not any views of my own to present, but I have some resolutions here which I think are worthy of the attention of the committee. They were recently adopted by the Metropolitan Industrial League, but they, in fact embody the resolutions adopted by the tariff convention in New York City, in 1881. That convention represented, I believe, a majority of the voters of this country; it represented the producers of the country—I mean the farmers, the mechanics, and the manufacturers. The convention was held in New York City two years ago.

Q. It seems to have represented a good many people. What was its organization; how large in numbers was it, and what was the character of its representations?—A. It represented all the agricultural industries that were organized. It represented those appointed by the different State labor organizations.

Q. How many were there in the convention?—A. Eight hundred and three delegates.

RESOLUTIONS OF THE TARIFF CONVENTION OF 1881, AND THE METROPOLITAN INDUSTRIAL LEAGUE, 1883.

These resolutions demanded—

First. Protection to American labor by duties on importations of all articles of the kind we can produce, equal to the differences between the cost of the foreign and domestic labor and capital necessary for their production.

Second. Increased duties on those articles that have been discriminated against in

Digitized by Google

the late tariff revision, so that all American labor may be impartially protected against underpaid foreign competition.

Third. The immediate abolition of all United States internal taxes.

Fourth. Repeal of all burdens upon American ships, and awarding ocean mail contracts to the lowest bidders among the owners of American vessels, after open competition.

Fifth. The abrogation of all treaties that interfere with the practical enforcement of the Monroe doctrine, so as to secure the removal of any obstacles that prevent our control of the trade of the South and Central American countries.

Sixth. The establishment of an efficient national bureau of labor statistics.

*Resolved*, That the agreement of political parties upon these principles, essential to American prosperity, will result in settling the question of free trade as completely as the slave question is now settled, and will prevent calamitous labor disturbances, and the disarrangement of the business and industrial interests, by insuring intelligent American labor a free and favorable field for this development.

I think if Congress would act on the suggestions contained in those resolutions, employment would be given to perhaps 400,000 people, and in that way a great deal would be contributed to the welfare of the country.

Q. Have you any idea as to the extent of idleness or the probable number of idle persons in this country who would be glad of employment?—A. No, sir.

Q. Have you any idea as to the number in this city, whether there are many or only a few?—A. I think that employment is pretty fair in the city just now, sir. I do not think that there are a great number of idle persons in the city who could not get employment if they tried to. There are some, of course, coming here without acquaintance who might find it difficult to obtain employment.

## WAGES OF MECHANICS.

Q. Do you know personally anything of the rates of compensation or wages paid?—A. Common labor is worth about $1.50 a day in New York City.

Q. That is for full grown men?—A. Full grown men.

Q. Mechanics?—A. Mechanics run from $2 to $4.50 a day, I suppose. I was in an iron-molding shop the other day and although the common labor is only $1.50 a day, there are men there that get $5.50 to $6.50 and $6.75 a day; that is their wages nearly all the year round.

## CONTRACT PRISON LABOR.

Q. Have you given any consideration to the contract prison labor system, as to its injurious competition with that of other laborers?—A. Of course it injures labor. For instance, it injures the molding business, the stove business, to a certain extent. There are about 1,700 to 2,000 men, I believe, employed in manufacturing stoves in the States, prisons, and their work must certainly come into competition with the manufacturers and laborers outside. I do not think that there is any question to-day in the minds of the people of the State of New York that the State's prison contract system should be abolished. The only thing they are after is to find out what to substitute for the present contract system.

Q. What do you think is the tendency of thought in that direction?—A. I do not think it is really crystallized yet in any practical way to say what is best to take the place of the contract system. That is the only thing that is delaying legislation on the subject now. It is to come before the people, however, this year, and I know that the people

Digitized by Google

will vote to abolish State's prison contracts, and then it will devolve upon the legislature of the State to know what to substitute. Of course the prisoners cannot be idle. They must be employed and profitably employed.

A PROPOSED SUBSTITUTE FOR PRISON CONTRACT LABOR.

Q. Has it ever been suggested that they be employed at such compensation as other workmen receive, and their wages be placed to their credit and cared for by the State, and that with perhaps reasonable deductions the funds should be paid to them as a start in life at the expiration of their sentences, or whenever they are turned out or discharged?—A. It has not been proposed. I do not think you could adopt that, because people would be afraid that the superintendent of the prison would not get sufficient work.

Q. Suppose the men worked by the piece and were paid by what they did, just as outside laborers are paid for the same work, letting the cost of their keep by the State be charged to them, letting them pay their way and letting their funds be superintended and cared for, and if the prisoner indicated good behavior and an industrious habit, giving him some advantage in the way of shortening his sentence, and perhaps some superintendence or help in getting employment when starting in the outside world again—have any ideas of that kind been discussed by the men?—A. They have been discussed, but have not been crystallized. You could not expect, of course, that men in the State's prison can make as good work as those outside. They do not make as good stoves as do outside stove men.

Q. Do the stoves sell for as much?—A. No, sir; they do not. At least that is my information.

Q. Then if the same workmen were working outside, they would not get the average wages?—A. No, sir.

Q. And they should not be paid for any better work when they are inside?—A. I think it will be a great thing for prisoners to have some means of employment when they can come out, but I think they should be taught trades at which they could individually work without having to go into shops. I don't think it is right to teach a trade to a prisoner that will necessitate his going into a shop with mechanics.

Q. What can be done with him—what can he do with himself when he gets out of prison—if he knows nothing about work and cannot be permitted to be with anybody else?—A. He might learn something of agriculture or shoe-making.

Q. Do you think that farmers want such people in their homes any more than anybody else?—A. No; but if he had money, he might get a quarter section of land for himself.

Q. But there doesn't seem to be any place for him around civilization.—A. I know it is difficult, but the problem will be solved, I have no doubt. We will have a year or two yet of it, and there will be a good deal of discussion on the subject. I have no doubt the people of the State of New York are competent to reach a just conclusion, and also the people of Ohio, where it will be decided in a few days. The resolutions that I have read are, I think, Mr. Chairman, very important.

Q. What is the first resolution?—A. It deals with protection to American labor.

Q. I do not care to discuss the tariff; what is the second resolution?—A. Well, the only point I would mention in that is that some people are in doubt whether the Constitution can be construed in favor of a protective tariff.

Digitized by Google

Q. If we have construed it so, for the last hundred years we may as well let that point go. What is the next resolution?—A. The abolition of all internal-revenue taxes.

Q. What is the next?—A. The repeal of all burdens on ships, &c.

The CHAIRMAN. That has been pretty fully discussed.

The WITNESS. Yes. I don't know whether you had the statement of how much the balance of trade was against us.

The CHAIRMAN. You may make that any way.

The WITNESS. It is one hundred and eighty millions that we could supply if we had ships.

TONNAGE DUES ON SHIPS.

The fifth resolution, in reference to the Monroe doctrine, the league was anxious to have the attention of Congress called to. As we understand the old treaties with Great Britain and other countries, if we took off tonnage dues from our own vessels, we would have to take it off theirs. The tonnage dues upon our own vessels are about three hundred thousand dollars, while on foreign vessels they are about one million three hundred thousand dollars, and it would seem that by taking those off it would be giving a premium to foreign commerce. They thought that the attention of Congress should called to that.

RENTS IN NEW YORK CITY.

Q. Is there any other matter that you would like to suggest?—A. There is one thing that I would like to impress upon the committee, and that is the question of rents in this city. Much of that arises from the fact that the city is bounded all around by water. I think rents are higher here than in any other city of the country. I do not find rents bearing so heavily on the people anywhere else as they do in the city of New York. I don't know but Congress might help us a little in that matter. It has occurred to me that as soon as the elevated road runs over the bridge to Brooklyn, and as soon as we have railroads going over it, we can have access to that large extent of country over in Long Island, and that ought to cheapen rents.

A BRIDGE ACROSS THE NORTH RIVER AT NEW YORK.

I think if we had another across the North River, about Forty-second or Fifty-ninth street, it would greatly relieve the pressure of rents in this city. I suppose Congress might build such a bridge. I do not think the city of New York would care about it perhaps. Unless the States of New York and New Jersey should combine to build it it would have to be built by national legislation. That would aid us considerably in getting places for our people to live in close by their places of work.

PRIMARY ELECTIONS IN NEW YORK.

Then I would like to call the attention of the committee to the necessity of the workmen being enabled to take part in the primaries of the large cities. I do not suppose, however, that Congress could legislate on that subject.

The CHAIRMAN. I suppose that would depend upon whether it was a national or a State election.

The WITNESS. Well, we have passed a primary law in this city by

Digitized by Google

which every man is allowed to vote, but the trouble is to get them out to vote. It occurred to me that if there was a system of having primaries for the two political parties on the same day, and a voting paper for the primary election sent to each person who had voted in the district last year, to be filled up with the name of his choice for delegate to the nominating convention, within a certain time, say a week, it would give an opportunity to every man to express his preference. The trouble now is that not one in one hundred goes to the primary—certainly not 10 per cent. The great difficulty is to send the people to the caucus.

Q. Who are less likely to attend, the wealthier classes or the poorer people, or is this a common indifference all the way up and down?—A. I think it is a common indifference. I do not think that they care to go there, but under this system I think they would. I think it would be an effective system. I do not see how it could be otherwise. Let them fill out their paper and have a proper officer to record their votes.

Q. Do you know of any way to compel them to fill out their paper?—A. It would be easy to fill out the paper.

Q. Do you think a man would be sure to stop and fill out the paper?—A. I think so, and I think those papers should be stamped or sent through the post-office free.

Q. You would have the Government affix stamps?—A. Yes. I think every man should take part in the primaries, every man who votes. I think it is the real source of power.

Q. Is there any other point that you wished to suggest?—A. No, sir; nothing else that occurs to me.

Adjourned.

---

NEW YORK, *October* 2, 1883.

Miss FRANCES E. WILLARD examined.

### THE WOMAN'S CHRISTIAN TEMPERANCE UNION.

By the CHAIRMAN:

Question. Please state your residence?—Answer. Chicago, Ill.

Q. What is your connection with the Woman's Christain Temperance Union of this country?—A. I have been the president of it for four years.

Q. Will you explain to the committee what that organization is, its extent, its purpose, and any observations that occur to you, and that will give us an idea of it, and its relation to the interest, of the people?

### HISTORY OF THE UNION.

A. We sometimes call ourselves in the National Woman's Christian Union "The sober second thought" of the great crusade in Ohio, which occurred in the winter of 1874, and lasted fifty days, and, by the weapons of prayer and persuasion, drove the saloons out of two hundred and fifty towns. That line of work of course could not be continued. It merely gave us the impetus. It became later an organic, systematized, methodical work, adapting carefully considered means to very definite ends, and in nine years—for it is now nine years since its incipiency—it has grown to be the largest organization of women, controlled entirely by women, that has ever been known in history so far as we can learn, having organized States to the number of thirty-four, and four organized

Digitized by Google

Territories; and we estimate over 3,000 (which I think is the number this year) local societies, and having not only an existence in our own country as a national confederated society, but also in Canada, as the Woman's Christian Temperance Union of the Dominion; and in England, as the Woman's Christain Temperance Union of Great Britain, with Mrs. Lucas, the sister of John Bright, as president there; and in Australia, wherever the English-speaking or Anglo-Saxon race is found, with its proclivity to the drinking habit, there, as a natural sequence, this society is organized. I have leaflets, which we shall be glad to show to the gentlemen of the committee and others, which explain our lines of work.

ITS METHODS OF WORK.

We take up the methods of our work in the order of evolution. The first is preventive, as, of course, the first thing in order is to prevent the evil if possible; the second is educational; the third, evangelistic; the fourth, social; the fifth, legal; and the sixth, the department of organization—for we are making a specialty of extending the organization so that it shall be truly national in fact as in name. This has been our greatest year of organization, and, having penetrated every State and Territory, in all their leading towns, we are now looking at the strategic positions on the map of our country to see where the work is most needed; and the next line of our forward progress will be the States that most need temperance work, because of their legal relation to the reform, or because of their lack of work in the past. That, in brief, is the origin, history, and method of the organization.

PREVENTIVE MEASURES FOR TEMPERANCE.

Under the head of preventive measures, we have the two departments, Heredity (as coming first) and Hygiene. Our department of Heredity has at its head a lady physician for the National Union. She has an assistant superintendent in every State, and the State superintendent has an assistant in every local society; so that the plan is identical in its national, State, and local aspects. The department of Heredity aims at the wise and careful teaching of women, who come together in groups to read and study the effects of pre-natal influences and naturally inherited appetites for intoxicants. This department is aided by the circulation of books, leaflets, &c., to societies of women. In the department of Hygiene we have an organization in the same way—the object being to study the laws of health, including food, cleanliness, ventilation, and all the physical conditions of life, in so far as they may affect the formation of habits of stimulation. And we carry out the work in the local societies as well as in the national and State societies. Under the head of Educational measures we have several divisions.

SCIENTIFIC TEMPERANCE INSTRUCTION.

First. Scientific instruction, which is one of our strongest departments, the details of whose work will be given to you I hope by Mrs. Mary H. Hunt, of Massachusetts. It will be found that our society works, not only on the principle of moral "suasion," but of legal "suasion," and has been instrumental in securing laws in three States for the teaching of the young in principles of total abstinence from stimulants and narcotics, based on hygiene, chemistry, and physiology. Mrs. Hunt has an assistant in each State; and in the local societies—that is, so far as we can bring it about.

Digitized by Google

### SUNDAY-SCHOOL TEMPERANCE WORK.

The second division of our educational department is Sunday-school work. This aims to teach the same habits and principles as the scientific division, but strictly from a Bible point of view, and by the means of exercises and lessons regularly prepared.

### JUVENILE WORK.

The department of juvenile work aims to find children and organize them into Bands of Hope and Juvenile Temperance Unions, with the feature of military drill added for the boys. There is no person in the country who has done more to make this department a success than Mrs. Sally F. Chapin, of Charleston, S. C. Mrs. Barnes will speak of her own work here in New York. In Charleston, the Legion of Honor is the pride of the city, and is bringing more and more boys of lower grade under its influence, but it is principally composed of boys of the best families, who feel a chivalrous pride in purity of habit. This lady has been in twenty towns of Alabama within the last month forming these societies and traveling everywhere with the heartiest indorsement of the best people; the work has had a splendid blossoming out in the South under Mrs. Chapin's enthusiastic and skillful hand.

### TEMPERANCE LITERATURE.

Also, under the head of Educational measures, we have the department of temperance literature, which seeks to secure a column in the local press for temperance, or, if not a column, as much of a column as possible. We have ladies in each town who aid this object, going to the editors and asking them to give the space. We have also ladies who study the subject topically. Mrs. Buell will speak to you about the work of influencing the press—a work which also comes under the head of Educational measures.

We have a department to influence the public mind in other ways. Whenever we hear of a Sunday-school conference, or an association of ministers, physicians, or teachers of any class, public or private, national, district, county, or local association, we try to get some gentleman or lady who believes in this movement of temperance to bring forward a resolution on the subject, so that there may be argumentation had in all the centers of intellectual movement throughout the country. We believe that what the cause wants is light—to arrest the thought of the people; and we think that women can arrest the thought of the people if they will work and persevere—for they have the leisure to devote to it. It may as a consequence have been noticed that within the last year there has been more done than at any previous time in the way of passing resolutions in all these conventions and societies. Of course we do not take the credit of that to ourselves, only we form a part of those who suggest to delegates the advantage or propriety of bringing the subject up. In my own State of Illinois, in one of the Teachers' conventions, we had one day of debate as to whether this subject should be brought up—that the children should be instructed in the hygiene, physiology, and chemistry of the alcoholic habit. It was opposed by a few gentlemen present who were in the habit of using beer, and I think the debate lasted until the afternoon session. They were able by parliamentary tactics to delay the vote, but when it came, finally, to a vote, the result was overwhelmingly with our side. Of course we try

Digitized by Google

to get a similar opportunity from the medical societies when they have their conventions—that they should resolve to recommend the laity not to use stimulants, and that they should not prescribe them.

### DEPARTMENT OF TEMPERANCE STATISTICS.

We have a department of Relative Statistics, to make people more intelligent regarding the waste, pauperism, and crime resulting from the liquor traffic, by gathering the latest statistics, and placing them, properly classified, before the people, in leaflets and through the press. This work is aided by charts exhibiting relative statistics to the eye by means of lines and colors. I have tried these charts and found them excellent. I may say that this is only a temporary measure, until Congress shall give us the Commission for which we have petitioned, in conjunction with the "National Temperance Society" of gentlemen.

We are doing a little in the way of Training Schools, to work our ladies up to the position of experts. I was untrained myself when I entered this work nine years ago. I had only heard one temperance lecturer, and in my travels abroad had not been a total abstainer. When the great struggle came, in Ohio, it brought my attention to the subject.

We have several gifted German ladies who speak to that part of our population using the German language. During the Iowa campaign our German men and women addressed great audiences and secured, I believe, as many as 7,000 votes of Germans in that State, in favor of prohibition. They went to the great lumbering establishments, where a large number of hands were employed, and the employers allowed the men extra time at the dinner hour to hear our speakers talk on the subject. These talks rewarded our cause well for the effort devoted to them.

Our society also goes, in the large cities, wherever we can get strength enough, to the police stations—but I will ask Mrs. Alvord to give you an account of our police and jail work, and the way in which we try to reach the inebriate class, which is, of course, largely the laboring class—when they have gone beyond preventive measures and it becomes a matter of cure.

### WORK AMONG INTEMPERATE WOMEN.

We have work also among intemperate women. It is impossible, of course, to train up societies of boys and girls without training them to such pure habits as shall bless the home, so that all our work directly helps and uplifts the hope of women. But we do work specifically for women who have fallen under the influence of stimulants. We have a place for women of the better class who have become addicted to stimulants, where they can go privately for cure, without the knowledge of any but their immediate friends. We have in Chicago the "Martha Washington Home"—an immense establishment—which is an asylum for inebriate women. We have in the purlieus of Chicago a "Rehoboth." It is a house in which we place women who are found in the haunts of iniquity in the city, if there is found any possible chance of reclaiming them. There we bring to bear upon them the best and kindest influences of Christianity. We have there a laundry in which they can find work. That institution has been the means of finding homes and work in the country for women who, if not looked after, would have pursued the career of vice—many of them having been originally from the country, and having only begun to form these evil habits.

Digitized by Google

### RAILWAY TEMPERANCE WORK.

We have also a work among railway employés. I wish Miss Jennie E. Smith were here to tell you of it.

The CHAIRMAN. As she is not here, won't you please tell us something of her efforts, and to what railroads she gives her attention, and, if you know anything of the co-operation of the railway managers with her, we should be glad to know that.

The WITNESS. She has been chiefly engaged on the Baltimore and Ohio line, because President Garrett and his associates have been so very favorable to the movement. I think that the employés who have attended Miss Smith's meetings and taken the pledge rank by thousands. I heard that one of the lieutenants of President Garrett was inquiring into the matter—it being new to him—and asked one of the trainmen some questions about it. He said, "How do you boys get along in this temperance movement? I hear there is something doing in that line among you," and the man replied, "Well, sir, if you had come around here about six months ago you would have heard nothing but cursing, but now you will hear us singing Moody and Sankey hymns." That is an indication of the change that has come over railroad men. I know that the officers have found it so practically advantageous, that they have given money to it. I learned from Mrs. Barnes that the Pennsylvania Railroad is now co-operating in the same way. We try to have a Railroad Union, and we hold Gospel meetings, and extend the pledge to all comers, and also get up reading rooms, and in every way possible endeavor to fit men to lead good and manly lives. The wives, mothers, and sisters of the men, whenever we can reach them, are brought into the societies.

### TEMPERANCE WORK AMONG SOLDIERS.

We also work among the soldiers and sailors. We have visited many of the military posts in the far West, and have addressed the soldiers, not always in the fort but by special arrangements to have them present in our hall, and have tried to have our national paper, "The Union Signal," placed in their reading rooms. Mrs. Roach of Washington has done a wonderful work in that city, in the Soldiers' Home; and, so pervasive and beneficial has been the work, that if it has not already reached the knowledge of the honorable gentlemen who have given us an invitation to be present this morning to tell of what we have been doing in this work throughout the country, it certainly will come to their knowledge before the coming winter is over, because nothing so beneficial for temperance has ever been done in Washington among the soldiers.

Mrs. Barnes will speak to you of the young women's temperance work. She is the superintendent of that department.

### PARLOR MEETINGS.

We have also a department of "Parlor Meetings," by which we are enabled to reach many ladies who would not come to us in our hall, but who through the intervention of some good hostess, will give us a hearing in their parlors. It is a form of work which commends itself to cultivated and conservative ladies. This department has been specially successful in the South, and will speak more and more for itself.

I will ask Miss Gordon to speak on the subject of the kitchen garden.

Digitized by Google

### TEMPERANCE AT FAIRS.

We have also a division for working at State and County Fairs. We feel that the occasion of these fairs should tend to the development of a pure patriotism, and not tend to the advancement of the liquor traffic, as has been so much the case in the past. At State and County Fairs we endeavor to secure some opportunity for the dissemination of the principles of temperance. I have just come from the Convention of Vermont. I was told that the delegates from Saint Johnsbury could not be there, because they were attending their County Fair, where they had a booth and were very busy. At the last State Fair, at Burlington, they fed about 2,000 people at their booths, and kept on hand temperance beverages of all kinds, and were the means of great good to the large number of inexperienced country boys who came there with stock, and who, of course, usually get rather bewildered in those places. There are always at those fairs people who drink and who induce these young men to drink. Our temperance ladies were of great benefit to these young men.

A few weeks ago I was in Denver, Colo., at the National Mining Exhibit, and there I found our arrangements very complete, the temperance corner being beautified with flags and flowers, and supplying temperance drinks. Ladies were present all the time and very active, and the place was quite a rendezvous. On Boston Common, on the Fourth of July last, there was a temperance booth and bazaar, and temperance lectures were delivered, and meetings held, from morning to night, by popular speakers who were able to interest the people.

### INTEMPERANCE, ITS RELATION TO CAPITAL AND LABOR.

We have a department on "The relation of intemperance to capital and labor," having ramifications in every State, and which tries to bring about the result that employers shall require total abstinence in their employés, and also to extend the discrimination in favor of abstinent habits to every branch of insurance risks. We try also to induce workingmen to introduce the same discrimination into their societies and trades-unions. The efforts are made by means of articles in the press, by circular letters, personal appeals, &c. In many cases we have been quite successful. We have endeavored to secure employers to sign a statement that for one year they would not employ men who drank.

### DEPARTMENT OF LEGISLATION.

We have also a "Department of Legislation," among the results of which are the Iowa and Ohio prohibition amendments, and the local option law, which the women of Florida petitioned for last winter; also a "home protection" law in Arkansas, and the scientific temperance instructions statutes of Michigan, New Hampshire, and Vermont.

Of the victories of our people in several States with regard to public school education, you will hear from Mrs. Hunt. I know there are many States in which petitions have been circulated and presented to the legislature, asking that the principles of temperance may be aided by an addition to the school laws requiring the instruction on the effects of stimulants and their relation to the human system, be added to the school course. From Georgia, Mrs. Sibley writes me that the work has been going gallantly ahead. In South Carolina, too, the work is prospering. In Virginia, where a Convention is to be held, I think next

Digitized by Google

week, there is a movement to secure similar recognition at the approaching meeting of the State legislature. In Oregon and California, the petitions are printed and in the hands of the committees, in preparation for the winter's work. In fact, you cannot find a State in which our society has not got its work laid out for the coming winter. Our women keep a keen eye on public affairs, and work up their petitions at the right time.

We have also special work among the Scandinavians and among the colored people. Mrs. Chapin works hard wherever she goes, and secures so many votes for "the dry ticket," as they call it in the South, that she is a terror to the saloon keepers of South Carolina. In many a town she has been successful in carrying the prohibition local ticket.

TEMPERANCE WORK IN THE SOUTH.

Q. You know something of the history of Mrs. Chapin, do you not?—A. I am glad to say I do.

Q. You might state it to the committee.—A. Mrs. Chapin is a native of Charleston, S. C., of Huguenot ancestry. She is a brilliant and talented lady, of fine education. No woman in the South was perhaps more active or prominent in support of the Confederacy. She wrote a book entitled "Fitz-Hugh St. Clair," which was a setting forth of the secession idea from the Southern point of view, and was considered one of the best statements of the position from that stand-point. By her work in the Sanitary department during the war, by her great kindness, and by her fine executive ability in the southern hospitals, she won so much love from the Southern soldiers and people that she is more effective than any one else could be in her field. Her husband was Mr. Leonard Chapin, a prominent man in all the great Christian work of the South. At his death she was left alone. Some of us made her acquaintance, and she has told me that it was work alone that gave, or could give, her any consolation. She has repeatedly written to me of the kindly reception that she has had from women of the North as well as the South, which has been a great blessing to her. Very few have approached her in power to achieve. She has a sister at Long Branch, with whom she could spend her summers very pleasantly, but she has preferred to spend her time in traveling over the country, bringing our petitions to the white and colored people to ask their co-operation. For what she has endured and what she has given of her time and her property, for the work, I could not exaggerate the sense of gratitude which the National Association entertains.

I may also mention that Mrs. William Sibley, of Augusta, Ga., is looking after the interests of the association in her State, and is the President of the State of Georgia. Mrs. Judge E. T. Merrick, of New Orleans, is the president of the State of Louisiana. She is a woman of the finest Southern type, and of great devotion. Miss Fanny Griffin, of Montgomery, Ala., is one of the most brilliant women I ever met, and is our leading woman in that State. In North Carolina, our president is Mrs. Governor Jarvis; in Texas, Mrs. Senator Maxey. I suppose that shortly annual conventions are to be held in Virginia, South Carolina, and Tennessee. Within the past three weeks I have come from the convention in Kentucky. Perhaps I have said as much now as the committee desire. I do not know what your method of examination may be.

The CHAIRMAN. Just state, if you will, the relation of the work of your society to the general good of the country.

Digitized by Google

### INTEMPERANCE: ITS EFFECT ON THE CONDITIONS OF LABOR.

The WITNESS. I notice that the resolution of the Senate refers to "the condition of the laboring classes in the United States," and what legislation should be adopted to modify or remedy the cause of their disability. Of course, we have had occasion to give a great deal of thought to that subject. We have come in contact with the working class, as never before. I was at the head of a Woman's College until I went into this movement, and it was a very new departure with me to come face to face with those of such different conditions, such narrow opportunities, and such varied temptations. I had never, to my knowledge, seen a saloon—I thought it was a good thing that saloons should be put down, but had no special interest in the subject. After that I interested myself greatly in organizing meetings and doing temperance work, and I found that every afternoon these laboring classes would come to our meetings in large numbers. When we had the strikes in Chicago, in 1877, there were thousands of rough men going through the streets muttering, threatening, and cursing. Our ladies went and held meetings at places where this class of men would be apt to attend, and great good was accomplished by this effort. The hall was packed, and the men expressed a determination to defend the Woman's Temperance Union with their lives. "We are here," they said, "and not with that mob, because of the interest which the Woman's Temperance Union have taken in us, and the sympathy they have for our families. We did not use to take much interest in well-to-do people, because we thought they cared nothing for us. We find now that we were too cynical." The fact of their being such a society of women in 3,000 towns and cities of the United States is a great change, I think, and is only the beginning of a greater change in the future up-look of the working classes. These ladies that sit here could give you the most romantic and wonderful revelations of the individual lives of working people to whom they have tried to be the almoners of Divine bounty; and that is really the core and center or our work. I have spoken of the other methods, but I regard them as an outshining from the wonderful gospel idea, "Do unto others as you would that others should do unto you"; and as the answer to the question, "Am I my brother's keeper?"

### THE LICENSE SYSTEM.

We believe that by beginning the inculcation of the habit of total abstinence, with the children in the schools, and by getting the upper classes to set the example, and then by making it a popular movement, so that even "Mrs. Grundy" will join in it and contribute to it, and then by securing prohibitory legislation which will frown on the traffic—not interfering with men's personal rights, but making the traffic an outlaw instead of protecting it by Government authority—we believe that these are the roads that lead to a solution of the rum difficulty. We are not believers in "high license." We have studied up the subject, and are in constant correspondence with the women in the towns of Nebraska, Missouri, and Illinois, where they have high license, and they write to us a very different view from that taken by those who are on the opposite side. They tell us how, in Des Moines, the license has only increased the number of saloons; how, in Nebraska, the license is enforced up to the point of getting the necessary amount of money, and there it stops, and drunkenness and crime are in no way diminished. Of course, we take the statements of our own workers, who are consci-

Digitized by Google

entious and who have this problem right under their eye, rather than the statements of others, upon hearsay.

The CHAIRMAN. I would like to have you give, a little more minutely, an idea of the extent and nature of the organization in the different States, the relation of these State organizations to the general organization, and the numbers engaged in this work.

## THE TEMPERANCE AGITATION.

The WITNESS. Perhaps I might take the State of Iowa as an illustration. Mrs. Burt, of New York, is present and will answer for the State of New York. I do not want to overstate anything, but I think the State of Iowa has local societies of the Woman's Christian Temperance Union in three hundred of the leading localities of that State. In some of these, the Union has been organized for nine years; in others six years, and so on. Iowa was the State that bore the palm in the recent prohibitory discussion. I should be very slow to arrogate to women more than they merit, because I should rather that gentlemen should give us praise than that we should take it to ourselves. But I have heard many gentlemen in that State praise the women for their temperance work. The "Iowa State Register" was constantly reiterating "We owe it to the women of our State that this agitation has been kept going for years." The movement began in that State in 1874 without any idea of influencing the law. It took some time for us to work up to this point of the law. We said, "Can't we get men to stop going to these drinking places?" So we brought Mr. Drew and other temperance speakers to Iowa, not even knowing where the money was to come from, and having almost none ourselves. The women entertained the speakers in their homes, and the husbands of these women, of course, stood nobly by their wives. Five hundred thousand men in Iowa signed the total abstinence pledge between 1874 and 1877. We regard that as the base of the pyramid whose apex we hope to see next Tuesday, and which we thought we had seen when prohibition was carried last year by 30,000 majority. The next thing we found was, that many of these men fell away, and then we said, "We must begin farther back—we must begin with the children." So the ladies got the best speakers, and organized meetings throughout the State, and had juvenile conferences, and impressed upon all the effectiveness and power of moral suasion. They organized juvenile associations, and got up little leaflets in which they asked such questions as, "What is a Constitutional amendment?" "Wherein does it differ from a prohibitory law?" "Is the representative to remember his constituents when he goes to the polls?" &c. Those children of ten years old talked over these matters which were put before them with illustrations and anecdotes, and they became wiser than some grown people.

## PROHIBITION IN THE CONSTITUTION.

Then they began to petition for the constitutional amendment. This great movement originated in the home of Mrs. Judith Helen Foster. Her little boy of ten years would spend his Saturday afternoons in taking the petition to the post-office, and at first there were "none so poor" as to do reverence to that petition? The women took this petition for a constitutional amendment into the offices and banks and hotels and homes, and as the women had no object but to protect the homes of the State they had the courage to ask men and women if they would not

Digitized by Google

petition the State to do away with the liquor traffic and so protect the home. That petition secured tens of thousands of signatures. Women are patient; they go out in the frost, and through the rain and storm and the fine weather. That petition went from the people to the legislature. The legislature gave it thought. Some people say that because we women have not the ballot no attention is paid to our petitions. That is true in a sense, and yet, in another sense, I think the fact that the petitions are sent by women has some consideration. However, the petition received no answer. No constitutional amendment was presented. There was a loyal Senator there, Elias Jessup, who stood up in the Senate in favor of the women's petitions, and spoke more than any other man for them. When it became apparent that neither of the political parties would touch this matter, the men and women of decided opinions said, "Let us see if we cannot have some independent voting in Iowa this fall," and they had, I think, to the number of 12,000 or 15,000. This time, they tried it with Mr. Jessup as canidate for governor. When the next caucuses were held we know that such men as the Wilsons, Mr. James Wilson (the Senator), and the other gentleman (the Scotchman), said to their party, "You had better heed this," and they heeded it somewhat, and they kept heeding it more and more, and finally, by votes not wholly Republican, but by votes from both parties, the balance of power came into the hands of the temperance people. Of course, it was at first non-partisan. We believe that up to a certain period our prohibition work will be non-partisan, but after that period it becomes partisan. The moment two canidates are put up for an office the movement becomes partisan, because of the very nature of our Government; and so, in the forward march of the movement, while the Woman's Christian Temperance Union has had no political power, it has been the power behind the throne. The men who had signed the pledge said, "The women tried to help us, even if we did not try to help ourselves; and we will vote on their side." And I have yet to hear of a man in Iowa who was reformed in the movement of 1877 who did not, in 1882, vote for the prohibition amendment. The women carried the movement on until they placed it in the hands of the voters; because, when it became a great matter, then men took notice of it, and incorporated it into their platforms.

### TEMPERANCE ORGANIZATION IN EUROPE AND AMERICA.

That is, in brief, the history of the working of the Iowa Woman's Christian Temperance Union. That union is an auxiliary of the National Woman's Christian Temperance Union. The National Union has thirty-four States as auxiliaries, and recognizes no auxiliaries but States. The State Union has for its auxiliaries the local unions within its own territory. The financial arrangement is the payment to the local Union of 50 cents by each person who joins the Union, and the State Union sends 5 cents of that to the National Union. We carry on our work without compensation on the part of the women, not because it would not be perfectly right to pay salaries but because the association could not afford it. It is a grand philanthropic movement on the part of women who were organized by that great uprising of 1874, and who have systematized the work, and have learned to plan and to do. And they have learned what *not* to do as well as what to do, and so they are moving along with increasing power year by year.

I have stated the extent of the society in respect to the fact of its not being confined to this country. An English lady came to see me at the

Digitized by Google

depot at Boston last evening, and told me that Mrs. Lucas, the sister of John Bright, is going like a superhuman power through Great Britain, from John O'Groat's to Land's End, organizing Woman's Christian Temperance Unions everywhere, and her plan is the same as ours.

Q. Is it organized on the continent of Europe yet?—A. I do not know of any society of our name there yet, but there are groups of women that we are in correspondence with in Germany and France. I know that there are such societies in Japan; I know this from missionary women with whom we correspond. In Yokohama and in Canton groups of women are carrying on this work among the English and American sailors. There is nothing obligatory in our methods, which are very flexible; we believe a great deal in leaving people free in this respect; there is nothing secret or special in them; our little leaflet is a mere list of sisterly suggestions, but they are generally taken up and the plan adopted. In some of the Western States, especially in Illinois, the women say that they do not expect to have prohibition in the constitution or laws until women have the ballot. They have not adopted that in the State of New York, or in the South. Mrs. Chapin does not make that a point at all. Her work is moral suasion work, and petitions to the legislature, from women. But in Illinois we have made quite a specialty of the effort to secure the ballot to women. Although we could not expect to accomplish a great deal in that Sebastopol of the rum traffic, yet woman's influence has brought about a great change in Illinois. I traveled in Arkansas two years ago. The women there were encouraged by what they had seen done elsewhere, and they petitioned the legislature to have the signatures of women count as the signature of a voter upon the question of the liquor traffic, and a law was passed to the effect that when a majority of men and women over twenty one years should request a municipal council in the State to declare against license, it should be obligatory on that council so to declare, and that this decision should be once for all. Then of course the liquor men had interest enough to get cities of the first-class excluded from the law. As the liquor men generally have something to tack on to a law—if they cannot get into the law itself, they get something like a postscript—so they got a postscript in this case, which disabled the law in about eight towns. But, in about seventy-five of the counties of Arkansas, I have been told that the people had never expected to see themselves so delivered from the bondage of the liquor traffic. I may mention a single illustration. In a certain locality there was a stone quarry, and the men who worked in that quarry were followed, as is usual, by the sword-fish of the saloon, as we know the saloon always follows the wage class and sets itself up at the handiest place it can find in order to make them its victims. These men spent their money in the saloon to such a degree that grocers and others, who had been supplying their families, felt pity for them, and, wanting, of course, themselves, to do as good a business as they could, went to the paymaster's car, which was brought up at regular intervals to pay these laborers, and garnisheed their wages to pay for the flour, groceries, &c., which their families had been getting. That was the only way to get hold of the wages of these men. But after this law was passed, and before the fact had become known to these men, a bright woman sallied forth and went to the homes of these women with a petition, and, although she did not get many signatures, she got many signs of the cross. She went all through the town, and before sundown a majority of the people of the town had signed the petition. Of course she had all the women without exception, and she had the better class of the men. The

Digitized by Google

law went into effect, and it was not one week before the saloons "folded their tents like the Arabs, and as silently stole away." That is one instance of what I had given to me of the operation of that law on the actual public sentiment of a community; for no public sentiment is actual that does not express the voice of the home as well as of the street.

There can be no question of the benefit of such a law upon the status of the laboring classes, and of its influence in ameliorating their condition.

The CHAIRMAN. I see there are several representatives of the society here, and, if you choose, you may designate the order in which they may present their statements.

The WITNESS. Of course we women are here in our representative capacity. The only vice-president of the society who is present is Mrs. Burt, of New York. The national secretary of the society is Mrs. Buell, of Connecticut. I suppose it would be the orderly way to hear Mrs. Burt first.

Mrs. BURT. I should prefer to have Mrs. Buell heard first.

---

NEW YORK, *Tuesday, October* 2, 1883.

Mrs. CAROLINE B. BUELL examined.

By Mr. PUGH:

Question. Please state your residence.—Answer. My home is in East Hampton, Conn.

Q. Please state the relation you occupy to the temperance movement of the women of the country?—A. I am the Corresponding Secretary of the National Woman's Christian Temperance Union.

Q. Will you please state, in your own way and your own order, all the information you desire to make public upon this important question?—A. I think our president, Miss Willard, has gone over the ground very fully. She has only left one or two departments, and has specified different ladies to speak on these departments. Mrs. Hunt is here for the scientific department, of which she is superintendent, and I think Miss Willard desired me to speak for the press.

Q. Any special information you have, upon any one of the departments of work, you can state to the committee, just as you think proper.

TEMPERANCE READING IN THE NEWSPAPERS.

A. Well, at the beginning of our work we were ignorant of temperance methods, and not only of what had been done in the past, but what was necessary for the future, and as we looked about we saw that throughout this great country there was an enginery that had not been brought into line, and that was the press of the country. So, three or four years ago, I think, we appointed a woman to take this matter under her supervision entirely, and she did so. By means of bulletins and letters, and by culling from scientific works, and from different newspapers which had already fallen into line, and were helping us in our temperance work, she was enabled to get the matter into the different secular and religious papers of the country. She made it a systematic work, first securing a list of all the newspapers in the country, and especially of those which it was most desirable to reach—our leading papers both religious and secular—in the leading cities, and then set herself to work

Digitized by Google

to find matter which would be acceptable to the people, and also to the editors and publishers of these journals. She, of course, had her representatives or superintendents in the local organizations throughout the States—she being the National Superintendent, and there being State Superintendents appointed also. In this way our meetings were reported more largely than they had ever been reported before—the speeches of our speakers, if not given in full, were given in substance—the gist of them was given. Then she began to take from scientific works by Dr. Richardson, and by different physicians and prominent men in England and in our own country. She culled from their writings very largely, and those cullings were published throughout the country. One particular line of work was in asking our local superintendents throughout the different towns in the different States to go and see the editors of the papers, and, if possible, secure a column to be edited by one of the ladies of the Woman's Christian Temperance Union in that locality. At last we had reported to us thousands of papers throughout the country, of which the women of the Union, of the particular locality, edited whole columns. During the last year this has not been urged as much as formerly. We have felt it was perhaps just as well to get in short, terse sentences—sentences which were right to the point, and in this way people would perhaps be more inclined to read them than by having a whole column. That plan was very largely carried out throughout the whole country, commencing in Maine and going down through the New England and Middle States, and finally reaching the Southern States. Mrs. George H. McLeod, who is a poetess of the South, and resides in Baltimore, Md., was the Secretary of the Southern portion of the country, and through her instrumentality the Southern papers have been very largely brought over to give us a good deal of space in their columns, not only by giving columns to the ladies to edit, but also by inserting short articles from the ladies' pens, and from scientific works. To-day, largely, I think, through the instrumentality of this department of work, the papers are well filled with temperance news.

We are just closing the year, and I have no statistics to present. We shall have those, of course, later. They will reach us with our reports, which are now but just coming in.

Q. Is there any other subject that you desire to speak about, except the one especially under your care?—A. I do not know that there is, sir. Miss Willard has gone over the ground so fully that it seems hardly necessary. I do not know that I could say any more regarding the press work, unless I spoke of particular places.

The CHAIRMAN. Perhaps Miss Willard could suggest something further that you might tell us.

Miss WILLARD. I would like to ask Mrs. Buell, who has been one of our most efficient and useful workers, and who has been in New York City for two or three years as our secretary, to give some idea of the work at headquarters—not only of the National Society, but of the State Societies—and what has been the special work in the whispering gallery of the National and State Societies, by which we keep up the current of communication with our women all over the country. I suppose we have about one hundred thousand women enlisted in the work.

### ORGANIZING WORK FOR THE TEMPERANCE AGITATION.

The WITNESS. I think we have about one hundred thousand women certainly in our following. Our headquarters are in this city, at No.

Digitized by Google

16 East 14th street. The work of the Corresponding Secretary is, of course, what would naturally be expected of a secretary—carrying on the necessary correspondence between the National Society and the State Societies and the local auxiliaries. Her special work is in, as far as possible, helping the different National superintendents and the State and local superintendents in plans of work and in carrying out their plans of work. Our plan of work, as Miss Willard told you, is embodied in the little leaflet which she had, and from which she took her heads. That maps out the work for the United States as a whole—not only for the National Society, but for the State Societies and for the Local Societies; but, as she has also said, no State Society or Local Society is obliged to take up any of these lines of work, unless it seems best for them to do so, and they are not obliged to take it up at any specified time. They can use their own discretion in that matter. But when they do take up that line of work, then it is the business of the National Secretary, so far as possible, to help them along in their plans, and in their work, in the different localities. The secretary is also expected to, and does, assist the organization in parts of the country where we have not local societies, and, during the last year, where we have not had State or Territorial organizations, by suggesting plans of work and carrying out in detail the plans of work that are given by the National Society. The outline of this is, of course, given in our little leaflet, but there is a great detail of that matter which it is necessary for the Corresponding Secretary to give to organizations or to women who are more remote from the centers. A great deal of our work is missionary work. The work during the last year in the more Northwestern States and Territories, as in Washington Territory, Oregon, and even on the Pacific Coast—in Nevada, Arizona and Utah—has been more especially missionary work. We have sent them a great deal of literature, and that is sent very largely by the Corresponding Secretary from our national headquarters on 14th street in this city.

Miss WILLARD. I simply thought that, in her statement, Mrs. Buell might give an idea of the voluminous correspondence that has to be done, for any account of her work would be incomplete without that. I know that, in my own case, during the last year, ten thousand letters and postal cards must have been sent out from my own hand, through my secretary, Miss Gordon, and I know that Mrs. Buell writes constantly, for there are women who always try to keep up a sympathetic relation and correspondence with our societies. For instance, I got today, a letter from Ogden, Utah, to be read in our societies, and we never allow such letters to go unanswered. So that the corresponding features of our work imply a great many features, and employ a good many persons. We probably have fifty women who give their constant time to organization and speaking, and who, for the last eight or nine years, have spoken on an average once a day. Of course, doing that once a day, and working so much on a complete plan, they have accomplished a great deal. Ours is the youngest organization of temperance workers in history, and we know that we could not have done so much in so short a time, but for the admirable organization and the unlimited zeal of the women engaged in the work.

Mr. PUGH. You are more familiar than are the members of the committee with this matter, and, of course, you have given it a great deal of thought. You understand the organization and its purposes, its work and its progress, and if there is any feature of it that you think it advantageous to make public, or to present to the committee, you can yourself suggest better than we can ask such points as it may be desir

Digitized by Google

able to present. For us to ask you, ladies, any questions on this subject would be like the case of pupils undertaking to question their instructors. We are in search of light ourselves, and you are able to give it to us, without interrogation upon our part. You have free and ample scope to speak on any branch or feature of the movement that you think it is important for the public or the committee to understand. I have no doubt that with the powerful agency of an enthusiastic membership, such as you seem to have, and with the aid of the press of the country, and the moral power of all good people, you can accomplish a great deal more than this committee can accomplish in anything that it can do.

The WITNESS. Our work is so divided into departments, and we have it, as we think so well systematized, and it is to-day so well represented here by the ladies of the different departments, that I think you would gather from them a fuller and better account than I could give.

Mr. PUGH. We certainly have had a very luminous account of the work, as good as could be given, I have no doubt.

Miss WILLARD. I might say that our work has been, incidentally, a means of bringing Christian communities of different denominational names into a more harmonious relation. For instance, we have Catholic ladies who are officers in our society in Arkansas and other places, and they have prominence in our work. When I was in Santa Fé, I went to see the Catholic bishop and the mother superior of the convent, and the latter agreed to send a vice-president to represent them at our meeting, and sent me word that at the hour of vespers, I might know that I was remembered by the nuns—which was to me a beautiful idea of sisterly relationship. I have spoken also in a Jewish synagogue, in episcopal vestries, and other places to which nothing but the great humanitarian and universal subject of temperance reform would admit outsiders. It is not many days since that, in the town of Lebanon, I was speaking in a Presbyterian church, and the Catholic priest was present. I was well aware that ten years ago, the session of that church would not allow a woman to speak in it, and that the Catholic priest would not go there to hear her. But he was so strong a total abstinence man, that he ignored his prejudices. I thought that fact would be of interest to the committee to hear. I would suggest that Mrs. Buell might give an idea of the successful summer meetings that we have had.

### PRISON TEMPERANCE WORK.

By Mr. CALL:

Q. Have you got anything like a prison service or department in your association?—A. The prison and jail work is quite a recently formed department of our work. I think there is a lady present who will give some idea of that so far as it has been worked in the city of Brooklyn, N. Y., and also in Portland, Me., where that work first began.

### PRESS-WORK FOR TEMPERANCE.

In connection with the press work, I might have given you an illustration of how well the papers are disposed to us in these later days, more than they used to be. At the last convention of the National Woman's Temperance Union, held in Washington last week, the leading papers of the District of Columbia gave the daily reports of the convention almost in full. The Republican gave us, I think, two and a half columns, and reported our meetings perhaps very nearly as fully as they might have done a political convention. This has been so, I think,

Digitized by Google

in the States generally. When we hold our National Conventions now-a-days we have very good reports in the locality where the convention is held. And so it is throughout the country—there is a very different state of affairs from what there was a few years ago.

NON-SECTARIAN CHARACTER OF THE WOMAN'S CHRISTIAN TEMPERANCE UNION.

Miss WILLARD. One of the ladies has requested me to say that five denominations are represented here to-day in this delegation. I want to add that we have no creed test whatever in the Woman's Christian Temperance Union. Any one who will partake with us this sacrament, of humanity is welcome. We have Unitarians, Universalists, Quakers, Catholics, and people from all churches. We only ask that they be sympathetic with us in our movement. And while ours is a thoroughly Christian work, founded on the Bible as the book for the conduct of life, we have no bounds that would prevent us from receiving anybody who would come to us of good character and earnest heart.

SUMMER MEETINGS FOR TEMPERANCE WORK.

The WITNESS. With regard to the summer meetings which Miss Willard asked me to say something about. We have been in the habit of holding meetings during the summer months, at the different summer resorts along the coast—at Ocean Grove, Martha's Vineyard, Old Orchard, &c., and at different mountain resorts in the interior of the States. Last year we held one at Old Orchard and at Martha's Vineyard, and at those places we got not only the ear of the people belonging to those places, but there were people there from all over the country, and not only from all over our country, but there were, notably at Old Orchard, people from other countries—from England and from Canada. We feel that these meetings do the cause a great deal of good. We try to give those in attendance an idea of our departments of work—show them just what we are doing—and let them see that wherever the liquor traffic comes to touch the community with its blight, there we women intend to put in some good, sound, solid temperance work.

By the CHAIRMAN:

Q. How numerously have those meetings been attended?—A. Well, sir, we have had all the way from hundreds up to tens of thousands of people in attendance. Sometimes there have been more and sometimes less, but we have always had, as a general thing, a very large number of people present.

Miss WILLARD. At Chautauqua we had, at least, ten thousand when we celebrated the anniversary of the society. It was formed in August, 1874, by a gathering of women who had been active in the cause before. They assembled in Chautauqua and formed this Society.

The CHAIRMAN [to Miss Willard]. Was Miss Gordon with you in your recent tour?

Miss WILLARD. Yes, sir.

The CHAIRMAN. The whole time?

Miss WILLARD. Yes. Miss Gordon has been my Secretary for six years, and has traveled with me for about four years of that time. She was my companion on a six months' trip to the twenty-seven States from which we have recently returned.

Digitized by Google

The CHAIRMAN. You spoke of desiring to call her attention to some particular point?

Miss WILLARD. Yes. That was the Kitchen Garden—a new branch of work—quite a unique department.

The CHAIRMAN. Would it require much time to present it?

Miss WILLARD. No, only a few minutes.

The CHAIRMAN. I would like Miss Gordon, then, to give us an account of that and also of this trip throughout the States and Territories. I think I know something of it, and I think that a presentation of it may give a better idea of the actual condition of the work and how it is done than almost any one thing that could be stated. Then, perhaps, Mrs. Hunt may give us a statement with regard to the scientific instruction, and what you have done to secure laws to introduce proper instruction in the common schools of the country.

---

NEW YORK, *October* 2, 1883.

Miss ANNA GORDON examined.

THE KITCHEN GARDEN: WHAT IT IS AND WHAT IT DOES.

By the CHAIRMAN:

Question. Please tell us something about the Kitchen Garden work?—Answer. The Kitchen Garden work is a comparatively new philanthropy. I think it came first to the thought of Miss Huntington, of this city. It was her idea to reach the children of the poorer classes, who are in very wretched homes, and homes often of drunkenness.

She gathered a number of these children together and taught them, much on the Kindergarten plan, by which lessons are given in all the household arts. At the close of their teaching, when graduated from these classes, they have been able to enter into house service, and have commanded high wages. The women of our Temperance Union have obtained permission to teach this method only to members of the Woman's Christian Temperance Union. They have established schools in Yonkers and Oswego, in this State, at Baltimore, Md., Louisville, Ky., and also in Cleveland, Ohio. In Cleveland the young ladies of our Society go to the workhouse, and have a class among the girls who are confined there for petty offenses; and they say that these children brighten their homes greatly by carrying to them the ideas of cleanliness and tidiness they glean in these Kitchen Garden classes, and, if they go into service, they are prepared to obtain good wages, and to give good service in the families to which they are sent. In the presence of those ladies of so much more experience, I hope the committee will be good enough to excuse me now.

Miss WILLARD. I thought Miss Gordon might give an idea of an exhibition that the Kitchen Garden ladies gave us in Cleveland.

The WITNESS. Yes. They gave us an exhibition of a class in Cleveland at the time that the reception was given to Miss Willard. Little girls, twelve or fifteen in number, marched into a hall to the music of a spirited march, carrying toy beds, and, placing them on tables that were in a row, made the beds properly. Then they set a table, four of the girls taking seats and four others coming in and serving properly the dishes on the table. Then followed a variety of household avocations, such as sweeping, waiting on the door, washing dishes, &c. The

Digitized by Google

work was done while keeping time to music, is very bright and pleasant in its influences, and full of instruction for the girls.

Q. How extensively are you applying this; is it a part of your work everywhere?—A. No, sir. A superintendent of our National Society has only been appointed this last year—Miss Mary McClees, of Yonkers, N. Y. She has established a society in Louisville under the charge of young ladies, also in her own home in New York, and is now in Minnesota on the same errand.

Q. Is it contemplated to introduce this feature everywhere?—A. Just as far as possible in large cities.

By Mr. CALL:

Q. Why is it named the "Kitchen Garden"?—A. Because they are taught so much of the kitchen art, cooking, washing, &c., so that they can become reliable servants.

Miss WILLARD. As I understand it, they are taught just as they would be taught in a regular industrial school where they set out to make good servants, only our ladies begin with them when they are children, and teach this work in the form of play, and add music to it in order to teach them habits of order. As the children get older the ladies take them to the markets, and teach them how to select meats, and then of course they are taught to cook them; and everything is taught which will enable them to keep their homes in nice order, or, if they are at service, to enable them to render good and acceptable service, so that they may be able to command better wages.

Mr. CALL. That is a little outside of the regular work of your organization?

Miss WILLARD. Oh, yes; but we believe that temperance, like the atmosphere, goes into everything. We think that if the people were taught to prepare food in a simple, hygienic, manner, it would greatly redound to their benefit in establishing simple, unartificial habits. Besides, very many fashionable and elegant young ladies, who would not come in with us on our more solid lines of work, the lines which we veterans are devoted to, would think it entirely enjoyable work, and perhaps, from their stand-point, more elegant, to do work of this character.

Mr. CALL. You are catchimg them with a little guile, then?

Miss WILLARD. Yes, a little, only we think it is the most guileless guile that can be imagined. We want to be all things to all women, if by that means we can do the most good. We have these elegant and interesting young ladies to do this kitchen garden work; it is a noble work. Of course, we talk a great deal to these little girls about the duty of not using liquors, and perhaps these young ladies who come with us may do us much good by fostering temperance sentiment in the refined society in which they move. It is really an outside department for reaching young ladies who have not hitherto been specially with us. Our latest department is the Flower Mission. That was organized for the purpose of getting those same lovely girls to take to the hospitals the prettiest posies they can find, bound up with a nice white ribbon and a pretty motto. I was at the recent Kentucky Exhibition, and spoke to the young ladies there. We found a young lady in Louisville, Miss Jennie Cassidy, a lifelong invalid, who had telephones all over the city communicating with her flower girls. We have found a re-enforcement there in the flower mission, and it has been an *entrez* to us really, which, perhaps, with our more sturdy methods, we could not find.

Digitized by Google

The CHAIRMAN [to Miss Gordon]. Won't you please give us an account of this trip which you made recently?

Miss GORDON. Yes, sir. We left Boston early in March, and organized the Woman's Christian Temperance Union where it had not been organized, in New Mexico and Arizona, at Santa Fé, Albuquerque, and Tucson. Then we went to California and visited, I think, thirty towns; then to Oregon, visiting there six towns, and holding a convention of the Oregon women in Portland, organizing the State Woman's Christian Temperance Union. Then we went on to Washington Territory and British Columbia, and then back through Montana and Idaho; then to Utah, and home through Colorado, Wyoming, Nebraska, and Dakota. In nearly all these localities we held conventions, so that the principal towns and cities of those Territories were then reached for the first time by our Union.

The CHAIRMAN. How much time was occupied?

Miss GORDON. We reached home by the last of August.

The CHAIRMAN. Were you "loafing" most of the time?

Miss GORDON. No, indeed, sir. We averaged a meeting a day, but very often the meetings were two or three a day. We always met the women by themselves first, to talk over the plans of work, and then would hold a public meeting. We averaged, really, two meetings a day while absent on that trip.

Miss WILLARD. Miss Gordon's special work was to organize the Bands of Hope. She met the children in almost every place, and also the young ladies, wherever practicable, introducing these lighter methods with the young ladies, and forming Bands of Hope on the plan that I spoke of in Iowa, a systematic method by which the boys were taught the military drill. We found a captain or colonel in some one of the forts, who would come to some adjacent point where we were, and teach the boys the military drill; then we would have banners painted with little mottoes, such as "Tremble, King Alcohol; we shall grow up;" and these banners they were very proud of. We taught them that they were to be the great strength of the future, for the temperance cause. By the introduction of this military drill we were actually able to bring in the sons of saloon keepers themselves, and young boys who would not come into any other sort of temperance organization. I have heard of a saloon keeper who said to a friend, "You should have seen my boy marching in a procession of rabid prohibitionists—and my boy walked the straightest of the lot." So by little means of this kind we get even the saloon keepers interested in letting their boys become temperance soldiers. I think that of all the methods adopted for the furtherance of the cause of temperance, this method is perhaps the most hopeful.

The women of the West take great interest in it. In San Francisco, Mrs. P. D. Brown is organizing what she calls "The Royal Legion," and she has pledged herself that it shall be organized in every town in California; it is an open society for boys.

May I say, before Mrs. Hunt makes her statement, that we have had no more fortunate feature of our work than that the inevitable duty always finds a worker ready. Wherever a new branch of work, or a new evolution, comes to us, there is some lady especially well equipped for it and ready to take it up. I wish to say that Mrs. Hunt has been second to none in the success of her efforts for our great cause. She is a graduate of Mrs. Lincoln Phelps' Institute, near Baltimore—a sister of Emma Willard, of Troy—and particularly gifted in the sciences. I remember one of my first books of study was Elmira Phelps' Botany. Mrs. Hunt's especial delight, also, has been in the natural sciences: she stood very

Digitized by Google

high in all branches, but especially in the natural sciences. When the idea came to us that scientific instruction in the public schools, as a part of the regular curriculum, would be the mightiest leverage possible, and that it would perhaps unite the people most, Mrs. Hunt seemed to have an inspiration for the work, and has dedicated her life to it with so much devotion, and so much success, as I have never known similar worker to meet with in the same degree. Through Mrs. Hunt's influence we have been able to secure the influence of the educational journals of this country on our side. She has spoken at the National Educational Convention, and a book upon the topics in which she is interested is now being prepared under her suggestion for use in the public schools. I merely mention these things because it may be interesting to you gentlemen of the committee, as it is to us to know that when we have had a department ready we have always found a specialist willing to devote her time to it. Mrs. Hunt's work is to address legislature, conventions, &c., on the subject of the scientific relations of temperance, and to influence the temperance sentiment as far as possible through scientific teaching in the public schools, and also, of course, in private schools.

---

NEW YORK, *Tuesday, October* 2, 1883.

Mrs. MARY H. HUNT examined.

By Mr. CALL:

Question. Will you please state your residence?—Answer. Hyde Park, Massachusetts.

Mr. CALL. We will be glad, Mrs. Hunt, to hear from you any opinions or facts which you may wish to present to the committee on the subject under consideration.

### NEED OF SCIENTIFIC INSTRUCTION IN TEMPERANCE.

The WITNESS. Well, sir, some four or five years ago my interest in this subject was aroused, from the fact that in my city, Boston, there were licenses granted to open four saloons very near where a large public building was being erected. There had been no need for such saloons before. I very naturally inquired into the cause of their building, and found that it was to supply the demand created by there being so many workmen employed there. I had been somewhat interested in working among the poor, and that raised in me a thought that in my next visits to the poor I would endeavor to ascertain how largely the drinking habit has to do with their poverty. In a series of twenty calls that I made on Portland and Beach streets, and some of the other streets of the poor of the city, when probing the matter, and inquiring why these people were so wretched and so poor, and why it was necessary for Christian women to go there and try to relieve them, I found that there was generally a drunken father or mother, or a dissipated son, or something of that sort behind it. Then, probing the matter still farther to get at why they drank, by going into our Washingtonian Home in Boston, an institution for reforming drunkards, and questioning the young men who were patients there, and asking how they came to drink, I found that they would sometimes answer that it was the example of their father, sometimes that it was from the mother's cooking, and sometimes from other causes, having their basis, as it seemed

Digitized by Google

to me, in the want of knowledge as to the nature and effects of alcohol upon the human system. I said to them, "Did you know that it is one of the characteristics of alcohol that it has a cumulative attraction for itself—that in the nature of things a little would create an appetite for more?" They said, "No," and very naturally and logically my thought went along back to the beginning of things, and I felt that our fathers, who founded our Government, were correct in the belief that men will choose the right if they know the right. And if that theory be correct, it was clear to me that if we could only show men the consequences of their acts before they begin to be under the power of appetite—before they tamper with the beverage which has the cumulative attraction for itself—we might save them.

But at that time there were no text-books on the subject. Then I began to look for some institution that would reach all classes in America upon so fundamental a thought, and about that time I was attracted to the Woman's Christian Temperance Union. I had found that there was no institution in America that really reached all classes of adults—the church only reaching a small portion of them, and that there was no institution except the public school which reached the people in childhood. Therefore, the thought came to us that by making that institution—by making our great system of public instruction—the vehicle for conveying to our population, before appetite is formed, and during the formative period of childhood, these great laws of vital chemistry, by teaching them what alcohol is, and, as Dr. Willard Parker says, what alcohol will do to us if we drink it, and what it will make us do, we would secure the largest possible amount of good. Our first thought was that we could work through school boards. We felt that it was so very reasonable and sensible a thing, that we would only have to go before school boards and tell them that we wanted the childdren so taught, and they would at once arrange it. Dr. Benjamin Richardson, of London, one of the greatest scientists of the age, had prepared a text-book on the subject which was much in advance, we thought, of the common school grade. Therefore, a lady of this city, Miss Colman, prepared a book on the subject somewhat on that plan.

### TEACHING OF TEMPERANCE IN THE PUBLIC SCHOOLS.

Then we went to the boards of education and pleaded with them, and we found that ours is a representative government in every sense of the word. We found that a man on the school board is a man who represents constituents, and if the constituents love beer, why, this man found himself in a position where he might lose re-election if he should do anything that the beer men did not approve of. I had been called to Southern Ohio by a Woman's Christian Temperance Union there. I went before a meeting of the citizens in the evening and before the board of education the next morning. We pleaded with them, and their objections immediately faded away, and they assured us that the teaching which we asked for would be introduced into the schools. The next year the ladies sent for me again. I was a little surprised at the second call, because they said they wanted me to come again before their board of education. When I went the gentlemen told me, "We have done something in this line for you." I said, "What have you done?" They said, "We have had some important chapters of your text-book printed on pieces of paper, and tacked up on the walls of the school-room, making a kind of object-lesson for the children." I said, "Did you give any direct lessons to the children?" They said, "No." Then

Digitized by Google

I asked "Would you teach geography that way or history that way?" "Oh, no," they said, "the law would not allow us."

We saw at once that if we were ever to get aid, as was our purpose, from the educational systems of America in the teaching of the science of temperance, we must have it embodied in the laws of the States. Therefore, our National Woman's Christian Temperance Union passed in Washington a resolution to this effect: "Resolved, that we will petition our legislatures, as far as is expedient, to enact a law requiring the science of temperance to be taught in the public schools."

### THE VERMONT LAW REQUIRING TEMPERANCE EDUCATION.

We presented petitions, beginning last year, and it has resulted in our having a law passed in Vermont, which I will read to you. It is as follows:

AN ACT relating to the study of physiology and hygiene in the public schools.

It is hereby enacted, &c.

SECTION 1. Section 558, chapter XXXIII, of the revised laws is hereby amended so as to read as follows: "One or more schools shall be maintained in each town for the instruction of the young in good behavior, reading, writing, spelling, English grammar, geography, arithmetic, free hand drawing, history, and Constitution of the United States, and elementary physiology and hygiene, which shall give special prominence to the effects of stimulants and narcotics upon the human system, and special instruction shall be given in the geography and history, constitution, and principles of government of Vermont. Text-book committees shall select and recommend a text-book on elementary physiology and hygiene for use in their respective towns.

"SEC. 2. No teacher shall be required to pass an examination in physiology and hygiene before November 1, 1883."

### THE MICHIGAN LAW.

Then, in Michigan, as a result of the system of national and State unions working with the local unions, that State passed the following amendment to its law:

AN ACT to amend section 15 of chapter III, and section 4 of chapter XII, of an act entitled "An act to revise and consolidate the laws relating to public instruction and primary schools, and to repeal all statutes and acts contravening the provisions of this act," being act No. 164 of the session laws of 1881.

SECTION 1. The people of the State of Michigan enact: That section 15 of chapter III, and section 4 of chapter XII, of an act entitled "An act to revise and consolidate the laws relating to public instruction and primary schools, and to repeal all statutes and acts contravening the provisions of this act," being act No. 164 of session laws of 1881, be amended so as to read as follows:

Chapter III, section 15. The district board shall specify the studies to be pursued in the schools of the district; provided always that provision shall be made for instructing all pupils in every school in physiology and hygiene—

You will notice that that includes all the children of the State, for the State of Michigan has a compulsory education law—

with special reference to the effects of alcoholic drinks, stimulants, and narcotics generally, upon the human system; provided further, that the text-books used in giving the foregoing instruction shall have received the joint approval of the State board of education and State board of health. The said district board shall prescribe the text-books to be used, which shall be uniform in each subject that may be taught, but text-books once adopted under the provisions of this act shall not be changed within five years, except by the consent of a majority of the qualified voters of the district present at an annual meeting. Each school board making a selection of text-books under this act shall make a record thereof in their proceedings.

Chapter XII, section 4. The board of school examiners shall grant certificates to teachers in such form as the superintendent of public instruction shall prescribe, licensing as teachers all persons who on thorough and full examination shall be found qualified in respect to good moral character, learning, and ability to instruct and govern a school, but no certificate shall be granted to any person who shall not pass

Digitized by Google

a satisfactory examination in orthography, reading, writing, grammar, geography, arithmetic, theory and art of teaching, United States history and civil government, and after September 1, 1884, in physiology and hygiene, with particular reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system.

### THE NEW HAMPSHIRE LAW.

And then, in addition to this, there was passed a law (the result of the same system of work) in New Hampshire, which reads as follows:

SECTION 3. That section 10 of chapter LXXXIX of the general laws be and is so amended as to read as follows: "The school committee may prescribe suitable rules and regulations for the attendance on, management, studies, classification, and discipline of the schools whenever they deem the same necessary: Provided, that physiology and hygiene, including special reference to the effects of alcoholic stimulants and narcotics upon the human system shall be prescribed in all schools sufficiently advanced, and said regulations and rules being recorded by the town clerk and a copy thereof given to the teachers and read in the schools, shall be binding upon scholars and teachers."

### TEMPERANCE AND TEACHERS'. INSTITUTES.

Thus we have now already ingrafted upon the system of public instruction of three States the teaching of the science of temperance. It works practically in this way: They sent me from Michigan the other day a syllabus prepared under the direction of the State superintendent of schools, for the consideration of every teachers' institute in the State. The syllabus begins with the question, in the first place, "What is alcohol?" Then comes a description of what alcohol is; how it is obtained; its genesis from the chemical standpoint; then its character when brought in contact with human tissues; then its results, and then, added to that, comes tobacco, and a long list of questions occupying more space than twice the space on the printed page which I now hold up before you; and every teachers' institute and every teachers' convention that meets in Michigan must consider that topic. Thus they are preparing their teachers to teach the science. In addition to that, every normal school in the State must teach this system, because the normal schools must teach what the law requires to be taught in the public schools

### TEMPERANCE DEPENDENT UPON KNOWLEDGE AND REASON.

Therefore we feel that we have set in motion a great and most intelligent force in these three States, making the sentiment of the people of those States intelligent, scientific sentiments, so far as temperance is concerned. Our thought is that just as long as the people believe that a little alcohol, at the worst, is harmless, they will drink it; and just as long as a little is drunk there will be more drinking, because it is one of the laws of vital chemistry that a little alcohol taken in contact with the human tissues creates this cumulative attraction for itself and calls for more. We feel, then, that, taking the children and giving them the drill of the school year after year, on this important subject, we shall get right back to the beginning of things and make intelligent total abstainers.

I think it was Mr. Gladstone that said that in any government of Anglo-Saxons there must be given a reason to convince the ordinary understanding and intelligence for whatever is done. Our thought is that our laws must begin, first, by fixing the habits of our people, and then they find their places easily among our statutes, and then you

Digitized by Google

have the whole body of State, municipal, and county officers for their enforcement. Very truthfully and justly did Senator Blair state to the national union of our society in Washington, that, to-day, the courts are against us; if we come in with a case of violation of prohibitory laws the judges are against us; the juries are against us, and the constables are against us; the whole machinery of the courts is against us, because these officers are more or less in the condition of the great majority of our people, and believe that a little alcohol is not very harmful, and they naturally would not be very strict in prohibiting the manufacture or sale of a beverage which is, as they believe, harmless if moderately used. We feel that our people must understand that alcohol is an outlaw, so far as the human body is concerned, and then they will themselves outlaw it. Because if otherwise—if men who know the right will not do the right, then the whole foundation on which our Government rests is weaker than sand, and will go to pieces—then men are not capable of self-government. It is the aim and purpose, therefore, of this department to teach all the people, through this system of public instruction, the real facts of vital chemistry in their relations to life.

We believe that in this way we shall reach the question of labor and capital, of poverty, of crime, and of the moral elevation of the people, and likewise solve, or help to solve, the problem now on trial in this nation: "Is man capable of self-government?"

Q. Do I understand that that comprises the scope of your special efforts in the organization, to endeavor to obtain the teaching of the scientific aspects of the alcohol question in its effects upon the human system?—A. Yes, sir; that is my special department.

Q. Have you gone any farther in any other of the States than those that you have mentioned?

NECESSITY OF ORGANIZATION IN TEMPERANCE WORK.

A. Through the efforts of our national society eleven States have petitioned their legislatures to enact these laws. The three States where a systematic canvass of the people has been made, namely, Michigan, Vermont, and New Hampshire, have passed the law. In the other States they have not done so yet. A gentleman—a State senator—once said to me that a petition from "Sally Jones and forty thousand more," if that is all there is to it, goes into the waste-basket, but where we added to the petition a canvass of the State we secured the law. Other States are moving along in this direction. We found that the matter of a thorough and complete organization of a State was very essential; and when I say "organization" I mean the organization of the Woman's Christian Temperance Union in every locality that sends a representative to the legislature. For instance, in the State of Pennsylvania the Woman's Christian Temperance Union think of petitioning the legislature which shall convene in 1885, and for that purpose they are now going into a thorough and complete organization of the State. Mrs. Burt will tell you all about New York State. We feel that to have a Woman's Christian Temperance Union in every place where there is a school-house, as well as where there is a church, will be a necessity, in view of securing such a law as this. Laws, unfortunately, do not enforce themselves in the United States; they depend upon the will of the people, and unless the people of a community want the law enforced we are very much afraid, even although the law is imperative and mandatory, that unless there is a Woman's Christian Temperance Union wherever there is a school-house the law might not be enforced.

## PRIZE ESSAYS ON TEMPERANCE.

Miss WILLARD. I would like to ask Mrs. Hunt to say a word about the prizes for essays and about the normal institutes.

The WITNESS. One of our great needs we found, as the work developed, was the want of educated teachers. They sent for me to go to Rhode Island the other day, and gave me an hour in which to show teachers how to teach the science of temperance. I felt as if they had asked me to come there and, in an hour, show them how to teach geometry or algebra when not one of the teachers had looked at a book. We must have the teachers taught.

All educators will tell you that the public-school system has no enemy like the saloon. You find by going into the manufacturing districts that the children are taken out of the public schools, put into factories and mines where child-labor can be used, and it is done largely to supply the need of the family, while the father, and perhaps the mother, sometimes, expend their money, and often the child's money, in drink; and educators seem to be realizing how helpful, as coadjutors, we may be to them; and, on the other hand, we feel the need of teachers who shall be abreast of the instructions required on this important subject of temperance. The president of the National Board of Instruction, Mr. Thomas Bicknell, of Boston, with a few friends of temperance, offered a set of prizes for the best essay on the various phases of the temperance question, to be given to the students of the normal schools throughout the country. Our Woman's Christian Temperance Union met together and appointed a committee, and decided what those topics should be, and prepared a list of text-books which might be consulted for information on the subject. For instance, we had one topic "The Saloon and the Village;" another, "The Saloon and Republican Institutions." Then we went over the whole scope of our temperance literature, and prepared a schedule showing the books which might advantageously be consulted for each topic. Then our Woman's Christian Temperance Union very largely throughout the country put these books into their normal-school libraries—books which gave the students the ability and opportunity to study the problem when they should be preparing their essays.

## TEMPERANCE WORK IN COLLEGES.

There has been a very large work done in the colleges in this connection also. We have felt very much the need of Christian men, men intelligent and instructed from the scientific standpoint, in places where we find educated men throughout the country. We want to see the day when our judges will not be against us, because they will know that alcohol is an enemy; and we want to see the day when our lawyers will be for us, and when our doctors, especially, will be for us. Therefore, we want to see the day when the men who are now going out into life will get scientific instruction in the principles of temperance. On that account I have visited the colleges very largely throughout the country. Eight colleges in Ohio have put into the regular course, in the form of lectures in connection with either chemistry or physiology, the scientific aspects of the temperance question. Many colleges in other States, as well as in Ohio, have already done this work as a result of our labors. There is one little incident in harmony with what Miss Willard has told you of the nature of our work and its force in breaking down barriers After I had spoken to an audience in the West on one occasion, a gen-

Digitized by Google

tleman told me that he was a Norwegian, and that there was in the vicinity a Lutheran college, in which Norwegians and Swedes were being educated. He asked me if I would go there and speak to the students. He said, "I do not know that I can get you a hearing, but I think I can." Such a thing was never known, he said, in the annals of the past, as a woman addressing a Lutheran theological assembly, whether of students or otherwise. Nevertheless, the next morning a carriage came around, and we went to address these students, who are being taught in their own language to become ministers to their people. Large numbers of Norwegians and Swedes are settling in the Northwest, in communities in which they have their own churches and speak their own language, so that it is necessary to have men prepared for the ministry through the medium of these colleges. We were very glad, indeed, of the opportunity to get a hearing there. The president of the college told me that if I spoke very slowly and deliberately the students could understand me, as they could understand English better than they could speak it. I have been told since that Dr. Richardson's Temperance Lesson Book had been in the hands of the pupils and lessons had been given there. We feel that we cannot overestimate the importance of reaching strategic points. In this way we will work out to the people, and so give to those who come to our country from foreign lands the benefit of our American ideas—ideas essential to the perpetuity of our Government.

## NUMERICAL STRENGTH OF THE WOMAN'S CHRISTIAN TEMPERANCE UNION.

Mr. CALL. What is the number of persons in your association in Massachusetts; how many women are there in it?

Miss WILLARD. There are about two hundred and fifty societies in that State; we estimate that they average perhaps about thirty to forty in a group, often, of course, several hundred, but thirty or forty would perhaps be an average. We consider that they are the flower of the churches, the most earnest and intelligent and practical of the different groups of women, and those in sympathy with them.

Mr. CALL. Do you think ten thousand women would cover the number in Massachusetts?

Miss WILLARD. I should judge so.

Mrs. HUNT. I regret that I am unable to answer the question more definitely.

Mr. CALL. That is quite sufficient; I only wanted to get an approximate idea.

Miss WILLARD. I understand that in Ohio there are five hundred local societies of the Woman's Christian Temperance Union; in Iowa there are four hundred. There are no better societies than those in Iowa, Illinois, and Ohio. They pay special attention to multiplying their local auxiliaries.

Mr. CALL. Have you any idea of the number of persons in each of these States who are associated with you in the work?

Miss WILLARD. I think that the State of Illinois hopes to report this year that they have eight thousand women, each of whom pays 50 cents, but every woman who pays 50 cents, and comes regularly to the meetings, represents two or three or four who come occasionally. Our women are much better at working than at reporting.

### EFFECTS OF SALOONS ON BOYS AND ON THEIR EDUCATION.

I may say in this connection that we have discovered one marvelous fact. Having been a teacher all my life until the year 1874 I should know something on this point, and have asked others; and I presume Mrs. Hunt has a larger experience than I. I have said to teachers, "What is the proportion of boys that graduate from the high schools. Tell me who get the salutatories and the valedictories?" I have been astonished to find that about two-thirds of the graduates from the high schools are girls. They say that the boys run up well until they get into the period of the second decade. But then the saloons and tobacco bring them temptations which the girls do not know anything about. A Michigan teacher told me that he could tell when one of his bright boys began to smoke, from the way in which his lessons were recited—but then I was not going to bring smoking in here; we do not make a specialty of that. When a reformed man has come to me to sign a pledge against tobacco, I have given him an opportunity to sign it; and I have had a very fine collection of meerschaums and pretty boxes that they put cigars into—a wholesale collection of smoking implements. Most of the men who come into our society to give up rum also give up tobacco.

### TEMPERANCE PRIZE ESSAYS IN CALIFORNIA.

I would like to add, in connection with the subject of essays, that in San Francisco 23,000 boys and girls have been reached by our method of written essays on the effects of liquor—in order to get prizes of some $1,500, divided into separate amounts, given by Dr. R. H. Macdonald, the president of the Pacific Bank in San Francisco, the wealthiest man I know of who is helping in the cause, and he is helping greatly. We have found that that is a grand way to help us. The children go home and talk about the matter to their parents and keep talking of it constantly while a prize is before them. Where the lambs go the flocks will follow. There was a grand looking up of leaflets and information. The ladies who keep our offices in San Francisco say that the children came there in processions for leaflets and facts.

### NON-PARTISAN CHARACTER OF THE WOMAN'S CHRISTIAN TEMPERANCE UNION.

May I also say, for fear I should forget it—although it is irrelevant to this matter—it would not be just fair to those whom we represent to leave any false impression in the mind of any gentleman, either of the committee or of that mightier audience, the press, as to the entirely non-partisan character of the Woman's Christian Temperance Union. When I was in Texas, word was sent throughout the State by the saloon men that I was a paid emissary of the Republican party. I had visited some sixteen county seats in that State, and, I hope, stirred up a good deal of enthusiasm. But, as for pay, the fact was, I did not take anything for my services, and the saloon men could not understand that. I had laid up some money from lecturing in the Northern States. In other States I had some aid, but in that case it was my own money that took me there. To the great credit of our Democratic fellow-citizens, when the temperance convention was held they sent forth no uncertain sound in my defense, for the resolutions they passed stated that I was no emissary of any party except of all parties who would aid in procur-

Digitized by Google

ing temperance legislation. Wherever the banner of temperance is, there will be found members of the Woman's Christian Temperance Union—whatever the name of the party may be.

### TOBACCO: ITS RELATION TO TEMPERANCE.

Mrs. HUNT. Speaking of this question of tobacco, I was impressed when we came before educational committees in the legislatures in the three States where we had these laws enacted, that the gentlemen were not willing that the bills should be so framed as to exclude tobacco. I had not really the courage to suggest that we should add narcotics, or tobacco. But, in every instance, they insisted upon adding tobacco, showing how we are getting along in aid of public sentiment.

### CIDER AS A STIMULANT.

Something that Miss Willard has said has suggested to me another thing. While the canvass was pending in Michigan the gentleman who was connected with one of the large schools in one of the large cities of Michigan, said, with regard to the working of the law in the schools, "I had a large class in physiology and was giving your lecture on the action of alcohol in its influence on the brain and its effect in benumbing the power of the will, &c. One of the students raised her hand and said, 'If you please, sir, I can't believe that there is anything of that bad poisonous stuff in the cider we drink at home.'" Said the Professor to me, "I was as much in doubt as she. I did not know how it would come out, but I told her to bring some of the cider and we would see. She brought two quarts of the cider, and we took it down to the laboratory, and from that cider we distilled eight per cent. of alcohol that would burn when we applied a match to it." "And," said he, "I never saw any lesson given to a class which made so profound an impression as that lesson did on that class." Then he said, "I went on to explain the action of alcohol on the brain substantially as I found it explained in the text-book, and in the course of the experiment I brought in two leeches, and put one of the leeches into the alcohol which had been distilled from the cider, and put the other of the leeches in the water, and I showed them they could see for themselves that the one in the water remained alive, while the leech in the alcohol curled up and died." There is one illustration of how thoroughly such lessons can be brought home to the intellect and understanding, and so to the consciences of children. I met a gentleman a short time since who said to me, "You are doing a wonderful work in the way of temperance. Our boy," said he, "comes home and tells us all about the percentages of alcohol in beer, in wine, &c. We had been having beer for dinner, but our boy coming home and talking to us constantly about this perc ntage of alcohol, and telling how it operates upon the brain and nerves, has revolutionized our home."

### ALCOHOL A FOOD OR A POISON?

The CHAIRMAN. Please state what you teach as the scientific fact with regard to the nature of alcohol and its operation on the human system—is it that of a poison or of a food?

The WITNESS. Well, sir, we feel that the burden of proof is with the scientists who declare that it is a food. There are persons who claim that it is a food, but claiming a thing as true is not proving its truth. Such men as Dr. Richardson, of England, and other men of that stamp,

Digitized by Google

declare alcohol not to be a food, and while specifically, in the new text-books that are being prepared, we shall perhaps not say that it is not a food—just as you would not throw a cannon ball at a man's head if you wanted to convert him—if you could you could persuade him—we shall state its action on the tissues. Alcohol has been declared a poison, and ranked as a poison by the dispensatories that are used by our apothecaries for the last fifteen or twenty years. The very word "intoxication" means poison. We teach the action of alcohol—just simply what we find under examination by the microscope—the action of alcohol on the blood corpuscles. We teach what we would find in the skull if it should be opened and the alcoholized brain should be developed—we teach simply what we see there, the plain researches and results of science. If the gentlemen of the committee will excuse me, I would not like to declare here, because I know it is such a mooted question——

The CHAIRMAN. I only ask what teaching you incorporate in your books.

Mrs. HUNT. Well, sir, we teach nothing except proven science. We teach no debatable points; but one must put it so carefully that one feels a little anxious, if it is going to be reported, just how it is going to be put before the people. There is exact science on the question and it is that alcohol is a poison; it is not in favor of alcohol as a food or as a benefit or aid to digestion, but rather the other way.

### ATTITUDE OF THE TEMPERANCE ORGANIZATION TOWARD SALOON KEEPERS.

Miss WILLARD. The remark of Mrs. Hunt that we do not wish to "throw cannon balls" at a man's head when we want to bring him over to our side, is a very salient way of putting the general spirit of our Union. We try not to invade what may be called debatable ground. We do not bring up mooted points as to different kinds of wine, and as to the interpretation of the word in the Bible, and as to this matter of which Mrs. Hunt has spoken. We have quite enough ground to stand on without antagonizing people. We do not even criticise the men engaged in the liquor traffic. We criticise their traffic, but say nothing harmful of them as men. And I desire it understood, on behalf of the Woman's Christian Temperance Union, that whatever faults we may have, or whatever errors we may have committed, we believe that the kindly attitude that is assumed by our society toward those of the opposition is something worthy of note, because we believe in the golden rule, and that the soft answer turneth away wrath. Therefore, when we are reviled we revile not again; it is not the theory of the alcoholic question that we care for so long as we have the practical result of our ideal.

In Des Moines, Iowa, one of our ladies spoke in the opera house two nights before the amendment of two years ago was voted on. Seven saloon keepers were present at the polls upon voting day, and voted an open ballot for prohibition. The judges of election were surprised and said that it was never known among their people that a man should vote against his own business, and asked the saloon keepers how they came to do it. The spokesman of the saloon keepers said that they had done it because the women didn't abuse them. They said, "We went to hear their lecturer, and we supposed she would say that each one of us should be strung up on a separate telegraph pole, but she said nothing of the kind; she said nothing harsh of us at all." The lady speaker had said that she had first assessed herself heavily for not aid-

Digitized by Google

ing in the work of temperance in the past; and she even confessed that she had once been a partaker of wine herself. She then went on to say that those who got their bread and butter out of the business did not see the harm of it as others did; and she put the matter to the people in such way that all could see she had no ill-will against these men, and that her point of attack was traffic. So she did not create animosity. I merely mention that as an instance of the effect of what I might call the "rising circumflex" instead of the downward inflexion of harshness. We use no expressions of personal opprobrium—as all can testify who have been to our meetings—even the saloon keepers themselves. When I had spoken in Cheyenne, Wyo., a rough looking man came up to me and said, "I suppose nobody wants to introduce me, but I just want to shake hands with you and to say that I hope you will live to be old and gray, and that you will do good in the temperance work. I say this to you although I am a saloon keeper myself." He went out before I had a chance to tell him how glad I was to hear him say that.

We have had many interpretations of the initials of our name—"W. C. T. U." Some people believe that it means, "We've come to unite;" others say that it means, "We've come to upset;" and a saloon keeper himself said that it means, "We'll see to you;" but we say for ourselves that it simply means, "Woman's Christian Temperance Union."

To the reformed men of that State, who struck a blow for their own freedom, the Woman's Christian Temperance Union said, "We promise you our continued prayers that you may have strength to persevere in the noble step which you have taken;" and to the men whose business was declared illegal they said, "We assure you that we have no unkind word for you, no unkind thought of you, and if you will go into some other business that will not harm society, nobody will more gladly patronize you than we." That announcement was sent broadcast by means of the Associated Press dispatches, and it was the spirit that actuated the ladies through all their work.

Our friend, Mrs. Burt, is a member of the Episcopal Church, and a daughter of an Episcopal minister, representing a very conservative form of thought, and I am sure the committee will be glad to hear her. She is the president of the Woman's Christian Temperance Union of the State of New York, and has been with us from the beginning. She was a national officer, as secretary, for years, and was also at one time the editor, and at another time the publisher, of our national organ.

---

NEW YORK, *Tuesday, October* 2, 1883.

Mrs. MARY BURT examined.

By Mr. PUGH:

Question. Where do you reside?—Answer. In Brooklyn, N. Y.

Q. Please state your relation to the temperance movement, or any facts or suggestions you deem proper to give to the committee. Just begin and state it in your own way, and without interrogation.—A. You ask me to begin, and I always go a good way back in my beginning. I go back to the very first meeting of our National Woman's Christian Temperance Union in 1874—though Miss Willard perhaps has gone over that—the first meeting of the Christian women of this country in behalf of temperance. We met at Cleveland. Miss Willard had at that time just resigned her position as dean of the Woman's College and professor

Digitized by Google

in the Northwestern University at Evanston, one of the suburbs of Chicago. And whenever I think of that, I think of Cowper's line—

God is His own interpreter, and He shall make it plain.

And how plain He has made the bringing together of those women at that time—how plain God's purpose was, and how plainly it was shown to us! I cannot help thinking of that when I think of those women who met there, and of the work which they have been able to do, and the manner in which they have been able to do it—the manner in which they have been able to influence not only communities and churches, but even the legislatures of States.

### THE WOMAN'S CHRISTIAN TEMPERANCE UNION IN NEW YORK.

In New York we organized as a State union in 1874. About one hundred and fifty women met in a church in Syracuse and organized a State society. We had then in the State about twenty local unions, and our work has grown to such an extent that to-day we have about two hundred and fifty local unions. We have organizations in forty-three of the sixty counties, and in those forty-three counties we have seventeen thoroughly organized auxiliary county unions. We have, in the State, eighty juvenile temperance organizations—bands of hope, legions of honor and juvenile unions and temperance schools—with a membership, all told, of thirteen thousand children, and these children are all being trained and taught the truths of total abstinence, and also, many of them—the majority I may say—the nature and effects of alcohol on the system. About two years ago I was down in Allegany County and was surprised at a meeting there to see that a young lady had arranged, upon the platform, Sewell's Charts, and she came forward and delivered a little lecture for about half an hour, on the scientific phase of the question. That is one way in which our children are being taught. We have in the State union fifteen departments and two standing committees. We have our scientific instruction department, of which Miss Greenwood, of Brooklyn, is chairman. During the past year Miss Greenwood has addressed a number of the State normal schools—the faculty and students—by request of the committee, and asked for the introduction of scientific temperance text-books into the regular course of study in these schools. At all of them she was most cordially received, and resolutions expressive of approval of her work and of the idea were passed.

In our juvenile work and in the Sunday school work which is being carried on in many of the churches, temperance lessons are given there. Then we have a temperance literature, Miss Colman being at the head of that department in the national union, with her headquarters in the Bible House in this city. Her work is allied with both the national and State unions, and is largely also, in connection with local unions, preparing leaflets and pamphlets for their study, and for the work of the society in general. Then we have our committee on unfermented wine. This work has been very satisfactory in the country parts. Some of the churches are now using unfermented wine.

### PROHIBITION IN THE CONSTITUTION.

We have a legislative committee also. That committee has been asking for a constitutional amendment requiring that the manufacture and sale of liquor as a beverage shall be prohibited in the State of New

Digitized by Google

York. We secured to that petition, during the last year, eighteen thousand signatures, and the committee took it to Albany and presented it before the judiciary committee of the house, of which Judge Poucher is chairman. To show you the drift of opinion in the State, I will mention that a year ago a petition of the same nature was taken to Albany, but it was impossible for our committee to get a hearing from any committee of the house. This last year, however, we were granted a most courteous hearing by one of the principal committees of the house, the judiciary committee. What we asked for before this committee was, that this resolution asking that an amendment be submitted to the people of the State, should be reported favorably by the judiciary committee of the house. Immediately after we left the room, as I understood next morning, five members of that committee voted for presenting it favorably and three members of the committee refused to vote at all. I understand that this action of the three was in direct violation of the rules of the house, as it required six to make a quorum. It was brought up, however, afterward in the house, but was defeated. It was reported by the senate committee also, there being two reports with regard to it.

During the past year our finances have been more encouraging. Before our last convention the State of New York had paid more money into the treasury during the past year than in any preceding year, and more was paid out. That, of course, is satisfactory, for we want to pay out our money as we get it in, to keep the work going.

We have our young women's work in our State union just as they have it in the national union, and we have our press department, and, at the last convention, we added the departments of heredity, hygiene, soldiers, and sailors.

### PHYSICIANS AND THE TEMPERANCE PROBLEM.

We have, also, a department for influencing physicians not to prescribe alcoholics. The last I consider of great importance. We send out our petitions to ministers not to use alcoholic wine at the communion table, and all know that physicians, too, have a very important relation to temperance, because of the great danger which must lie in the prescribing, by physicians, of stimulants, as medicine, especially for young men. I know in my own experience of a case in which a physician told a young man that he must drink a certain quantity of Bourbon whisky every day. He had been brought up in the most strict temperance principles, and he refused to take it; he said it would be impossible for him to drink it. That young man had been so carefully guarded all his life that he was able to withstand this order of his physician, but there are others who have not had the same safeguards placed around them, and I consider that this department is most important in its relation to the young.

By the CHAIRMAN:

Q. How did this young man get on who disregarded the prescription?—A. He took something else. The whisky had been prescribed for debility, and when he refused to take it something else was prescribed for him, and he recovered his health without the use of the whisky. Wine and liquors have been prescribed in many families where I have known the prescription to be disregarded, and requests have been made that something else be prescribed instead—some other remedy to be used instead of the liquor.

Digitized by Google

### TENTH ANNUAL MEETING OF THE NEW YORK WOMAN'S CHRISTIAN TEMPERANCE UNION.

I should like to say something of our last meeting. We have just had our tenth annual meeting at Poughkeepsie. There were present one hundred and thirty delegates; it was one of the lagrest and most enthusiastic meetings that we have ever had, and the interest displayed in it shows plainly the growth of our work and how it is taking hold of the Christian women of the State. This convention was held in the eärstern portion of our State. You know how large the territory of our State is. Its population equals one-tenth of that of the whole United States, and it is equal to the population of Canada. In the cities of Brooklyn and New York alone I think the population is equal to more than one-third of the whole State of New York. So when we hold a convention it requires a day, and sometimes longer, to go the whole length of the State. In the eastern part we get, largely, the eastern ladies interested in the work, and in the western part the western ladies. At this convention, held in the east, we had a large number of our eastern ladies, and I do not know where we could find a church that could accommodate us if our ladies were fully represented.

### COMPULSORY TEMPERANCE EDUCATION.

With regard to Mrs. Hunt's line of work, which I consider very important indeed, we passed resolutions at the last meeting indorsing the national plan, and resolutions of co-operation with Mrs. Hunt in this line of work, and we also resolved to petition the legislature of the State of New York during this coming winter for the same sort of bill that she has spoken of—the compulsory temperance education bill. In the county of Monroe they tell me that these scientific temperance text-books are largely used in the schools, owing to the petitions of our unions. The counties of Allegany, Chautauqua, Monroe, Westchester, and Dutchess are the best organized counties. In some of these counties we have a Woman's Temperance Union in almost every township. We have also appointed organizers to cover the fourteen or fifteen counties of the State which have no unions, and during this coming year we shall endeavor to effect organizations there. Where there are two or three unions in a county we shall endeavor to form a county union. And where there are no unions we shall endeavor to organize unions. In this way we shall endeavor to create a net-work of unions all over our State. It is only through those local unions that the State can make itself felt in these different communities so that we can bring the plans of the national and State unions before the people for consideration and action. When a local union is once organized, we simply lay before them our plan, and they have their different departments to carry on the work. It is through these local unions that we secure petitions, and there is where we can get our power in organizing the State, and bringing in the hundreds of thousands in the State of New York who are simply waiting for the call.

We have resolved, as I have said, to petition the legislature of the State this coming winter for this compulsory temperance education bill, and to co-operate with Mrs. Hunt, and we have also resolved to establish a State paper, and have appointed organizers for the purpose. It will be a small paper, but it will be something that will go out to our local unions and our women generally, and bring before them our plans and suggestions for work, and will be a medium of communication for

Digitized by Google

them also, in which they may ask questions and through which the officers can correspond with the local unions. The petition to the legislature for a compulsory temperance education bill is as follows: "Believing that prevention through the education of the people is the antidote for the vice of intemperance, we, the undersigned citizens, respectfully petition our legislature now in session to enact laws requiring instruction in physiology and hygiene which shall give special prominence to the effects of alcoholic drinks, stimulants, and narcotics upon the human system, given in all schools supported by public money or under State control." That is the work which we shall take up in our State during the coming winter, and we shall petition our legislature for this law which has been enacted in three other States of the Union.

Q. Does that complete your statement on that subject?—A. Yes, sir; I think it does.

DOES PROHIBITION PROHIBIT.

The CHAIRMAN. I have here a telegram which I will read:

PORTLAND, ME., *October* 2, 1883.

To Miss FRANCIS E. WILLARD or Senator BLAIR,
*Room* 100, *Post-Office Building, New York:*

In Maine prohibition does prohibit. It is accepted as the settled policy of the State. There is no organized or well-considered opposition to it. The interests of the State and people have been greatly promoted by it. Crime, illiteracy, and pauperism are less than in any other State in proportion to population.

L. M. N. STEVENS,
*President Maine Woman's Christian Temperance Union.*

Miss WILLARD. It would be a favor to us if that could be printed in the papers. Mrs. Stevens is a constant worker for temperance in every form, and is a most competent witness, being a native of the State of Maine. I had hoped she would be able to meet us here, but she could not be here owing to her duties in the convention.

The CHAIRMAN. The telegram is already incorporated in the proceedings of the committee, by the official stenographer, and the gentlemen of the press can take it and make such disposition of it as they see fit.

Miss WILLARD. Mrs. Alford is the secretary of our scientific department, and also secretary of the Hayes memorial committee, which has placed a portrait of Mrs. Hayes in the White House.

---

NEW YORK, *Tuesday, October* 2, 1883.

Mrs. C. CORNELIA ALFORD examined.

By the CHAIRMAN:

Question. Please make such statement on this subject to the committee as you think proper.—Answer. I have been connected, as Miss Willard has said, with the national work, as Secretary of the Department of Scientific Instruction, for the last four years, and I think I am more interested in that line of work than any other; but as that has been so well developed by the other ladies who have spoken of it, I will not enlarge upon it, especially as Miss Willard has suggested my speaking of the Police work in Brooklyn. That is a local work, but, as it is such a need as has been felt in many places, I would like to speak of it so that it might be brought to the mind of the public, and in that way more good be accomplished.

Digitized by Google

NEED OF POLICE MATRONS IN CITIES.

The work I refer to is that of establishing a Police Matron in each of our cities. It is an entirely missionary work. At the beginning of the work, quite a misunderstanding arose owing to the fact that, just at the inception of it in Brooklyn, a bill was presented to the legislature by some women of the State of New York—I think they were called the Woman's Suffrage Society, though I am not positive about the society that presented it—but a bill was presented to our legislature, asking for the appointment of a Police Matron, their idea being that a woman should be stationed in every police station of the cities of New York and Brooklyn, who should care for the women who might be brought there as prisoners. That was not our idea at all. Our idea was that of putting a Police Matron in the field who should stay in her own home, but who should go at any time when she was needed to the police stations, and who should go every day to the police courts and be there on the arrival of the prisoners from the various police stations, single them out, talk with them, and especially talk with the younger members among them—young girls who perhaps would be arrested for the first time, and who, if a kindly hand were extended to them and they were saved from the disgrace of being sent to jail, might be reformed and saved for a better life. That was the idea with us—that this woman should do this kind of work. And the Union of which I am a member in Brooklyn, the Woman's Christian Temperance Union on the Hill, began with one woman as a Police Matron. We have never had any more than that, although we should have been glad to have one for every police court. We have four courts in Brooklyn, and a woman is really needed for each. But the hindrance to our doing that is just the hindrance to our doing a great deal of work; that is, the need of money. Of course, we could not get a woman to do this work unless we should pay her a salary. And, as has been stated, all our money is gathered by voluntery contributions. It was a very pertinent thought, that of saving these women from their probable future and caring for them, and that the city should bear a part of the burden, but they were not willing to do this. While Mayor Low and Commissioner Jourdan and others in charge were very kind indeed and gave the matron an official appointment, which enabled her to reach the points desired, and also gave her the protection and aid of the police in carrying out her work, still they were not willing to put on the city the burden of the salary of this matron. So the society has supported her during the last few months.

Q. That is, doing police work for the city of Brooklyn at the expense of your Society?—A. Yes; but I find that that is what we are doing all the time in this temperance work. The city and State and National Government receive a revenue from the liquor dealers for the privilege of selling liquor to the people, but really that involves the privilege also of making criminals and paupers and bringing destitution to families. Then it is the Christian people of every community who take up and care for those people who are thus thrown on the community. The people who do not patronize the liquor saloons—the people who are opposed to them—are largely the people who take care of the results of the liquor saloons, and not the Government itself. Of course that is not a correct statement in all its breadth, because the Government does provide jails for the support of the criminals, and, to some extent, it cares for the paupers, and those who are made insane through drink. But it does all this by taxing the people. Besides this, when one member goes out of a family into the jail or penitentiary, or the insane

Digitized by Google

asylum, or the almshouse, the other members of the family are very often left without means to provide for their support—their natural supporter being taken away from them; and then it is the charity of Christian people that it is necessary to invoke, in order to take care of the fruits of the liquor business.

In doing this missionary work of the Police Matron, therefore, we are only doing a little part of the great work which is constantly being done in our orphan asylums and all our great benevolent institutions. I suppose the truth is that we would not have the need for one-quarter of them, perhaps not for one-tenth of them, if it were not for the saloon back of them; and so when we reflect on these things, we have to go back to the cause and realize that we are constantly taking care of the fruits of the liquor traffic.

As I have said, it was in March, 1882, that we inaugurated this work, and a Police Matron was appointed by Mayor Low and Commissioner Jourdan. She went immediately through the courts, visiting them all occasionally, but making her principal line of work in Judge Bergen's court, on the corner of Court street and Butler street, I think, and in Judge Walsh's court, under the City Hall—those two being the courts in which the greatest number of prisoners are brought up. The lady whom we have for Police Matron is Mrs. Crocker. She came to us from Portland, Me., and is especially fitted for the work she has undertaken. She is about sixty years of age, with gray hair, and a beautiful, pleasant face, and so kindly in her bearings that she has never aroused the least enmity in anybody, so far as we have ever heard. She has won the respect of all the officers of the court and of the judges and policemen as she has been going around in her good work. And she has won the love, I guess, of every woman that she has spoken to. She does not go to them and talk to them harshly about their sin or downfall, but speaks to them as one Christian woman should speak to another woman, of the love of Christ, and His willingness to save them even from the lives of sin in which they may have entered. So she has gone about up and down those city streets, doing her work, month after month. When Mrs. Crocker went away on her vacation this summer, Judge Bergen told me that he did not know what he should do without her, because in all cases where he was afraid he did not hear both sides, and that possibly enmity or personal feeling had induced some charge against some woman, which ought to be further investigated, he had got into the habit of suspending the case for a day, putting it in Mrs. Crocker's hands, and letting her make the necessary inquiries and come back the next day and report to him. He has told me that whatever Mrs. Crocker said was best to be done with a women he always did. We did not take hold of the old people—the "rounders" as we would call them. There are some women arrested in Brooklpn almost every ten days. They come out of jail at the end of that time and are again arrested before night, and go back to jail. We do not spend our efforts on them, although we have a kind word for them, but we try to prevent the younger ones from becoming hardened criminals.

### NEED OF STATE REFORMATORIES FOR WOMEN.

One great difficulty we have found in this work is the want of a place in which to put these women. A great many of them have no homes. Many of them when released from imprisonment and sent out into the world have no place to go to, except to go back among their old associates. There is no place that I know of in the State of New York founded

Digitized by Google

especially for the reforming of women—no State reformatory. A bill has passed our legislature, as I am informed, which provides that such a reformatory shall be established in the State of New York. At Hudson, a town on the Hudson River, a site has been selected for such an institution, and some preparatory steps have been taken, but the building is not yet erected, and we have no place in Brooklyn, except a voluntary place gotton up by a little band of christain women, who have organized themselves into a society and called their home the "Wayside Home." Their intention was to offer a place where women who had been arrested and had led a life of vice, and who wished to be reformed, could be received and brought back into better ways. But it was very limited in its capacity and could hold only thirty-five inmates, I think. So we were constantly restricted in our efforts to help to reform these women by the difficulty of finding places for them. We could not expect them to be taken into private homes until they had been tested as to there desire to lead a better life.

Q. Is there any other topic which you would like to suggest?—A. I do not think of any at present, thank you.

Miss WILLARD. The next lady whom we have in our delegation is Mrs. Barnes, who is the National Superintendent of work among the young ladies—active temperance work in various lines. She has been living some years in New York, and spending her entire time in this work.

---

NEW YORK, *October* 2, 1883.

Mrs. FRANCES J. BARNES examined.

YOUNG LADIES' WORK FOR TEMPERANCE.

Mr. CALL. You may make such statement to the committee as you desire.

The WITNESS. I will state then, that this department of the National Temperance Work was formed some years after the efforts in Gospel Temperance lines were undertaken. It was the outgrowth of our experience in the Gospel Temperance meetings, after learning the stories of the ship-wrecked lives of so many young men, who came to Chicago, which was then my home, and where I was working in connection with Miss Willard. We found that many of these young men came not only from the better classes, but were educated men, and that among them were graduates of our colleges, some of them holding good positions and some occupying menial positions, such as those of street-car drivers and conductors. There were numerous cases brought to our attention of young men who had been ruined through drink, and we concluded to organize among our young women a department which would influence social life. In our work with the little children of course we are doing a good deal, and we have their mothers with us, but with the young women already grown it is different, and we thought that we must use all the ammunition that we could find. This department was accordingly organized, following in harmony with the other plans of the Woman's Christian Temperance Union. State Superintendents were appointed and also County and District Superintendents, and nearly all the States that have been organized have now a Superintendent in this department of work.

The reports that have come in to us for the past few years are of the

Digitized by Google

most encouraging character, showing that the young women are the connecting link between the children and the older women who have led the way. That which seems most suitable for young ladies' work is the influence which they may bring to bear in the home and in society, and, next to that, the advantages which come from their studying and disseminating temperance knowledge and working for the children.

### TEMPERANCE SOCIABLES.

The young ladies have inaugurated temperance sociables where, as Miss Gordon has said, young ladies may have a good time and yet aid the cause of temperance. We have an autograph album for the signatures of those who at a public meeting will not take a pledge, and to whom it may not be necessary, but who, for the sake of influence and example, through a gentle word from some lady friend, will give their signatures and become honorary members of our society. In that way we reach some people who are not much inclined to go to temperance meetings, but who, through the social influence of their young lady friends, and their sisters, may begin to open their eyes to the importance of this question, and not only consider it from the standpoint of home and of future happiness, as well as personal character and physical constitution and well-being, but may get a broader outlook upon life, and see the governing necessity of having a home that shall send out its influence into society. These sociables are held by the young ladies' societies throughout the country, and have become quite a power.

### TOPICAL STUDIES OF TEMPERANCE.

In the line of meetings for topical studies, we have found from the experience of our older sisters, that our young ladies know very little on the subject of temperance as a study. We all have found really, as we began to study it, how little we knew as to how seriously many of the brightest minds of the country have been affected by intemperance, not only statesmen, but poets and men of literary ability. So we said that we would have our meetings for topical study, and such meetings have been held in all large cities, and many rural districts and smaller towns, under the care and supervision of the young women.

### TEMPERANCE WORK AMONG CHILDREN.

Then came the work among the children in the various departments, of which the other ladies have spoken, especially the work of which Miss Gordon has spoken. "Blue Ribbon Societies," and societies of "Cadets of Temperance," as well as Kitchen Garden Societies have been organized. The Kitchen Garden idea we consider closely related to temperance. I have heard of an instance of the influence of the Kitchen Garden as an aid to temperance. A little girl who attended a Kitchen Garden School in Yonkers has been the means of reforming her drunken father, because of the improvement in the home work, resulting from her instruction in the Kitchen Garden. He said that his home had been entirely changed by reason of his little girl's knowledge of cooking and housekeeping, and her influence generally upon the work of the home. Besides these societies that I have mentioned we have the "Loyal Legion" for boys. The Legion in this city was the outcome of one boy signing the pledge and getting his mates to say that they wanted to hear something about temperance. A little parlor meeting was arranged, which was attended by the boys living upon Fifth avenue and Murray Hill, some

Digitized by Google

of the brightest boys in New York. They were told of the work of the Crusade, and how numbers of boys and girls were taking part in it. At this meeting we had refreshments and, as we thought we would like to know whether they were influenced by the "loaves and fishes," we had another meeting without refreshments and found that they were just as much interested. They chose the name of the "The Loyal Legion." They have held their meetings in the parlors of the better educated class and perhaps the wealthier portions of society. We have had such men as Dr. John Hall, of this city, to address the boys, besides Miss Willard, Mrs. Hunt, &c. These meetings have become very interesting. Our object is not only to give an idea of education in temperance, but our idea is to develop as much enthusiam as possible in the cause, so that they may grow up to the total abstainers. Of course they have their Sabbath schools and church connections, and these do a great deal of good for temperance, but special temperance education is exceedingly necessary to boys growing up in such a city as this, and we therefore try to make the meetings as interesting for them as possible. One of the first achievements of the Loyal Legion was the erection of an ice-water fountain, to be placed in one of the most thickly populated portions of this city. That was a year ago. They collected money for it and erected the fountain on Grand street, near Center Market Place, and during the last summer and the summer before it gave our cup of cold water to the thirsty, dusty crowds of that neighborhood. People would come to this fountain and take away ice-water, not only in cups but in pails. Some of the boys of that neighborhood said it was "Protestant Temperance water," but finally, by getting a man to stand on the corner and sell fruit we were enabled to keep the place in good order and to keep the boys from molesting it. That is one of the ways in which the Loyal Legion shows its idea of the "relation of capital to labor."

### FREE READING-ROOMS FOR BOYS.

We next said that for the benefit of other boys we would establish a free reading-room, and this we have done at No. 16 East 14th street—uniting our money for the purpose with that of the National Woman's Christian Temperance Union; we took a floor, through, between Fifth Avenue and University Place, where every night are gathered the boys who are employed through the day. There have been at least twenty-five hundred boys in attendance during the summer evenings since June, and we have four hundred boys on our list. They are boys that work at Lord & Taylor's, Arnold & Constable's, and some of our best stores, and also in manufactories of various kinds. Some of them are boys whose fathers keep saloons. They are not all pledged boys, but they come for the benefit of the reading-room. Our highest compliment is received from the police force, who say that our place, with its bright lights and pleasant surroundings, is a counter attraction to places elsewhere, and is a great benefit to boys who need facilities for improving their mind. This institution has been really a benefaction. The night we opened our reading-room, it would seem as though if we had a dozen such places in New York City they would have been well filled. We have already exceeded our facilities and are praying and hoping for better quarters. We really need a whole building.

### PARLOR MEETINGS FOR TEMPERANCE.

We shall begin our parlor meetings again soon, in New York. I mention these matters to show you what the young women are doing in this

Digitized by Google

city, and especially to show that they are doing something for the children, particularly for the boys who are tempted, and the working boys who have had no opportunity of finishing their education. The reports that are coming in, of the young ladies' work, have so outgrown those of last year that we are obliged to make the work one of statistics. Where young ladies have not formed societies, they are working with the older unions, doing a portion of the work as members of committees, &c. Miss Willard and Miss Gordon, in traveling through the South, have interested very many young ladies in the work, in the various States and Territories. I have nothing further to say with regard to the young women's work. But Miss Willard alluded to the work of the Woman's Christian Temperance Home, answering or corresponding to the work of the Christian Home for Men, of which Mr. Bunting is in charge. It meets the same want that that does. At this Home, which was only opened last spring, there have been a number of inmates. When I went away in the spring, I think there were six; since I have returned I have not visited it. This is for a class of women who can pay board; without such a place there would be no place for them to go to but to the Island. Many of these cases of intemperance among ladies have been caused by the prescription, perhaps, of physicians or by the dissipation of social life, and some women have, as one might say, become educated to intemperance. Through the kindness of Mr. William E. Dodge and his wife this Home has been opened, and it has been occupied through the summer, and has shown very favorable results.

The great need now in this city is a "Rehoboth," where the women who come from the Island may be taken and protected. We hope it will come. It is a great need.

In the line of social effort it seems to us that a good deal is being done; and, to go into details, or to give incidents of our work, would take too much time. There is so much that each one of us could say that it would make a long account. But there is great need, of course, for the exercise of social effort in the creation of a sentiment favorable to temperance. As I represent the Society of Friends, or Quakers, I might say that we are doing our best in that direction, and might quote, in conclusion, a line from the Quaker poet: "If woman lost us Eden, she can alone restore it."

By Mr. CALL:

Q. Does that present all the points that you desired to make?—A. I think that covers the general ground, yes, unless there are any other questions that you desire to ask.

Q. Can you state the number of women that have been engaged in this association you mention?—A. I cannot give the exact number—I suppose you mean the Women's Christian Temperance Home. I might say that of young ladies that work all over the country, we have, I should think, about five thousand actively engaged.

In our Loyal Legion Temperance Society we have only a handful of forty boys, but their work is far beyond their numbers.

Q. You have five thousand doing what?—A. Members of distinctively "Young Woman's Christian Temperance Unions." All of our "Young Woman's Christian Temperance Unions" are auxiliary to the State and National Society.

Q. They confine themselves to the species of work you have been speaking of?—A. Yes.

Miss. WILLARD. The Woman's Temperance Home in this city is a very fine establishment, and well patronized; I think its capacity is constantly taxed. The Young Woman's Branch, is a new one.

Digitized by Google

Mr. CALL. Is the building owned by them?

Mrs. BARNES. It is owned by an association of ladies. It was bought by Mr. Dodge, and given to them. The inception of this work was by the local society of the Woman's Christian Temperance Union—not the "Young Ladies' Union," but the other.

Miss. WILLARD. I believe it is the custom with women, when they have finished a seam, to put in an extra stitch or two; so I will, with the kind permission of the committee, say a word or two in closing.

### WATER FOUNTAINS IN CITIES, AS AIDS TO TEMPERANCE.

I desire to say, first, that we have made the erection of fountains in large cities a specialty. Mrs. Dr. Gordon, of Boston, has told me that they put up an elegant fountain there this year. I have heard of similar instances in the Western cities. I want to emphasize the question, "Is there any trade or occupation of men in this city or elsewhere, except the liquor traffic, which would overthrow a cold-water fountain for man and beast?" The liquor-traffic people have made our fountains in some instances nugatory by destroying the pipes and taking away the cups. They do all they can to upset the work of the cold-water fountains. They say it hurts their business—and I suppose it does.

### KINDERGARTEN EDUCATION.

With regard to the oblique line in temperance work, I may say that we have also interwoven the kindergarten with our work, seeking by kindergarten methods and by gymnastics, diagrams, illustrations, &c., to bring the children under the influence of temperance work. In Chicago, through the influence of Robert Fowler, a rich pork-packer there, we have been enabled to have a large number of children—I think about two thousand—in beautiful rooms, fitted up with toys and kindergarten furniture. That is an outgrowth of our work in Illinois.

### POLICE MATRONS IN CITIES.

We have police matrons in Chicago, Portland, Providence, Brooklyn, and the ladies are making an effort to introduce them here. My only brother was a journalist, and I have an opinion that that guild is humanitarian; so I would like the gentlemen of the press, if they please, to speak a word in favor of police matrons in the courts of New York City. In Chicago, our mayor and council vote as much from the city funds as may be necessary to support these police matrons, and we have them in the four courts of that city; so that when these poor, forlorn women are brought in, it is not men only that meet them; but some kind woman speaks a kind word to them. I do not believe that there is a gentleman present who does not respond to that phase of our work, whatever he may think of any other. Help us, then, if you can, all of you gentlemen, to get the police, or the city authorities, to appoint police matrons in every place where women are arrested; and if judges will be so kind as to let these good women have something to say in the disposition of the cases, and put these poor women in the care of the police matron, they will be more likely to be saved.

And now, friends and brothers, I want to say how appreciative we are for your kindness, courtesy, and patience in hearing us. As I was coming home from the Pacific slope, and read of the investigation of this committee, I said to myself, "I wish they would ask us, or let us

Digitized by Google

tell, something about our work"; but I did not suppose it would come into your minds. I did not like to write a letter about it, although I had the honor of personal acquaintance with the chairman of the committee. We thank you, gentlemen, for the opportunity you have given us. And in closing I would simply remark that the patriotic men of America have always found that women are patriots too; they did their share in building up the nation. You have heard woman's voice to-day; it is the voice of the Home. I hope it has been a truly womanly voice; I hope it has been a kindly, thoughtful voice. I hope we have not spoken harshly. We are not seeking self-advancement; but we believe that God has a great work for this Republic to do, and we believe that the women of the Republic are willing to bear their share of that work.

In conclusion, let me say, that we shall carry, with grateful hearts, to our friends everywhere, the picture of this scene to-day—the picture of this committee of Senators hearing the voices of women raised for a great humanitarian cause—of these gentlemen of the Press, who give our utterances to the great audience of our countrymen—of the busy stenographer who records our words, that they may live in enduring form, to help, if they may, the great purpose which it is our hope to serve. All this will long remain with us to gladden our memories of this occasion—for which the Christian women of America will ask God's blessing on you all.

## NEW YORK ASSOCIATED PRESS.

DANIEL H. CRAIG sworn and examined.

By the CHAIRMAN:

Question. Please state to the committee what opportunities you have had to become familiar with the newspaper business of the country, particularly in its relation to news reporting, by telegraph or otherwise; also, what business connections you have had with telegraph companies, especially in their relations to the New York Associated Press and the press of the country. Also give us the best information in your power as to the cost of telegraph lines, and the best systems of telegraphy now in use.—Answer. I have worked with hands and brains, almost without a holiday, since I was twelve years old; first, about 1825, at Plymouth, N. H., as an apprentice in the Gazette printing office. Journeymen printers, in those days, were paid $20 per month without and $15 with board. I labored twelve hours daily, with no compensation but my board. After a few years the publisher failed, and I finished my apprenticeship in the Lancaster Gazette office, at Lancaster, Mass.

From there, about 1832, I went to Boston and issued, some months in advance of the publication of the New York Sun (the first penny paper of the country), a prospectus for a daily penny journal. The undertaking became at once exceedingly popular, but the gentleman who was to edit the paper persuaded me to give up my venture, characterizing it as contemptible, and I permitted him to turn it into a daily evening subscription paper, which soon exhausted my limited capital, and it was sold out to one of the present leading Boston journals.

I then embarked somewhat extensively in the importation and training of carrier-pigeons, for the conveyance of commercial and other news, and at different periods, during ten or twelve years, I used them successfully at various points between Halifax, Nova Scotia, and Washington, D. C., and had pigeon news relations with Harnden, the projector of

Digitized by Google

the express business of the country, Jacob Little, the Wall street Jay Gould of 1845, Moses Y. Beach, of the New York Sun, and several other journals between Boston and Baltimore.

Years before the establishment of the telegraph I had a regular news reporting business, by means of carrier pigeons, from Halifax to Boston. I carried my birds by land to Halifax to meet the incoming Cunard steamers, and then took passage for Boston. After gathering news from London and Liverpool journals I printed it on tissue paper, with small type, in my state-room, fastened it to the legs of the birds, and at the proper time flew them from the decks or port holes of the steamers. My birds carried the news to Boston several hours in advance of the steamers, where it was used for speculative purposes, and subsequently for publication. When it became known that I was anticipating with my birds the news brought to Boston by the steamers, the agent of some of the New York journals made representations to the Cunard Company that I was using the news for speculative purposes, and they undertook to prevent me from taking my birds on board their steamers at Halifax. On one occasion Captain Ryrie seized and held them until after the steamer arrived at Boston. Apprehending this outrage, I had put one of my birds in my overcoat pocket before going on board, and after putting the news on his legs I went on deck and flew the bird close to the captain's head. He darted into his state-room and caught his rifle, but before he got a chance to shoot, the bird was a mile above him, flying straight to his home in Boston, a hundred miles away, and safely delivered his news several hours in advance of the steamer.

I first came into direct antagonism with some of the leading New York and Boston journals about 1847, on the occasion of their putting on an express steamer between Halifax and Boston to bring the European news by the New York branch of the Cunard Line. The first trip was successful, as the express-boat arrived just before daylight, and I could not use my birds. On the second trip my carriers took the news in advance, and when the express-boat arrived in Boston, at 10 o'clock a. m., the news was already published there and telegraphed to New York. The express-boat then retired, and I had the field to myself until the telegraph was extended to Saint John, New Brunswick, a year or so later.

My business relations with the telegraph companies commenced as soon as their lines east of New York were opened for business. After lines were extended to Saint John, New Brunswick, about 1848, I organized a horse express between Halifax, Nova Scotia, and Digby, about 100 miles; thence 30 or 40 miles across the Bay of Fundy, by steamboat express, to Saint John, with European news brought weekly to Halifax by the Cunard Line of steamships. From Saint John two or three columns of European news summary were telegraphed to the Boston and New York daily journals. On my first trip through Saint John, on my way to Halifax, to arrange for my express from that city to Saint John, the superintendent of the telegraph told me that I had better save my money, as under no circumstances would he permit me to telegraph the news until after the agent of several of the New York journals had sent the news forward. I answered him that I expected to beat all competitors in putting the news on file; that if I should do so, and he left me in any doubt as to my having the first use of the wire, I would prevent him from sending the news to any one, and then prosecute him for damages. On my arrival with my express steamer, at 10 o'clock p. m., hours ahead of my competitor, I found the superintendent standing in the door of the telegraph office, and he gave me a cordial reception. Two columns of European news were telegraphed to my agent and pub-

Digitized by Google

lished in the Boston and New York journals the following morning. It is quite certain they paid more for it than they ever paid before or since for any two columns of news by telegraph.

This enterprise was at first opposed by six of the leading journals of New York, but their agent employed poor horses and a slow steamer, and "got left." The opposing journals finally made a contract with me to superintend their interests in New Brunswick and Nova Scotia, and in 1850 a committee of those journals, consisting of the late Henry J. Raymond, of the Times, then of the Courier and Enquirer, and the late Frederic Hudson, of the Herald, invited me to come to New York to organize and manage an association, to be called the New York Associated Press. I assumed this duty in 1850, and continued in that position until near the end of 1866. Previous to this organization, in 1850, there were no regular or systematized arrangements for gathering the general domestic news of the country by telegraph, though there were numerous so-called news reporters, who were in the habit of telegraphing a few words, and then to draw upon their imaginations for details, and with showy headings writing up and selling to the editors nearly as many paragraphs as there had been words telegraphed. A leading member of this news-reporting fraternity, on entering my employ, was greatly shocked when ordered to telegraph the details of all important news, and assured me that from an intimate acquaintance with the editors for more than two years, he was sure they didn't know real from imaginary news, and he thought it very foolish to waste money in telegraphing details of any event.

When organizing the Associated Press, I visited all the leading editors of the country and the managers of the numerous telegraph companies and explained to them my purpose to establish a complete system for reporting the details of all important news by telegraph. I found a large majority of the editors violently opposed to my views, and among the telegraph managers, such men as Amos Kendall, F. O. J. Smith, Professor Morse, and their associates, did all in their power to defeat my purpose of combining the whole daily press of the country in sustaining one substantial telegraph news organization, their selfish and absurd idea being that each individual editor should telegraph all the news he desired to publish, and thus bring a larger grist to their mill. It required several years to force our news reports on to the editors of the country. Even as late as 1855 one of the leading editors of Chicago was greatly incensed when I raised the price of daily reports, averaging two columns of fresh news from all quarters of the globe, from twelve to fifteen dollars per week, all of which, I contributed for years with considerable sums from the press in all the large towns in the West, to the Western Union Telegraph Company, then in its infancy, and languishing for want of support. A distinguished editor of a leading party organ on the direct telegraph line to Buffalo, complained to me very bitterly when I raised the rates to him for two or more columns of fresh news daily from one to three dollars per week.

These are somewhat extreme examples of the illiberality of leading editors in forming a just estimate of the value of the telegraph and a well organized system of news reporting. The Chicago editor learned in time to know that a newspaper must have news, regardless of cost, and he has for years freely expended for news many hundreds, perhaps thousands, of dollars weekly in place of the ten or fifteen, which he denounced thirty years ago as "extortion."

From about 1853, until I retired from the management of the Associated Press at the close of 1866, every daily journal in the country and

Digitized by Google

in Canada was compelled to submit to our rules in regard to telegraph news reports.

The average payments by the members of the New York Association varied from $200 to $230 per week each. The evening journals paid about half as much. The morning and evening journals outside the city paid to our local agents certain fixed charges aggregating about $10,000 or $12,000 per week, exclusive of their special reports. Very soon after I retired from the association, rival telegraph and news organizations sprang up, and for some years past there have been about as many journals outside as inside the New York Association's arrangements; and very recently the association was compelled, through the co-operation of certain leading journals in the West and the Gould interest in the Western Union Company and certain New York journals under his influence, to open the way to what is practically a governing control by the Western journals and the Gould journals in this city. This combination is so distasteful to certain members of the association that it is unlikely to be maintained a day longer than the dissatisfied parties can secure reliable and permanent telegraphic facilities.

Between 1850 and 1854 there were two or three independent, antagonistic, and generally poverty-stricken telegraph companies between all the leading cities of the Union, east of Saint Louis, and as their stock had almost no market value, I made a vigorous effort in 1853 to induce the Associated Press to buy up the direct trunk lines between Boston and New Orleans, on the seaboard, and the great cities of the West and Southwest, which could then have been done for less than $1,000,000.

The editors had two long sessions to consider my programme, and finally decided that "telegraphing was outside the business of newspaper editors," and declined to permit me to go on with the enterprise. Had they assented to my wishes, the Western Union Telegraph Company would have been buried in its infancy, or, if permitted to live, it would have been as the tail to the Associated Press kite, instead of the association's being in that relation to the Western Union Company, as it is, and has been for the last sixteen years. I will admit, however, that as it was then my mission to build up a monopoly in news for the benefit of the members of the New York Associated Press, and as I was armed with arbitrary power to this end, it is unlikely that the public would have been served with any more tenderness than it has since been served by the Western Union Telegraph Company, who entered the field of telegraph monopoly, after I had failed to enlist the Associated Press in my scheme to do what the Western Union Company have since accomplished.

The Associated Press, though declining to go into the telegraph business, permitted me to control a half interest in a line to Boston, which was purchased for a trifle, and netted in a few years over $100,000. I subsequently built and controlled several other lines at the East, and for several years between the first Atlantic cable and its more fortunate successor, in 1866, I held, as manager of the Associated Press, a lease of the Newfoundland, Ariel and Cable Telegraph lines, and built a new line from Saint John's, Newfoundland, to Cape Race. Off that fearful coast I established life-boats to intercept the outward and inward bound ocean steamers and telegraphed their news direct to this city, where it was published three or four days in advance of the arrival of steamers.

Those steamers which were not intercepted at Cape Race were met outside of Sandy Hook, and their news dispatched to the telegraph office on Sandy Hook by carrier-pigeons, thence to this city by telegraph

Digitized by Google

and distributed all over the country before the steamers arrived in the harbor.

The successful working of the Atlantic cable in and after 1866 put an end to all the excitements and most dangerous and expensive enterprises for securing European news, and since then there has been no more trouble and scarcely more expense in getting European news than there formerly was in getting news reports from New Orleans.

In 1866, after the Western Union Company had swallowed up the "United States," the "National," and the "American" telegraph companies, the then managers of the Western Union Company expressed a desire to have me form a general news company, and give them one share more than one-half of it, pledging themselves to leave the absolute control of the organization in my hands. The inducements offered to me were, first, to make no further advances for news reports to the press of the country; second, to give me, free of expense, the services of all the managers of Western Union offices to report the news, thus saving a very heavy expense for reporters; and thirdly, I was promised a special wire to all the main points in the country, both to receive and to send news reports. It was expected that I would organize a commercial news bureau in all the cities of the Union, to which all bankers, brokers, merchants, and speculators would be forced to subscribe, and from this source we had no doubt an almost unlimited amount of money could be realized yearly. My own estimate was one million dollars net, and half as much more from the press.

One of the three members of the executive committee of the Associated Press cordially approved of all the preliminaries of my deal with the managers of the Western Union Company; so did an ex-member of the executive committee, who had just retired from office. This alliance with the managers of the Western Union Company was prematurely made known to the Associated Press, as I had reason to believe, by a leading member of the Board of the Western Union Company, who was not allowed to be one of the parties to participate in the news organization. The result was a quarrel between myself and four of the seven members of the Associated Press, and for fear of consequences, the managers of the Western Union Company wished to be released from the general news programme, but gave me strong assurances of their intention to co-operate with me in the commercial news department enterprise. I accordingly abandoned the general news business to my successor in the management of the Associated Press, who agreed, through the president of the association, not to compete with me in the commercial department of telegraph news reporting, and I proceeded to develop what is now known as the commercial news department of the Gold and Stock Telegraph Company. After I had that business well developed, the Western Union Company, aided by four of the seven members of the Associated Press, wrested it from my control—the Western Union Company forming an alliance or partnership with the New York Associated Press. The business netted the first year over $200,000, as I was informed by the then manager.

At this time, 1869, the Gold and Stock Telegraph Company was a very prosperous concern, with a capital of about one million dollars. The Western Union Company conceived the idea of capturing it, and to this end dissolved partnership with their friends of the Associated Press, and served a notice upon the Gold and Stock Company that they would start an opposition to them unless they would consent to increase their capital to $2,500,000, and give a majority of the stock to the Western Union Company in even exchange for the Commercial News Bureau,

Digitized by Google

which they had dishonorably wrested from me, and subsequently from the Associated Press.

Since 1867, the Western Union Company has supplied telegraph facilities for the advance receipt, at all commercial centers of the markets of the world, and has been directly interested in the profits of this business—outside of the profits arising from telegraphing the commercial reports. The company has directly conspired with its confederates to crush out all parties who have been from time to time in competition with the company's reports. They first robbed me of this business, which I originated and organized in 1867, and then divided its stolen property with the Associated Press, hiding its responsible head under the outspread wings of that association; then, after two years, seeing a still better chance to cover up their fraud and promote their interests, they kicked out the Associated Press and turned the whole affair over to the Gold and Stock Company, first, however, wresting the control of that company from its owners, and thereafter to the present time directing the management of the speculating news business under the thin disguise of the Gold and Stock Company, of which the officers are the same men as the officers of the Western Union Company.

Constant efforts were made by the late General Lefferts and myself, from 1850 to 1868, to find some way to develop a system of machine chemical telegraphing, and in 1869 we realized our hopes. It fell to my lot to put the machine system, under the name of automatic telegraphy, into use. I should say that previous to 1869 all scientific electrical authority went strongly to prove that it was practically impossible to telegraph over an ordinary wire 250 miles long more than 60 or 65 words per minute. A more rapid rate of transmission caused the telegraphic marks on the chemical paper to run together and make a continuous mark or line—caused by the failure of the conducting wire to discharge instantly all the electric current received from the battery at the transmitting end of the wire. After satisfying myself that it was perfectly practicable to telegraph by our newly discovered appliances one thousand words per minute, I ventured, in 1869, to appear before some of the leading editors of the country with a programme in which I modestly claimed a practical speed of transmission of 250 words per minute. The editors appointed a committee to investigate our automatic system, which was practically illustrated to their entire satisfaction. The chairman of that committee, a prominent editor of Chicago, volunteered to raise one and a quarter millions of dollars to build a trunk line from Boston to New York through the West, to New Orleans, and to Washington and New Orleans by the seaboard. As soon as this arrangement was discovered by the Western Union Company it commenced a bitter tirade against me through the president's annual report, and through various other publications, and in some of these I was denounced as a fool or a knave for claiming that it was possible to telegraph at a greater speed than 60 or 70 words per minute. The Western Union Company also attacked the chairman of the editors' committee through the adroit and plausible general superintendent of the company, then at Chicago, who succeeded in making him believe that what he had seen in New York was not a possible reality, and that it would be much more conducive to his health to make an excursion to the Pacific as a guest of the Western Union Company, than to undertake the labor of building telegraph lines for a system of telegraphing which had, he professed to know, no reality except in my imagination. This Western Union missionary closed his argument against the editors' enterprise by assuring the chairman that he and his friends would, in sustaining an

Digitized by Google

opposition telegraph, antagonize the Western Union Company, and the result would be that he and they, with their newspapers, would come to grief.

One night's reflection was sufficient to satisfy the distinguished chairman that his health imperatively demanded that he should make a two-months' excursion in a palace car, as the guest of the Western Union Company, and from that time to the present the gentleman has had no patience with any enterprise which contemplated any form of competition with his friends of the Western Union Company.

My next effort to put the automatic system in practical use was in 1869, under the patronage of the late Mr. Bennett, of the Herald, who agreed to invest $150,000, and subsequently asked the late Commodore Vanderbilt to invest a similar amount. The Commodore consulted his friend, the president of the Western Union Company, and that gentleman quickly convinced the Commodore that the right thing for him to do was to keep clear of my nonsense about fast telegraphing, and come into the Western Union Company, which he did, and until his death was the ruling power of the Western Union Company, as Mr. Gould is now. The president then labored with Mr. Bennett with equal success, and he declined to go on with me. I was similarly balked by the Western Union Company in obtaining capital to put the automatic system into practical use, in two other cases, but I finally succeeded in building a superior one-wire line to Washington, and in August, 1870, telegraphed accurately, between New York and Washington direct, one thousand words per minute—thus practically proving the offensive statements of the managers of the Western Union Company to have been totally untrue.

After I had worked the system four months, between New York and Washington, George Harrington, then fresh from the United States Treasury, played a confidence game on me, and induced me to give to him and his immediate friends the control of the automatic system, and the Washington line. He subsequently enlisted the late Colonel Scott, of the Pennsylvania, Mr. Garrett, of the Baltimore and Ohio, and Mr. Jewett, of the Erie, railroad companies, in a scheme to build up an opposition telegraph company.

Harrington was greatly aided in that enterprise by the then threatening attitude of the Western Union Company, who had control of the fraudulently obtained patent of Page, and undertook to make, through this ill-gotten affair, an absolute monopoly of every form of telegraphing. The railroad interest, in competition with the Western Union-Vanderbilt interest was greatly alarmed, and readily came into Harrington's plans. But here the hand of the Western Union Company was again felt, and they induced Colonel Scott to abandon the opposition enterprise, and his defection and the conviction of the Western Union Company that it would be neither politic nor possible to enforce the claims of the fraudulent Page patent against any party capable of making any real defense put an end to the railroad companies' opposition. Then Colonel Scott advised Gould to buy out the automatic interests of Harrington and his party for four million dollars worth of the stock of the Atlantic and Pacific Telegraph Company, which was then (1875) selling at 28 per cent. of its par value—one million of which was to go into the pocket of Gould and three millions to the Harrington party. Gould immediately bought the control of the Atlantic and Pacific Telegraph Company, and took from Harrington an assignment of the automatic interests, and, on the same day, Harrington fled to Europe, where he is yet, in the enjoyment of his ill-gotten wealth, and Gould still owes some $3,000,000 of the stock of the Atlantic and Pacific

Digitized by Google

Telegraph Company to the defrauded Automatic Company's stockholders. Simultaneously with the purchase, by Gould, of the Atlantic and Pacific Company and the automatic system, General Eckert, the present real dictator, under Gould, of the Western Union Company, went from a high position in the Western Union Company to Gould and the Atlantic and Pacific Company, but when Eckert undertook to operate the automatic system on ordinary wires, with several wires on the poles, he found so much induction and other electrical difficulties, which neither he nor his associates were able to overcome, that the system had to be abandoned for practical work.

I had foreseen, in 1871, the impossibility of working the automatic system for general telegraphing without radical changes, and, when consulted by Gould, a month before he bought the system for nominally $4,000,000, I told him it was utterly valueless for practical work. Eckert and Edison told him the system was all right, and he bought it for the equivalent of over $1,000,000 cash, and, under Eckert's lead, commenced a vigorous war upon the Western Union Company, which resulted in a reduction of telegraph rates from 30 to 60 per cent., and to some points 75 per cent. or more.

While the Atlantic and Pacific Company continued to run as a competing company till 1881, it was really sold out by Gould to the Western Union Company in 1877. In 1880 Gould and Eckert (finding that the Western Union Company would not admit them to any share in its management) started the American Union Telegraph Company in direct opposition to the Western Union and Atlantic and Pacific Companies; the result of which was another general reduction of telegraph rates, and after the American Union Company had expended three or four millions of dollars, Gould compelled the Western Union Company to accept himself and Eckert as its masters, and also to take their property at an advance of two or three hundred per cent., and also to take upon itself the payment of 5 per cent. interest on Gould's Atlantic Cable stock of about $14,000,000, when it is notorious that the English cable companies have never paid an average of even two per cent. on their stock. It is a singular fact that this extraordinary transaction has never been officially mentioned by the Western Union Company.

By these three transactions it is well known that Gould netted between fifteen and eighteen millions of dollars, the result being to turn the Vanderbilt interest out of the Western Union Company, and to put Gould and Eckert in absolute control of the company, Dr. Green being, at best, merely a respectable figure-head.

My experience in the development of the automatic system of machine telegraphing, in 1869–70, enabled me to know what was necessary to remedy the defects of that system, and I commenced the needed improvements in 1871, and completed them in 1878. In 1879 I organized the present Rapid Telegraph Company, and the first line was opened to Boston in 1881, with wires having but about one-third of the electrical resistance of the wires of the Western Union Company, and it was found to be perfectly practicable to telegraph between the two cities at the rate of fifteen hundred words per minute—90,000 words per hour—necessitating the making and breaking of the electric current about five hundred times per second.

In practical telegraphing of short messages the capacity of the Rapid wire might be reduced to 20,000 words per hour, or 667 thirty-word messages; this would make each Rapid wire's capacity, in 8 hours, 160,000 words, or 5,333 thirty-word messages. By this system the telegraph message requires to be set up, or perforated in ribbon paper be-

Digitized by Google

fore it can be telegraphed. This is girl's labor, and is accomplished by a piano-shaped key-board, which is operated with as much ease and rapidity as a piano key-board. It taxes the mind scarcely more than reading, at a speed of 35 to 50 words per minute, and the proper handling of the perforating machine can be acquired in one or two months. An expert operator can perforate 50 words per minute, or 3,000 words per hour; assuming that each girl perforates 33 words per minute, or 2,000 words per hour, there would be required 10 girls to keep one Rapid wire moderately active on short messages, of about 30 words each.

Machine telegraphing is a purely mechanical operation, requiring no labor or intelligence beyond turning a light cylinder, which would be light labor for the most delicate girl. Similar labor only is required at the receiving end of the line.

The message, received in black, distinct telegraphic characters, recorded upon a ribbon of paper, is handed to a girl sitting at an ordinary type-writing machine, is translated and printed in note form at about the same rate as it was perforated at the transmitting office, and in one minute or less a message of 30 words is ready for delivery.

This constitutes the whole process or labor of telegraphing by the Rapid system.

RECAPITULATION—"RAPID" OR MACHINE TELEGRAPHING—1 WIRE.

| | |
|---|---|
| 10 girls to perforate 160,000 words, or 5,333 thirty-word messages in 8 hours, at $35 per month | $350 00 |
| 2 girls to transmit and receive, at $40 per month | 80 00 |
| 11 girls to translate and print, at $30 per month | 330 00 |
| Total wages per month, Rapid (23 operators) | 760 00 |

Total cost per message, Rapid, $\frac{44}{100}$ of one cent.

If the messages averaged 100 words, thus economizing labor in handling, one Rapid wire would carry 200,000 words per day, without any inconvenience or extra cost, except for perforating and copying, say, at most, $200 per month.

MORSE OR HAND-KEY SYSTEM—18 WIRES.

By the Morse, or any other system of hand-key telegraphing, 300 thirty-word messages per day is a very large day's work for two expert operators. There would be needed therefor 18 Morse operators to transmit and 18 to receive 5,333 messages per day. Total, 36 first class operators and 18 wires and appliances.

| | |
|---|---|
| 36 first-class operators at $85 per month | $3,060 00 |
| Maintaining 17 extra wires on circuit of 250 miles at $4 per mile (the sum allowed by the Western Union Company in their official reports | 1,416 00 |
| Total cost per month, Morse | 4,476 00 |

Total cost per message, Morse, 3¼ cents.

Difference in favor of rapid system, $5\frac{17}{19}$, or nearly six to one.

The cost of labor for telegraphing by the Morse system business letters averaging 150 words would exceed 16 cents each, or about fifteen times more than by the rapid system.

The 18 wires used to operate the Morse system would have no reserved transmitting power, so that any increase of business would necessitate an enlargement of the whole plant.

No candid Morse telegrapher will express any doubt as to the great economy of the Rapid system, for the large or main line offices; but the

Digitized by Google

comparative advantages of the Rapid system over the Morse is really greater for small or way-office business.

Any fairly intelligent girl will learn to perforate, telegraph, and copy messages by the Rapid system in one-third the time in which she could learn to work the Morse system.

An expert rapid operator can easily perforate, transmit (or receive), and copy on the type-writer 18 thirty-word messages per hour, or 180 messages in 10 hours, so that 20 offices could complete 3,600 messages in one day of 10 hours, as the whole force could be kept fully employed in perforating, telegraphing, or copying messages. Twenty first-class girls at $35 per month, $700.

The class of Morse operators employed on way lines do not average over 400 or 500 words per hour, say 16 thirty-word messages. Allowing that two circuits are kept actively at work 10 hours, the 20 offices at best could not complete over 330 messages per day, as not over 2 to 4 of the 20 operators could be employed at one and the same time. Twenty third-class Morse operators at $40, $800.

The Rapid line costs $100 less per month, and is capable of completing more than eleven times the number of messages that can be completed by the Morse line.

The Morse line would be in constant use.

The Rapid line would have a reserved transmitting capacity equal to 50,000 words, or 1,666 thirty-word messages, per day.

In 1870 Mr. Postmaster-General Cresswell sent an expert from his Department to this city, to consult with the postmaster and myself as to the practicability of utilizing machine telegraphy as an adjunct of the postal department. After full consideration a report was made, favorable to my views, which were in brief, that the Department should undertake to deliver, during business hours in all commercial centers, telegrams through the carriers every 30 to 60 minutes, and collect stamped telegrams through the street post-office boxes once or twice per hour, and deliver the same to the telegraph office for transmission. For these services the telegraph company would pay the post-office 2 cents for delivery and 1 cent for collection, per message. It was assumed that the telegraph company could afford to telegraph ordinary business letters in circuits of 500 miles for post-office delivery at 15 to 20 cents, and in circuits of 1,000 miles for 20 to 25 cents, inclusive of post-office dues, but the automatic system of machine telegraphing, which was then developing, was found to have defects in practical use, and I deemed it wise to abandon it.

After I had developed, in 1879, the Rapid system, to supersede the Automatic system, and doing away with all the defects of that system, whilst greatly increasing the speed, simplicity, and reliability of machine telegraphing, I again publicly presented this feature of letter telegraphing through the facilities of the Post-Office. The executive officers of the Rapid Company warmly favored my ideas, but they did nothing toward putting them into effective use, and finally, in 1882, a so-called Postal Telegraph Company was organized, and they seized upon my published ideas of 1879–'80, claiming originality for the same, though that company did not then, nor does it now, possess any system of fast telegraphing of the least practical value for general use; nor is there any such system, except that of the Rapid Company, which possesses any merit entitling it to be regarded, as a whole, superior to the Morse, or hand-key system.

The rapidity and ease with which the Rapid system of machine telegraphing can be learned by any person of common intelligence, makes

Digitized by Google

it especially fitted for use at all post-offices where the postmaster has leisure for this kind of work. I would have every such post-office supplied with the machines, wherever there was not telegraph business enough to justify the telegraph company in maintaining an office, thus putting a large percentage of the post offices in the country in direct telegraphic communication with each other; the telegraph company receiving at, and telegraphing over their trunk lines all messages from small post-offices and local lines, accepting one-half the tolls for their services. The whole cost of Rapid machinery, adapted to such offices, would not exceed $50 to $75 each. A girl or boy could become fully expert in working the Rapid system in two to four months.

Notwithstanding the actual advantages of the Rapid system, certainly as a whole more than 75 per cent. superior to the Morse or any other hand-key system, the friends of that system, notably the Morse operators (who naturally, as a class, prefer to see 18 wires manned with 36 of their high-priced associates, to telegraph 5,333 30-word messages in a day of 8 hours, at a cost of $150, in preference to seeing the same amount of work better done by 23 young ladies over 1 wire, at a cost of $25), have been able, so far, aided by the overshadowing influence of the Western Union Company, to discredit the Rapid system; that company, with many millions of dollars invested in a plant that would be nearly valueless should machine telegraphing be properly introduced, by itself or by a well managed competing company, has from the first worked hand-in-hand with its hand-key operators, and by arts and devices, alike discreditable to both, has succeeded in discrediting the Rapid system, probably hoping to shift their load of old lines and worthless apparatus on to the Government, leaving to the Post-Office Department the loss and labor of introducing modern telegraph machinery and low telegraph rates of tariff.

There seems to be a general disposition on the part of telegraph companies and telegraph builders to avoid giving to the public any reliable data as to the cost and maintenance of telegraph lines. I have taken much pains to obtain from one of the oldest, most experienced, and reliable telegraph builders in this part of the country the following statistics, in the reliability of which I have the fullest confidence.

The cost, per mile, of a first-class line of No. 9 best galvanized iron wire, with bracket and glass insulator, with good 25-foot poles, equal to chestnut, firmly planted 4 to 5 feet in the ground, would average, throughout the country, not exceeding the following figures:

| | |
|---|---|
| 30 poles, 6 inches at top, at $2 | $60 00 |
| 30 brackets and spikes | 1 00 |
| 30 glass insulators, at 6 cents | 1 80 |
| 330 pounds No. 9 galvanized iron wire | 16 50 |
| Labor and other expenses | 60 00 |
| Total cost of one-wire line | 139 30 |

For a line of four wires, No. 8 galvanized iron wire, good poles, 30 feet long, 6 inches at top:

| | |
|---|---|
| 30 poles, at $3.25 | $97 50 |
| 30 cross-arms, with bolts and washers | 15 00 |
| 120 insulators, at 6 cents | 7 20 |
| 1,550 pounds of wire, at 5 cents | 77 50 |
| Labor and expenses | 125 00 |
| Total cost of four-wire line | 322 20 |

The cost of a good line of 30-foot poles, equal to chestnut, per mile, without wires or fixtures, would be $190; brackets and glass, per mile,

Digitized by Google

erected, will cost $4.50; cross-arms and glass, per mile, for two wires, erected, will cost $15; cross-arms and glass, per mile, for four wires, erected, will cost $28; for rights of way, $5 per mile is a fair allowance.

Responsible telegraph engineers will contract to build the range of first-class lines, before named, at figures above stated.

| Average resistance: | Ohms. |
|---|---|
| No. 9 wire, per mile | 15½ |
| No. 8 wire, per mile | 13 |
| No. 6 wire, per mile | 9½ |
| No. 4 wire, per mile | 7 |

A range of trunk lines from Calais, Me., to New Orleans; from Boston to Buffalo, Chicago, and Saint Paul; from New York to Albany, Chicago, Saint Louis, to Omaha; from New York to Philadelphia, Pittsburgh, Cincinnati, Indianapolis, to Saint Louis, and from New York to Baltimore, Washington, Louisville, Memphis, to New Orleans, with all important intermediate points, would require about 9,000 miles of posts, 30 feet long, and 6 to 7 inches in diameter at the small end; wood equal to chestnut, and set 4½ to 5 feet in the ground.

Such a line of posts, in every respect first-class, with four No. 8 galvanized iron wires, and first-class appurtenances, would cost, exclusive of rights of way, $3,204,000.

The same 9,000 miles of poles should carry, also, two copper and steel wires, with an electrical resistance not exceeding 1 to 1½ ohms per mile, and would cost, completed, about $2,844,000—total, $6,048,000.

To which add, for machinery, fixtures, &c., for 1,000 offices (machine or Rapid telegraphing), $2,000,000—total, $8,048,000.

(If the lines were worked by hand-key system, the office fixtures would not cost over about $500,000).

There are a great many cross-country or way-line offices required to intersect small villages, which would necessitate building and equipping about 5,000 miles of 25-foot poles, with No. 8 galvanized iron wire, the total cost of which would not exceed $1,000,000; to which add, for machinery, fixtures, &c., for 1,000 small offices for machine or Rapid telegraphing $1,000,000; total, for 5,000 miles way-lines and 1,000 offices $2,000,000.

RECAPITULATION.

| | |
|---|---|
| 9,000 miles of 30-foot poles and 4 wires | $3,204,000 |
| Add 2 copper and steel wires of low resistance | 2,844,000 |
| Machinery, fixtures, &c., 1,000 Rapid offices | 2,000,000 |
| 5,000 miles of 25-foot poles and 2 wires | 1,000,000 |
| Machinery, fixtures, &c., for 1,000 offices | 1,000,000 |
| Total, for 14,000 miles of poles and 64,000 miles of wire, with 2,000 offices and fixtures, complete | 10,048,000 |

(which would be reduced to about $8,000,000 if the lines were worked by the Morse or hand-key system.)

These 64,000 miles of wire lines, operated by the Rapid system and divided up into average telegraph circuits of 150 miles, would easily handle four to six times more messages that the Western Union Company report as the total of their present business.

The very ingenious gentlemen who have appeared before this honorable committee as representatives of the Western Union Telegraph Company have given to it certain statistics well calculated to impress it with the immensity of that company's plant, and to terrify the advocates of postal telegraphy and also those who might entertain the idea

Digitized by Google

of entering into competition with the Western Union Company as a business venture. While the statements referred to may be true, they are very far from being consistent with my own knowledge of the telegraph business. The Western Union Company says officially, through its testifiers, that it requires 375,000 miles of wires, and 131,000 miles of poles to transmit 39,000,000 thirty-word messages. Practically, a very large per centage of telegraphing in this country is done in wire circuits of less than 100 miles, but to be far on the safe side, assume that the average circuits are 200 miles, and there would be 1,875 circuits.

If 58 messages were transmitted in each 200 mile circuits (1,875), there would be telegraphed 108,951 messages daily, or 39,760,915 in one year, about one million messages more than are claimed by the Western Union Company. Three hundred 30-word messages per day, for a good hand-key, or Morse operator, is considered good work, and if there were transmitted 300 messages per day in 1,875 circuits, there would be a total of 562,500 messages daily, and 205,312,500 yearly, or over five times more than the official claims of the Western Union Company.

Obviously, the claim of the controller of the Western Union Company, that it is necessary to have a plant of 375,000 miles of wire and 131,000 miles of posts to transact that company's business, is a pure fiction.

Assuming that the Western Union Company has 75,000 miles of good wire, and that it is divided into average circuits of 150 miles, there would be 500 circuits. If from each circuit 214 messages were transmitted daily, there would be a total of 107,000 messages per day; more than the official statement of the company claims.

The only possible way, apparently, by which the Western Union Company can figure its plant at 131,000 miles of poles and 375,000 miles of wire is to assume that the company now uses all the old rattle-trap lines it has bought or leased in its eagerness to wield a monopoly of telegraphing. It is true, beyond dispute, that a very large percentage of the many thousands of miles of posts and wires, leased or bought from opposing companies, were utterly or nearly worthless for practical work when they came into the possession of the Western Union Company, and were bought wholly and solely to be rid of a rival company. Whatever number of miles of line the Western Union Company has in its plant, it is very certain that not more than 75,000 or 80,000 miles of wire and 25,000 to 30,000 miles of poles can possibly be required to cover, with the system in use by the Western Union Company, all the paying territory it occupies.

Among the extensive telegraph plants absorbed by the Western Union Company during the past ten years were the Pacific and Atlantic, the Southern Atlantic, the Atlantic and Pacific, the Franklin, the Continental, the American Union, the Mutual Union, &c. Their many thousand miles of posts and wires were built parallel to the Western Union Company's lines, but upon dirt roads; therefore could have been of very little use to that company, even had they been well-built lines. It is well-known, however, that every one of the lines, except the Mutual Union, was built expressly to be sold to the Western Union Company, and built in the cheapest way possible. Being intended for annoyance to that company, they ran as close as possible to its wires between all the cities north of Omaha, and therefore were of little practical use to the purchasing company as plant. These seven companies drew from the Western Union Company not less than thirty to forty millions of its stock, though it could construct a range of lines at a cost of five millions of dollars that would be far more useful and valuable to the company than all of those speculative lines could have been.

Digitized by Google

Of all the extraordinary statements made by the Western Union Company before your honorable committee, that which announced that the Company was not influenced in the matter of telegraph rates or tariff by opposing telegraph companies, is most remarkable. I have been a close observer of the movements of telegraph companies since 1866, when the Western Union Company was recognized as aspiring to a monopoly of the telegraph business of the country. Since 1867 that company has bought a controlling interest in some ten prominent opposition companies, and after each operation its president has proclaimed an unchangeable resolution to "crush," and not purchase or lease any more competing lines; but the consolidation music never ceases, and obviously never can cease so long as there is serious competition in its road to dominion. I affirm, without fear of truthful contradiction, that while telegraph rates in this country are less now than they were in 1867, by forty to three hundred per cent., the telegraphing public has been almost wholly indebted to the opposition companies which have successively gone into the insatiable maw of the Western Union Company for such reductions.

These competing companies led the way in nearly every reduction of telegraph rates, and it is not unjust to say that there has been nothing in the management of the Western Union Company, as there is nothing in the character of its managers, to justify the belief that the company would ever have made any material reduction in its rates but for the influence of competing companies.

The patents of the Western Union Company, valued by Dr. Green at several millions of dollars, consist of the fraudulent Page patent, for which $25,000 were paid for a controlling interest, in the absurd belief that the company could thereby deter capitalists from embarking in telegraph business, and thus secure a monopoly throughout the country. It owns the Stearn Duplex patents, now nearly expired, and the Edison-Smith Quadruplex patents, which have five years to run. Neither of these patents was of great value; first, because it was not possible to do telegraphing as economically or reliably by either device as it could be done by the simple Morse system; and, secondly, because there are several similar devices outside of the Western Union Company's patents far more simple and quite as reliable and economical.

Any sum paid for these patents in excess of $100,000 was wastefully expended; they could not now be sold, on their merits, for one quarter of the money. With these three exceptions the Western Union Company does not own or use in connection with its telegraph business a single patent of any appreciable value whatever, so I am reliably informed.

It is quite true that the Western Union Company have valuable franchises in their contracts with railroad companies. It is equally true that they hold these rights at an enormous cost every year. If a true balance of profit and loss were struck, it would probably be found that the net profit was very small, and to grow rapidly less as the railroad companies demand more and more concessions as contracts expire.

In some instances the Western Union Company supplies as many as six wires to a railroad company for the privilege of setting poles on one side of the road, and in many other cases erects lines for the free and exclusive use of the railroad companies for the poor satisfaction of keeping off rival telegraph companies.

Doubtless the Western Union Company has a very considerable percentage of its lines on railroads under circumstances which leave it without any consideration more valuable than the use of one or both

Digitized by Google

sides of the railroad track to plant poles and string its own wires, as an offset for the free use by the railroad companies of one to five or six wires; and this is a very small advantage, provided lines on dirt roads are properly built.

It is undoubtedly largely to the advantage of the Western Union Company to control newspaper telegraph reports, as most of the work is done at night, when the wires would be unemployed except for those reports. At present rates, the business aggregates about ten per cent. of the whole telegraph business, and yields at least one million dollars, net, to the Western Union Company. There is mutual co-operation between it and the New York Associated Press in enforcing rules, which, on both sides, aim at monopoly in their respective business departments.

There are a large number of daily journals outside the Associated Press, and to keep them from combining and helping rival telegraph organizations, the Western Union Company has strained its obligations to the New York Associated Press to a sufficient degree to permit the organization, through convenient tools, of a second association, which exists only by its favor, and is really a menace to the old association, and by serving the second-class journals with all important news, at a quarter or half the rates charged to the journals in or served by the New York Association, the company is enabled to control all of the press business, and keep every journal from patronizing a rival telegraph company.

Just now it is endeavoring to drive the publishers of the second-class journals into a long and binding contract to remain faithful to the Western Union Company. To this end they are feeding them very liberally with fresh reports, easily and economically obtained, and at a small price compared with the charges to the journals in the association. Notice is now given to the editors that the news rates must be raised about fifty per cent., but they are privately informed that if they will execute a contract to remain faithful to the Western Union Company, the news rates can remain as at present.

For seventeen years previous to 1867 it was an unwritten law of the New York Associated Press and the telegraph company (I have no doubt it has so remained to the present time) that neither should do anything to the prejudice of the other's interests. This can be well illustrated by an occurrence which took place while I was manager of the Associated Press. The advance receipt of European news, by steamers at Halifax, Nova Scotia (before the Atlantic cables were laid), was so important to the association, that no consideration of money or effort would have excused me for a single failure. At one time the Government managers of the Nova Scotia line, at Halifax, taking up a personal quarrel between one of the executive committee of the telegraph here and myself, issued an order that my news report should not pass over their line until after a rival report had been telegraphed.

As soon as the steamer was signaled in the harbor, one of the two wires this side of Amherst, where the Halifax and New York lines met, was conveniently out of order, and the operator on the other line was ordered to commence to send me the Bible, and continue till the arrival of my horse express, which was run through the 120 miles from Halifax to Amherst in five hours, during which time not a word, except from the Bible, was telegraphed this side of the Nova Scotia boundary. Before the next steamer arrived, the obnoxious committee man was ejected from the company here, and peace was re-established with the Nova Scotia telegraph commissioners. At another time the only morning journal in one of the largest of the interior cities of this State com-

Digitized by Google

menced to take news reports over a competing telegraph line. This was an offense to the officers of the Western Union Company, though the editor continued to publish and pay for my Associated Press reports. After learning the company's wishes, I notified the editor that he could not have the association's reports unless he ceased to patronize the opposition line. He continued his business with it, and the following day we entered into negotiations with an evening journal in his city to publish a morning edition, pledging to him free and exclusive reports for a year. This movement, coming to the ears of the unruly editor, he quickly dropped the opposition line, and begged to be reinstated in the Associated Press.

I am familiar with all the Congressional legislation in regard to the telegraph; also with all the arguments of the press and others in favor of the building by the Government of postal telegraph lines in competition with the Western Union Company. I have reason to know that the proprietor of the New York Herald has been strongly in favor of this policy, as his father was before him. The Herald was for years almost the only influential journal favorable to Government control; but there are now many converts to this scheme, among the press who, I have good reason to believe, are laboring for a consideration in the interest of the majority owner of the Western Union Company. That shrewd individual has ready to harvest from twenty to thirty millions of dollars from his telegraph ventures, but whenever he undertakes to do so, real investors decline to relieve him of his load. His only possible hope would seem to be to inveigle the Government into the idea of a postal telegraph, looking to the ultimate sale of the lines of the company for eighty or a hundred millions of dollars. Mr. Gould and his wire-pullers know very well that neither the Government or the public would listen to this monstrous idea, as a formal proposition; therefore his tools are laboring to create a boom on the idea of the Government's building lines in competition with the Western Union Company. When Gould succeeds in getting public sentiment and the Government in favor of the postal telegraph *per se*, it will be a very easy matter for him to show, by citing the Congressional law of 1866, and subsequent amendments, that the Government is bound in honor, to purchase the Western Union and all other telegraph companies at an appraised valuation before it can enter upon any postal telegraph scheme. The public mind having been educated to demand a postal telegraph, the Western Union managers hope to sail into the public treasury upon that tidal wave. Hence, I firmly believe, and in some instances I think I know, that the advocates of postal telegraphy are the paid or fooled advocates of a line of argument prepared for them by Gould himself.

I assume and feel sure all disinterested and intelligent citizens will agree with me, if the naked proposition is submitted to them, as to the purchase of all the telegraph and telephone lines, valued by their owners at not much less than $150,000,000, preparatory to the establishment of a postal telegraph, that it is wholly out of the question; yet that is a much more likely thing for the Government to do than for it to ignore the honorable obligations it is under to all telegraph companies who have accepted the Congressional law of 1866, and rush into direct competition with established telegraph companies.

There is one thing the Government might do, I think, with great propriety: that is, receive and transmit, for the commercial public, telegraph letter correspondence. The Postmaster-General contracts with railroads, steamboats, stage coaches, horse and foot conveyances, &c.,

Digitized by Google

to carry our letters and deliver them at our offices and dwellings. The time has come when all of these are *too slow*. In 1870, when I told ex-Postmaster-General Creswell that machine telegraphy was capable of telegraphing mail correspondence in 1,000 mile circuits at an actual cost for the transmission of less than the postal rates, and, what is more than true now, if the writers of letters in the city of Washington for New York would compose their letters on one of the perforating machines, which they could do even more rapidly than they could write them with a pen, they could be sent at a cost of less than three cents per 100 words, he remarked that "such a system of telegraphy could easily bankrupt the Post Office Department."

While a Government telegraph, without purchasing (as was contemplated by the law of 1866) all the telegraph lines in the country at an enormous cost, is unlikely to be entertained, there would seem to be no sound reason why the Postmaster General should not be authorized to ascertain upon what terms he could contract with responsible parties to carry, by telegraph, such mail matter as may be thought advisable.

Present fully and practically developed improvements in telegraphy justify the belief that the Government could contract to have ordinary business letters telegraphed from any post-office to any other within a range of one thousand miles at a cost not exceeding ten cents, and even for less money, if the writers would compose their letters on small, easily understood, and inexpensive perforating machines, which are capable of millions of combinations; so if a writer wished to communicate in privacy it would be impossible for any one not in possession of his key to translate a single word of any communication, though such letters could be as easily read by the writer or receiver as if they had been written in the usual form of telegraph writing. Any girl of ordinary intelligence could learn to read the secret telegraph characters of her employer in one week or less, and after practicing upon the perforating machine thirty days, would be able to compose for the telegraph, from dictation or manuscript, from 15 to 30 words per minute, thus avoiding the expense and loss of time in the preparation of the communication at the telegraph office. The postmaster could receive and deliver such communications, collecting the telegraph and postal rates by stamps, through street boxes and otherwise (as is now being done in Rome and other cities in Europe), and as is now done here with letters, &c. This would involve no new machinery for the post-offices, except, perhaps, an extension of methods and rules already in use, while the advantage to the commercial public would be more than two thousand per cent. as compared with the present rate of the Western Union Company on letter correspondence.

The new system of machine telegraphy is of great importance in another respect; it is vastly more accurate and reliable in all atmospheric changes, or other forms of electrical or other difficulties than the Morse or any other system of telegraphy.

In the important matter of accuracy, the difference as ascertained by an examination of several hundred messages, transmitted on different days, and subsequently compared with the original copies, was more than twenty to one against the Morse or hand-key system.

A single wire between the city of New York and Chicago connected with machinery easily controlled by a girl at either end, would carry all the business letters that could be put on to it, at the rate of *one hundred words per second*, with no more difficulty than there would be in

Digitized by Google

telegraphing by any of the hand-key devices of the Western Union Company *twenty-five words in one minute!* If the Government would advertise for proposals for telegraphing letter correspondence through the post-offices of the country it will realize very quickly how unnecessary it is for the Postmaster-General to undertake the Herculean task of managing the details of a business which is already but little inferior to the postal, and destined in the near future to far exceed it. There would be, to my mind, as much reason to require the Post-Office Department to assume the management of the railroads which carry under well-defined contracts, the mails from Washington to Boston, as to control the telegraph between those or other points. If the railroad companies would not carry the mails upon equitable terms, it might be necessary for the Government to build and run railroads. Only a candidate for a lunatic asylum, however, would propose to have the Government compete unnecessarily with the railroads of the country. If not with the railroads, why with the telegraphs? While responsible parties stand ready to contract for all the telegraphing the Government may authorize, at rates low enough to meet the most contracted views of any who may wish to send correspondence by telegraph, at the same time giving a most remunerative and increasing revenue to the Post-Office Department.

The Department might be called upon to extend some special aid to the contractors to enable them to carry machine-telegraphy to small, out-of-the way post-offices where there is not business enough to justify the expense on the part of telegraph contractors. At no point, however, would the Government need to have anything more to do with the telegraph than it has with mail-carrying railroads, or than it now has with telegraph companies in contracts for telegraphing, at stated intervals, the weather reports for the Signal Bureau.

Under such business relations as I have suggested between the Post-Office Department and the contracting telegraph company, it would be found to be advantageous to both parties to permit the postmasters in small offices to assume the telegraph business connected with their offices, thus lightening the salaries now paid by the Post-Office Department. Machine telegraphing being almost wholly a matter of practice upon the most simple machinery, requiring no more skill or brains than to operate an ordinary sewing-machine. It can, therefore, be safely placed in the hands of any person of the age of fifteen, of average intelligence, after two to four months of instruction.

Modern systems and methods of telegraphing require wires of low electrical resistance and of great tensile strength. Previous to 1870 it had not dawned upon the minds of the managers of the Western Union Company that the speed at which telegraphing was possible depended largely upon the electrical conductivity of the wire, and they had been content to jog along with wires of 20 to 30 ohms of electrical resistance per mile; and when I proposed, in 1869, to build a line of compound copper and steel wire from New York to Washington, with the electrical resistance reduced to about five ohms per mile, the idea was ridiculed by old school hand-key telegraphers as next in absurdity to that of telegraphing several hundred words per minute. Since then the old plan of putting up iron wires of No. 9 gauge has been abandoned, except for way lines and short circuits, and No. 6 galvanized iron wire of about 10 ohms of resistance per mile has come into general use, but its great weight and liability to damage in sleet and wind storms renders it very objectionable. As a matter of great importance I can state that a new

Digitized by Google

and cheap copper and steel wire has been developed which is free from the very serious faults of the so-called "compound wire" of steel, plated with copper, which is very expensive, brittle, and unsatisfactory, electrically and otherwise. The new copper and steel wire is wholly mechanical in construction, and costs less than one-half the price of the "compound;" indeed, the cost of the new wire, with an electrical resistance of one ohm per mile, will not much, if at all, exceed that of a No. 6 iron wire of 10 or 11 ohms. Practically, therefore, the enormous plant of old iron wires of the Western Union Company is of very little value beyond the cost of taking them down, for the improved copper and steel wire is destined, with machine telegraphing, to work in the near future an entire revolution in telegraph construction and telegraph methods.

[APPENDIX: Note from Mr. Craig.]

Since the preceding statements were made, there has been a considerable reduction in the cost of iron wire and some other articles used in telegraphing, and the following estimates are submitted and are correct to January 1, 1884:

1. The present price of good telegraph-poles suitable for a main line of six wires of No. 8, 6 inches at small end and 30 feet long, delivered, $3.50 to $4.50 each.
2. Telegraph wire of best quality iron, galvanized, can be bought at about 5 cents per pound, which is unprecedentedly low, 6 to 7 cents being the average price.
3. Cross-arms, 6 feet long, fitted with 4 pins, 45 cents.
4. Glass insulators, 6 cents, pins 2 cents.
5. Cross-arm spikes with washers, 3 cents.
6. Morse telegraph instruments, complete, $14.
7. Gravity battery-cells complete, 80 cents each.
8. Telegraph builders: ground hands, $1.25 to $1.50 and board; climbers, $1.50 to $2; superintendents, $2.50 to $3.
9. A first-class line of 1 wire of No. 8, galvanized, with good 30-foot poles, from Washington to Chicago, via New York, would cost per mile about as follows, exclusive of river cables and work in large cities:

| | |
|---|---|
| 30 poles, 6 inches at top | $105 00 |
| 30 cross-arms fitted for 4 wires | 15 00 |
| 30 insulators and pins | 2 00 |
| 388 pounds No. 8 wire | 20 00 |
| Labor and expense, exclusive of right of way | 70 00 |
| Total | 212 00 |

10. The cost of adding three additional wires will be about as follows per mile:

| | |
|---|---|
| 90 insulators and pins | $6 00 |
| 1,164 pounds No. 8 wire | 60 00 |
| Labor and expenses | 60 00 |
| Total | 126 00 |
| Add for first wire | 212 00 |
| Total for a 4-wire line per mile | 338 00 |

11. Local batteries and operating outfit, $65 per small office, and $75 for fitting up each small office. For fitting up terminal offices complete $3,000 would be required, and possibly $4,000. In all large cities at least $3,000 would be required, and at repeating stations (at intervals of 250 to 300 miles) $4,000. For complete apparatus and fixtures, $4,000 would be required.

12. The average rent of offices at 50 stations between Washington and Chicago would be about $800 to $1,000 per annum, in fair localities.

13. I have had a large and varied experience with telegraph lines and telegraph business in all its phases, running through thirty years, from the introduction of the Morse system, and I have recently fortified my own judgment by careful inquiries among practical managers of telegraph lines whose integrity and knowledge are unquestioned.

D. H. CRAIG.

NEW YORK, *January* 10, 1884.

## LAND AND LABOR IN CALIFORNIA.

ALFRED A. COHEN examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. In California.

Q. How long have you resided there?—A. Over thirty-three years.

Q. Are you one of the original "Forty-niners," as they are called?—A. Yes, sir.

Q. What is your avocation?—A. I am a lawyer by profession. I have been engaged a portion of my time in railroad business and farming.

Q. Will you state to the committee, so that we may comprehend your capacity to speak upon the subject-matter of our resolution, what has been your connection with the industrial development of the Pacific coast?—A. I have been a land-owner there for a great many years, an owner of city and of agricultural property, have been engaged in building railroads, steamboats, and work of that character, and have had occasion to become the employer of labor of almost every class. I am now, in addition to other little matters, carrying on some farming.

Q. For how long a time have you been an employer of labor?—A. For thirty-three years past—probably longer—very nearly forty.

Q. How thorough and extensive has been your acquaintance with the development of California, and of the coast generally?—A. I have had that experience which a man engaged in active business since the earliest settlement of that State by the American people would be likely to have.

Q. And you have been more or less connected with the development of all portions of the coast—the entire State?—A. My interests have been confined mostly to the different counties around the Bay of San Francisco, though I have had interests in the interior of the State.

Q. And that knowledge of the whole which an intelligent man would naturally obtain, I suppose?—A. Probably that knowledge which a man engaged in active pursuits would get in the course of a long and laborious life.

Q. Have you been more or less brought in connection with legislation of the State?—A. My efforts with respect to legislation have been professionally as a lawyer in drafting bills, but I have been more generally engaged in connection with legislative bodies, in trying to prevent what I thought was viscious or improper legislation.

Q. What special character do you refer to?—A. I have generally sought to prevent such legislation as would increase the burdens of the tax-payer.

Q. There have been controversies of which we have all heard, with reference to corporations, their franchises and the like, on the Pacific coast. In those controversies, with which side have you usually been identified?—A. For a great many years past I have been engaged in opposition to the views of the principal railroad corporations in California.

The CHAIRMAN. I would like you to take up such topics as occur to you as to which you would like to talk to the committee. Give us your views as fully as you please, and with such suggestions as come to your mind which you think might be of use to the committee.

The WITNESS. I understand one of the objects of this committee is to inquire why it is that there is so much unemployed labor in the country, and whether the rates paid as compensation cannot be increased. Am I correct about that?

The CHAIRMAN. You are. Have you read the resolution under which the committee is acting?

Digitized by Google

### TEMPERANCE AND THE LABOR PROBLEM.

The WITNESS. Yes. I have read the testimony given here by Mr. Medill as published in the newspapers, and have heard the testimony given here on the subject of temperance by some prominent ladies this morning. I heartily believe that the cause of temperance is the cause of the laborer. In the course of my experience, I have scarcely ever known a laborer of good health, who was of temperate habits, that did not become a successful man. Take the laborers of the State of California, which is a wine-producing community, and I do not think there will be found a more thrifty, temperate, and industrious set of men. It is a State where probably a larger number of working people own their own homes than any other that I know of. I do not think there is any community in the world, except, perhaps, the city of Philadelphia, where there are so many mechanics who live on their own property, as in the city of San Francisco. I attribute that result not only to the liberal wages paid, but to their temperate and saving habits.

### TRADES UNIONS.

One of the causes which, in my judgment, tends to the disadvantage of the laboring man, is the high cost of manufactures, which, I think, is produced by the trades unions requiring every man to be paid alike. The result of that, as I undestand it, is to force the employer to pay the inefficient man the same wages he pays to the most efficient; or, perhaps, putting it more correctly for the purposes of this case, it prevents the employer from paying to the most skillful man any more than he can afford to pay to the least capable of his workmen.

I do not mean to say anything against some of the general purposes of trades unions. No doubt the members, and perhaps the employers, receive some benefit from them, when the employés get together and discuss the relative situations of themselves and their employers; and in the end it may induce to a more perfect understanding of their relative rights. The workingmen get together in those unions, compare views with each other, the stronger and more intelligent control, and the result is to educate the workingmen to a knowledge of what their rights and real interests are, which, in the end, conduces perhaps equally to the benefit of the laborer and the employer.

### EXTRAVAGANT COST OF GOVERNMENT.

Another cause, I think, tending to the great disadvantage of labor in this country is the extravagant cost of government. We have too large a proportion of tax-eaters to tax-payers in this country; and that is especially true of municipal governments. The principal taxation of this country comes from land and railroads, but land pays more than its proportion. The tax upon land must necessarily deduct from the wages that can be paid to the laborer who cultivates it. And the result of our system of revenue, I think, is that the burden of the cost of governments falls too heavily upon the laboring man.

### CORPORATIONS: THEIR RELATION TO WAGES.

I understand that a great deal has been said here on the influence of corporations, and the combination and aggregation of capital in corporations on the employment of labor; that it rests with the corporations,

Digitized by Google

they being the principal employers, and railroad corporations, more especially (they being the largest employers), to establish and enforce a low rate of wages. If I am correct in assuming that to be the tendency of the evidence before this committee, it is, in my judgment, erroneous. I think that railroad corporations, and, in fact, all corporations, are paying, as a general thing, better wages than are paid by any other class of employers. That is so in the West. I am not familiar with the rate of wages paid by Eastern railroads, but on the Pacific coast railroad corporations pay mechanics, artisans, and laborers a higher rate of wages than can be obtained from other employers. The employment is more steady and certain and the pay more prompt. Whatever dissatisfaction may prevail in that respect on the part of the employés of railroad corporations, I think, might be obviated if the managers of those railroads could induce or enable their employés to invest their savings in the shares of those companies. There is nothing that tends to satisfy a workingman quite so much as to feel that he has a personal interest in the result of his labor beyond his days' wages. But unfortunately, as matters now exist, the laborer has no confidence in the outcome of the property that he works for, and feels, as the public generally feel, that by becoming a stockholder in a railroad he will not get that portion of its earnings which the stock that he holds would entitle him to. I do not know that the committee care to have me go into that subject.

The CHAIRMAN. I think that is an important aspect of the matter, and would be glad to have your views in full.

### REPORTS OF RAILROAD COMPANIES.

The WITNESS. It is one of the crying evils of our time that the people of this country have not confidence in the managers of the principal railroads. They do not think that any minority stockholder is supposed by the majority to have any rights which the majority are bound to respect. The only remedy that I can see for this is, to compel the president or other responsible official of every railroad company, to make monthly reports of the exact condition of the company; and to visit with severe penalties a departure from the truth in making such reports. It should also, in my judgment, be made a very serious, indeed a penal offense, for any director or responsible manager of any railroad or other corporation to "short" the stock of that company. When a company is prosperous and the insiders desire to buy more stock, they have a means by false reports of depressing it; when it is not prosperous and they know it, and the public do not know it, they are enabled, by giving false reports, not only to sell the stock that they hold, but to sell stock "short," as it is termed, with the anticipation that when the true condition of the company becomes known, they can buy it in again at a lower price. I do not know whether the committee understand these stock terms which are best known to the initiated in such matters in that dangerous portion of our country known as "Wall street," but my last remark will probably make plain the evil that arises from "selling short." Such dealing as that with corporate property certainly ought to be prevented by the strong arm of the Federal legislature.

Q. And your suggestion is that there should be frequent and truthful reports required by law, and heavy penalties enforced if the law is not complied with?—A. That is my suggestion.

Q. You think that if the light is brought to bear on the matter, and the public have the facts, they can take care of themselves?—A. I think the railroads of this country ought to be generally in a prosper-

Digitized by Google

ous condition. This is a large and growing country. Each railroad has an army of men working for it. I think it would conduce very much to the contentment of these employés, and to the good order of society, if they were enabled to become interested in their work, as I have said, beyond their wages. If they could feel that they had some sort of ownership in the property on which they were working, which they might well have, and if they could have confidence in its management, it certainly would give a better outlook for the workingman, and make him more contented.

Q. Do you think that upon the wages which are paid by corporations in your part of the country (and throughout the country at large, if you have knowledge of it), the laboring men employed by the railroads could save enough to invest anything in the stock of the company after providing a living for themselves and their families?

CALIFORNIA SAVINGS BANKS.

A. The savings banks of California have deposits amounting, I think, to nearly twenty-four million dollars at this time, most of which is owned by the laboring people of California. I should say that fully three-fourths of all the deposits in our savings banks are made by the laboring population, and when you come to consider that the population of the whole State of California does not much exceed 800,000, you will realize what that means. In addition to that, a very large percentage of our laboring people, and especially in the towns adjacent to San Francisco, own their own dwellings.

It is somewhat curious that there should be such an outcry here of there being so much unemployed labor, when the northwest coast of this country is actually suffering for want of it.

WAGES IN CALIFORNIA.

All wages in that section have advanced within the last twelve months from 10 to 25 per cent. Mechanics receive now from a half to a dollar a day more than they did last year. Farm laborers are paid this year $5 a month more than they were last year. I am paying those increased wages myself.

Q. What is the cause of an increase of wages on that coast when there is a depression on this?—A. Well, it commenced three or four years ago; first, in the political disturbances there, in what have been known as the "Sand Lot" disturbances, when a "gentlemen" by the name of Kearney came to the front, thinking he could form a new political party, or a new dynasty, in this country. A great many mechanics then left in consequence of the great disorder created there and the stoppage of improvements. Then the demand for railroad building in the Northwestern States and Territories drew a great many mechanics from us, and the country has been growing in all this time, and the white laboring population has not been increasing. Since then there has come what is known as the "Chinese Restriction Act," which has prevented the landing of any more of that class of laborers, the importance of which may be estimated when it is stated that the Central Pacific Railroad, and in fact all the overland railroads running out of California have been built principally by it. The Chinese have been employed in vineyards and orchards, and that kind of labor is getting scarce. One gentleman, largely engaged in the cultivation of grapes in the county of San Bernardino, told me a few months ago when I was

Digitized by Google

living there that he was apprehensive he might not be able to pick or take care of his crop for want of labor. There has been a great scarcity of labor there, and it has been with some difficulty and at large expense that the large wheat crop of California has been harvested. Undoubtedly there is to-day on the whole Pacific coast in Washington Territory, Oregon, and all parts of California, a great scarcity of labor.

IMMIGRATION TO CALIFORNIA.

Q. How can that scarcity be supplied?—A. I do not suppose that the labor problem of the Pacific coast will ever be entirely settled, or that the contest between white and Chinese labor there will ever be entirely solved until the Panama canal is completed. When a ship can leave the centers of population of the old world, such as Bremen, Southampton, Liverpool, or any of those ports, with a load of emigrants, and, going through that canal without breaking bulk, can land them in San Francisco at a cost of $35 or $40 a head, which can be done under those circumstances, we can then, I think, procure in California all the labor we need. Until that time the only help we can get is by the Southern Pacific Railroad, which runs from the waters of the Atlantic to those of the Pacific under one management. There has always been a difficulty in getting a laborer who lands at Castle Garden to go to California. We have very frequently made an attempt to induce that class of labor to California, but we have never been able to do it for the reason that they have to run the gauntlet of Eastern cities; and these Eastern roads, with their large business and their desire to locate emigrants along their own lines, have never been willing to consent to "*pro*-rate" at such a price as the emigrant can afford to pay to be taken to California. Now, the Southern Pacific, which is a work destined, I think, to be of very great benefit of California, is under one management. When that is fully organized and equipped—and a line of steamers is to run in connection with it, I understand from the president of that company (Gov. Stanford), from New Orleans to Liverpool—we will probably be able to get a larger drift of immigration into the Pacific Coast States.

CHINESE LABOR IN CALIFORNIA.

Q. I suppose there is a general desire there that the labor of the Pacific should be white labor, if it can be obtained, rather than Mongolian labor?—A. There is no question that everybody would prefer white labor. There is a small percentage of people on that coast (and I am one of the small minority) who do not believe in the wisdom of the Chinese restriction act. The larger part of our people demanded that act; and I must say that I am acquainted with gentlemen usually of great liberality of thought and of great intelligence and education who believe that the presence of the Chinese in that State is fraught with great danger to our institutions, and of great disadvantage to the rising generation. Certainly, however, the condition of the labor problem at the present time is somewhat inconvenient for the people. The Chinese who are there understand very fully that they are not to be supplemented by any more, and they have advanced their views of the value of their services accordingly.

Q. Really, then, the "Chinese cheap labor" is not much cheaper than white labor now?—A. Chinese labor in California is not any cheaper than white labor now, taken altogether. I think if the people of Cali-

Digitized by Google

fornia could get all the white labor they wanted, they would not employ any Chinese.

A great deal has been said on the subject of the desirableness of Chinese labor. I think as a class—as laborers—they are certainly not equal to white people. As domestic servants they are probably neither better nor worse than the run of general servants of that kind which we are able to obtain in most parts of this country, that is, of other foreign help.

THE PANAMA CANAL.

Q. Speaking of the canal, what prospect is there of the completion of that canal; have you any knowledge on that subject?—A. I have been brought in contact with the gentlemen on this side, the bankers and men who handle the finances of that company in this city, and I should judge, from what I can learn of them, there is a very good prospect of its completion, though I think it will take at least seven years from this time before it can be put to any use.

Q. You mean the "Lesseps" canal, of course?—A. Yes, sir.

Q. Is there any prospect of another canal farther north?—A. I do not know; I am not sufficiently informed to answer that question.

Q. But either of these methods of supplying California with labor, especially by way of the canal, looks a considerable time to the future and would not seem to give you any present relief?—A. No, sir.

Q. Seven or eight or ten years is a good while to wait. Now even the Southern Pacific Railroad does not look to supplying the Pacific coast with white labor which will at the same time afford any relief to the laborers of the east; it seems to contemplate a supply being derived from the old world; is that so?

LINES OF TRAVEL AND RATES OF FARE AND FREIGHT TO CALIFORNIA.

A. I think there is now a line of steamers running from New York city to New Orleans which is carrying freight for California, and which line really delivers freight in one week less time than it could be delivered by shipping it on any of the trunk lines running out of New York.

Q. Do you mean that you can ship freight by this water line from New York to New Orleans and over the Southern Pacific to San Francisco in a week's less time than from New York directly across?—A. I think you can send freight directly by the Morgan line of steamers recently purchased by Mr. Huntington and his associates, from New Orleans to California with great regularity in from 15 to 20 days. My experience has been that the average time of shipping by the New York Central or Pensylvania Railroad to Chicago, and continuing from there through by rail to San Francisco, has been about 25 days, sometimes 30. If a road could be made that would carry passengers that way (second class and immigrants) at a price that the laboring people felt they could afford to pay, undoubtedly a great deal of the surplus labor of the east could and would find employment on the Pacific coast. I am not speaking alone of California, but also of the great territory around Puget Sound and taking in all the valleys of Oregon. But, as you probably know, there is a growing inclination on the part of the laboring classes of this country to settle around the large centers of population. They want to be either in, or immediately contiguous to, large cities; and to a laborer who has lived in New York or Pennsylvania, the Pacific coast is a sort of unknown territory. They would almost as soon perhaps go

Digitized by Google

to Africa. There is a disinclination, I think, on the part of mechanics and laboring people to emigrate from the great centers of population.

Q. Do you think that the mechanics and laboring people who really want work in the eastern States comprehend the great advantage of residence on the Pacific coast? A. I don't think they do. I dont think it is understood that a man can labor there every day in the year, despite the march of the seasons; nor that the cost of fuel in one month in this neighborhood is perhaps as much if not more than in a whole year in the valleys of California.

Q. Before coming to the advantages of the Pacific coast to working people, I would like to ask you one or two more questions in regard to the possible facilities of transit there, because it is not of much use to talk about heaven unless there is a way to get there. These people are without means as a rule, and several who have been before the committee have testified that there are a great many who would be willing to abandon this city and other cities if they had the means of helping themselves to transporation. Can you make any additional suggestions in that regard? Is there any probability of competition, now that we have these three great trunk lines; or are they so far apart that they would not make competition practicable?—A. The competition to the Pacific coast is now, or rather will be, active. The Northern Pacific Railroad Company is to a certain extent the competitor of all the other lines; but that will only take people into Oregon and Washinton Territory, and from there they will have to take other lines to California. A new line now about opening by way of the Atchison and Topeka, the Atlantic and Pacific, and the Southern Pacific, runs from Kansas City right to San Francisco over these three roads. The Central Pacific Railroad Company, is at present under the same management, and substantially the same ownership, as the Southern Pacific proper. But I have not the slightest doubt that if a thousand men and their families would go to Mr. Huntington, who is the manager here of the Southern Pacific Railroad Company, and ask to be transported by their steamers and cars by way of New Orleans to San Francisco, he would make a rate for them that they could afford to pay.

Q. What do you think might be done in that way—what rate could be made for passengers? Of course I do not understand that you can speak conclusively.—A. Well, I don't know, but I should say that if I were the manager of that line and could get a thousand well disposed and capable men——

The CHAIRMAN [interposing]. With their families, you mean?

The WITNESS [continuing]. With their families, into a territory where I had a railroad running, while I could not afford to take them for nothing, I certainly would not charge them very much.

Q. Do you not think that in the end, and not putting the end very far away either, it would be profitable to carry them even for nothing rather than not have them go?—A. I do really think so. If they could carry a few thousand people on their line where they could found homes and become purchasers of land which those companies have for sale, it would be very much more to the advantage of the companies to carry them for nothing than not to carry them at all.

### AVAILABLE LANDS IN CALIFORNIA.

Q. Assume that that solution of the difficulty of getting to the Pacific coast exists as a fact; now what chance has a man got when he gets there? How is it about obtaining land? We have a common impres-

Digitized by Google

sion that the good lands of California are in the Mexican grants, and held in large pieces by families; how is that?—A. It is a great deal better for a man to buy land that is in the Mexican grant than to take the Government land. He is much more likely to get a good title in the one case than in the other, unless he goes off from the settlements and takes up some Government land which has not been previously entered or settled upon. There are a vast number of people along in the southern tier of counties—in the counties of Monterey, San Benito, San Luis Obispo, Santa Barbara, and Los Angeles, who are proving every day, before the land officers, their claims to public lands. The northern part of the State has been very little taken up. The central part of the State is mostly held in private ownership. But I don't know to-day of any owner of land that is not looking for people to sell to.

Q. Even in these Mexican grants?—A. Those are the very people who are desirous of dividing up and selling. There are some large ranges of land held by the cattle men which it is, perhaps, more advantageous for them to hold than to sell. But you will find very few men who are cultivating land who are not willing to share it with some one else.

Q. In how small tracts can it be had?—A. In that climate a man can handle 160 acres of land as easily as a man here can 40. A farmer there can work 160 acres with about the same capital that a farmer in Pennsylvania can 40. He requires no barn of any consequence. His grain is harvested in the dry season, and he gets it to market before the rain comes. He does not have to protect his stock from the inclemency of the weather as the Pennsylvania farmer does. The cost of farming, too, has decreased in a number of ways.

Q. What will this land cost him to purchase?—A. That would depend on the locality. Prices are various. You can buy farming lands in California, that is, lands held in private ownership, all the way from $5 an acre perhaps up to $50 in some cases. Perhaps where it is very favorable for the growth of the vine one may have to pay $100 an acre.

Q. What opportunity would there be for making purchases and giving the land itself as security with small payments down?—A. I think there is a great disposition to do that. I know, for myself, I have lands which I would be very glad to divide up in that way and sell on time, without any advance payment, to people living on them and improving them.

Q. What chances would there be of their paying for the lands, so as to hold them ultimately?—A. Well, I have in my mind the cases of two young men who started growing wheat in that State. They bought on one of the lines of the Central Pacific Company 640 acres of land. They made, I think, a small payment that the company required in advance, and within three years from that time the president of the company told me that that land was paid for and the men were several thousand dollars ahead. There have been some instances of great success with wheat growing in the State. Last year many men were made rich by growing hops, because the hop crop failed almost everywhere except throughout California.

Q. You have been speaking of the opportunities for agricultural laborers and farmers there. What population of that description do you think California might absorb, if they were disposed to go there?—A. Well, of course it would have to be done somewhat gradually.

The CHAIRMAN. I mean gradually.

The WITNESS. It would be difficult for me to make an estimate. The capability of the country to absorb agricultural labor is immense. The State is an enormous one.

Digitized by Google

VARIETIES OF CLIMATE IN CALIFORNIA.

I think it has a coast of 700 miles or more. It has a great variety of climate, from mountain peaks over 7,000 feet above the sea to valleys 250 feet below the ocean level. You can leave Sacramento when the roses are blooming, and in three hours you will be in 30 feet of snow in the Sierra Nevada Mountains. We raise every description of fruit that is raised in either a temperate or tropical climate. We have all descriptions of soil and all extremes of climate in that State, and the unoccupied land is very extensive. Probably you can get that information by reference to Federal statistics more accurately than I could give it.

The CHAIRMAN. The difficulty about statistics generally is that they do not give a common man any idea of the land available for improvement. They measure mountains, deserts, &c.

The WITNESS. I am a very poor hand at statistics myself.

The CHAIRMAN. That sort of statistics is not instructive to the ordinary mind; but you think there is plenty of room available to get land, such as a man would want to settle upon, for many thousand people?

The WITNESS. There is plenty of it, sir, in all parts of the country. There is nothing in California which is so much in the market as agricultural land. There is a great deal of such land for sale. Almost everybody feels that he has too large a tract, and is willing to sell some; and the farmers there are generally prosperous, and nearly all of them are willing to realize on a part of their holdings.

AGRICULTURE IN CALIFORNIA.

Q. What do the farmers of California raise?—A. They are mostly wheat speculators. They farm enormous tracts of wheat, and you will see a man with a magnificent field of growing wheat, probably covering 1,000 or 1,500 acres, who does not raise his own potatoes, and gets his hams and his lard from Chicago.

Q. They are brought across the continent by rail?—A. Yes; and it is a wonder if he makes his own butter. Some of them do so, and some others prefer to go to the grocery and buy it. It may not be a popular thing for a man who lives in California to say, but the fact is there are very few farmers there; and the wheat-growers, who are in effect wheat speculators, are not a thrifty race of people. They do not live within themselves as farmers should. If a man strikes a good season there with his wheat, the land being so prolific, he makes a large amount of money; and as a general thing he expects that about one season in five there will probably be a short crop, by reason of the drought.

Q. What is the reason that there is such a lack of diversity in agricultural productions there? Why do not the farmers or those who live on the soil raise different commodities?—A. Because wheat is easily raised and easily handled and finds a more ready market in large quantities. You cannot have a crop so large that you could not handle it at some price. We can send to Liverpool or the European ports $30,000,000 worth of wheat as easily as $20,000,000 worth. We have been sending something more than an average of $20,000,000 worth of it each year, for several years, to European ports.

Q. About what chance would a small farmer have in competition with such men?—A. There are a large number of these men that I have in my mind who will take an immigrant on their places and furnish him with land, house, and tools, and with seed for the first year, and give him a share of the crop for his labor. There is a great deal

Digitized by Google

of that done. I know a gentleman who lives in the county of Alameda, where my house is situated, who has done a great deal of that. Whenever he found a thrifty looking immigrant and his family coming in, overland or otherwise, he would settle him upon one of his farms. In that way a man very soon gets enough to buy a farm for himself.

Q. This class of immigrants, however, would have to be men who understand farming already?—A. Undoubtedly.

### WAGES IN CALIFORNIA.

Q. What opening is there among mechanics and common laborers?—A. There is probably no country in the world where mechanics are better paid than in California. We are paying now for common carpenters $3.50 to $4 a day, and mostly $4; and to men of any extra skill, such as I have frequently employed, we pay not less than $4.50 and $5 a day.

Q. There is constant work all the year round, is there?—A. It is seldom that a man loses a day there. Sometimes in the rainy season, between December and March, he might occasionally lose one. Such a day as this, for instance, when the storm is so considerable as not to allow him to work out-doors, he would lose time, but there are very few days in that State that a man would lose, in the course of a year, by reason of the weather.

Q. This demand for the carpenter, I suppose, extends to all the building trades?—A. To all the building trades, yes, though probably carpenters are more in demand for the reason that most of the structures in that country are of wood, especially outside of the cities. It is very seldom that any body is willing to live in a brick house, outside of a city.

Q. The plasterer, and painter, and plumber, and machinist are needed, I suppose, are they?—A. Yes, they are all needed. We have a great many steam craft running about the coast, and there is still a great deal of mining going on in all parts of the country. All those things that require the services of a machinist come from San Francisco or some one of the towns.

Q. Has there been any tendency of white labor to California since the passage of the act restricting the further importation or landing of Chinese?—A. I have not seen much increase; I think not.

Q And yet the demand has increased and wages have gone up from 10 to 20 per cent., I think you said?—A. Yes.

### WHY LABOR DOES NOT TEND TO CALIFORNIA.

Q. What is the reason why this demand is not supplied?—A. I should think the cost of getting there, principally.

Q. Should you not think that that is an obstacle that business men on both coasts would undertake in some way to remove?—A. We cannot remove it, as I said, on account of the action of those eastern trunk lines; and there is very good reason why they do not consent to the removal of that obstacle. They will not issue tickets or make prices which will interfere with their local rates.

Q. How is that? I do not know whether I quite understand you.—A. For instance, suppose the fare from here to Chicago of an immigrant today to be $10, and the Pacific Railroad lines are willing to transport the passenger to San Francisco for $30, that would be, say, about a cent a mile.

Q. That is, the Pacific Railroad would be willing to transport at a

Digitized by Google

rate which would make the whole cost over their own and the intermediate lines, taken together, $30?—A. Yes. Now, some of the eastern roads have expressed themselves, when this proposition was made, as unwilling to take their *pro rata* shares of that; for the reason that a man would buy a ticket from the east to San Francisco, and would get off at Chicago and sell his ticket to somebody else and probably get as much for it at Chicago as he had paid for it in New York, and in that way these roads would lose a great deal of the profit of their local business in attempting to foster the through business.

Q. Do you think there could be much serious loss in just the transportation of immigrants?—A. Well, my experience has shown that it has made quite a difference.

Q. But there is very little transporation of immigrants, I take it, from what you say?—A. Well, it does not make any difference how many go beyond the termination of the eastern road. It is the interference with the business of these eastern roads that is the trouble. They have no interest in taking passengers on other roads.

The CHAIRMAN. There is a natural desire on the part of those roads, I suppose, to keep the immigrant where he, by production, contributes to the continued prosperity of the transportation lines on this side the Mississippi.

## UNNECESSARY BURDENS OF GOVERNMENT.

The WITNESS. If the committee desire me to express myself fully on this subject, one of the causes that I think acts somewhat disadvantageously to the laboring man is, as I have said, the great cost of government—the large amount of taxes that are levied, and which, in great measure, come out of the earnings of the laboring men. An employer who has to pay a large amount for the support of the Government, all of which has to be taken out of the price he obtains for the article he manufactures, cannot afford to pay as much for labor as where those excessive taxes are not paid; and for that reason it is always an advantage to a manufacturer to have his works located outside of a municipal corporation. If I may be permitted to say so, I think that one of the things that oppresses the whole commerce of the country and retards or interferes with its prosperity is the unnecessary burdens which are laid on the people to support the Government; and by Government I mean every branch of Government, not only the Federal, but the State governments and their various local branches, counties, cities, &c. I do not think there is anything that requires redress or alteration for the general good of all the people in the United States to so great an extent, or in any more important in its results to the laboring population, than that I now speak of. And if Senator Pugh would not take exception to what I am about to say, it occurs to me that you will probably not get exactly the relief that I speak of until we get a change in the administration and get a Democratic government.

Mr. PUGH. I heartily concur in that opinion, but my friend the chairman will not agree with you, probably.

The CHAIRMAN. Well, it seems to be a hopeless remedy to look for. I am afraid that the country will lose confidence in the testimony of the witness. I had begun to think it was going to do a great deal of good.

Mr. PUGH. No. I think that remark of his fortifies and strengthens his testimony very much.

The WITNESS. We want some government that is in harmony with the common people.

Digitized by Google

Q. Won't you give us a little more definite illustration of the excessive taxation, national, municipal, and State, to which you refer; for it is a very important matter. State anything that occurs to you now that should be either removed or decreased.—A. Well, as I have said, I am not very good at statistics. I find that one of the first indications of my advancing age is the loss of memory. I am not prepared to state what the burdens are in different localities, except in my own. I know they are exceedingly onerous there.

The CHAIRNAN. That would be an illustration probably of the whole covntry.

TAXATION IN.

The WITNESS. Perhaps so. If I am correct in my recollection, we are about to collect this year for the support of the State government alone, in Califoroia, with its 800,000 people, something like $4,000,000; but that is simply for the State. Th n we have in addition to that the burdens laid by county governments and by the city or municipal governments. I have no doubt at all that altogether it will amount to probably twice as much more. I may not be entirely exact in my figures, but I think that I am not far out when I say that 800,000 people in California will pay for the support of their government this year about $12,000,000; and I do not think that we are any worse off than a great many other States.

LAND AND LABOR PAY TOO MUCH TAXES, CAPITALISTS TOO LITTLE.

Q. I think you said you thought an unjust proportion of this taxation falls upon the land, and so upon the farmer or laborer.—A. It does, undoubtedly. The great capitalists of the country do not pay their proportion of the taxes.

Q. How would you lessen that evil and better apportion taxation?—A. If a man is worth five, ten, or fifty millions of dollars, and the Federal law says that he can put that into United States bonds and be free from taxation on it, I don't see any way to get at it.

The CHAIRMAN. The amount of United States bonds is somewhat limited, so that that would account for the investment of but very little.

The WITNESS. Then there are various ways in which gentlemen who have personal property keep it from the prying gaze of the assessor or tax gatherer. How that is to be remedied there are probably many persons much more competent than myself (who have never been a legislator) to devise.

INCOME TAXATION.

Q. Have you ever considered the desirableness of an income tax?—A. I have.

Q. What is your view upon that?—A. I think it is a tax of which the largest portion is paid by people of small incomes.

Q. That would depend somewhat, would it not, on the provisions of the law itself? If small incomes, say up to $5,000 or $10,000, were exempted, and the incomes of greater amount than that were taxed, the evil that you mention would not exist.—A. Well, I think it is a tax that never will be approved by the American people. It depends too much upon *espionage* into the private affairs of people to become a popular tax in this country. And it is very difficult for gentlemen of large incomes, when the assessor calls upon them for statement of their last year's in-

Digitized by Google

come to tell what it really was; it has not been realized; it rests somewhat upon conjecture; and in that way a correct return is very often evaded.

Q. Well, if there is to be no income tax, and the burden is mainly on the land, that is an injustice, of course. What other suggestion could you make?—A. I think that if all property, every class of property, were equally taxed, there would be no necessity of having recourse to an income tax.

Q. In what way would you contrive to tax all property equally?—A. Simply by the same process by which men are compelled to tell the truth as to other affairs of life.

Q. Well, is that any more difficult with reference to their incomes than with reference to any other things?—A. No, but what a man has he knows, and what he may be estimated to have made on last year's business is, as I say, at the date the statement is asked for, largely conjectural.

Q. If a man has made a very large sum, he might be willing perhaps to swear that he has made so much and give himself the benefit of the doubt?—A. We used to find during the war that the only gentlemen who gave the Government the benefit of the doubt as to the size of their incomes were those who were in failing circumstances and wanted credit.

Q. I suppose if there were to be a Democratic administration and the people were to be relieved by it, and the income tax were to be the means of relief, you would hardly run some of your former candidates? You would find it necessary to cull a little for candidates?—A. I am not acquainted with the gentleman who is supposed to be the foremost Democrat of the age, and therefore I cannot intelligently answer that question.

Q. Can you make any suggestion to relieve the country, the land owners, or the land cultivators from this unjust proportion of the burden of taxation which they bear?—A. I do not know that I am prepared to speak to the committee on that subject. I never had really thought much about it and probably there are gentleman more experienced than myself who can. I have suffered a great deal from being a large land owner and having to pay more than what I thought was my share of the taxes.

### CORPORATIONS: THEIR BENEFITS TO SOCIETY.

There is one other subject which I would like to mention to the committee (as probably the time is growing short), that is, the subject of corporations. I have seen in the few reports that I have read of the proceedings before this committee that there has been a somewhat general denunciation of corporations. I think that is one of the reasons why things are unsettled in this country at this time. There is no doubt that there has been much in corporate management which calls for redress; much that requires relief; but the usefulness of the aggregation of capital in corporate form I should suppose could not be a subject of much doubt in the minds of this committee. The outcry against corporations, or the objection to the use of capital in corporate form, seems to me to be about as tenable as it would be to object to using a four-horse team, and insist upon requiring that whatever work was to be done by the use of horse-power should be done by each animal singly. The aggregation of capital in corporate form in this country is simply an aggregation of motive power, so to speak; it is enabling men combined to do that which no individual, or very few of the individuals of the country could

Digitized by Google

do alone. If it rested with individuals or with partnerships to build railroads—if men had in their combinations to undergo the risks of partnership business, there would be very few railroads built. The enormous benefit that has been conferred on this country even in the last five years by the building of railroads, it seems to me, should prevent any attack upon the desirableness or usefulness of corporate enterprise. I have no doubt the committee is aware of the fact that I am about to mention, but within the time I speak of—within the last few years, from 1878, to 1882 we have increased our railroad mileage in this country from 80,000 to about 120,000 miles. The earnings of the railroads for the last year—the gross earnings, as I remember them, though I do not intend to be entirely responsible for the figures I give—were $777,000,000. Of that amount $450,000,000 nearly were expended in the operation of the roads. The net earnings are somewhere in the neighborhood of $320,000,000, so that, even bringing it to this labor question that you are inquiring about, you will see the benefit that the laboring people of this country have derived from this aggregation of capital.

### TAXATION OF RAILROADS.

Q. You spoke of land and railroads as the principal sources of taxation. If there is excessive taxation upon the land, would it not be probable that there is a deficient taxation upon the railroads?—A. I think as a rule there is.

Q. Does any way occur to you of remedying that evil—how would you impose a tax to remedy it?—A. The only way is to compel the assessment of a railroad by the same rule that you would apply to the assessment of a farm or the tools or teams of the farmer; by the same rule that my house is assessed it seems to me a railroad should be assessed.

Q. As a rule they are undervalued, you think, for the purposes of taxation?—A. I think, as a rule, the railroads do not contribute their proportion to the support of the Government, but there may be, of course, exceptions to that rule.

### LEGISLATIVE INTERFERENCE WITH RAILROADS INJURIOUS.

A great deal has been said, as I understand, on the subject of legislative interference with the earnings of railroads. I do not know that that subject comes within the scope of your inquiry.

The CHAIRMAN. Yes, it has been discussed before us, and we would be glad to hear anything that you may have to say on that subject.

The WITNESS. For several years I endeavored to promote legislative action in the State in which I live to that end. Nothing was done about it, and in the mean time, in looking about and seeing what had been accomplished on this side of the Missouri River without legislative coercion, and principally by competition, I came to the conclusion that legislative coercion of railroads was one of the mistakes that we had better grow out of. I found, on looking into the statistics of this country, that the cost of transporting a bushel of wheat from the Lakes to the seaboard; or, putting it as exactly as I can, from Chicago to New York, had decreased about 69 per cent. in 14 years; that the transportation of breadstuffs for which we had paid one dollar in 1869, was in 1882 performed for 31 cents, and that the cost of bread had thereby been reduced to that extent. I also came to the conclusion, and especially in view of the result of the legislation in the State of Wisconsin, where what is known as the granger laws were some few years ago en-

Digitized by Google

acted, and which were sustained as being constitutional enactments by the supreme court of that State, but were afterwards abandoned as being in conflict with the more legitimate rules of commerce, that it was unwise and improvident for us to attempt to fix the value of the service performed by railroads. I did not see that we could compel or coerce a railroad to render any more efficient service than we would be likely to obtain from the coerced service of an individual; that if we would reduce the cost of transportation to a limited price, the value and quality of the service performed would in all probability decline somewhat in the same ratio. If you are not willing to pay the price which a railroad demands for an express train, undoubtedly you will have to put up with a slower train. If you fix their rates at such a price that they cannot afford to run trains composed of ordinary passenger coaches, you will have to go back to the old days when they ran mixed trains, partially freight and partially passenger cars.

COMPETITION THE BEST REGULATOR OF RAILROAD CHARGES.

In all respects it seems to me that you would accomplish by competition all that you can accomplish by legislation.

Q. How is it where there is no competition?—A. The very fact of receiving liberal rates will invite competition.

Q. But it may be years, may it not, before it is reached?—A. That is better than to shut the door to all competition by showing that the rates paid to existing companies are unremunerative.

Q. But you would not, for the purpose of inducing competition, permit existing roads to charge exorbitantly?—A. I think nearly every charter of a railroad has a maximum price beyond which the railroad shall not go, and there is an agreement on the part of the carrier not to charge any more than those rates, so that they cannot go beyond the price which their charter fixes.

Q. Yet we know this to be the fact, that in no instance has any railroad made a return of any surplus whatever to any State which has chartered it; but, on the other hand, many of the railroads of this country have vastly increased their roads and enormously increased their accommodations out of the surplus earnings which they have taken from the public by very large charters of fares and freights. Now do you think that that is the right thing for the railroads to be allowed to do, there being no competition?—A. I will answer that by enlarging somewhat on the rates charged from this city to Chicago. Nearly all the corporations which own the different roads running between this city and Chicago have become rich and powerful organizations. They have never made any concession to the public from mere philanthropic motives. They have, however, made that reduction that I speak of in the case of breadstuffs, simply because the competition forced them to do it. If the rate had been an unremunerative rate, there probably would have been but one road to day, and the danger of one road passing through a country always is that it has necessarily great political power. It is the chief employer of labor. Every man employed is a voting machine, and generally votes in such a way as his employer wishes, or the manager dictates, and the result of that is that that company, so far as legislative action is concerned, has pretty much its own way.

Q. But that can be no objection when you would not allow the legislature to act at all; your principle is that the legislature should not act at all, as I understand?—A. Yes; but that does not reach the point at which I am striking, if you will permit me. Speaking of the action of

Digitized by Google

the legislature, with reference to one line, I say the effect of legislative action is to perpetuate the monopoly of that one. If you, by legislative action, put the price down so that other companies are not tempted to come in and compete for the business, you will never have more than one line. Of course where there is but one line, and that the subject of no coercive legislative action, it will not do any business at any lower price than is for its own interest. It will charge such a price as will not check the business along its line; in other words, such a price as will give it the greatest income that it can get. That being the case, the fact that such a company as that exists will bring competition.

### THE PACIFIC RAILROADS: THEIR COMPETITION.

What brought the competition of the Northern Pacific, the Atchison and Topeka, and the Atlantic and Pacific, against the Central Union and Southern Pacific Railroads? Why, the simple announcement all over the country that the Union and Central Pacific had a very extravagant tariff and was reaping a rich harvest. The Northern Pacific was the first line to start in and compete. What was the result? The surplus earnings of the Central Pacific stockholders were used in building the Southern Pacific Railroad. That railroad is certainly a great benefit to the State of California. Perhaps I am not correct in saying that the surplus earnings of the Central Pacific stockholders were used entirely in building the Southern, but the wealth and business standing of the Central Pacific managers gave to the Southern that standing and character which enabled these men to build the road. The value of that road to that State is, I think, much greater than any excess of charges ever made by the Central Pacific on the business of that State.

### INFLUENCE OF RAILROADS ON LEGISLATION.

But coming back to the question. I contend that if the rate of charge permitted by law to a railroad is niggardly and unremunerative, it simply results in the perpetuation of the monopoly of that road, and the time necessarily comes when the corporation gets the better of the public. The corporation exists; one set of men are possibly all the time managing the corporation. In their contests with the public they get to have experience and knowledge of how to handle legislative bodies. Legislators change; the public are not appreciative enough to keep all their great incorruptible statesmen in one place; somebody on the outside usually wants a chance, and the men of experience in legislative bodies are not seen in their places in succeeding sessions. But the railroad men are there, the same men that were there before, and the end of it is, according to our experience, that in the contest between the railroad and the public the railroads are sure to come out ahead.

### GOVERNMENT CONTROL OF RAILROADS.

Q. Might not this be a strong argument for Government control and management of the railroads themselves?—A. Well, I should think that from our experience that would be about the last thing we should want. I certainly say that in that case the remedy would be very much worse than the disease. If such a thing were to take place now, it would certainly postpone the day that Mr. Pugh and the great statesmen of his party are looking for, when the country will return to the better government of the Democratic party; because, if the Republican

Digitized by Google

party ever get control of the railroads, there certainly would never be any change of Government by the usual forms of election.

The CHAIRMAN. Some might think that that would be an additional argument in favor of government control.

The WITNESS. Yes, some might. There are all classes of opinion in the country.

The CHAIRMAN. It strikes me as one of the soundest that you have propounded.

The WITNESS. I have never seen anything done in this country by the Government, from the building of a ship or carrying on of any business, that was not and could not be as well done by individuals.

Q. You consider competition the best regulator of the public interests?—A. I do.

I would like to say, in this connection, that the success which the Government has made of the post-office is often cited as an illustration to show that it would also succeed with the railroads. The answer to that is, that anybody can make a success of a business where they can do it upon their own terms and allow no competition. The Federal Government, substantially, takes at its own price—at what it chooses to pay—all the facilities for doing its postal business, the railroad cars and motive power of all the railroad corporations of this country, and compels the companies to carry mails at just such prices as it is willing to pay; but if it had to pay the same rate for the use of cars as private individuals pay—in other words, if the postal service of the country was paid for at the same price that all other business is paid for on railroads—there is a strong probability that even the Postal Department would not be a success.

The CHAIRMAN. I do not think the country usually stops to consider how the mails really are transported. There may be other points which you have to suggest, and if so we should be glad to hear you.

The WITNESS. Well, if I have not exhausted the subject, I must certainly have exhausted the committee.

Mr. PUGH. Not at all, sir; we are glad to hear you.

### IF GOVERNMENT MAY REGULATE RAILROADS, WHY NOT REGULATE OTHER DEPARTMENTS OF COMMERCE?

The WITNESS. I was about to say, in reply to the chairman's last remark about the benefits of competition, that there is another view of the subject of legislative interference in the affairs of railroads, and that is this: In the first place, it is very inefficient when done by States. The business of all large railroads runs from one State to another, and the jurisdiction of the State legislature is confined within the lines of each commonwealth. If there is to be any serviceable interference at all, it must be done by Federal action, so that there can be one tariff upon the whole line of one railroad. But the great danger of this whole matter, as it strikes me, and as I would like to suggest to you gentlemen, who are the representatives of the leading branch of the Federal legislature, is, that when you once commence to interfere by legislative action with private business, it is difficult to tell where you are to stop. It has been often said that the application of steam to the carrying commerce of the world has revolutionized everything and demands some new departure in the making of contracts between carrier and shipper, some different mode of regulation and supervision from that which pertains to the ordinary affairs of life. But look at the practical result! When you have said that the carrier should do its business at a given rate,

Digitized by Google

must you not in terms provide at what rate it shall be able to get the means whereby it does that business? When you have fixed the service of a carrier by legislative enactment, should you not at the same time fix the cost to him of the carriage, the fuel, the rails, and locomotive power with which he peforms this service?

Take this other view of it. You say the passenger should be protected from corporate imposition, and therefore you enact the rate that he should pay for being carried to his destination. The legislature of Illinois has been asked to go beyond that. It has been asked to say what price he shall pay for his bed while on the road, how much the Pullman Company shall be permitted to charge him. I do not know but what that is the natural result of regulating the cost of his passage. If he needs to go to sleep on the way, that ought to be regulated also. It would be of very little use to protect him from the rapacity of the railroad corporation if you allow the sleeping-car company or the bootblack to take what is left.

Now, when you have done that, and he arrives at his destination, should he not be as much the object of your solicitude in protecting him from the extortion of the innkeeper? Certainly you have done him but a very inadequate service, having saved him from being charged a large price by the carrier and the sleeping-car company, if he is to be turned over, unprotected, to the mercy of the men that he is compelled to board and lodge with. Then, again, after you have done that, he will say to you that the usages of society require that he should be clothed, and he will want you to make some contract for him with his tailor, and when you have done all these things, the question comes, What is to become of the people who are thus regulated in their employment of labor? Are they to be compelled to pay just what the laborer exacts from them, or will you regulate that also? It must logically follow that you cannot stop short of that, and that you must enact how much each day the laborer is to receive. And having accomplished that, and having got at the final post in your journey, what has become of your republican form of government? In what better position have you left the American citizen than the Russian serf?

Q. Then you object to the provision in these railroad charters limiting their charges to 10 per cent?—A. I do not object to any contract or condition the carrier chooses to make.

Q. But if you confine your principles to those which you have enunciated, do you not necessarily say that the provision that they shall be limited to 10 per cent. is an injust and unrepublican principle to set up?—A. Not if it is contained in the original charter. Whatever contract a railroad company or individual chooses to make, let him make; but what I contend for is this, that after a railroad is constructed under a general law of the State or under a special charter, there should be no change in it unless both parties are heard to consent to the change; in other words, I say that the bad effect of that is to stop the construction of railroads and it leads the legislative power necessarily from one step to another until this becomes, not a free Government, but a Government of coercion. When you have attempted to regulate any trade or occupation into which labor enters, it necessarily results that you must regulate the price of the labor. If you do not do that directly by legislative enactment, you do it indirectly; and when you say that the carriers or the manufacturers who are the principal employers of labor in this country, shall not receive more than a given sum for the service performed or the article produced, you have in that enactment said that they shall not pay more than a certain *per diem* for their labor.

Digitized by Google

Q. Suppose that to be so, do you not recognize it as a truth that in every charter, whether expressed in words or not, and as a part of every charter or grant of franchise of every description which is the basis of effort or of service to the public, the common-law principle that only reasonable charges shall be made to the public for the services rendered, is incorporated?—A. I do.

Q. And that is so whether it is actually written in the charter or not?—A. Undoubtedly.

Q. Then there is the principle of governmental regulation of corporations in every charter belonging to every corporation in this country already, and it is as much there as though every one of them had the written condition that not over 10 per cent. shall be taken?—A. I go farther than you. I do not think we differ in that. I say that every one of these railroad charters of the present day should be read in the light of the organic law of the State in which those corporations are formed, and the constitution of nearly every State now provides that all corporations formed under the laws of that State, shall be subject to alteration and amendment or repeal at the will of the legislature. Undoubtedly that legislative theory is reserved in every charter, but that also is intended to have a reasonable construction. It does not mean confiscation.

The CHAIRMAN. Oh, no.

The WITNESS. And it does not mean the putting down of the price to an unreasonable extent. But beyond that, although that power is possessed by the State, undoubtedly, yet I am speaking of the wisdom of exercising it.

Q. The wisdom of the exercise would depend upon whether there was any abuse or not?—A. Undoubtedly, if there were such a gross abuse as to amount to a crying evil; but I am speaking of a difference of opinion as to the policy of charging one price or another—the question of such tariffs as we know to prevail throughout the country and which we know are not onerous enough to check transportation. I say it is better to leave tariffs like this to the higher law of competition than that of coercion. I do not propose to go back to the decision in the Dartmouth College case, when the law was, as declared there by the Supreme Court of the United States, that there being no reservation of power by the law or legislature in granting the charter, it was a contract that could only be disturbed by the agreement of both parties. Things are different now.

### UNION OF RAILROADS TO DESTROY COMPETITION.

Mr. PUGH. Mr. Fink is the railroad commissioner here, and, in his testimony before this committee, he says that he represents a combination of railroads east of the Mississippi, numbering about forty, and including five trunk lines. He says that that combination was formed mainly for the purpose of destroying competition between the roads entering into that combination. Now, it is just the same, therefore, as though there were but one railroad; and he stated that that was a part of his illustration. He said, substantially, "We want the power over transportation by these 40 roads to be the same as though they were but one road"; it was in substance one of his statements that the object of the combination was to make the rate of transportation the same over the 40 roads that it would be over one. In other words, it was to make the 40 roads one road. Now, when the Government granted the franchise to build these roads—a right that belongs

Digitized by Google

to the public, and which the State holds in trust for the public, and which it granted in trust to these men—do you not think that that is such an abuse of the franchise as demands interference by the State? That is an instance in existence now of combination for the express purpose of destroying the very power that you say will regulate and keep within reasonable bounds the rates of transportation.

The WITNESS. I answer that in this way: that as I understand the status of these Eastern roads represented by Mr. Fink, competition had not only accomplished all that I say, and all that I think it will in most cases accomplish, but that it was necessary for those roads to thus combine, not to the detriment of the public, but really for its benefit; in this: competition was so great—so violent, that it actually disturbed the due regulation of commerce. The man who had to make a price for his goods at a given point had no fixed rate of freight. He found that if he went to one road and got a price, his competitor in business went to another road and got a price much under the price named to him, and the consequence was that he was undersold and deprived of his business, or if he shipped his goods to a certain point, he found that somebody else had shipped goods there cheaper. It was found that the value of the railroads to their stockholders was being destroyed. You have seen from time to time small panics in different stocks which resulted from lowering the cost of carriage to an; unremunerative figure; the holders of these stocks, seeing these panics coming on, would throw the stocks on the market to sell them at any price they could obtain, and it necessarily resulted that these railroads were bound to come together and make a price. It is not effective, it does not, as I understand it, produce the result intended; because there is always some one road or another that thinks it is not getting its share of business, and it cuts under those prices. But the fact of the existence of that pool that Mr. Fink speaks about is, I think, one of the strongest arguments that can be used in support of my position. It shows what competition had accomplished, and it had not only accomplished all that, I say, but had accomplished more and had gone beyond any healthy result. The fact of your making a tariff for these roads would not prevent that result, because those roads have been doing business under the pressure of a fierce competition and struggling to get the advantage of each other, at a price that no legislative body would ever think of fixing.

### DISCRIMINATION IN RAILROAD RATES.

There is one point, however, that I would like to call attention to that I had forgotten, where I think legislative interference in the affairs of corporations would be wise. You speak of charters being given to these railroads by legislative bodies in the public interest. All railroads have great concessions; every railroad has delegated to it the highest attribute of sovereignty—the right of eminent domain—to take your farm and mine, without our consent, for the purposes of a railroad. It is necessarily intended, of course, that under any intelligent Government such privileges as that should sound in the public interest, and the abuse to which we are subjected in the railroad interest, and which, I think, should receive the attention of the Federal and State legislatures, is the practice of discrimination. The prevention of this is more important than the regulation of the tariff. It rests with the rail oad company to-day, having control between any two commercial points to confer a privilege upon any merchant not second to any of the privileges that were granted in the days of Queen Elizabeth or King James.

Digitized by Google

A railroad company may be so situated, and many of them are so situated, that they say to one man, "You shall have the selling of all dry goods sold on our road, or at such place; we will give you special privileges which will enable you to control that business." They can say to another that he can sell all the iron sold along their road. Those are things that I think require legislative attention. I have in my mind a recent case, "Evershed against the London and Northwestern Railroad Company." In that case the House of lords (the Lord chancellor delivering the opinion) laid it down as a principle of law that all these highways were organized and built with the consent of Parliament for the public good, and that every subject of the sovereign had equal rights in their use, and should be served in the order of their application, for a like consideration. And in that case it was decided that where one man had paid more than his neighbor for the service performed, he was entitled to recover back the difference. That would be really of great service to this country. It would take from these corporations a power which is a very great one, and which I think has been abused in some instances—to how great an extent I do not know at present; but it is too great a power to leave in the hands of the men controlling a leading railroad.

Mr. PUGH. Mr. Fink said that this combination had been effected to stop the same result which you said was the evil—that is, cutting the rates.

The WITNESS. It disorganized commerce to such an extent that men could not foresee the result of their business with any safety.

Mr. PUGH. Mr. Fink also said, and Mr. Medill gave instances of the fact, that in the transportation of grain from Chicago to New York, the rate had been changed within a very short time from 20 to 25, and from 25 to 30, and from 30 to 35 cents per hundred pounds; that it had ranged all the way from 20 to 35 cents per hundred pounds, and that even by this combination this evil has not been remedied. The difficulty suggesting itself to my mind in the Government undertaking to fix a maximum rate that does not interfere with the right of the road to undercharge that rate, is that these same evils would be worked in all instances where we undertake to fix a maximum rate—say 30 or 20 cents a hundred pounds. That does not take away the power of carrying it for 15 or for 10 cents.

The WITNESS. I do not think there is any difficulty at all in fixing a maximum rate.

Mr. PUGH. That is the extent of the power?

The WITNESS. Of course the power exists; but my idea is as to the general public utility of legislation of the character referred to.

Mr. PUGH. Your views have been the views that have caused the Government to delay interference up to this time.

The WITNESS. If you will look over the history of railroad legislation, you will find that the maximum rates that have been fixed by legislation have always been above the rates that the carrier has found it for his interest ever to charge.

The CHAIRMAN. The New York Central Railway charges, I believe, the rate that the statute provides—two cents per mile, does it not?—A. Yes, it does; but that probably proves the strength of the rule; that is a road of very low grades, through a well-settled country. It is the exception. That was agreed to in consideration of certain privileges which were allowed. That is a contract which the road and the State made.

The CHAIRMAN. But it is one which is profitable for the road to abide by?

Digitized by Google

The WITNESS. I don't know; in some cases not. I believe, however, that the lowest rate that a railroad can reasonably charge is the most profitable in such a community as this. That, of course, will not extend all over the country, because it must have reference to the bulk of population. A rate that will pay in New York for trains running out of New York, would not pay for trains running out of some interior town. For instance, if you take the charges in our State: the Central Pacific Railroad Company charges, for a distance of about 100 miles, from San Francisco to Sacramento, $2.50 for passengers on their first-class express trains. The Pennsylvania Railroad charges, if I am correctly informed, the same rate for a single passage from New York to Philadelphia, selling you a return ticket, I think, for $4. The distance from here to Philadelphia is 88 miles; but the Pennsylvania Railroad carries 100 passengers every day on its express trains for every one passenger that is carried on the Central Pacific. Therefore you see that while the Pennsylvania Railroad could probably with advantage to itself, and while increasing its net income, reduce its rate, the Central Pacific, not having the same facilties, could not afford to reduce its rate.

By the CHAIRMAN:

Q. Which road carries the fullest trains?—A. The Pennsylvania Railroad.

Mr. PUGH. Another one of the provisions of this combination was that the power of the combination was exercised only over roads where there was competition. As to the local freights, there was no interference at all by the combination, no interference with the power to charge what they pleased unless they were in competition with other roads. Wherever they had the power they retained it. That shows that they only did this wherever there was competition. And Mr. Fink called the through freights a mere incident of the road, but I believe he qualified that.

The WITNESS. Well, every first-class road has its most valuable business in its local traffic.

Mr. PUGH. That is the source of complaint, and it is at that that the Reagan bill, of which you have heard, no doubt, is aimed and undertakes to reach.

STATE RAILROAD COMMISSIONS.

The WITNESS. I think if there is to be any legislative interference at all with railroad charges as to the railroads running through more than one State, it should come from Congressional action. If State legislatures persist in passing laws embodying the views of each State, the chances will be that there will be a great deal of trouble. It is really controlling the commerce between the States.

By Mr. PUGH:

Q. What do you do with the fact that in every State that I know of where railroad commissions have been created by the legislature, for the purpose of controlling freight and passenger rates, the system is working successfully, and even giving satisfaction to the roads?—A. You are very much more apt to be correct than I am. All I can say on that point is that your knowledge on the subject is much better and different from mine.

Mr. PUGH. I know that in South Carolina, Georgia, and Alabama there seems to be no difficulty; the commissions and the railroads work harmoniously and give general satisfaction to all parties, the public as well as the railroad companys.

Digitized by Google

The WITNESS. If that is so, it shows that they have very intelligent commissioners.

Mr. PUGH. I think they have.

The WITNESS. But in nine cases out of ten you will find that the men elected as railroad commissioners, to manage or control the destinies, income and the business of great railroad enterprises involving millions of dollars each year, are of that caliber that you would scarcely employ them to transact your private business.

Mr. PUGH. No doubt the power of control ought to be exercised with great care and wisdom.

The WITNESS. I think it should be in the hands of men of national reputation, and of great scope and knowledge of the subject—men having both the character and knowledge necessary; and that can only be done by leaving the whole subject within the jurisdiction of the Federal Government.

The CHAIRMAN. This will close the taking of testimony orally in this city, for the present at least. We have received a large number of communications from persons anxious to testify, but the absolute necessity of going elsewhere and taking testimony in other parts of the country will prevent our hearing them. We have received many valuable communications, and any person desirous of laying any matter before the committee, or of suggesting any fact, can do so in writing and we will receive the communication and give it attention with the rest of the testimony. The hearing is adjourned for the present.

---

NEW YORK, *August* 30, 1883.

## FOOD AND GAS REFORMS.

### *STATEMENT OF JAMES CRUTCHETT.*

#### FOOD REFORM.

*To the Hon. the United States Senate Committee on Education and Labor:*

It was intimated by your esteemed chairman that I might write in reference to food reform and education thereon, and also the gas reform in which I feel interested. Allow me to send the following synopsis of my views pertaining thereto, together with pamphlets and circulars in print, for the use of your committee.

In reference to food reform and education thereon, as this specially pertains to the masses of the people, their health, contentment, and homes among the whole country, allow me to quote Charles Lane's advice, at the vegetarian congress in Eisenach, Germany, recently: "Make one vegetarian home happy and healthy on the least possible income; show the poor how the poor can live, for home must be the center of all reform." That this might be generally known, it is suggested that in addition to more general public education, there be established by the Government "a department of agriculture and food reform," by means of which the knowledge of the nutriment of all kinds of cereals and fruits might be made known to every citizen. These productions were created by the Infinite Divine for man's use, for which, when man was created, the Lord said to him, "Behold I have given you every herb bearing seed which is upon the face of all the earth, in which is the fruit of a tree yielding seed. To you it shall be for meat." This is the first commandment given to man (Genesis 1, 29). The infinite and perfect

Digitized by Google

Creator of all things thus created the best food for us, and if we obeyed Him man would become an herbivorous man of peace instead of carnivorous man of contention.

The masses of mankind in the United States and Western Europe are carnivorous in food, and are worse than beasts in allowing evil habits to rule over their natural senses, raising animals in order to kill them and eat their dead bodies, fabricating epicurean modes of compounding such which poison the blood, induce disease, lead to the making and using of intoxicating drinks and narcotics, which have come into general use for food, drink, and indulgence, inflaming the sensual organs to selfish, wanton, evil lives, and worldly gratifications; thus rendering their votaries senseless to the use and enjoyment of elevated, rational, moral, and truly religious qualities of the higher order of mind and life. This life of "carnival" costs three times as much as a proper, healthful, and most enjoyable life on food made for man's use, not to mention the waste by contention and costly government to preserve social order. It causes the slavery which comes of ten to seventeen hours of daily labor to keep the society groveling through life instead of the few hours, labor which under right conditions would be necessary for happiness and peace, for enlightening the minds of men, and teaching them to love the Creator for all his blessings, as well as for helping the neighbor on whom affliction has fallen. The reform in food will be followed by reform in habits, which will elevate the artisan and mechanic to a higher plane, enabling him better to improve and fabricate machinery for the best uses of man, conducing to the elevation of mankind by dispensing with the necessity for so much manual labor.

### GAS REFORM.

This brings me to specially call your attention to the progress and numerous uses and industries to follow the *gas reform.*

The larger knowledge of science leading to the development of labor-saving machinery and motive power has changed things materially within a comparatively short time. I think one of the greatest developments is the knowledge that the Divine Power created water not only to refresh, cleanse, and make fruitful the earth, but also to be the principal element in the production of heat, power, and light, with a little addition of carbon.

It has not been long known that water became solid at 32°; that at 212° it became steam and expanded in volume over 1,600 times. It is but a few years ago that it became known that water at about 2,200° became fixed elements of hydrogen and oxygen, and that its affinity for carbons of any kind was greater in proportion to the temperature at which they were present. This knowledge developed a large field of usefulness, for which especially these most abundant elements of water and carbon were provided by the All-wise Providence for man's use and enjoyment. The discoverer of the gas to which I refer called it "Atomic steam coal gas" or "Steam carbon gas." It was patented and offered free to Washington, Philadelphia and other gas companies, on condition that the public be supplied therewith at 50 cents per 1,000 feet for light and 25 to 50 cents per 1,000 feet for fuel and power instead of steam. But the slow and "watered stock" companies opposed it by every possible means year after year. The chief engineer of the Washington Gas Light Company, at the seventh annual meeting of the American Gas Light Association, at the Franklin Institute, Philadelphia, October 15, 1879, when addressing them on the new process of making cheap gas

Digitized by Google

said, "We have all heard of the new process. I have known parties in the community in which I live to go to our legislature, which is Congress, and offer to make gas for $1 a thousand when the old company was selling gas at $2.25, and it was only by the greatest effort, influence, persuasion, and exertion upon the part of the old company that the scheme was frustrated. (See the association proceedings of the society officially published, page 223.) Thus, by the opposition of scheming "watered" and ignorant companies, gas reform has been retarded and the public wronged. Washington and most other cities have been paying four to eight times as much for gas as they might with the new and better gas. I offered the Government these improvements (as you may see by the pamphlets and circulars) at low prices, and, if the United States erected works, to supply them at 25 cents per 1,000 feet for light, and 15 and 20 cents per 1,000 for fuel and power, but Congress was influenced, as above referred to, and the Government for their benefit as stated in preliminary syndicate circular, prevented me personally from doing all myself. Yet, notwithstanding the opposition to steam carbon gas (which is seventeen-twentieths to nineteen-twentieths simple water), over one hundred and fifty cities, towns, and places are now making it in various ways, mostly by infringements, and with but little reduction of price. Therefore I have for years made it public to all the principal Governments and people..

There are now over ten thousand gas engines in use instead of steam, mostly in Europe, from the smallest size to over seventy-horse power each. There are hundreds of metal and blast works now using gas fuel alone, at one-quarter the cost of coal. Allow me, therefore, to respectfully suggest that Congress appoint a special committee to inquire into and take advantage of these improvements, as more fully described in the printed documents which accompany this letter.

Allow me further to say that it is only for want of the offering of premiums that portable gas plows and cultivators are not now in use. Yachts, carriages, small vessels, all road carriages, and machinery will ultimately, and that soon, be operated by gas engines. Ocean ships will make the gas they need for power from the elements they travel over. Much more astonishing things than these are being operated on by foreign Governments. The result will surprise society in a few years. There is so much red tape in Washington and inattention in Congress, that I have been led to become a cosmopolitan and to desire all to be benefited who are in a state to appreciate and receve benefit. For what are we? Children of one Heavenly Father, who in the twelfth commandment admonishes us to "Love one another."

Allow me to add that I have felt personal interest in relation to education especially connected with the development of improved agriculture, fruit culture, &c. About twenty-five years ago I was the first to subscribe $1,000 toward the establishment of the Maryland Agricultural College, which, I regret to say, has not progressed as well as it might have done if a Government department had more fully enabled it to do so.

The Divine Creator first prepared man for developing and improving this necessary employment—agriculture; furnished the plant, seeds, and life to animate the material thereof. Agriculture, therefore, is the most noble as well as most necessary occupation of mankind; and the nation which has most individual or family homes and cultivates them has, in a supreme sense, the largest national wealth. Those who engage in mechanical and manufacturing industries save the manual and animal labor of the masses (or agriculturists) and become most useful

Digitized by Google

help, diminishing the hours of agricultural labor, and enabling families to improve in education and knowledge of science, so as to learn how more perfectly to produce the fruits of the field, as well as to attend to the higher rational, spiritual, and eternal associations of man here and hereafter.

The discovery of gold and the labored accumulations of thousands of millions of dollars of specie does not add to the real wealth of a nation, but mostly quite the reverse, leads to investment in land and raising the money value thereof, which makes it harder for the poor man to get and improve a homestead. The rich spend their money for alluring and extravagant things of mere outward show, or for the personal gratification of sensual appetites. Not being producers of food by cultivation of the soil, such men live off the labor of those who work, and as all require to be fed the agriculturists are required to produce for such people (at the cost of more labor) in proportion to the number of non-workers and their aids. In proportion to extravagance and abuse of the body by bad and unnecessary foods, intoxicants, and narcotics, we have disease, immorality, and crime. More than twice the cost of living in social order has to be borne by those who are honestly and industriously engaged. Where education and industrial progress are not encouraged all the evils of opposites will spring up and affect the surroundings. "The devil finds some mischief still, for idle hands to do."

I have had evidence, from my son's residence in China, and travels there and elsewhere, as well as from personal knowledge, of the desirableness of homestead industry. The Chinese, Japanese, Hindoos, and others are more industrious and law-abiding, and have a much higher standard of morality and domestic duties, family affection, and affiliation, than the so-called Christians generally, and as such are more readily receptive of instruction and obedience to those who properly employ or instruct them.

My experience would suggest general education for all and the establishment of an Agricultural Department by the Government.

Your humble servant,

JAS. CRUTCHETT.

*STATEMENT OF MRS. TWITCHELL RESUMED.*

1st. The competition of skilled with unskilled labor: has it a fair chance?—and this involves the trades and labor unions. Are these operated upon an honest and right basis? As at present any man who joins a union is put upon a par with every other member, and demands the same price, and employers are compelled to pay *the* price fixed by the union, whether the work be well done or not; hence the man who has—like one we know—spent years in obtaining a thorough knowledge of his trade, receiving an average of $375 or $380 per annum for seven years, gets no more for his labor as a workman than the man who has jumped into the trade, and knows thoroughly not even the rudiments. Having acquired thorough knowledge, this same man is placed at the head of one of the largest iron works in the country at a salary of $4,000; but, being a conscientious man, he is obliged to resign that lucrative position because those whom he was forced to employ were *not* skilled in their profession. The trades and labor unions also prevent the acquirement of skill by refusing to permit the employment of more than a very small percentage of apprentices, their plea being a desire to prevent overstocking the market with skilled laborers. It becomes, therefore, a question of liberty and right against a monopoly of labor.

Digitized by Google

2d. Wages, past and present. It is assumed that wages have on the whole been advanced equally with the advance of *necessities*. Fast living and high living, that with our ancestors were not known, have come to be regarded as a necessity among the laboring classes of the better sort, emulous of those of the next grade above them, and those of the next beyond. The opulence and extravagance of the millionaire descends by rapid gradation to the cottage, and even to the hut! But, more than this, the pampering of the appetite as tempted by unwholesome food, and still more by unwholesome drink, displayed enticingly at every turn, trenches fearfully upon a mechanic's income. "A liquor store for every thirty families," tempting to the expenditure of "an average of 20 cents per day"—as is shown by statistics—reaches, when multiplied by the number who make this expenditure, into the millions annually. So long as this state of things can be uncomplainingly submitted to, how can the wolf be kept from the door, even by co-operation simply for supply.

3d. Is the division and subdivision of the mechanic arts a benefit?

Machinery performs so much of the labor in the mechanic arts that but comparatively little is left for any but the managers of the machine—emulating in this the (supposed) higher art of politics—and of this little each man is supposed to be capable of performing labor in but one branch of any business—as, for instance, in house carpentry, one man or set of men for the frame, another for each of the different kinds of work, the windows, the stairs, the inside finishing, the outside finishing, so that when each is accomplished this gang must relinquish work until somewhat more of the same kind is prepared. Though there may be advantages in a larger distribution of labor is it not bad economy for employer and employés in the long run to have done, or to do all our building and manufacturing by piece work?

4th. What has already been done for the laboring classes?

Schools, both by day and by night, hospitals, dispensaries, church and private charities, *if properly managed*, it would seem, were enough to provide for the education and care of all who are really and *unavoidably* needy. Drink and dirt are the avoidable but prime cause of extreme poverty, each tending to both physical and moral degeneracy; and a system of compulsory cleanliness is even a more important factor in solving the enigma of human progress than compulsory education. A properly organized board of health properly empowered and ready for duty could do more for the race than even a New York or Brooklyn board of education. Even the crowded tenaments could become homes instead of styes. It is true the poor as well as the rich must contend with the evils that result from adulterated food, but if the money wasted in lager and laziness could be utilized in real co-operation on the basis equality of right, this matter could be regulated and a saving of at least 25 per cent. made, beside the amounts saved from waste in the two I's.

## LAND.

We hear much complaint about the unequal distribution of land. When land or water or air becomes property, and a man has a vested right in either, what just claim has another man upon it so long as he is not prevented from acquiring the same right to either where there is plenty of it? If we put croton into our house, while we do not deny to any the privilege of drinking at the fountain anywhere, where the fluid is free to him, we *do* protest against his insisting that it is his right to drink from the particular faucet we have provided for our own conven-

Digitized by Google

ience; or, when by building the four walls of our house we inclose such portion of the "free air of heaven" as shall be contained therein, we naturally, while conceding to all the privileges of the "free air of heaven," object to the appropriation at any or all times of the particular portion contained in our dwelling. So land should be free, "free as the free air of heaven," or the rain that descends from that locality—free to any and all who can and are willing to appropriate it, redeeming it from its freedom to personal use. Should any man attempt to appropriate so large a share as to impinge upon the rights of others, *i. e.*, to monopolize to such an extent as to prevent others from securing such a lease as they can appropriate and make useful, and particularly to such an extent as to prevent others from any participation, *then* he should be suppressed and boundaries should be marked out for him. While there are thousands, ay millions, of acres waiting to be occupied and improved, there need be no trouble, except among those who require not only the land but improvements to the extent of stock, houses, modern improvements, and full outfit. And there are plenty of these whose highest ambition appears to be to stand around with their hands in their own empty pockets, because they lack opportunity to get them into the full pockets of their more ambitious and energetic neighbor.

### ADULTERATED FOOD AS A CAUSE OF DISSIPATION AND CONSEQUENT POVERTY.

It is a well-known fact that the whole mental and moral nature, as well as the physical is affected by the healthy or unhealthy state of the stomach and digestive organs. Henry Ward Beecher once said he believed a dyspeptic stomach was as much an abomination to the Lord as a lying tongue. In a way this must be true, for not an organ in the body, and least of all the brain, can work normally when the digestive processes are interfered with. Let us draw, then, the legitimate conclusion, when perhaps from one-half to two-thirds of all the food the poor man eats is adulterated with poisons, or at least with admixtures that derange the digestive functions. This leads to the desire for stimulants, and this to poverty and crime. Those who have money can discriminate, and by paying a larger price may have a better chance to get pure articles, though even the "bloated bondholder" is compelled to take his chance in many articles of both food and drink, for the adulterations are not confined to food or the lower grades of drink furnished to the workingman and the poverty ridden. If the Government would strike at the largest root of the tree that bears the fruit of misery and crime, the place to aim at is the adulteration of food and drink, and the sale of market produce and meats that are unfit for consumption. What the rich or those who can choose will not have is peddled out to the poorer classes at reduced rates, and they are compelled to eat *or* die, and the result is they eat *and* die; or what is worse, they drag themselves through a living death.

Speculating in breadstuffs is one of the most damaging in the whole category. It is plainly talked and appears to be well understood that corners are made on cattle and other animals that are brought to market for consumption, and that the market being overstocked, they are held until they are so nearly dead from starvation, or from heat and thirst that they are but one remove from a carcass when they arrive at the yards, and then this meat is put into the shambles for sale, and the poorer classes are rejoiced when, occasionally, the price of meat gives them a chance to indulge even in this life-destroying stuff. The same

Digitized by Google

appears to be true of fruits and perishable vegetables, and all manner of disease is generated by the use of decaying animal and vegetable products. Moreover, the producer is not benefited more than the consumer. The farmer is not taken into the account or into the ring when these corners are made. It is only the stock board and the middlemen, not even the retailer. It is bad enough for the unsuspecting and the uninitiated to lose their money in stock and paper gambling; but we plead in Heaven's name for the coming, in some form, of laws, if principles will not serve, which will stop this dreadful gambling in the most absolute necessities of life for the million. If Sodom could not be tolerated on the earth because of the wickedness of its people, one would almost tremble for the fate of a city or county that will tamely permit such traffic in the lives of men and women, and most of all, little children; for these suffer as the weakest always must, most.

### SPECULATION, BANKS, AND BROKERAGE.

What is there that is not in these days made a basis for speculation? Society, civil, social, and eclesiastic is built upon it. In politics the man that can put the most money or its equivalent into the hands of the party is the man to vote for. Political *principle* is one of the lost arts, and the arts of the present appear to be those that are associated in sacred history with the "wiles" of the gentleman in black who is represented as "going up and down seeking whom he may devour." When an honest man is unwarily entrapped in the political net men fall to wondering how long he will last; and men who have business interests, and who can afford to live outside "the dirty pool of politics," wash their hands clean and white from all responsibility, except to sit with those same clean white hands folded and to wonder and growl at the abominations of city and State and national profligacy and dishonesty. If indeed in this fair Republic our politics *is* a "dirty pool" and it is a matter of congratulation to those who can keep out of it, whose fault is it? Are there more rogues in America than honest men? If so the salvable element is not strong enough to perpetuate the Republic, and, like its predecessors, it is doomed to dismemberment and ruin. If otherwise, and the honest men are in the majority, what are those honest men doing that they allow this domination of the vicious and the unruly? Our papers teem with the scorn and derision of men for each other in the political arena. Whose fault is it that such a state of things exists? Why are not honest and honorable men at the primaries to affect the nominations, and why are they not then at the polls to vote for the best men and so make clean these Augean stables? In society men and women speculate on each other; they buy long on the reputations of the rising man, but are not so ready to sell short on a declining reputation. They jostle and crowd and bid for the one who appears to be able to carry more than his own weight in his social ascent. The church bids high for the most popular speaker, for the man who by any sort of legerdemain can fill the house, sell the seats, and attract the longest line of carriages before the door, and brim the house with the most plethoric pocket-books, until the poor are turned, well, we may say, "out to grass," for the parks and the fields are becoming their only places of worship; and it were *better* so, if only these might be kept for that purpose, or even kept free from the curse of both town and hamlet in these days, the soul and body destroying liquor-stands and their accessaries. The only modifying circumstance connected with this practical ejection of the poor from our churches is the fact that

Digitized by Google

they really lose so little; and yet the churches have their uses, and in spite of the waste and bad management of their charities they do much good. Their missionaries have extended civilization, but much more have benefited commerce, for if the missionary does not in every instance soon become a commercial man he is followed by those who do; and commerce is followed by arts and the higher influences of civilization, and this opens the door for religious sects to promulgate their dogmas, and so we have commerce, civilization, religion. Speculation has come, therefore, to be but the preying of men upon their fellows, ignoring the golden rule.

BANKS.

The bank is too useful an institution to be dispensed with, but when it is made the tool of the speculator and the broker to the extent of defrauding the depositors to secure the speculator, it is time for legal enactment to make that thing impossible. While banks are permitted to issue stock with no security for the stockholder or the depositor except the integrity of the officers, neither the officers or the depositors are safe, for speculators are usually the largest depositors and require the largest accommodations, often upon worthless securities, and then, in the cross-fires of speculation in railroad and other stocks and bonds, the bank is engulphed and the money of the smaller depositors is swallowed up in the general whirlpool of "black Fridays" or some financial cyclone, or the bank may go down with some individual calamity. A gold basis beyond which banks could not go in these loans would protect the public and greatly simplify the business of the majority. So long as any man or set of men can make a bank and transact business by begging or borrowing money or Government bonds enough to realize a small capital, our banking will be precarious and the community will suffer.

THE INDUSTRIES OF WOMEN AND THEIR COMPENSATION.

That what is called "the sphere of woman's labor" is enlarging is true, but it has been achieved step by step, and by the arduous labor of woman herself, driven by her necessities. Being so driven, she has been content to submit to many hardships, much imposition and cruelty. She is having at last some compensation in seeing that men are coming to regard her as something more and better than either a plaything, a machine, or a serf. Her common rights are being recognized, and the thoughtful and the observing of the other sex are awakening to the fact of her needs and her responsibilities, and are disposed to at least cease from determined opposition if they do not actually lend a helping hand. There are yet, though, many wrongs to be righted, many grievances to be redressed, and men have yet to learn that the limit of a woman's *right* is, like that of man, the *limit of her possibilities* in legitimate directions. Ignoring the sentimental nonsense about "the clinging vine" and "the noble oak," "the modesty which covers the face with blushes," whenever woman is driven by her wants to step into the arena of strife with men to secure bread for the hungry mouths that a brutal father has left for her to feed, we pass and take the facts. On the data of statistics there is a very large percentage of what are called "superfluous women," *i. e.*, women who are supposed to have no right to live, because they have no male relative or protector who can provide for her; add to these the even larger percentage of those who *leave*, ostensibly, either husband, brother, or father, who *will not* provide for her, and you have a vast army of unprotected, unprovided-for women.

Digitized by Google

What will you do with them? Under the old theory let them teach, sew, nurse the sick, &c. To carry this out it would require all the producers in the community to become either pupils, invalids, or consumers of the fruits of the needle, and the pay would have to be doubled and quadrupled or the poor-house or potter's field would become the resting place of the majority. Do you ask, What do women want? A chance to do any and every thing that they are capable of doing well, and for it the same wage or pay that men have for the same thing. The privilege, ay, the *right* to go into the marts of commerce, of manufacture, of exchange, and be a woman, and, as such, command at least the share of respect she is entitled to for her womanliness, her energy, and her success. It has ever been true, and is becoming more emphatically so, that women are reconstructionists, as well as conservitors of the public good, for they are always in demand to rebuild what men have thrown down, to repair the waste, and act as pioneers where civilization is to be carried. Are missionaries of any kind required? Women are called in and deemed worthy to take the front rank in subduing heathenism, whether foreign or domestic. Are churches, schools, hospitals, or charitable institutions to be founded? Women are deemed worthy to do the hardest part of the work, receive the smallest compensation, and be satisfied that others shall, like the man whose wife whipped the bear, proclaim to the world: Behold what *we* have done! In proof of what we have said, we refer to the beneficent operations of whatever character in New York and all other cities. But when a woman, to support the children she has borne to a lazy, profligate husband, and the husband himself, often, ventures into the same publicity that is necessary to accomplish *public* benefactions, she hears but the cry of the blood-hounds that yelp at her heels, and the taunt of Amazon! Strong-minded! Masculine! Is this chivalrous, generous, or just? We speak now of the rule, and would take occasion to make many honorable exceptions, which stand out with beautiful coloring against the darker back-ground, because they *are* exceptions.

### THE PUBLIC SCHOOLS.

The public schools, are they conducted in the best manner for the promotion of the highest good of the masses for whom they were ostensibly established? Yes, if it is more important for a boy or a girl who can spare the time for school no longer than to the age of twelve to fourteen, to have a little smattering of French and German, a little drawing and music, and a little of the higher mathematics than a good practical and thorough knowledge of such branches as shall fit them to become artisans and skilled laborers with hand and head. I submit that the curriculum of our public schools when carried out is an actual theft of the time of the majority of pupils, since the ornamental branches are of no service to them, and the time spent upon them is taken from the useful and the pupil is defrauded. Moreover, the schools are so crowded, the classes are so large, that individual instruction is impossible. And this has come to pass partly as the cause and partly as the effect of the introduction of so much of the ornamental. As those who have plenty of time, not being obliged at an early age to commence to be self-supporting, are attracted to these schools—and being free they are by parents regarded as more desirable—they become overcrowded, and, as in everything else, the weaker are the sufferers. Did all who can afford it resort to private teaching, where individual instruction can be given, both public an dprivate schools would be very largely benefited, as better teaching would be possible in both.

MINES AND OTHER NATIONAL INTERESTS.

The development of all the natural resources of the country in the last half century has given an impetus to the progress of art, science, manufacture, and commerce almost unparalleled in the annals of history. Steam and electricity have held first rank. These have cost the country millions and have paid back a good profit, but where has any investment paid as have the mining interests? What came to the front in our greatest peril, and filled the treasuries, redeemed our currency, and put finance in its hour of jeopardy upon a substantial basis like our mines? All other industries must have failed had not the mines poured forth their treasures as a foundation on which to build all other prosperities, and to-day, but for the speculative spirit, legitimate enough, kept within the boundaries of honor and honesty, our mines would be the best property in the country, affording employment to thousands now out of work and dependent upon charity, and filling the coffers of tens of thousands more with substantial wealth. Experiments in railroads, in telegraphy, and all the appliances of electricity would be more successful, and prosperity, which is now only fictitious, because having no substantial basis, would be real and permanent. Now, if it is insisted that the Government must take to itself the most profitable interests of the country and manage them in the interests of the people, why stop at the telegraph? Why not include the still more profitable business of distilling and selling distilled liquors? Why not have Government dramshops, and, above all, why not include the mines, and then there would be a place for our convict and pauper labor. In short, why not declare us all orphans, and resolve the whole country into an orphan asylum and take care of us all as one family, with common rights and common privileges, *but no freedom.* In a little time what strength there is might be dissipated and wrongs endured without resistance.

*STATEMENT OF GEORGE W. SAYRE, RECEIVED IN COMPLIANCE WITH A REQUEST OF MR. SAYRE TO BE HEARD.*

To the Hon. H. W. BLAIR,
*Chairman Committee on Education and Labor:*

DEAR SIR: In accordance with your request I transmit the following:

The true solution of the labor question is this: Workingmen should be paid in their own manufactures; by certificates enabling them to dispose of their goods with one another at the wholesale price. Then, if they did not get fair wages, it would be because one trade would not give its equivalent of labor to another. The Singer Sewing Machine Company might issue $1, $2, and $5 certificates, that would buy a machine at the wholesale price at stores established by the company throughout the country. Congress might pass a law to engrave these certificates, making them a beautiful advertisement for the company, and guarantee that the machine should be delivered. These certificates would add to, or take the place of, our present currency. This is what the Greenbackers want. And then the money-lender would find his occupation gone.

If the shoemakers and hatters would give the equity of a day's labor to each other, 5 cents a day for labor would be as good as $5, and this low valuation would keep out foreign competition. High wages may be a benefit to the rich, who lay up money and draw interest thereon,

Digitized by Google

but to the poor man, who consumes all he earns, it makes no difference whether it is $1 or $5 a day, if he gets the same to eat.

One thousand firkins of butter could be sent to a factory, enabling as many men to take one home, and it would last all winter, besides lending to neighbors and poor relations, who buy by the quarter of a pound and there is no telling how *fur kin* might go by this arrangement.

In these days of consolidation of manufacturing and money interests, and the organizing of laboring men, this plan could be carried out with less difficulty than when society was more isolated.

Objectors to my plan say it is the old bungling system of barter, and would not work in this progressive age. But they forget that in the days of barter the goods were made in the same bungling way. Every man made his own hats and shoes, but they gradually co-operated with machinery and capital until now they manufacture to perfection. In those days the workman had two ideas; one, to make his hat, and the other to dispose of his surplus. Now he leaves the disposal to the capitalist and the middleman. If the manufacturer and employé had only co-operated in disposing of their goods, with the same energy and wisdom that they have in manufacturing, they would have long ago solved this troublesome labor problem. Trades unions act unwisely in restricting the number of apprentices, because it tends to make more middlemen, idlers, and criminals, and the workman has to work so many more hours to clothe and feed these classes. Workmen are told that wages are regulated according to supply and demand. They would create a greater demand if they could buy their goods cheaper. The wife would sell her husband's work whenever she bought anything by these certificates.

In our present way of doing business the manufacturer puts $10,000 in a factory, employs one hundred men, and sells to the rich dealer, who, when he gets a large stock, refuses to pay so much for the goods. The employer cuts down the wages and the men go out on a strike for six months, but never take a single thought of selling their manufactures, and the factory is idle and pays no interest.

If workingmen can manufacture to perfection, have they not got brains enough to dispose of their goods in harmony with their employer and his capital, and have the profits of the merchant princes divided among themselves. It would be more to the interest of the manufacturer to sell his goods to one thousand employés than to a dealer, because they would act as clerks whenever they bought anything, and would take more interest in making their goods better and not be so wasteful in the factory, and they would then know whether he was able to pay them more wages or not. Let the wisdom of the world act on these crude ideas, and see if they cannot be made to bear fruit.

The miners in coal and iron, by their certificates, could exchange with the grain producers of the West, and furnish the raw materials so low that manufacturers would have all that the protectionists want. One reason why we are so poorly paid is because so many of our young men, hardly out of the triangular linen-soiled period, want to go into business as merchants. Their time and rent of stores all add to the cost of our goods, and wages are reduced accordingly. These certificates would be safer than a Government coin, for a trade order would not be subject to a discount of 15 per cent. like a trade dollar. Workmen might take some goods home and exchange with one another.

One of the greatest fallacies of the age is the universal execration of the miser as the most contemptible person living. It is said, "A miser is like a hog, good for nothing until he is dead." Why do we spend so

Digitized by Google

many millions to raise hogs and think they are such a benefit, and yet curse the miser, who lives until he is old, while the spendthrift dies from gluttony and dissipations, or blows his brains out before he has lived out half his days. If the miser was held up as an ideal, and workingmen would only try to be like him, it would save them from most of the miseries that they now endure. Only one per cent. of our productions is laid up, and the world appears to be waiting and wishing for the few sensible people, who do lay up anything, to die, so that they may put it out of existence as soon as possible.

The wretchedness of the miser is caused by the covetousness of the world around him, who would murder and rob to get hold of what they despise him for having. There is more justice and charity in taking a warm dinner to some old miser than to give it to those who are spending their wages for rum. People imagine the sufferings of the miser when he comes to die because he cannot take his money with him, but never think of the miseries of the world when they have to part with their money to buy anything with. One only suffers from the getting; the other from the getting and the spending too.

It is easier for 50,000,000 of persons to lay up $1 each than for a Vanderbilt to lay up $50,000,000, but they don't do it. If the workingman was more thrifty he would prevent the accumulation of wealth by the few from interest and the poverty of the many. He could buy more by cash and wholesale and get things cheaper. This buying a pound of flour and a pail of coal is one reason why they are poor. It would set an army of book-keepers and bank clerks to work as producers if men would lay up money and buy for cash, and many retailers would have to go to work too. If this "order" system has been so profitable to the employer why not to the employé?

I do not belong to the Knights of Labor, I do not *belong* to anything; but own myself, as it were.

I hope that employers and workingmen will give these suggestions their most serious consideration.

Yours, most respectfully,

GEO. W. SAYRE,
*Compositor, Newark Daily Advertiser.*

NEWARK, *September* 21, 1883.

---

NEW YORK, *September* 27, 1883.

## INTEMPERANCE.

*STATEMENT OF "DR. CLAUDIUS."*

Hon. HENRY W. BLAIR,
*Chairman United States Senatorial*
*Committee on Education and Labor:*

MY DEAR SIR: No one man knows better than you do the influence of the liquor traffic on the educational status of the United States. Here is a slip cut from your speech in the United States Senate on December 27, 1876:

BEARING OF THE SUBJECT UPON THE EDUCATION OF THE PEOPLE.

Some paper has sneeringly alluded to this proposed amendment as a measure of temperance reform for posterity. Chiefly so it is; and all the voices of humanity cry out for its adoption. All thinking men admit that the condition of posterity depends

Digitized by Google

upon intelligence and virtue, and these are transmitted and developed by the educational institutions and processes of the country, of which by far the most important is the common school; and over that alone has the Government any control. Contrast for a moment the means of education in virtue and intelligence with those which exist for the promotion of vice and crime and misery in this country, and then let those sneer who will at a measure which aims to save posterity from the fate which, if there is no reform, will overtake us in national life, just as surely as the time finally comes when the individual inebriate, whether in the horrors of delirium or the stupidity of the consumed sot, drops into the tomb of despair.

The census of 1870 shows that there are in the United States 141,629 schools, with 221,042 teachers and 7,209,938 pupils, who attend in the aggregate—the average is less—costing $95,402,826. Of these 125,059 are public schools, with 183,198 teachers, 6,228,060 pupils, costing $64,030,673 yearly.

There are 12,955,443 between the ages of five and eighteen years who should be at school, leaving 4,845,505 who do not attend at all. About 740,000 of these are engaged in labor of some kind; but there must be more than 3,000,000 who do not go to school at all. Dr. Hargreaves says that ninety-nine hundredths of them are children of the intemperate, and he makes the following tabular statement showing the relative efficiency of the "two educational systems" as they are operated in Pennsylvania, whose condition is not discreditable in comparison with the country at large:

| EDUCATION IN KNOWLEDGE AND VIRTUE. | | EDUCATION IN IMMORALITY AND VICE. | |
|---|---|---|---|
| Schools, colleges, &c., in Pennsylvania | 16,090 | Drinking-places in Pennsylvania | 23,606 |
| Professors and teachers | 18,783 | Persons employed in liquor shops | 45,490 |
| Pupils and students, &c., in regular attendance | 542,076 | Tipplers and drunkards | 802,604 |
| Cost for educational purposes in Pennsylvania | $8,399,723 | Direct cost of liquors in Pennsylvania | $80,000,000 |

More than nine times as much money spent to destroy as there is to save "posterity" by these two systems. And again he says:

"Though within the last twenty years our teachers have increased from 25 to 30 per cent. and pupils attending school more than 50 per cent., yet crime has increased more than 60 per cent."

Rather a hard look for "posterity," and if there is no change "posterity" better not be there.

This speech is now public property, and as a citizen deeply interested in bettering the condition of the working class, I desire that the quotation in this letter from that speech shall be placed in the record of the present committee.

The working class are dependent on wages for life, health, and enjoyment of happiness, but if a government will not only allow but foster a traffic which robs the working class of their blessings and entails upon the country a misery such as is indicated in the following extract, then, indeed, modern civilization must be greatly at fault.

PAUPERISM.

I cannot detain the House with full statistics from the various States in regard to the pauperism occasioned by alcohol, but not less than one hundred and thirty thousand widows and orphans are left such in our country annually by liquor-drinkers, and from two-thirds to four-fifths of the inmates of our poor-houses are sent there by drink.—[Speech of Hon. H. W. Blair, of New Hampshire, December 27, 1876, in United States Senate.]

If I understand the purpose of your committee, it is that the cause of so much misery among the working class shall, if possible, be ascertained, and as a possible remedy for the evil you have incorporated the investigation of the subject of education, as a comparison with ignorance among this class, and thus hope to find a bettering of the working class by making the educational systems of the country more easy of

Digitized by Google

access. Any sane person in this country knows that we have the best system of popular education in the world, and yet look at the following statement:

CRIME.

The statistics of crime are even more astounding. In the report of the United States Commissioner of Education for 1871, page 541, I find this statement: "The fourth fact is, that from 80 to 90 per cent. of our criminals connect their courses of crime with intemperance. Of the 14,315 inmates of the Massachusetts prisons, 12,396 are reported to have been intemperate, or 84 per cent." Ninety-three per cent. of those confined in Deer Island House of Industry are confined for crimes connected with liquor. "In the New Hampshire prison sixty-five out of ninety-one admit themselves to have been intemperate. Reports from every State, county, and municipal prison in Connecticut, made in 1871, show that more than 90 per cent. had been in habits of drink by their own admission." The warden of the Rhode Island State prison estimates 90 per cent. of his prisoners as drinkers. These relate to those who have been guilty of the more serious offenses, not mere every-day arrests for drunkenness and disorderly conduct.

The report of the board of State charities of Pennsylvania for 1871 says, page 89:

"The most prolific source of disease, poverty, and crime observing men will acknowledge is intemperance."

Mr. William J. Mullen, the well-known and highly esteemed prison agent, in his report for 1870, says:

"An evidence of the bad effects of this unholy business may be seen in the fact that there have been thirty-four murders within this city (Philadelphia) during the last year alone, *each one of which was traceable to intemperance, and one hundred and twenty-one assaults for murder proceeding from the same cause.* Of over 38,000 arrests in our city within the year, 75 per cent. were caused by intemperance. Of 18,300 persons committed to our prisons within the year, more than two-thirds were the consequence of intemperance."

Judge Allison, in a speech delivered in Philadelphia in 1872, says:

"In our criminal courts we can trace four-fifths of the crimes that are committed to the influence of rum. There is not one case in twenty where a man is tried for his life in which rum is not the direct or indirect cause of the murder."—[Senator H. W. Blair, United States Senate, December 27, 1876.]

It follows that, no matter how well you educate, if this curse upon education is permitted the labor of love falls fallow. That which is the "gigantic crime of crimes" must breed lesser crimes for courts and prisons to care for at the expense of the tax-payer. It is true that in a few of our schools throughout this country Dr. Richardson's temperance-lesson book has been introduced, and the studies from this book may, and no doubt will, so firmly impress hundreds of young minds as to make them shun the curse for life, and thus accomplish sober men and women. There is a subject which has not yet been touched upon by your honorable committee, viz: the relation of the intoxicating-liquor shops to the population in great cities. I would suggest that you call the excise commissioners of the cities of New York, Boston, Philadelphia, Chicago, and Saint Louis, and have them tell you how many intoxicating-liquor shops exist in their cities, and give their street localities; then call the chief of police, and ask what kind of people live where the liquor shops are in most number. You will find that where the working class live (the muscle workers) there the hell creating element is most to be found. Look at Third avenue, Fifth avenue, Broadway above Twenty-third street, Eighth avenue, Fourteenth street east of Broadway—intoxicants to be had everywhere; and here the wage-workers are to be found in greatest numbers. Go into our tenement-house districts; every four corners of the streets have at least two, and often on every corner a poison, crime, and misery shop will be found. At the foot of East Twenty-third street, and south from Twenty-third street to Eighteenth street, I have counted twenty intoxicating-liquor

Digitized by Google

shops. Why so many in five blocks? Because the gas works are there and some other manufactories, employing several hundred men. These shops stand between the place of work and the tenement houses on the cross streets, and the wages of these workingmen must pass through these shops on the way to the home (?), and in these wretched places, called homes, stand poor women and children, waiting for the pittance which may escape the fiends of hell who conduct these shops. We who live in better condition, study the problems of life, know very little of the misery which lies at our back door. A government which permits one portion of its citizens to rob, murder, and drive mad another portion, is itself a disgrace to modern civilization.

The source of the "labor strikes" is in the intoxicating-liquor shops.

The source of murder and all crime is in the intoxicating-liquor shop.

The source of ignorance, misery, poverty, and sickness is in the intoxicating-liquor shop.

Gentlemen of the committee, if you can create a system of law for these United States whereby the liquor traffic can be placed on a par with the sale of breadstuffs, and every man compelled to purchase his quota and drink at his home, a step in reform will be made for the working class. This is the way the wage payer drinks his poison, why not the wage receiver? Then if there is misery and crime it is kept back and reformed partially within the sacred walls of the man's castlet. When this has been done, then we can take a step farther. But you say how can this be accomplished? I know there are thousands of villages and towns and wards in cities, the population of which are ready to wipe this traffic out from their midst, but they have no permanent law. When States will pass a perfect local option law, then results will follow; a cause will be created which will result in the effect of prohibition in the whole State. What is prohibition in the States but local option when compared with the whole country? Therefore, why not give us a national local-option law, so strong that it will stick, and the powers of hell cannot prevail against it? Call before you William Daniels, of Baltimore, or some other man who knows the working of local prohibition in Maryland, and he will tell you a worderful tale. The Rev. D. B. Peck, of Brooklyn (Methodist Episcopal preacher), will tell you all about it in the largest detail.

Gentlemen of the committee, when you can control the poison traffic then and then only will it serve you with pleasure to hold such an investigation as you are now making. You are considering now the misery of the working class. Come back here in ten years after the liquor traffic has been beaten back into darkness and you will be enabled to investigate the happiness of the working class. The muscle-worker is not a creature of brains; his intelligence is dull; he is a creature of instinct; he is an animal of higher grade, and where he finds most physical enjoyment there he will seek his pleasure. The poison-shop fills the bill, his brain is rendered yet more dull, and his physical nature is awakened to a kind of enjoyment which, while it lasts, is agreeable, but there comes a reaction, and then the morbid and low instincts of the brute assert themselves, and murder, crime, and misery follow. You cannot educate such minds until you remove the cause of their greater ignorance. It is the duty of Government to protect its people and think for them; but when Government fosters crime, misery, and the crushing out of happiness in the home, and the poverty of women and children, then we can only expect that such investigation as yours will continue until the end of time without result.

Digitized by Google

I do not give you my name, for I fear I might be considered as wishing to air myself before your honorable committee. You, Senator Blair, know better than I do how to bring out the points I have touched upon, and the men and women to send for who can give the country the information wanted to make this subject clear.

With earnest regard,

DR. CLAUDIUS.

---

## PRECAUTIONS AGAINST ACCIDENTS.

*STATEMENT OF W. R. HINSDALE, HYDRAULIC AND SANITARY ENGINEER.*

NEW YORK, *September* 28, 1883.

HON. H. W. BLAIR,

*Chairman Senate Committee Education and Labor:*

DEAR SIR: I wish very briefly to suggest as deserving examination at the hands of your committee certain risks to life and capital through lack of proper education and safeguards.

The specific subjects to which I would direct you are as follows:

First. The establishment of a system of examinations and license for firemen on steam vessels engaged in the carrying of passengers on the waters of the United States similar to the examinations and license now required for engineers and extending to matters in their particular department.

The great number of disasters and their investigation shows that few firemen are properly informed of the nature of the element with which they are working, or of the nature and construction of the appliances for its control, such as the boiler itself, its steam-pressure gauges, recording and others, safety-valves, check-valves, feed-water injectors, or pumps, try-cocks, water-gauges, &c., all of them being necessary and ordinarily used in connection with steam-boilers, and requiring for safety their intelligent management as well as of the fires; and, as a general rule, these matters are really placed in charge of the fireman, though perhaps nominally in charge of the engineer.

The fireman should be of sufficient intelligence to pass an examination as to the internal and hidden mechanism of all these appliances, and as to methods of detecting, so far as practicable, indications of danger, such as foaming, leaking joints and seams, defective rivets, blistered sheets, burned sheets or flues, evidences of corrosion, &c., in their early stages of development, low-water, over-pressure, and in case of over-pressure the danger to be avoided by too suddenly releasing it, and many other emergencies, and as to how to apply the remedy nearest to hand and ward off the immediate danger. In fact, with the present system of management, we can better dispense with the intelligent engineer than with the intelligent fireman.

While we build "floating palaces" and equip them with the highest attainments of science in the way of engines and boilers, and for their nominal management with scientific masters and engineers, yet that "demon of disaster," when it does arise within the boiler, we find has been placed under the immediate supervision of the person least fitted by education to cope with it.

An increased intelligence here might cost the owners a trifle more in salary, but this would obviously be no hardship in view of the economy of human lives, of fuel, and occasionally of steamboats in the line.

Digitized by Google

Another point of great importance, and pertinent to this subject, is in the question of the *legal requirements* in the matter of steam-pressure gauges used on steam vessels in the merchant service of the United States. In every investigation made after the so-called "accident" and "mysterious dispensation of Providence" there seems to be no data nor information attainable (the man who might have known generally being dead) of the actual steam pressure at the time of the disaster, and no absolute record only "hearsay evidence" of the strains to which the boiler may have been subjected in the past, which record, if it does not save this particular boiler, would be useful in discovering the party immediately responsible, and in determning the chances for future explosions, as well as enabling the so-called "inspector" to inspect with a fuller knowledge of the case before him. It is high time that we accept for a fact that *all* mysterious explosions of steam boilers are due to overstraining through the culpable ignorance or carelessness of someone. The boiler was not to blame.

Such "accidents" (?) as that of the "Riverdale" not being in any sense mysterious, so far as the boiler is concerned (the only mystery possible being between the so-called "inspector" and the owners), suggests a preventive at your hands for many possible future disasters in a suitable amendment of the inspection laws, so as to make the lot of such inspectors more uncomfortable *here* than mere dismissal from the service.

A third point, with its attending risks, it seems to me, deserving your attention, is that of foreign passenger steamers being permitted lawfully to leave ports of the United States with their machinery in a disabled and unseaworthy condition rather than to employ American labor for necessary repairs.

It is but a few weeks since one of these ocean steamers was reported to have left this port to cross the Atlantic with a fair complement of passengers, and perhaps of crew, with the machinery in so disabled a condition that the officers are said to have estimated that their passage would be only one-third longer than usual; this was, however, a fair-weather estimate, and had a severe storm occurred, their destination on the other side of the Atlantic might have been peremptorily changed to the under side. The passengers were presumably ignorant of any defect or reduction in the elements of safety of the vessel.

Respectfully,

W. R. HINSDALE.

---

## INDUSTRIAL EDUCATION.

*STATEMENT OF JOSEPH RODES BUCHANAN.*

205 EAST THIRTY-SIXTH STREET, NEW YORK,
*September* 28, 1883.

The immense increase of productive power in the last fifty years has not been very beneficial to the majority of laborers, and it is easy to ascertain the cause.

The productive power of unskilled labor is about half that of skilled labor. Hence unskilled labor must always have the lowest wages that are paid.

In consequence of the lack of industrial education, and the difficulties

Digitized by Google

in the way of apprenticeship, there has always been a great excess of unskilled labor, and the glutted labor markets of the world necessarily reduce wages to the lowest point compatible with the life of the laborer—a condition which holds this class of laborers in permanent vassalage, their children being doomed by poverty to a similar condition.

The very obvious method of relief must be by diminishing the amount of unskilled labor in the market so as to raise its wages, and by converting unskilled into skilled and intelligent laborers enable them to work their way to comfort and independence.

This is accomplished by industrial education, and there is no duty for American commonwealths half so important as providing industrial education for all citizens; for the degradation of intense poverty and wage slavery is incompatible with the existence of a sound and stable republic.

While a complete industrial education thus emancipates the poorest class of toilers, and gives them the dignity of independent citizens, it has a still greater effect in increasing the productive power and national wealth, and giving to our country by superior skill the command of all the markets of the world.

Moreover, a right industrial education puts an end to the commercial convulsions which throw thousands out of employment, and, by keeping all in steady occupation, will add not less than from 10 to 20 per cent. to the prosperity of producers. I mean that a good industrial education will give to each pupil in less time than is required for the study of Latin and Greek, a thorough and skillful command of not less than *five* or *ten* of the most useful arts or trades. Two months of proper industrial education will give much more knowledge and practical skill than two or three years of common apprenticeship, as has been fully shown in the Boston Institute of Technology and other schools. Pupils thus trained and competent to hold the best positions in any one of their favorite occupations, five to ten in number, can never be disturbed or thrown out of employment by any fluctuations of business or changes in the labor market, and unprofitable occupations will be quietly abandoned until their prosperity is restored. Moreover a large number of these skilled artisans will be able to establish business for themselves, and become employers so as to increase the demand for labor.

Regarding industrial education as the panacea for the evils endured by the laboring population, I would add that industrial education is in a certain degree *moral* education, developing, as it does, industry and fidelity to duty, which are not promoted by mere literary education.

Moral education, the power and practicability of which I have shown in my work on "Moral Education," requires the industrial education as its basis. The reformatory schools of Lancaster, Ohio, and other places I need not mention, have fully proved that industrial combined with moral education is capable of revolutionizing character, converting young criminals into good citizens, and elevating youths of the better class to a moral dignity and refinement superior to the conditions of our best society. I refer especialy to the experience of Fellenberg at Hofwyl, and Rev. Mr. Wichern at Hamburg.

Industrial and moral education will place our country very far in advance of all other nations, and rightly applied they will in less than fifty years establish such prosperity and virtue that agitators and iconoclastic reformers will disappear.

JOSEPH RODES BUCHANAN.

## THE KNIGHTS OF LABOR. LETTER OF GEORGE BRAINERD.

5 BRIGGS PLACE, ROCHESTER, N. Y.,
*September* 14, 1883.

*Chairman Senate Committee:*

DEAR SIR: For the last ten years I have been employed by one of the large manufacturing firms of this city. I know much of the greed of employers as well as a great deal of the ignorance that pervades working people as to political economy, &c.; and have such inside facts as convinces me that the Knights of Labor as an organization is an outrageous humbug, and so far as it affects labor at all is injurious to it. The history of the labor party in this city for a year or two past is an interesting chapter, I think, for your committee to consider.

I am not anxious for a ride to New York, but think, as a committee of the National Legislature is investigating the matter, everything giving any light, or that is of interest to the workingman, should be especially looked into, with the end in view of letting them know who are their true friends—if any such there are. I am sure they are not the men who usually figure as their leaders. If you think it worth while, and wish to hear anything more from me, you can address as above.

Very respectfully, &c.,

GEO. BRAINERD.

[Endorsement on the above.]

Please send us a statement in the form of an affidavit and it will be received as testimony by the committee.

Truly, yours,

H. W. BLAIR,
*Chairman, Senate Committee on Education and Labor.*

---

*STATEMENT OF GEORGE BRAINERD, OF ROCHESTER, N. Y.*

I went to Rochester ten years ago, coming next November, and became employed varnishing coach bodies in the Cunningham factory in February following. Have been employed there most of the time since, with the exception of four years, when I was foreman of another shop in the same city.

I believe that the law of supply and demand must always determine, mainly, the price labor will receive for its services. This law may be defied for a time by either capital or labor, but will ultimately prevail. There is one duty, however, which the governing power, or rather the people as such, owe to the laboring classes, the performance of which should no longer be delayed. All necessary laws should be passed for the complete protection of persons working in factories—protecting labor (in matters other than wages) from the greed and thoughtlessness of its employers not only, but against its own greed, as, where children are sent to work at too tender years, &c. Such a law would also protect employers against the results of their own ignorance. There is very "*much of a muchness*" in human nature, whether it dwells in a brown-stone front or a cabin. Ignorance and greed are about equally divided and equally active in the respective spheres of the rich and poor. In view of the rapid extension of the factory system in this country at present, and its undoubted increasing extension in the future,

Digitized by Google

such laws cannot be too quickly enacted. I have no detailed formulation of such laws. They should provide for inspection of all factories and shops, and give authority and power to prohibit the employment of persons in grossly unheathful and unsafe buildings. Such laws have been in operation in England, and would serve as models till we could by experience perfect and adapt them to our own necessities.

The necessity of such laws may be seen from an experience of my own in Rochester, one of many similar ones. The room where I worked (with several others) varnishing was heated by steam. Mornings the atmosphere would be very foul and dead. Had one of the windows open one morning to let the room fill with fresh air and was told by one of the firm that "*if you are too warm turn off the steam.*" No explanations were asked from us and none would have been received if offered. Next day or two was surprised with the window open again. Nothing was said, but in a few minutes up came the carpenter and nailed, securely, strong strips along the casings so that in the future there was no possibility of opening the windows. I think that was a case that called for the revival of the "Society for the diffusion of Useful Knowledge" for the benefit of the employer, and the intervention of the Bergh Society for prevention of cruelty to animals in behalf of the employés. The arbitrary acts of this firm finally, in January, 1882, led to a strike. This strike was ordered from headquarters of Knights of Labor, at Pittsburgh, through its district representatives here. Nearly all (about four hundred) of the men, who had been made Knights of Labor by the active exertions of organizers, left the shop at a given signal. The strike was successful, its demands complied with after six weeks idleness, entailing loss on the hands and firm alike. The success of the strike was not due to the aid the strikers received from the Knights of Labor. That organization failed to keep its promise. The strike was a success because the men were determined to relieve themselves of the arbitrary and unnecessary exactions of the firm, and because their places could not be filled by the firm, who made very strenuous efforts to do so, simply their labor was worth more than they were getting for it.

The ordering of this strike by the authorities of the Knights of Labor was an indefensible outrage on their part; on the part of the men, just enough. Grand Secretary Layton was immediately on hand and said, during his interview with the firm, that the only difference the continuance of the strike would make to the Knights of Labor it would necessitate the employment of additional clerical help at his office—money was no object there. In brief he came there with false smiles of promise on his face and skipped away during the interval between sunset and sunrise with a lie on his lips. I have never known of a case where this organization kept its promises; the recent experience of the striking telegraphers being a fair sample of its workings. The local activity in Rochester two years ago seems to me to have had its origin and stimulus in the political aspirations of certain individuals who exhibited considerable cunning of a not very high degree in working their field of operations. One of these "statesmen" claims to have studied law. Health was so poor had to relinquish his studies. Think this last statement may be true, for the consideration of the sound principles upon which laws are built must have necessarily terribly shocked a system so thoroughly saturated with communism as his. Another "active man" failed to achieve the priesthood in the Catholic church. Still another was a disappointed aspirant to the robes of the Episcopal communion.

The first of the above mentioned with some capacity for speaking, and apparently a good knowledge of the weak points of the laboring

Digitized by Google

classes became the chief beneficiary of these operations, having been elected to the assembly and thence appointed clerk of board of labor statistics created by the State government last winter. To further his ends I think he not only encouraged strikes, but maneuvered to keep them from being settled until after election. I have reference now to the Kelly strike of shoemakers. This strike created a great deal of disturbance, the employers' union going so far as to agree to all shut down if the strike was not ended by a certain day named. A committee of the employers' union and one from employés, Mr. Healy being chairman of the latter, were appointed to meet and come to some terms, if possible. The committees met, but were prevented from organizing for business by Mr. Healy's committee insisting that before organizing the employers' committee should agree to certain impossible conditions. I have not the papers here, but the conditions were published in the daily papers and the comments of all agreed that the blame for failure rested on the labor committee. That, I think, ended negotiations till after election, when other committees met, when the labor committee signed a paper, which was given to the public through the daily press, stating that Mr. Kelly had all along been right and they wrong. The men were then, by the proper officer of the Knights of Labor, ordered back to work. This strike continued through several months. It was an outrage, not only on Mr. Kelly but upon those workingmen who through a sense of duty contributed to the fund out of which the idle hands were paid.

The remodeling of the penal code, or rather the codification of the various penal laws of the State, which went into effect last year, furnished much of the capital of these "labor" leaders, who had done their best to be anything but laborers. They asserted that the penal code was enacted for the especial purpose of enslaving the working man and woman too. The very name penal code came to be a frightful sound to the laborer when awake, and a horrible nightmare to him in his sleep. The interpretation of some of the provisions of the code given by these blatherskite Blackstones was indeed calculated to cause many a poor man to become a convert to the new and beautiful religion of Rev. T. K. Beecher, and commit suicide. At one of their meetings a man—I think his name was Blair, though I may have been misinformed—read this awful code from a large bound book—'twas a fact, an awful reality, binding the "servant" in perpetual slavery to the "master." One of the provisions of this code, read from this book, and soon to come into effect, compelled the servant—and, awful to think, every man who sold his labor was a servant—no matter how he got into his master's service—to wear any kind of uniform or diabolical hat that said master might in his hellishness put upon said servant. The servant not even having the right to quit his master, though he might not be engaged for any stated time. The penalty for violation of this clause was two years' imprisonment.

Another provision of the code related to justifiable homicide. I give you this provision or its interpretation verbatim, as I received it from a person who was a prominent officer at one time of the Knights of Labor, and at the time a member of that order. He is an American born citizen, and has enjoyed all the benefits of American citizenship, and no doubt would love his country dearly but for this unfortunate episode of the general code. But this is the law: "If you should go to your employer and ask for wages and get into an altercation, and he should shoot you, that would be a case of justifiable homicide." All such stuff would be laughable if it were not deplorable that men exist who will

Digitized by Google

take such means to help themselves, as well as pitiful, that men could be found to believe it. That many did believe it I know from the excitement over the matter in the shop, and a deep feeling which found vent in a demonstration consisting of a procession numbering several thousands, and mass convention to "protest" against the enslavement of freemen. In my opinion it is eminently proper for the laboring class to be represented in the legislatures of the States, but these representatives should be men of correct views, and not the Dennis Kearneys, Justus Schwarbs, David Healeys, of former and present times. I am very decidedly of the opinion that drunkenness among workingmen has the effect of keeping wages, in many places, down. Such men are always hard up, and their condition is taken advantage of by employers.

I recall a case in Rochester of a man who had been foreman of a department who worked all one winter for $5 a week, doing a good day's work every day, as he only drank when on a spree. Many such work along for a little less than they would if steady, and others are gradually brought to their level, or have to seek employment elsewhere. A favorite way of cutting wages in some factories is to cut down the hours of work during the fall and winter months, and then by applying pressure get as much work out of a great many as had been done when working full time. All branches of industry in Rochester are active, and labor generally fully employed, and as fully, if not more, contented than for some time past.

GEO. BRAINERD.

STATE OF NEW YORK,
*Monroe County:*

George Brainerd, being duly sworn, says the contents by him subscribed is true of his own knowledge, except as to those matters therein stated on information and belief, and as to those matters he believes to be true.

Subscribed and sworn to before me this 20th day of September, 1883.

J. W. WILSON,
*Commissioner of Deeds.*

---

*STATEMENT OF ROBERT JOHN.*

430 EAST ONE HUNDRED AND TWENTY-SECOND STREET,
*New York City, September* 17, 1883.

The CHAIRMAN SENATE COMMITTEE:

DEAR SIR: I hope that the labor of your committee will be productive of good results, and that you will recommend such measures as you may deem necessary (however radical they may appear to be) to solve the difficulty and relieve the toilers of this country of much pain and suffering. No one class can be blamed more than another for the great discontent, suffering, and misery that universally prevails. As true patriots you can arrive at but one decision, and that that the whole difficulty is caused by great waste of time and good material.

The business of the country should be carried on with the economy that a good business man carries on a business. Our country is self-supporting, and the New York Herald says its work can be done in nine months of the year. A communication to same paper puts it at four months of the year. To keep us fully employed at office, workshop, and labor-field *for the whole of the year* they suggest that we have "free trade," so that after we have done our own work we may have the

Digitized by Google

pleasure of working to keep up tyranny and standing armies in Europe by doing some of their work. It is fair trade we want, not "free trade."

You should appoint or recommend to Congress to be appointed eminent statisticians, whose duty it would be to calculate the amount of time and material necessary to do the work of the country in a substantial and thorough manner.

If, after the work of our country has been done, and it would seem necessary for the health of the community that they, the workers, should be further employed, put them at something that would be the least wasteful, say to hunting or at the tread mill; if the latter, then the power could be utilized for pumping water power for machinery, &c. The health of the people, mental and physical, should be kept up to a high standard; that nation which enslaves its manual laborer cannot retain its liberties nor transmit them to posterity.

Yours, truly,

ROBERT JOHN.

P. S.—I would suggest you accept as evidence Combe's "Constitution of Man," and "Progress and Poverty," by Henry George. As I am a man of family I would not dare to give evidence before your committee, for I know I would be discharged as soon as my employers could find a fitting opportunity.

R. J.

---

*STATEMENT OF CHARLES RICHARDSON, OF PHILADELPHIA.*

THE FATE OF THE WORKING CLASSES.

The pages of history are mostly filled with the annals of those who have held the laboring classes in subjection, and obliged them to work far more for their rulers than for themselves. But enough has been recorded to make us acquainted with the more important facts in the lives of those children of toil whose labors have produced all the necessaries and all the luxuries of human life. They have generally occupied the positions of slaves or serfs or peasants, ignorant and debased, cringing under the lash, and begging only for permission to prolong a miserable existence. But they have occasionally appeared as the famished and frenzied actors in wild rebellions ending in horrible massacres, and in later times the world has seen them organizing strikes and banding together in secret societies which threaten to abolish both nobles and capitalists, and to take forcible possession of the whole earth.

THEIR DISCONTENT.

This smouldering fire of discontent seems the more serious when we remember that it is no longer practicable to make use of the methods by which these hewers of wood and drawers of water were formerly controlled and made to do the world's work. They have listened for thousands of years to their task-masters' favorite doctrine, that the working men have been placed in their inferior positions by the wise ordering of Providence, and that it is their religious duty to be contented, industrious, and submissive to their divinely-constituted superiors. But they have long since ceased to receive such preaching with anything but derision and contempt. Neither can they now be driven to their tasks by brute force as they were when legions of an absolute monarch, or the

Digitized by Google

armed bands of the mediæval knights, could be resorted to for the arbitrary coercion of the isolated and untrained peasants. The soldiers and the police of a republic are supposed to move only in obedience to laws established by the representatives of the majority of the people.

### THE WORKERS ARE A MAJORITY.

It can hardly be denied that employés or those who work for wages or salaries are a majority of the people of this country. They are far more numerous in the United States than those who employ them. They are rapidly becoming organized, and if the efforts to unite them at the polls should meet with any considerable degree of success, the leaders of these dissatisfied masses could secure the control of the Government, and could pass such laws as they might see fit.

If, then, it be at all probable that these new comers in the halls of legislation will be able to overturn the political pyramid in this unprecedented manner, it is exceedingly important that the ideas and theories which they are likely to adopt should be generally understood.

### THEIR SKEPTICISM AS TO AUTHORITIES.

But in order to look at the problems of capital and labor from the stand-point of the workingmen, it is necessary to assume an attitude of doubt and suspicion towards many of the most cherished doctrines of their employers. There is a great deal of intelligence and education among the laborers of this country, and they generally follow men who are perfectly able to understand sound arguments when they are presented with clearness and tact, but it is useless to attempt to silence them by mere appeals to authorities, whether human or divine. They know that Christianity, like all other great religions, abounds in denunciations of avarice, and of the rich men who can only be saved by the most marvelous of miracles. And, on the other hand, if they are asked to bow their heads in submissive reverence before the principles of the most distinguished writers on political economy, they are ready to answer that the worthlessness of those principles is shown by the fact that the world has rarely, if ever, contained so much poverty and misery as at present; and that no hope now remains for the sufferers except in their own efforts. They are evidently disposed to think that it is time for a patient to dismiss his doctors when he finds that they can neither benefit him, nor agree among themselves as to what his disease is, or what treatment should be adopted, and can only unite in urging him to be satisfied with suffering and to attempt nothing for himself.

### INDUCED BY THE CONFLICT OF AUTHORITIES.

It must be admitted that although the pursuit of wealth has always engrossed more of the desires and thoughts and energies of mankind than anything else in the world, there is hardly any other subject in regard to which there are so many hostile beliefs and theories. And this seems the more strange when we remember that the facts to be studied, and the lessons to be learned from experience have always been open to all who had eyes to see with and histories to read. The continual battle between free trade and protection is perhaps the most conspicuous example of these conflicts between the opposing doctrines of political economy, but they all afford numerous illustrations of the

Digitized by Google

manner in which men can be biased by self-interest or blinded by devotion to a theory.

Some earnest thinkers assert that the proportion of the poorly paid and unemployed is rapidly increasing, and that the extent to which men are being replaced by machinery, the labor trouble and socialistic and communistic movements, the "bonanza farms," giant monopolies, and colossal fortunes, are indications of the speedy approach of such wide-spread suffering as must lead to a crisis wherein the old theories of capital and labor will be destroyed as by fire, and society will be passed through the melting-pot and cast into new forms. Others declare that the growth of new wants and the demand for new luxuries are keeping pace with the ever-increasing powers of production, and that although machinery and improved methods may enable one man to produce as much as formerly could be produced by a hundred, yet, the other ninety-nine can still find occupation in new industries, or as miners or machinists or in connection with the handling, storage, and transportation of raw materials and finished products. They allege that whereas in old times a man's food and clothes and shelter were produced on his own farm or in his immediate neighborhood, yet now nearly everything he uses is brought to him from a great distance or from foreign countries, over land and sea, passing through multitudes of human hands and so paying tribute to many who, under the old system, would have been raising food or making clothes, but who are now supported as traders, carriers, bankers, brokers, and other middlemen, of many kinds. Conservative authors denounce every proposition to restrain the rights of private owership, while their opponents declare that it is no longer possible to defend unlimited monopoly on the ground either of a divinely sanctioned right of possession, or of the sacred title of labor to the fruits of its own industry; and they point out that the most remarkable accumulations of wealth in corporations and in private hands have not generally been produced by honest work, but by superior foresight, cunning, or rascality, or by controlling the labors of subordinates who have received but little of the profits.

### FACTS MADE TO PROVE OPPOSITE THEORIES.

We find that admitted facts are seized upon as unanswerable proofs of the most opposite theories, and in times of panic and unusual distress such apparently contradictory prescriptions as free trade and protection, taxation of land and taxation of incomes, hard money and paper money, importation of laborers and restricted immigration, donations of public lands and confiscation of private estates, limitation of production and employment for all by the State, reduction of working hours and increase of wages, laws to encourage trades unions and laws to forbid them, and the success or defeat of this or that political party, are all urged upon a bewildered public as infallible panaceas for the woes of the nation. With all this confusion and uncertainty, it does not seem surprising to the ordinary citizen that political economy has been called "the dismal science," and has become a matter for ridicule and disgust, wherein every man can find evidence and authority for whatever doctrine may seem most favorable for his own selfish interests, but where the average voter may search in vain for the plain unbiased statements and clear impartial reasoning which he so urgently needs. It is natural, therefore, that workingmen who have learned to read and think for themselves should be determined to seek for better explanations and remedies for their hardships than any that have yet been found and ap-

Digitized by Google

plied. And as they represent the great majority of the voters in this country, and are not likely to be turned aside by sneers, threats, or promises, it would seem wise for even the most selfish and prejudiced of the rich to meet them in a spirit of concession, and to join in honest efforts to discover measures so just and fair that they can be united on with benefit to all and ruin to none.

### THE MISSION OF INTELLECT AND PHILANTHROPY.

There has never been a nobler task for philanthropy and intellect than this search for means to lift the masses of humanity out of that extreme poverty which is the begetter of ignorance, degradation, and crime. And if success can be achieved in this, it will make all the other charities of the world seem weak and insignificant in comparison. The discussion of the different plans is rapidly attracting the attention of the public, and there are already signs that it will lead to the general recognition of certain luminous facts in the conditions of human existence which can never be ignored in remedial legislation without failure and disappointment.

### TWO FUNDAMENTAL TRUTHS.

One of these leading truths is that it is only by means of the work of the laboring classes that men can obtain either the necessaries or the luxuries of life. Another is that in order to produce anything for themselves or for others, these laboring classes who till the farms and work the mines and run the machinery, must have access to the lands and materials and factories supplied by nature or accumulated as capital. And from these two axioms it follows that whenever these supplies that are as necessary to the laborer as the air he breathes, can be acquired and absolutely controlled by a portion of the people, the remainder must submit to their terms or starve.

It is by the labor of the machinist that wind and water and fire are made to serve the purposes of man. It is by the toil of human hands that the lands and mines and forests and streams produce for us our food and shelter and clothing. The law of nature that men must either work or starve has never been, and can never be, evaded by any portion of any community, except where the real laborers have been induced or compelled to do the work of the idlers in addition to their own.

### ABANDONMENT OF OPPRESSION BY PHYSICAL FORCE: ADOPTION OF OPPRESSION BY MIND-FORCE.

But the desire to command the services of others and to live in luxury upon the product of their labor is one of the strongest characteristics of our race, and in all nations and at all periods we find that this unhealthy ambition has led the most able or unscrupulous into efforts to oppress and degrade instead of to guide and elevate the masses of the people. In barbarous and feudal times this lust of power and wealth sought its ends with battle-ax and sword, and the wretched and unarmed serfs and peasants kept always at work, and without the training and the time and means for communicating with each other, which might have enabled them to organize in successful revolt, were at the mercy of their masters. With the advance of civilization, however, the absolute necessity for restraining these local tyrants became so apparent

Digitized by Google

that they were gradually compelled to submit to general laws. But instead of being destroyed or even weakened by being thus obligated to abandon the weapons of brute force, the natural desire to achieve superiority and luxury without labor speedily prompted men to lay hold upon the new and still more effectual means afforded by the power of a strong government, and with the sanction of the laws, and by the various methods of speculation and competitive business the shrewd and ambitious proceeded to acquire the wealth which would enable them to control and live at ease upon the labor of others. In fact this last state of the people is in some respects worse than the first, for under the rule of the old nobility a bad master could sometimes be got rid of in the course of a foray or by means of a local rebellion, but the whole naval and military force of the nation is behind the laws which protect the exactions of modern competition. The baron of the middle ages, if he chose to be merciful, could make his dependents comfortable without injuring himself; but the employer of this generation cannot materially improve the condition of his workmen unless he increases their wages, and if he should do this his rivals in business would soon be able to offer the same kind of goods in the market at lower prices, and his bankruptcy would be only a question of time.

### OPERATION OF THE "LAWS OF TRADE" UPON WORKINGMEN.

Modern legislation is largely based upon the curious theory that all men are equal, and that when the wolves and the lambs of humanity are included in one fold the wolves are as likely to suffer as the lambs. But experience shows that this idea is the reverse of correct, and that in communities like ours, where men as a rule are constantly trying to get ahead of their neighbors, the power of the farsighted and unscrupulous to obtain and control an ever-increasing proportion of the resources and products of the nation is likely to be the cause of almost infinite evil.

In order to see clearly just how the poorer classes are injured by this excessive concentration of land and personal property in the hands of a few owners, even when it is still devoted to business purposes instead of being entirely withdrawn from the laborers and used for such private ends as parks and hunting grounds, we must trace its effects under the operation of the laws of competition. No matter how kind and liberal individual employers may be they are generally forced by the rivalry of others to join in continual efforts for reducing wages to as near the starvation point as possible, and to substitute machinery for men as rapidly as it can be done. And although the tide ebbs and flows and there are occasional intervals of prosperity when the demand exceeds the supply, and workmen can hold their own or even secure increased compensation, yet the industrial establishments are so stimulated and multiplied by seasons of tempting profits that they are sure to be followed by years of overproduction, falling prices, and other disheartening but familiar features of panics and hard times. During these periods of difficulty and disaster the workman can offer but little resistance to the tendency of his employer to depress wages and to increase the number of the unemployed by dismissing men, whose consequent sufferings compel them in their turn to aggravate the evil by offering to work at still lower rates. Nor is this the worst, for whenever the compensation of the laboring classes is reduced, their ability to purchase the goods which the employers are always trying to sell is thereby diminished,

Digitized by Google

and as the demand for these goods accordingly falls off, the manufacturers are obliged to lessen the supply by discharging more of their hands, who are thus also forced into the ranks of those whose constant efforts to obtain work at almost any price, tend to bring about still further reductions in the rates of wages. This completes the vicious circle of the operation of those mysterious "laws of trade" that are looked upon by some as being like the sacred ark which it was death to touch.

A little further consideration will show that these excesses of competition, with their attendant train of apparently unavoidable evils, would be checked almost at the outset by the natural effect of declining markets, if it were not for the ability of the employers to keep up the struggle by continually grinding down the wages of the laborers, who can only avoid starvation by working at such rates as the manufacturers are willing, or can afford, to give. If the workmen had any other means of supporting themselves and their families it would of course be impossible to force them to work for extremely low rates by threatening them with starvation; and if they could thus avoid the reduction of their wages they would thereby escape the other evils of poverty and destitution which depend as we have seen upon that first link in the chain of misfortune.

### THE NUMBER OF WORKERS SMALL; OF IDLERS AND MIDDLEMEN LARGE.

Now there can be no doubt about the strength of ordinary men being much in excess of what is needful for the production of the food and shelter, and clothing, which they require. We need only to consider how many people are idlers, or soldiers, or unnecessary middlemen, or sick, or disabled, or engaged in producing articles of mere luxury or pleasure, to see that the really important part of the world's work is done by a small portion of its inhabitants who support the rest. And it is therefore evident that when a strong man who is anxious to work cannot live except by hiring himself out upon such terms as may be dictated by others, it can only be because he is prevented from using the lands, or mines, or factories, without which his strength is useless. If we ask why the poorly paid or unemployed submit to their sufferings instead of tilling the soil or working in the mills, and thus producing for themselves the food and clothing which they need for their own use, the answer of course is that the mills and all the available lands belong to people who would forbid it, and who would call upon the Government to aid them in resisting such an interference with their private property.

### CAUSE OF THE OPPRESSION AND DEGRADATION OF LABOR.

And this brings us to the conclusion that the oppression and degradation of the laboring classes is mainly owing to the absence of any effectual restrictions upon the natural tendency of those who are the most shrewd or the least honest to acquire and monopolize the lands and personal property of each community, and to then prevent the laborers from using them on fair terms, and that unless this tendency is in some way restrained and limited, the evils of poverty and destitution, and the pauperism, and crime, and anarchy to which they lead are in the long run inevitable.

Digitized by Google

### WHAT SHALL BE DONE TO REMOVE IT.

There may be much difference of opinion and discussion as to what remedial methods would be the best and most practicable, but it is perfectly clear that the measures which should be adopted must be such as will to some extent, directly or indirectly, limit or curtail the power of the minority, who have obtained possession of the store-houses of nature and capital, to dictate terms to the majority, who must use them or die. But this plain teaching of common sense is met with the venerable assertions that all attempts to restrain private accumulation and ownership have always been and must always continue to be at once wrong, foolish, and utterly impracticable.

These statements, however, will not bear examination, for in the first place, the teachings of religion and philosophy, and of the greatest lawgivers and statesmen from Moses to Gladstone, unite in condemning the lust for wealth and the unbridled power of land-owners and capitalists. And in the second place, we find recorded in history innumerable instances where wise rulers, or oppressed subjects, have recognized these parents of evil, and have endeavored by legislation or revolution, or by the more modern "strikes" of the laborers, to abate or abolish them, and in proportion to the success or failure of such efforts, have been the prosperity and intelligence, or the poverty and debasement, of the masses of the people. And if it were ever right and wise to interfere with

> The good old rule, the simple plan,
> That he should take who has the power
> And he should keep who can—

it seems strange that it should now be thought wicked and silly to assail the modern adaptation of the same rule, when the only difference is that the "power" now used is that of brains instead of swords. It is a most grievous error to imagine that when the monopoly of the resources of nature and the means of production is effected by business methods sanctioned by law, it is any less ruinous in its consequences than when it was achieved by the massacre of those who ventured to resist.

### PALLIATIVES WILL NOT DO.

During the present century the opening of new territories like those of the United States has averted the most serious effects of this monopolizing tendency, by enabling the overburdened and the unemployed to gain access to other lands and mines and forests, in place of those which they were forbidden to use at home except upon terms of hardship and misery. But the rapid diminution of the unappropriated lands, the enormous accumulations of wealth by corporations and speculators, the continual denunciations of monopolies, and the distress and agitation among the laboring classes, are signs that it will soon be impossible to prevent the workingmen from making very serious changes in our laws. Nor is it likely that they will be contented with such palliatives as "compulsory education," "technical training," or measures to encourage temperance, industry, and thrift, for although these things are admirable and invaluable, none of them can reach the main root of the evil. If you take a few men and change them by teaching them to be temperate, educated, industrious, thrifty, and highly skilled mechanics or business men, instead of the opposite of all these, you will undoubtedly benefit those particular individuals, but, so far as the masses are concerned, you will simply enable your pupils to get ahead

Digitized by Google

of them in the struggle for an undue share of the world's wealth. And on the other hand if you extend these great blessings of wise training to the whole population you will still leave uncurbed the desire and ability of the few to acquire and control a dangerous proportion of the lands and riches of the whole community.

## THE REMEDY.

The object of these pages is to call attention to the fact that there is no longer any possibility of keeping our laws as they now are, and that the only course for sensible people to pursue is to try to lead the rising tide of the labor vote into such channels as will be the least dangerous, and will afford the most chances of doing some good. But the main purpose of the writer has been to show, with as much brevity as possible, the direction in which alone these channels can run with any prospect of success.

## GOVERNMENT INSTRUMENTALITY TO SUSTAIN WAGES.

It may be added, however, that the power of a government to collect money by taxation and expend it for the benefit of the weak or unfortunate is not only founded on moral right and natural justice but also on abundant and almost daily precedent. And there are many arguments that can be urged in favor of using this power to a moderate extent, not with the design of dispensing charity or of supporting the idle, but for the purpose of maintaining fair rates of wages throughout the land by simply enabling the most needy to earn their own living, either by allowing them to use lands or machinery bought and owned by the Government, and teaching them to produce therewith the food and other necessaries which they will themselves require and consume, or by employing them on works of public utility at rates of compensation high enough to enable them to support life, but too low to induce them to injure private employers by deserting them when wages are at all reasonable. If the discharged and unemployed could always escape the scourge of famine by working for the State, the contests between capital and labor would result in just terms for both, because each would be in a position to resist any exorbitant demands from the other. It is not likely that any very large sums would be required. From the very dawn of history it has been the practice of almost every Government to maintain and pay a large portion of the people out of the funds provided by taxation; but the armies obtained in this manner in the past were only used for war and destruction, while the legions of industry would always be engaged in the production of new wealth and the multiplication of the blessings of plenty and peace. The mere adoption of such a system would go very far towards obviating the necessity for applying it, because attempts would hardly be made to reduce wages down to the starvation point so long as it was known that if the laborers were driven to the wall they could always find refuge upon the lands or in the service of the Government.

And it should not be forgotten that any system which will result in universal employment at fair rates, will also be a great benefit to the employers by providing them with customers for their goods. If it should be necessary to protect our manufacturers from foreign competition in our home markets the tariff could be adjusted accordingly, but this point is of course a debatable one, and of minor importance.

Digitized by Google

By the means suggested for protecting the laborers from the last turn of the screw of capital, the power of capital to oppress and degrade labor would be indirectly brought under the necessary degree of control.

OBJECTIONS ANSWERED.

If such methods are objected to on the ground that there would be no way of confining the exercise of such a power within reasonable limits, it may be answered that in this, as in many other matters of vital importance, we have no alternative but to trust to the common sense and experience of the majority of the people. And if it is argued that plans of this kind would lead to infinite theft and corruption among public officials, it can be urged in reply that such evils tend to cure themselves, and to do good by arousing the people to take a more active part in introducing better men and better methods of administration; and also, that if necessary every person employed by the Government could be required to abandon the right to vote until the expiration of six months or a year after he should have left the service.

Other objections can of course be urged, but it is well to remember that under the present circumstances, and in view of the fact that great changes are now inevitable, instead of trying to magnify the difficulties in the way of every plan that may be suggested, it will be wiser to employ our ingenuity in efforts to lessen and remove them.

There are always plenty of people ready to prove that the problems of riches and poverty can never be solved by any power, human or Divine, and their demonstrations are much more pleasant to some ears than the sound of the Marseillaise, but even if the gulf were really impassible it might be better to take the lead and jump than to be suddenly cast headlong.

---

## CAUSES OF IDLENESS: THE REMEDY.

*STATEMENT OF JOHN E. MORRISSEY.*

NEW YORK, *October* 5, 1883.

*To the Senate Committee on Labor and Education:*

GENTLEMEN: As a workingman I beg to lay before you the conclusions which experience and a little study of the labor question forced me to come to. I believe it is widely admitted, and the existence of your committee proves, that our present systems are not the best, and that if this glorious Republic is to be built up and sustained as a great, prosperous, and free community, those in whose hands is placed the sacred trust of its Government will have to take a new departure, and cease to follow the barbarous systems of the effete monarchies of the Old World.

This Republic possesses all those means in the amplest degree which are necessary to make it a land of "happy homes and altars free," if those having the stewardship of those means were only possessed of the brains, the energy, and the *honesty* to make the proper use of them. It is needless to enumerate what those means are; all that is necessary is to keep in mind that land and labor are the two great factors in the production of wealth. This is clearly understood by capitalists, monopolies, and all those corporations and combinations which grasp the source of wealth and fence it around with partisan laws so as to debar labor until that labor is entirely to their advantage.

Digitized by Google

Now, I hold that the best way to settle the labor question is to give an opportunity and to assist the surplus and unemployed labor in large cities to go out on the land. We need not rack our brains a great deal to see that this move would be for the benefit of all classes. Take, for instance, this city of New York. I verily believe that not more than one-half of the labor power (the great factor of national wealth and strength) at its disposal is utilized. Then, what, it may be asked, becomes of the other half. It is this: The unemployed become a burden on those who work. A man who works will often have to keep some friend who can get no work, or that friend must live by those means which degrade mankind and society, and they are either begging or thieving. I hold that seven-eighths of the culprits in our prisons at present are those who themselves, or their parents for them, failed to find a way of making an honest or decent living. Find a way for this surplus labor out on the land and the effect on our cities will be most salutary. Then our food supply will be abundant and consequently cheap. This will benefit *all* classes. We will have cheaper and less crowded, and therefere better, houses to live in. This will benefit the workingman, and will not cause much loss to the property owner; for what he loses by low rents he will gain in the punctuality with which they are paid, and in the cheapness of the necessaries of life, which will arise from *all* labor being employed and contributing to the common wealth. Then, lastly, it will give the laborer who remains in the cities a chance of *constant* employment, instead of the "day now and then" on which he must try at present to eke out a miserable living for himself and those dependent on him. Give our laborers a chance of being constantly employed, and if you do I promise you that in the vocabulary of our working community, there will be no such words as "loafer," "sharper," "thief," "murderer," and that the characters which these names represent must be sought for in some other quarter than in the ranks of *independent* and *intelligent* workingmen.

The question of immigration to this country is one which, in my opinion, requires investigation, and I believe that the time has come when these States can afford to withdraw all inducements whatsoever which are held out to immigrants. Let our Government devote the time and the means which it now expends in maintaining immigration bureaus to the development of increased power in the present population of this country and they will have no need of importing muscle or brain from foreign shores. This foreign element, which has no *real* interest in the national welfare of this country, has been and still is the greatest weapon in the hand of capital for crushing labor. People crushed into slavery in the Old World come here and are contented so long as they enjoy a nominal freedom, having none of that true spirit of republicanism which is necessary to preserve a people from relapsing into slavery, and to give them that intelligence and independence which will make it impossible for any person or party to exercise despotic or monarchical power over a vast community. By all means let all persons be welcome to these shores who come in friendship and at their own expense, but let our Government prevent all other countries shipping their slaves and paupers individually or wholesale to our shores, unless they want to prove themselves tools in the hands of corporations, whom alone benefit by the importation of those people.

In conclusion I will again say that this country possesses all the means which, properly utilized, would make it something like what God intended this beautiful world to be, a world of happiness in as far as man could make it, as he was ordered to, and a world of patience in

Digitized by Google

as far as he could not; in fine, a *real*, not an *ideal*, "Utopia." I would ask the committee to excuse this sheet, as I originally intended it only as a draft, but not having time to put it in proper form, I hope the style in which it is presented, or even the source from which it has come, will not prevent them from considering its contents.

I am, gentlemen, very respectfully, your obedient servant,

JOHN E. MORRISSEY.

223 WEST SIXTIETH STEET, *New York City.*

---

## SOCIAL SCIENCE.

### *STATEMENT OF CLINTON ROOSEVELT.*

Both science and religion recognize the fact as true to nature, that in order to make peace on earth and good will to all mankind, the hungry must be fed and naked clothed, not by degrading charity so much as by giving every man and child old enough to work, and every woman who may seek it, a fair day's wages for a fair day's work. There is nothing in any maxim of the seven wise men of ancient Greece, or in Darwin, Huxley, Tyndal, or Spencer, to compare in practical philosophy with these humble words of honest workingmen, "A fair day's wages for a fair day's work."

But what workingman is sufficiently instructed in political economy or social science to determine accurately whatis really a fair day's wages for a fair day's work? It has not been determined even how many hours' labor constitutes a fair time for work, to make it a day's work.

A cordwainer, as he chooses to be called on some occasions, may inform you that five shoes for women's wear is a day's work, but I have lately read that a pair of woman's shoes has been made complete by aid of machinery from the hides of leather, and the cloth for lining, in twenty minutes. But this fact strikes terror in the parent's heart while hammering on his lapstone. For he is forced to ask himself, What will now become of my poor wife and children, if iron arms can do the work and the machinery requires only to be fed with coal, which may be dug all ready to the hand out of the bowels of the earth?

The free-trader has replied by Malthus that whenever the demand for hands to work falls off, the children in excess of the demand must die. No one has yet demonstrated that if one community can co-exist with ten thousand and not with eleven thousand hands, then to collect the odd thousand and set them to work in another section on some other mines or water power, they may not subsist together as the first have done. For even if the free-trade Malthusian doctrine is true, which I deny, for as I have contended, as I think, conclusively, it is a false appearance, arising chiefly from a defect in the nature of the money of commerce, which may be very easily corrected. The want of education on this subject amongst not only workmen but the politicians of our country only emphasizes the demand for the establishment of an institution to supply the crying want. For it is want that goes abroad throughout the earth like a roaring lion seeking what or whom he may devour. The true name of the devil is want in whatever protean forms it may appear, whether in regimentals or canonicals. All the troubles in the world arise from want of something. But the greatest want of all is understanding of the ways and means of happiness by genius and

Digitized by Google

industry at the right times and places. The ignorant in ways and means would fain have all things in common. But experience has proved long ago that thereby industry and genius are alike discouraged.

All the reasonable wants of man should be supplied by industry and genius, in that order in which wants arise in nature.

The wants of man are all included in three orders of the social science.

First, for the means of subsistence.

Second, for the means of defense.

Third, for the means of refinement.

Under the first order, for subsistence, come:

1. Agriculture.
2. Manufactures.
3. Commerce.

Under the second order, for defense:

1. The military science.
2. Jurisprudence.
3. Hygiene.

Under the refining or perfecting order:

1. Physics.
2. Metaphysics.
3. Politics.

Politics, including all that man can reasonably desire on earth as useful or delightful to him.

Nothing less than this arrangement can be reasonably termed scientific as a social science. Nothing can be safely left to chance, for chance always in the end destroys by accidents. Only a very few are born capable of thinking for themselves and others at the same time. But in a social system it is absolutely necessary that the selfish and the social instincts should be reconciled in the same acts, as with an army in action, every blow the soldier strikes is as much to the advantage of the army and the country he is hired to defend as to his own. But remember he requires to be hired and be paid his daily wages whether conquered or victorious against the common enemy. Human nature and the nature of things require all this to insure success. Without action on this understanding the worst enemies of an association will arise in its own household. It has always been so. Only a very few have been like the great Washington, who demanded only repayment of his own expenses while risking life and fortune for his country. Indeed, necessity as higher law compels even the most patriotic soldier to demand support for his dependent family while he fights the battles of the commonwealth, and what is needed now, as the most pressing need, is the conversion to the arts of peace, that scientific system of co-operation now best known in war. By the division and subdivision of labor no one ever need to lack the means of living, if with skill enough to turn a grindstone or polish up a needle's point. For however far apart the individual's labors may be, or however incomplete alone, all may be united in the end and each will be discovered essential in the grand result. By analysis and synthesis all good things are created. All of science is contained in these two processes. To separate and bring together in new forms of being is the work of genius in all cases. But no one man can do everything alone.

System is required, and discipline. Some may rebel against irksomeness, as the beast of prey, the lion, will hunt only with his mate, and can tolerate no rival in his forest. So the man of prey will still insist on standing out alone until he shows no line of differentialism between the freebooter on the coast of Africa, in supplying the demand for slaves

Digitized by Google

in Cuba, and the free-trader in the use of common money, not for a fair rate of interest, but in order to reap that he does not sow, and gather that he does not strew—a usurer. In government, candidates should be elected only to the lower grades and rise thereafter as in the army or the navy, and learn thus the science and the arts of government together, and, after passing through the various grades, pass out to become judges in a high court for the trials of impeachments and correction of errors.

Taking it for granted that almost every individual has by nature peculiar excellences and defects, and fails in life from having no facilities to take the position in which he may exhibit all his excellence, a court of honor ought to be established whereby every individual may be enabled to prove undeniably that he ought to rise in public estimation, or if placed too high his fellow-citizens may on proper charges prove that he ought to yield up any office in which he may be unfit and take some place better suited to his genius or accomplishments, whether in a university or a penitentiary.

In the fewest words I have been enabled to command I have thus placed my purposes before you. I claim that they are strictly scientific, and that no other can avail to render light the burdens of humanity. I am not in want of anything myself; that is to say, I am not anxious now for either fame or fortune. I hope others will take hold of my propositions and go on with them to perfection. I can hardly hope to see the full fruition of a work like this at my time of life. The present purpose is to find persons who by what they have experienced of the world must see that unless we advance the general interests the most selfish instincts prevail, as formerly has been the case, and we are told that even in the country claiming for itself the highest civilization nineteen-twentieths of the people die prematurely of diseases superinduced by excessive labor and deficient nourishment, while they supply the world with merchandise and rob other starving peoples of employment, and in the Parliament it has been actually said they knew of no remedy for such a barbarous condition. Nor do I suppose the poor and ignorant can help themselves. My purpose is in future to apply only to rich men to afford the means of placing these ideas on a proper footing. I claim that they are strictly scientific; that they show no conflict between science and religion. Both agree upon the point that to make peace on earth and good will to mankind the hungry must be fed and the naked clothed. Extreme want knows no law of God or man, and want must be overcome—not only by misdirected charity, but by finding work for all disposed to help themselves by honest industry of head or hand, or both together; for mere labor without thought is of little value, and the first thing to be done now is to think.

CLINTON ROOSEVELT.

---

*[Statement of Frank X. Heissinger, landscape and garden engineer, New York City.]*

## COLONIZATION AND ITS RELATION TO SOCIALISM.

I am pleased that the idea of distribution of labor is rapidly moving over the land, instead of a desire to concentrate it in the large cities. Yet it would be still better were the emigration of all countries organized more systematically, and were colonies created for the purpose of drawing out the immense riches that exist in the virgin soil of our great West.

Nearly all the crimes of which we read day after day, and which are mostly the consequence of overpopulation in the large manufacturing cities, would be greatly reduced were such a plan carried out. If a

Digitized by Google

society were organized which united in the aim of building up the Western prairies by a large colonization of industrious, energetic laborers it would not only be a great blessing to them but to the capitalists as well, for the capitalists would not only retain the old capital but gain a new one by the industry, energy, and prosperity of the laboring class, and thus confidence, credit, and happiness would return to the country generally. The unreasonable, niggardly, and narrow-minded ones, who seem to believe that all the good things of this world are only for those who chance to be blessed with fortune, rank, and means, may live and die in their conceit and the world will not grieve at their loss.

On the subject of colonization, however, and how it could be made most productive of the common good, opinions differ very much, as the opponents of the plan most probably wish they should.

For this reason I submit a short sketch of my ideas on the subject. Far, however, from demanding their acknowledgment as the only and correct method of solving this most important problem, I merely assert the belief that they are as well considered as any yet given.

As all enterprises of this kind are naturally more effective when carried out in connection with larger masses of people, it would above all be necessary to establish an association or company; the larger and more extended the better. If the Government could be led to take part in the enterprise it would of course be best, yet as it will not apparently do so at present we must have recourse to other means.

My own belief, however, is that the Government of the United States have not only the right (which many seem to doubt) but also the obligation to assist in such cases as this. As Mr. Hendrick B. Wright once very truly stated in Congress, "It is not Wall street, New York, that will pay our colossal national debt; it is the emigrant and farmer to whom it will eventually be left, who will after all be compelled to raise the heavy load of indebtedness."

As has further been proven, agriculture is and will always remain the chief resource and foundation of national wealth, upon which alone it can rely and maintain itself in its present advanced stage.

For these reasons it is, as above stated, the duty of our Government, if possible, to assist colonies of emigrants to sustain themselves until they are able, if necessary, to comply with the demands which will eventually be made on them—to pay our national debt.

It would at least be something if the States interested in this subject would assist in furthering the enterprise, especially if they would act in concert with each other, which would certainly be far more effective than if each State acted on its own account, more especially in regard to emigrant agencies and commissions, which could be located at certain points, not alone for the sake of less expense, but for the good of the concern itself.

Until either the national or State governments take hold of this matter, however, if that ever occurs, we will hold fast to the idea of a private association.

The prospectus of such an association would be about as follows:

## I.

### OBJECT OF THE ASSOCIATION.

1. The highest possible security for the citizen and laborer in his spiritual, moral, sanitary, and material circumstances, as well as in his social position, *i. e.*, to obtain a worthy existence for such of the citizens and laborers of large cities and manufacturing centers (where they are being

Digitized by Google

demoralized, body and soul) as are inclined to join and assist the project of colonization by founding new homes and towns in the West and South. Also assisting and protecting those remaining at home, suppressed by all-absorbing capital, to sustain their freedom and rights as worthy citizens of our great republic. In other words it should be an association for the protection of man against the so-called "higher order of animals."

2. The society should as far as possible protect that greatly threatened institution—domestic life. It should scarcely be necessary to present a long article on the subject of domestic life in the morally contaminated atmosphere of large centers, but we have only to refer to the lists of the poor and to the records of the criminal courts, for any one having possession of his senses and some regard for the miseries of his race to see that help is absolutely necessary here.

3. To bring labor and consequently the value of the same to an equal standard at all places.

4. To protect the employer against extortionate demands of employés. The society should in fact prevent these everlasting mutual troubles of employer and employé, by which one can readily see that human nature never gains, but on the contrary, becomes more embittered at every outbreak.

5. By founding such new colonies, towns, and cities we would secure new markets for our industries and a fresh impetus would be given to all trades, thus giving the honest and upright business man an opportunity for existence.

6. To establish an equilibrium between the consumers of agricultural products and their producers.

## II.

### HOW THESE OBJECTS MAY BE ATTAINED.

The ends sought may be attained—

A. By finding and securing lands, suitable for our purpose, as new places for labor and fresh business sources.

B. By finding and securing the means for purchasing such lands and places and to operate them advantageously.

C. By establishing one or more model farms.

D. By absolute guarantee of title deeds.

This last point is now under cer'ain circumstances one of the most difficult to remedy. It is a pity to be first compelled to expend so much money for discovering whether your title deeds are really valid or not, as though it were not possible, as it is elsewhere, to compel the officials of that particular department by assurance of punishment and loss of office to give the purchaser all the necessary information. Then of course there would be far fewer litigations in America—now the Eldorado of the lawyers.

This dark spot upon the fair name of the United States has cost it not only millions but thousands of millions, and injured it to the same extent. If a European knows comparatively nothing of American circumstances, he is sure to know of the occurrences above referred to. Such knowledge is then used to keep back from this country that class of emigrants most needed here, and this all for the sake of a few lawyers and their accomplices, so that these may live upon ill-gotten gains.

One might really believe those to be right who say: The Americans are a nation subsisting entirely upon the booty they plunder from strangers; when they came to the country they robbed the Indians of

Digitized by Google

their freedom and rights, and now they do the same to all who come to them. If they cannot plunder them of their property, because perchance they have none, these people rob the stranger of his labor and time, still oftener of all moral virtues and possibilities of a higher existence by their demoralizing examples. The nation should at all hazards and with all possible energy relieve herself of all apparent complicity in such matters, which would not by any means be so difficult. Adorn the limbs of a few trees with the culprits and the work is done.

## III.

### THE STEPS NECESSARY.

Now, how shall all this be done.

The object which I have marked A can only be attained—

1. By appointing a commission, composed of two or three reliable and expert men, who will not, as is most usually the case, visit one place or State alone, but explore the whole Union, wherever suitable locations exist, and examine all lands in regard to locality, character of soil, with regard to irrigation, vegetation, and productiveness, minerological and climatic circumstances, natural or artificial communications with other places, States, &c. All these things the commissioners would examine and report conscientiously and without prejudice. The mutual comparisons would show what districts would be best for any class of people—or for any race, as, for example, Europeans, Asiatics, or even Africans, each according to their national characteristics. All this we must consider, if colonization on a large scale should succeed. Every one will comprehend this who has had opportunity to observe the different races in their native countries as compared with their conditions elsewhere.

Of lands we would at first use only the best and most advantageous, because it is success which gives people pleasure, courage, and endurance, and eventually draws thousands after them who would otherwise stay away; and thus accomplish more in ten years than could be done in one hundred years without the success of the pioneers.

These commissioners would also have to discover at what new or old towns or colonies tradesmen or mechanics are needed, and of what class, and how many could make a living there without injuring the business of those already established.

2. By issuing a newspaper which should from time to time give accurate reports of the rates of wages in the various businesses at the more important places; also the value of all necessaries of life, rent rates, &c., so that every one may have an oversight of the mutual circumstances and be well informed on all these subjects.

For these purposes there would be needed a correspondent at each place who should be interested in the matter, and who would, if possible, do the work gratuitously.

The object which I have above marked B can be attained—

1. By the issue of bonds of $10 each, which, with interest at 6 per per cent., would in ten years be redeemed or transferred lawfully to other then existing objects.

Shares to the number of 10,000 should at first comprise the funds of the association, secured through subscription, and paid up by subscribers within five months by monthly payments of $2 each. If the State interested would buy up the stock it would of course be best. The State could even derive advantage from such investment, for it would not run

Digitized by Google

any risk. If any man should give up and run away, the work he had done, and the remaining colonists would certainly make up for what the State had done for him. The individual States could also furnish the colonists within their respective boundaries with all necessary tools and implements of home manufacture, should they be inclined to the enterprise, as also even the necessaries of life, thereby furthering industrial as well as agricultural interests.

For these advantages given the colonists the State could demand a certain portion of the crops, or, in fact, make any arrangement which may be agreed on, of mutual advantage to the colonists and the State.

2. By weekly payments of 50 cents from co-operative members, *i. e.*, actual members, such as will sooner or later colonize.

3. By weekly payments of 10 cents from members who, remaining at home, still wish to partake of the advantages the association offers this class of its members.

The object which I have above marked C can be attained—

By securing suitable land and erecting the necessary buildings thereon. We must have a teaching and operative personality. Stock necessary for operating the farms, as well as farming implements, machinery, &c., must also be secured. In all of which, next to the cheapness and durability of the articles, the chief object must not be forgotten, namely, the practical instruction and advantage of the laboring class.

If the means permit, it might not be out of place to establish model farms in various places or States where the climatic and other circumstances differ, using these also as experimenting stations for the test of new and alleged better varieties of grain, &c. As a matter of course, these model farms would soon be self-sustaining, if correctly conducted.

The object, which I have marked D, can be gained by employing a trustworthy advocate, who, however, should be made responsible for all his actions, and should give the association good security.

Should it happen that more persons apply for removal to the colonies at first than the means at command will allow, lots may be cast to determine the selection. Should any member join the colony at his own expense, the stock-shares, or other payments, with interest added, would be returned to him, the latter, however, only $10 at a time, and from year to year.

All who possess the means and should join any of the associations or colonies, and accept their laws, would at all times be welcome.

For the ease and comfort of members branch associations should be established in most of the large and small cities of the Union, all to be under control of one chief association which may be called the "central office" of the entire association, to be located wherever agreed upon. The branches should remit their balances of cash to the central office at the end of every three months, and should also draw money, if necessary, from it in order to comply with demands at the respective places.

In each colony a board of commissioners should be appointed, composed of residents who should be capable men, whose duty it should be—

1. To receive new comers and assist them to obtain as quickly as possible what they need, and find them employment suited to their special skill, so that they may not lose their time or waste their money. No one should, however, be compelled to accept the lands or employment which the commissioners might appoint or obtain for him.

2. To conduct and guard, according to the constitution of the association, the entire colony, and from time to time make report of its growth, &c., to the central association, which report might be published in the newspaper of the association.

Digitized by Google

In each colony a house should be either built or rented, in which new comers could be hospitably received and entertained until entering upon their business, or until their own homes are completed. Where model farms exist such houses should be under control of the supervisors of the farm.

Such an association would be of the greatest importance, not only to settlers, but to those living in old and crowded localities, and for this reason all such should be drawn in, even through payments of only 10 cents each per week. For, in the first place, they will more easily find work, as so many persons would go to these colonies; and, secondly, if each man thereby earned only 10 cents per day more than before, that would make $30, reckoning three hundred working days per annum, and in ten years $300, while all this time he would pay only $52. Deducting interest on invested capital, initiation fee, &c., there still remains a balance of about $240 net gain. He certainly could not invest his money more advantageously, to say nothing of the far better treatment and the freer and more independent position he would occupy. Members remaining at home should, moreover, receive some consideration as by a "drawing" every three years at the central office, to a participation in which a five-years' membership would be necessary. At these "drawings" some of the prices would be in cash, but most in the products of the colonists, who would, therefore, also be gainers by the "drawings." As every co-operative member can, after ten years membership, receive back his money and interest, or can transfer it to others, the association could also be considered a savings bank for the middle-class, citizen, mechanic, and laboring man.

I will now present my idea of a body of rules for the government of such an association:

## RULES FOR THE GOVERNMENT OF A COLONIZATION ASSOCIATION.

[BY FRANK X. HEISSINGER, NEW YORK.]

### ARTICLE I.

The objects of the association are:

1. The greatest possible security to the citizen and laborer in his spiritual, moral, sanitary, and pecuniary circumstances and relations, and in his social position.

2. To protect domestic life now so seriously threatened by the circumstances and surroundings of crowded cities.

3. To distribute labor more evenly and as far as possible to equalize its value.

4. To protect employers from extortionate demands of employés, and *vice versa*, and to suppress the unpleasant feelings so often existing between employers and their laborers.

5. To create new markets for industry and trade, thus alleviating the distress of upright tradesmen.

6. To establish, as far as possible, an equilibrium between producers of agricultural products and consumers thereof.

### ARTICLE II.

These objects are to be attained:

1. By founding colonies in the West or South, or in other parts of the Union where there are few or no settlements.

Digitized by Google

2. By appointing a commission to seek and select suitable territory and new avenues for trade and labor.

3. By raising sufficient means to enable members to reach the colonies and operate them to advantage.

The sum of $250 is considered sufficient for each member to reach the place of destination, to erect a dwelling, purchase tools, seeds, &c., and to obtain the necessary farm stock, possibly also to supply the food, &c., for the first half year, or, if necessary, the whole year.

Only the best and most approved machines and implements shall be purchased by and for the community, but as the cost of some expensive machines might be more for the single individual than he can afford, the company shall provide the same, and such machines shall be kept in a store-house, which is to be erected for the purpose.

Each member of the community shall be taxed a certain percentage of the cost for the purchase of such machines and shall consequently have the right to use them. In regard to such use the members shall draw lots, and each have the use of the machines according to his turn; each to be responsible for damages occasioned to the machines while in his use.

4. By founding one or more model farms.

5. By absolute guarantee of title, deeds, and possessions.

6. By publishing a gazette or journal of the association.

## ARTICLE III.—MEMBERSHIP.

1. Members of the association are divided into three classes, viz:

Class A. Stockholders; the shares repayable in 10 years, at 6 per cent. interest; $10 a share.

Class B. Co-operative members, *i. e.*, those who will go to the colonies sooner or later.

Class C. Those who, remaining at home, still wish to partake of the advantages of the association.

### 2. ADMISSION OF MEMBERS.

Any person, whether male or female, of good moral character, can become a member of the association. In Class B, however, only those will be admitted who possess health and strength in sufficient measure for such enterprizes, or who bring relatives with them who possess these qualifications.

### 3. RIGHTS OF MEMBERS.

*a*. Every member has the right to vote at elections.

Stockholders possessing more than one share have for each ten additional shares one extra vote, but no one member shall have more than five votes, no matter how many shares are owned by him or her.

Every member is eligible for office, except those excluded by section V, paragraph 2.

*b*. Each member has the right to sit and vote in any regular, general, or extraordinary meeting of the association.

Members should submit to the assembly suggestions which in their opinion may tend to the welfare of all. Such proposals are to be debated and promptly voted upon.

Such of these suggestions as may be interesting to all the branches

Digitized by Google

should be sent to the central office and from there transmitted to the various branches to be by them debated, and if found good accepted.

In all debates and proceedings a majority shall rule.

*c.* Each member has the right of access to the books of the association at any reasonable time.

*d.* Stockholders possess all the rights of membership excepting those of actual colonization, which are the privileges of Class B, and participation in the drawings, which are intended for Class C. Should any stockholder wish at any time to settle in a colony he or she must possess as many shares as are equal to the sum of the contributions of a member of Class B for the time of his or her membership, or pay an amount equal thereto. Then he or she shall have the full rights of a co-operative member.

*e.* Every member of Class B shall after one year's membership and duties performed have and possess the rights stated in sec. II in regard to means for reaching the colonies, the erection of dwellings, purchase of stock, implements, &c. If these expenses should amount to less than $250 the balance up to this sum shall be paid in cash. If a member shall have given extra contribution for wife or children, as explained in paragraph *d* above, he shall receive for each of the same, *i. e.*, for as many as he has paid for, $100, partly in traveling expenses, food, &c., for the first period, and the remainder in cash.

*f.* Should there be too great a press toward colonization at any time the members desiring to colonize shall draw lots to determine who shall do so, their turn to draw being determined by the term of their membership. Should there be any members who join the colony at their own expense the shares of such shall be refunded with interest, the latter, however, reckoned only from $10 to $10 and from year to year. After a membership of ten years a member of Class C shall be entitled to the means of removal to the colony, whether he or she has received benefit from the drawings or otherwise. In such tenth year, if a member of Class C so prefer, his or her shares shall be taken back, as in the case of stockholders, of course with the forfeiture of the right of colonization. Such member can now also transfer his rights to another.

*g.* Each member of Class C shall after five years and every three years thereafter, have the right to take part in the drawings explained in section X, paragraph 3.

*h.* Every member has the right to vote upon the disposition of the funds in case of dissolution.

### 4. Duties of members.

*a.* The initiation fee is $1, upon payment of which a member receives the rules of the association and annually a printed account of the efforts and results, as well as a financial statement of the association.

*b.* To become a member of Class A it is only necessary to buy a few shares.

*c.* The shares may be purchased in five monthly payments of $2 each.

*d.* The members of Class B shall pay 50 cents weekly. As soon as an amount of $10 has thus been paid in, it is considered a share of the association's stock and bears interest as such; *i. e.*, the interest will be added to the capital and credited to the member's account, because whenever members go to the colonies, they will be to some extent debtors to the association.

*e.* Whoever wishes to secure for wife or children a payment for traveling expenses must contribute for each individual 25 cents weekly,

Digitized by Google

extra, which would, however, be refunded in case of death or renunciation of further payment. For children under four years only one-half that sum shall be paid.

*f.* From the eleventh year of colonial possession each member shall contribute to the "drawings" or lotteries occurring every three years, which are arranged especially for the benefit of the members of Class C. The contributions may be in natural products, representing, however, a value of not less than $2. Besides this every member whose possessions are worth $3,000 free of incumbrance shall pay $2 annually to the treasury of the association as long as he lives, these funds to be used in favor of the younger colonists. From this tax a member can be made exempt forever by paying at once the sum of $25.

*g.* The members of Class C shall pay 10 cents weekly. These payments continue as long as the member participates in the drawings of the lottery.

*h.* The contributions of the latter two classes may be paid semi or quarter annually; of course in advance.

*i.* Whoever shall neglect paying for six months in succession without sufficient excuse shall be excluded from the association and its rights.

*j.* Members so excluded may be reinstated upon paying a new initiation fee, and shall thenceforth be treated as new members.

*k.* If pecuniary circumstances compel a co-operative member to withdraw or be excluded, his contributions, without interest, must be refunded on demand, in which case he will for a time be suspended from membership, but may afterward be reinstated with all former rights. Should a member die his next heirs, wife, or children can demand refunding as above. Should the wife or eldest child prefer taking the member's place they can do so, with all the rights and duties which the father possessed.

## ARTICLE IV.—ADMINISTRATION.

1. The general management of business is in charge of the central office of the association.

2. To offices in the central bureau any member in good standing of any branch of the association can be elected, it not being necessary for such persons to be located in the place where the central office is located.

3. The administration of the central office shall be composed of seven members—a president, a vice president, a secretary, an assistant secretary, a cashier, an assistant cashier, and a comptroller.

4. These officers shall receive salaries as follows: The president, $50 from every $1,000 of shares paid up in full per annum; the vice-president, secretary, cashier, and comptroller, each $37.50 to every $1,000 paid in as above; the assistant cashier and assistant secretary, $25 to every $1,000 paid in as above. Amounts of shares less than $1,000 shall not be reckoned in these cases. These salaries will be paid at the end of each year according to the average number of shares. Advances may, under special circumstances, be allowed, but only with the consent of the members, and with some regard to the amount to be received at the end of the year.

5. These officers shall be elected every three years. They may be elected a second time. They must enter upon the discharge of their duties fourteen days after election.

6. Besides these officers there shall be three assessors and a revising commission, composed of three members, who shall have no salaries.

7. The management of the branches shall be similar to that of the

Digitized by Google

central office, except that the officers must be residents of the place, as their salaries can be but small in comparison with those above named. They shall have relatively the same remuneration as those of the central office, based upon the number of shares sold at their branches, so as to make the cost of management at each branch not more than about 1 per cent. of the entire stock capital. Should any one be inclined to serve gratuitously, the sum thus saved would be regarded and entered in the books as a donation, with the donor's name. These officers will be elected annually, and, like those of the central office, may be once re-elected.

8. The commissioners mentioned in section II, paragraph 2, shall be elected every three years, and be eligible for re-election. (In the case of these officers it might be well to retain them as long as they prove efficient.) They shall receive fixed salaries and mileage while traveling.

9. Every three months the branches will remit the surplus cash to the central office; and if the inclination to colonize should cause them greater expenses than their income they will draw upon the latter.

10. The association shall obtain a fire-proof safe with three different locks, to which each of the following officers shall possess keys: The president, the cashier, and the comptroller.

### ARTICLE V.—ELECTIONS.

1. In all elections a majority of the votes cast shall decide. For the election of officers of the central bureau the votes are to be cast at all the branches, recorded, and transmitted to the central office.

2. Minors or those who have received degrading punishment, or are on trial for criminal or other offenses, cannot hold offices.

3. The elections for branch officers shall take place at the annual meeting, notice of which shall be printed in the gazette of the association, or some other paper with large circulation. The election of officers of the central bureau shall take place three months earlier.

4. At the election of officers of the central bureau, as well as of the branches, substitutes for those officers shall be elected. These shall be the members receiving the next highest number of votes for the respective offices. The elections of the assessors and revising and land commissioners shall take place at the same time.

5. In case of a tie the president decides.

6. A regularly announced general meeting can conduct business, no matter what number of members are present.

### ARTICLE VI.—GENERAL DUTIES OF THE OFFICERS.

1. To conduct all business of the association except that which has been transferred to special committees.

2. To control the funds.

The special provisions regarding funds are:

*a.* After securing sufficient for the expenses of management, all current funds except a balance of 10 per cent. shall be used as rapidly as possible for colonizing purposes. The remaining 10 per cent. shall form a stock capital for use in special cases, and later to be used in the lotteries.

*b.* In the treasury of the central office there shall never be more than $1,000 cash. Everything over this sum shall be deposited in safe banks, or, if the members in general meeting permit, can be loaned out at legal rates of interest or on mortgage to members. Business estab-

Digitized by Google

lishments or factories may be established to make or sell such articles as can be made or used in the colonies.

*c.* The cashiers of the branches shall every three months, or when their cash on hand amounts to more than $1,000, remit the balance to the cashier of the central office, obtaining a receipt for the same.

*d.* If money should be loaned out on mortgage to members, or to be used for establishing business or factories, and the demand for such money be greater than can be complied with, the applicants shall draw lots for the preference.

*e.* Whatever sum of money the colonist receives from the association he shall pay interest on at the rate of 6 per cent. After ten years' use, however, such sums must be returned to the association if not otherwise determined upon.

*f.* Only the president shall be allowed to loan out the association's surplus funds, distribute traveling tickets, implements, &c.

*g.* Every branch pays its own expenses, but must give account thereof to the central office.

*h.* In regard to loaning out money, a majority of votes of the officers at the central bureau shall decide.

*i.* Should any one consider himself injured through the decision of those officers he can appeal to the heads of all the branches and even to all members, at general meeting, which will then decide by a majority of votes.

*j.* In case of intention to withdraw or call in money loaned out one-half year's notice shall be given.

*k.* Delinquents shall be sued.

3. To appoint and control subordinate officials or servants and issue rules and regulations of service.

4. To conduct the drawings of the lotteries.

5. To call special and general meetings.

6. To organize at the close of every year a regular general meeting, and submit thereto an account of the general progress of the enterprise, submit a financial statement thereof, and conduct the elections. In regard to the officers of the central bureau the latter would only be necessary once in three years.

7. The financial statement of the central bureau shall be printed in the newspapers four weeks before the meeting; that of the branches two weeks before.

### ARTICLE VII.—DUTIES OF INDIVIDUAL OFFICERS.

1. The president represents the association in every sense, and has control of the business as well as of the officials.

2. The vice-president assists the president in all business of the association; makes out the financial statements in conjunction with the cashier and especially watches over and controls his actions as an official.

3. The secretary conducts the outside correspondence.

4. The assistant secretary conducts the inside correspondence.

5. The cashier of the central bureau receives the funds from the cashiers of the branches, invests it or pays out to co-operative members.

6. The cashier receives the monthly contributions, takes up new members, and pays the bills presented to him by the comptroller.

7. The comptroller examines all bills presented by and if correct signs and presents them to the cashier for payment. At the close of the year he assists the cashier with the statements and submits them to the assembly.

Digitized by Google

8. The revising commissioners have especially to examine and control the treasuries and to give an account of the same at the close of the year.

9. The same course of business will be carried on at all the branches of the association.

### ARTICLE VIII.—MEETINGS.

1. On the first Saturday of each month regular meetings shall be held.

2. In these only the business and interests of the association shall be transacted or discussed.

3. At the close of each year there shall be a regular general meeting, the object of which is explained in Article VI, section 6.

4. Meetings of officers shall take place weekly, but when circumstances demand they may assemble at any time.

5. Special meetings either of the central bureau or branches can be called when necessary by the chief officers of the central bureau or of the branches respectively. Such meetings must also be called whenever a petition is presented signed, if for a meeting of the central bureau, by 100 members, if for a meeting of one of the branches, by 25 members. Should the members of any branch number less than 100, then the signatures of one-tenth the number would suffice.

6. For calling a special general meeting at the same time at all the branches it would be necessary to have at least 100 signatures of members to the petition.

### ARTICLE IX.—DONATIONS.

1. If no special regulations be made about donations (which regulations must not, however, in any case conflict with the rules of the association), all donations shall at once be used for colonizing purposes.

2. Should securities be given to the association in this manner, not the donor but the debtor shall be held responsible for them.

### ARTICLE X.—DRAWINGS.

1. For the privilege of colonization.

*a.* The number of prizes will be arranged according to the amount of that part of the associations funds set aside for this purpose.

*b.* The names of unsuccessful persons will be placed on the list again at every successive drawing until they draw the number which shall entitle them to the privilege of colonization, thus giving the older members a just advantage over the newer ones.

*c.* The chances are to be given according to the term of membership, the eldest first, no matter whether called for personally or through an authenticated representative.

*d.* Four weeks before the drawing members must send in their names.

*e.* If a member draws blanks eight times he is at the ninth entitled to the means for colonization, as already stated, given in Article III, paragraph 3, *f.*

*f.* These drawings shall take place semi-annually—at the end of January and end of August, respectively.

*g.* The number entitling to colonization is good for five years for that individual only.

2. Drawings by persons wishing the loan of capital shall be the same, as far as practicable, as the above.

3. Drawings for the benefit of the members of Class C.

Digitized by Google

*a.* At these one-fourth of the contributions of this class shall be given as prizes. To each one hundred members there shall be ten prizes, the value of which shall depend upon the amount available for this purpose. They will be so arranged that the first prize will be worth 10 per cent. more than the following one.

*b.* The slips will be drawn from two urns at the same time; one containing the names of members, the other the names or designation of the prizes.

*c.* All these drawings shall be conducted in the rooms of the association at the central office, in the presence of at least two-thirds of its officers.

### ARTICLE XI.—COURT OF ARBITRATION.

In cases of controversies this court decides. It shall be composed of thirteen elected members. Should a decision of the same be unsatisfactory, and unless both parties should prefer to go to court, the case can be brought before the general assembly, and if not fully decided, go to the central offices, and from thence to all the branches, where all these courts of arbitration shall decide upon the same and send their returns to the central office. Here, as elsewhere, the ordinary majority rules. If this is still unsatisfactory, let the parties go before the bar.

### ARTICLE XII.

Whoever injures the association in any respect shall be brought before the court and excluded from the association, and under certain circumstances the offense shall be published and the offender declared dishonorable.

### ARTICLE XIII.—THE GAZETTE OF THE ASSOCIATION.

Regarding a gazette eventually to be established:

1. It should conform strictly to the objects and programme of the association, *i. e.*, it should prevent the necessity of members spending their means in subscribing for other more expensive papers, and for this reason should contain the political news and daily occurrences, but withhold all criticism or judgment upon them.

2. It should assist the land commissioners in discovering desirable towns or sites.

3. Every three months it shall quote the value of labor in the various trades and businesses at the principal places or cities. It must also quote the prices of the various articles of merchandise, products, house rent, &c. In short, the paper must seek to advance the interests of the association in every respect.

4. To insert advertisements of or for work for members at low rates of profit.

5. The association shall support the paper, the editor receiving a fixed salary. The association receives any profits that may accrue from the publication.

### ARTICLE XIV.—DISSOLUTION OF THE ASSOCIATION.

The association can only dissolve when the entire number of its members becomes less than fifty.

## PATHOLOGY OF DISTRIBUTION.

*VIEWS OF CHARLES FRED. ADAMS, COUNSELOR AT LAW.*

11 PINE STREET, NEW YORK,
*August* 17, 1883.

Hon. H. W. BLAIR,
*Chairman Senate Committee on Education and Labor:*

SIR: Should the time, patience, and programme of your committee admit of such a thing, I would esteem it my duty (to be performed with no little diffidence and trepidation, let me assure you) to present to you, at such time within the coming week as you may appoint, as terse a statement as I can make of what—basing myself not only upon the logical analysis of admitted facts, but likewise upon the most recent results of eminent scientific authority—I take to be the true "pathology of distribution;" in other words, the correct theory of that part of the subject referred to you which the resolution speaks of as "the division between labor and capital of their joint productions in the United States." The discussion would bear, of course, upon the further question as to what "legislation, if any, is calculated to promote harmonious relations between capitalists and laborers, and the interests of both, by the improvement of the condition of the industrial classes of the United States."

By way of borrowing as much "representativeness" as is within my reach, I may mention that I am the national secretary of each of two societies, "The American Free Soil Society," and "The People's Tontine Society for Mutual Assurance against Absolute Dependence upon Wages," the programmes of which embody, in different and (so to speak) mutually alternative forms, the principle of the policy I wish to advocate.

Both societies are young, but the former receives accessions every day (of lawyers, doctors, clergymen, laborers, artisans, editors, in fact from all classes), and is officered by such prominent men as Henry George and Rev. Dr. R. Heber Newton; the second society, on the other hand, is not only growing, but, furthermore, already fully established as a complete "working model" of the institution which is desired, and, though as yet on but a small scale, is actually carrying out, in every detail, the programme which embodies what, if done on a large scale, might well be expected to contribute largely toward the removal of the existing defects in distribution.

If granted an opportunity, I shall endeavor to justify a position which, in general outline, may be thus pointed to:

1. That the only just and safe rule of distribution is this: That differences in the reward received shall be proportioned to differences in the contributions (whether of capital or labor) personally made to production.

2. That this rule is fatally disregarded by the maintenance of artificial privileges, which, without adequate compensation to the public, enable limited portions of the community to exact for their capital or their labor a larger share in distribution than it would have received in competition free from the unfair advantage of such artificial privilege.

3. That the mitigation of the degree in which this evil already exists, and the prevention of its further extension hereafter, are conditions so essential to the preservation of our institutions, and to the well-being of our people, that, if that course be necessary to their attainment, even Henry George's heroic remedy would be proper and expedient; while

Digitized by Google

if, as I myself believe, the adoption, in time and upon a commanding scale, of the milder method of "mutual assurance against absolute dependence upon wages," would quite as certainly, and perhaps as quickly, and without danger of contention or revolution, promote the abolition and permanent prevention of improper monopolies of natural advantages; then, of course, there could be no question as to the propriety and expediency of so adopting that alternative method.

Awaiting such appointment, if any, as you may feel justified in making, I remain, very respectfully, yours,

CHAS. FRED. ADAMS.

P. S.—I have written upon these subjects in the International Review, The National Quarterly, The Times, Justice, and other papers.

---

*PROSPECTUS OF THE AMERICAN FREE-SOIL SOCIETY.*

The conviction that the soil of every country belongs equally and inalienably to the whole people of that country, and that pauperism, want, and the industrial and political enslavement of the masses flow inevitably from the institution of private property in land, is so rapidly growing that only the union of those who hold this conviction is needed to bring into the arena of practical questions this greatest of all issues.

In England, where the truth that the land belongs inalienably to the whole people has within the past year been making most rapid progress, a Land Reform Union has been recently formed by inflential and earnest men and women for the purpose of better carrying on the agitation, and has already commenced active work by publications, meetings, and lectures. In Australia and New Zealand similar societies have been formed and a similar agitation begun; and though the Irish Land League, which at one time promised so much, has been disbanded, the impulse which it gave to the agitation of the land question still continues.

In the United States and Canada special circumstances are concurring with this general movement of thought to force the land question into prominence. The rapid exhaustion of the public domain, the enormous tracts which are passing into the possession of foreign aristocrats and syndicates, the growth of monstrous fortunes, and the increasing bitterness of the struggle for existence, combine to direct attention to this fundamental question; and the growing restiveness of the masses show that a momentous conflict between popular rights and special privilege is near at hand.

Believing that in this country the time is ripe for bringing all the vigor that comes from union to the promulgation of the truth that the land belongs to the people, the American Free-Soil Society has been formed as a means whereby those who hold this truth may become acquainted with each other, learn their strength, cultivate that fraternity that comes of a common belief, and unite their efforts for a great purpose. The formation of this society is the result of consultations extending over several months. Realizing that the only way of beginning a movement is to begin, we have formed an organization. By next spring we hope to have the society so extended that all parts of the country will be represented, and such changes may be made in our plan as experience and consultation may dictate.

The name we have chosen, while it well expresses our purpose, is associated with a great movement in the cause of human liberty. The

Digitized by Google

first free-soil movement culminated in the abolition of chattel slavery. The one we desire to begin aims at the abolition of that industrial and social slavery, more widespread, more insidious, and more cruel, which results from making the soil on which and from which the whole people must live, the private proverty of a portion of their number.

Such a movement must encounter the opposition of ignorance, prejudice, and powerful interests, and for a long time to come can have no attractions for the demagogue and self-seeker, but to earnest men, desirous of working for the success of a great principle, this will but make it more attractive, and we call upon such to join with us, without regard to differences as to methods. We propose to recognize no distinction of race, sex, nationality, or creed. Any one of eighteen years of age and of good moral character can become a member. Our plan contemplates local groups, consisting of one or more members, from which city, county, State, and national organizations are formed; and we desire in every locality where there is a single person animated by the purpose we have at heart to form a nucleus of organization.

If you are willing to co-operate in establishing such a society, please write to Charles F. Adams, 11 Pine street, New York, inclosing 10 cents in postage-stamps towards defraying expenses of correspondence, when documents relative to organization will be sent you, and you will be put in communication with others in your locality from whom similar responses have been received. You will also aid us by forwarding the addresses of others in any part of the country to whom you think it would be desirable to send this circular, and by giving us any information or suggestions you may deem useful.

For the purpose of raising necessary funds, an initiation fee not to exceed $1, and a weekly subscription of 5 cents have been fixed. Ten cents of the initiation fee, and half a cent of the weekly dues it is proposed to reserve to the national organization for general expenses; but as it is our wish to raise as quickly as possible a fund for the printing of tracts and the general expenses of organization and propaganda, we would be glad to receive any special contribution with which you may desire to help forward the work.

---

*CONSTITUTION OF THE WORKING WOMEN'S PROTECTIVE UNION, NO. 38 BLEECKER STREET, NEW YORK CITY.*

[Submitted with the testimony of Mrs. Farrer.]

ARTICLE I.—OBJECT.

The object of this union shall be to promote the interests of women who obtain a livelihood by employments other than household service.

This object shall be sought:

1. By securing for them legal protection from frauds and impositions, free of expense.

2. By appeals respectfully but urgently made to employers for wages proportioned to the work performed, and to the cost of living, and such shortening of the hours of labor as is due to health and the requirements of household affairs.

3. By seeking new and appropriate spheres of labor in departments not ordinarily occupied by women.

Digitized by Google

4. By maintaining a registry through which those out of work may obtain employment.
5. By appeals to the community for that sympathy and support which are due to the otherwise defenseless condition of working women.

### ARTICLE II.—OFFICERS.

The officers of this society shall be a president, a vice-president, a secretary, a treasurer, and twelve directors, who, together with the officers, shall constitute a board for the management of its affairs, five of whom shall constitute a quorum for the transaction of business. The said board shall have power to fill any vacancies that may occur in their own body.

The officers and directors shall be elected by the society annually, and shall perform the duties and exercise the power usual to the offices held. The term of office shall be one year and until a successor has been duly elected.

### ARTICLE III.—MEMBERS.

The society shall consist of such persons as shall contribute to its funds by paying to the treasurer the sum of $10, and who shall thereafter be approved by the board of directors; such membership to continue for one year from the time of such payment. The contribution and payment of $50 during any one year shall, subject to the approval of the board of directors, constitute a membership for life. Honorary members may be elected at any regular meeting, either of the union or of the board of directors.

### ARTICLE IV.—ELECTIONS.

The society shall hold an annual meeting at the rooms of the union for the election of officers and directors, and the transaction of other business, on the second Monday in November, and the officers and directors then elected shall enter upon their duties on the first day of January thereafter.

### ARTICLE V.—BY-LAWS.

The officers and directors of the society may from time to time adopt such by-laws, in accordance with this constitution, as they may deem necessary for the proper government of the society; and all by-laws so adopted shall have the same force as if made by the society.

### ARTICLE VI.—SPECIAL MEETINGS.

Special meetings of the society may be called by the president at his discretion, and shall be called by the secretary on the written application of ten members, two of whom shall be directors; the business to be laid before such special meeting being stated in the call thereof.

### ARTICLE VII.—AMENDMENTS.

This constitution may be amended at any meeting of the society, a notice of the proposed amendment having been given at a meeting prior to the one at which the amendment is acted upon.

## NEW YORK CENTRAL PARK.

*STATEMENT OF THE PRESIDENT OF THE DEPARTMENT OF PUBLIC PARKS.*

CITY OF NEW YORK,
DEPARTMENT OF PUBLIC PARKS,
36 *Union Square, December* 1, 1883.

Hon. H. W. BLAIR,
*Chairman United States Senate Committee on Labor and Education:*

DEAR SIR: I have been requested by Dexter A. Hawkins, esq., to communicate with you in regard to the use of the Central Park.

It appears from his communication to me that an impression has been made upon the minds of members of your committee that the park is chiefly of benefit to the rich, and used very little by "the rest of the public."

I beg leave to state that this is an entire mistake. While the Central Park is very extensively used by the richer classes, who ride through it either in their carriages or upon horseback, yet the great mass of visitors is composed of those who are unable to enjoy such luxuries. We have, during the past year, discontinued the practice of recording the number of persons who visit the park (which was kept up for several years), simply for the reason that on gala days, especially, it very much interfered with the proper police service; but as an illustration of the correctness of my statement above made, I will remark that it is estimated by the manager of the small menagerie, which is on public exhibition in the park, that over three millions of people visited it in one year. During public days, and on pleasant Sundays, the Central Park is thronged with men, women, and children, sauntering about its varied walks and resting places. During the summer public concerts are given upon the mall of the park, and also at the Battery. These concerts in the Central Park are attended by thousands of people, and are very much enjoyed.

It is, in fact, from my observation and long connection with the department, the great breathing ground for thousands every year, who are, by reason of situation and occupation, unable to visit the country.

I can say this with reference to nearly if not quite all the parks of the city, and I hope this will be a satisfactory response to your desire for information on this subject. If you need more, please communicate me such interrogatories as you would be pleased to have answered, and I will attend to them.

Yours, respectfully,

S. H. WALES,
*President Department Public Parks.*

---

*VIEWS OF MR. ARAD BARROWS, OF PHILADELPHIA, PA.*

I have been in the manufacturing business forty-seven years, and have never had trouble with hands that amounted to a "strike;" have found them reasonable when lower prices were required, and not unreasonable when they asked for an advance. I have never known a labor strike that did not result in more losses to the workmen than to capital. Without the employer and employé work together, no establishment can be in a

Digitized by Google

healthy condition, and I suggest that all trades unions abandon their fight with capital, hold their meetings with open doors, and contend politically for some of the reforms and changes I shall hereafter mention.

I have sought in this paper to give the result of my own experience, leaving the arguments on the subject for and against to be supplied by your own judgment and knowledge; but should you wish to ask any questions put them in writing, and I will answer in the same manner, truly and honestly, without regard to my interest or political bias.

### TARIFF.

It is published to the world that the iron business in this country is highly protected when it receives no protection. The duty levied by our laws, except in a few cases, only represents the difference between labor in this country and in Europe. The cost of our coal and iron ore is nearly all in labor. These articles are worth in the earth only 25 cents per ton. Limestone is all labor, and the labor in the case of furnaces is much more expensive than in Europe, and when you come to our business (the use of the pig-iron) the labor is from 33⅓ to 50 per cent. higher than in Scotland. Neither is labor protected; but we pay these high wages to enable us to pay the agriculturist $1 per bushel for potatoes, instead of from 25 to 40 cents, the price in 1840, and $8 per barrel for flour, instead of $4, as in 1840; and nearly all farm products are higher in about the same ratio now than previous to 1860. Notwithstanding the higher wages paid in some cases, 100 per cent. higher now than in 1840, our hands save comparatively nothing; whereas at that time they saved money and bought homes.

We are a young nation, and a tariff for protection is required to develop our boundless resources. Free trade does not give us low-priced goods. When we used Scotch pig-iron we got it very low for a year or two, until our charcoal furnaces were broken up and their hands scattered; then double or treble price was charged for that iron. The importer gets for an article all it will stand; home competition gives the consumer low prices.

### SPECIE PAYMENTS.

The panic of 1836, just previous to the commencement of my business life, was more widespread than any since. Thousands of honest business men were brought down to poverty, and in all these financial troubles the loss by the laborers of their few hundred dollars and also of employment is seldom considered, but it increases the number of sufferers in these periodical depressions ten-fold. In my time, with one exception (the war), all these panics have been brought about by the effort to maintain specie payments—an impossibility. Take late reports from Washington. Say we have in the country $743,000,000 in specie and $820,000,000 in circulating notes—not enough specie to pay the notes; but in addition, this specie is expected to pay our Government debt, our State debts, our city, town, and county debts, our corporation and individual debts, and to be used to transact all the business of the country. The only circulating notes I have ever known truly representing specie except in name are our own Government coin notes, the specie representing them remaining in the Government vaults until they are paid. The next best are our national bank notes, the bonds of the Government remaining with the Government as security until the notes are paid.

Digitized by Google

Our national banking system should be improved and extended with additional safeguards to give stability to trade and permanency and security to our accumulated earnings. We should redeem no more of our national debt, but retain it as the property of the commonwealth for banking purposes. The nation can well afford to pay 3 per cent. on one billion of dollars, as I believe the people have saved since the existence of this banking system in being exempt from paying discounts on uncurrent money and in suffering no loss comparatively by counterfeit and broken bank notes a sum amounting to more than the whole national debt.

TRANSPORTATION.

With our various productions and boundless ability to increase, it is proper for our Government to open intercourse with points that would give an outlet for our manufactures and food surplus. We would willingly pay 3 cents postage if the 1 cent extra could be used by the Post-Office Department to pay liberally for carrying the mails by steam to ports in Asia, South America, Central America, Africa, and to any other point on the globe where there is a prospect of finding a market for our own surplus. This would encourage our ship-owners and ship-builders and revive a trade that for twenty years has required aid.

CORPORATIONS.

We ask in the name of labor that our Government shall establish a bureau to enable our law-makers to learn our wants, and shall pass such laws as will prevent the few from becoming excessively rich at the expense of the many. All wealth obtained by the labor of hand or head is legitimate, and should be protected, but that acquired by watering stocks, buying the necessaries of life to create a scarcity, or working to create a panic in order to rob the weak of their earnings is not legitimate. To illustrate, I will mention that a member of my family had occasion to telegraph me a few weeks ago from Western Pennsylvania. I was charged 40 cents for a message of seven words. Now, had the stock of the Western Union Telegraph Company been represented by $20,000,000 instead of $80,000,000, that message need have cost but 10 cents to pay 7 per cent. on the former sum. Railroad directors and managers get excessively rich while their employés make only a living. In some cases this may be legitimate, as the foreknowledge of the intentions of the company may have enabled these directors to make paying investments, but when the wealth is procured by the watering of stocks it is a proper subject for the consideration of Government. Mr. Gould in his testimony before you is reported as saying that the Western Union stock is not watered more than the stock of many other corporations, which leads us to suppose it is a common thing; and as the labor and business of the country have to bear these excessive charges which are required to pay interest on these excessive amounts of stock, we ask that this subject receive early consideration. If this process of gaining wealth remains unchecked, we shall soon have billionaires instead of only millionaires; for in addition to this watering process a few Jay Goulds, on some pretext, can absorb all the available specie in the country, create a panic, reduce all values and then buy in the property of those that happen to be in debt at one-tenth its cost. I do not propose that the Government shall own either railroads or telegraph lines, but it should have a supervising control over them to prevent its citizens from being plundered. Our Post-Office Department is managed on

Digitized by Google

strictly business principles. The heads are liberally paid, and the subordinates receive fair compensation for the service rendered, so this Department gives us cheap service. I do not expect outside corporations to do as well, but there can be a vast improvement.

### TEMPERANCE.

Our shop is a temperance shop in comparison with many, but I estimate that 10 per cent. of the wages paid by us is spent by the workmen for intoxicating beverages. This question has been before the public in some sections of our country for fifty years, and many of the workers in it will tell you they have made no progress. Our Government lays a heavy duty on these beverages and licenses our citizens to manufacture them, while many of our States have laws outlawing their sale and outlawing the citizen that makes use of them. To my mind this is an inconsistency. If drunkenness is a disease, let those that cannot control themselves be sent to a hospital; if a crime, send them to prison. We should encourage the manufacture and use of cheap, light wines that all classes can use without so great a waste of health, mind, and money. This would place our citizens in the position of responsible human beings, and not treat them as wards. We can reason our people into temperance, but we can never force them.

### THE EIGHT-HOUR LAW.

Labor, like any other article, is regulated by supply and demand. About forty years ago the State of Pennsylvania passed an eight-hour law. We at once kept our accounts with our men by the hour, and have done so ever since, paying only for the hours worked. No laws can be made to regulate this matter; it should be left to custom and the necessity of the case.

### APPRENTICES.

Forty years ago apprentices were taken, and they learned a full trade. At first $3 per week was paid them; the wages was raised $1 each year until the end of their term of service. We paid our workmen by the piece; and outside influence and the influence of our workmen prevented these apprentices from doing any more work than just what would make their wages if done by journeymen, although each of them, of course, occupied the room of a full man. Some shops paid them by the piece—half or three-quarters the full price, but their bad work and their carelessness made neither system desirable. Young men now are taken and set at work without there being any obligation to teach them a full trade. They are put at some one branch of the trade, become expert at it, and learn no other branch; so there are very few young men at present who learn a trade, although they serve the time.

### SCHOOLS.

Our apprentice system being so unsatisfactory, I suggest that our common schools teach the principles of all branches of business, particularly agriculture, that it is possible to bring to the minds of the young in such a place. The children would get a theoretical knowledge of the several branches and be able to choose for themselves a calling, and in after life could put to a practical test what they had

Digitized by Google

learned at school. The girls also should be taught in our public schools housewifery in theory, and all branches of business that they are capable of learning, leaving the practical part to be learned when they are called to fill their position in life.

PRISON LABOR.

New York State has 5,000 convicts; of whom 1,700 are at work in the stove and hollowware foundry business—900 at Sing Sing, 400 at Auburn, and 400 at the Elmira Reform School; at least they have shops for this number. Ohio has 400 men in an iron foundry in her State prison at Columbus; about 200 are employed in an iron foundry at the State prison at Baltimore, Md., and some of the Western and Southern States have now embarked, or are about to embark, in this branch of industry. In New York State three contractors pay for these convicts from 25 to 60 cents per day, about enough to furnish the State money to buy the prisoners food, these contractors receiving the difference between that and the price of outside labor; the State gains nothing, but furnishes the contractor with buildings, and keeps them in repair clear of taxes. These establishments cannot supply the entire trade, but they do enough to make a price so low that outside labor and capital cannot compete with them. There are other branches of business affected in the same manner, such as boot and shoe making, cigar-making, agricultural implements, and chairs, articles of hardware, &c. I give the foundry business as an example. If the State must employ these men, they should receive something near the price of the same labor outside. The result of the employment of these large bodies of convicts in any one industry is to make our investments of a lifetime unremunerative, and to compel molders, many of them in their old age, to seek other employment. Arguments against the system are not required. I simply state the facts.

Hon. HENRY W. BLAIR,
*Chairman Committee of Education and Labor.*

---

*VIEWS OF MR. J. M. HANNAHS, OF CHICAGO.*

MR. CHAIRMAN AND GENTLEMEN OF THE COMMITTEE: While the National Legislature, which your committee authoritatively represents, is considering the question of labor, which is understood to be the relations of labor, or rather of our workingmen to the prosperity and stability of the nation, permit me, as a man who has worked steadily and laboriously as a mechanic for thirteen years, to address you.

I hardly need to say that if workingmen, that is men who perform manual labor for wages, and who compose the great majority of our population, that if these are comfortable and without good cause for complaint, if they are enjoying the constantly increasing bounties of nature, so far as is consistent with frugality and proper self-denial, then the prosperity and stability of the Republic is assured. Patriotism will be fostered, intelligence will become disseminated, strikes and mob-rule will be unheard of, and morality and religion will have their best conditions to reach the popular heart; hence this inquiry by Congress at this time, when popular and dangerous outbreaks are imminent, is of the highest importance.

In this I shall confine myself to one point or matter bearing upon the

Digitized by Google

inquiry, which is that of the introduction of labor-saving machinery and appliances as affecting the condition and interests of workingmen.

Within the last fifty years probably more labor-saving machinery has been introduced than in all time before that. By this means all commodities for man's use and enjoyment, not only fabricants, but products of the soil, are not only largely increased, but they are produced with less manual labor than before. This condition ought to be, and may be, a great benefit to our race, and especially to workingmen. But lamentably it is not so as yet. In fact, so far, workingmen are losers instead of gainers by labor-saving machinery. I say it ought to be and may be a great benefit to them, but the only way such can be accomplished is by shortening the hours of labor. This fact was partially recognized by Congress, and a law was passed fixing a day's work at eight hours on all Government work; but the law was nullified by the Hayes administration. There seems to be no other way to reconcile and harmonize increased production by means of labor-saving machinery, with the necessities of workingmen, than by shortening the hours of labor.

The hours of labor should be reduced to eight, and so on, as less and less labor is required for adequate production. And Congress can, without interfering with personal rights, do much toward establishing this principle. The most I can do in this is to call attention to the subject. Modes of action in the matter are obvious. Hence, not to extend, I will only add that where a capitalist is producing goods adequate to the market demands, by the employment of, say, 100 men ten hours a day, and one of those men invents machinery whereby the same quantity can be produced by 75 men at no greater cost than before, then that man can lose no more by reducing the hours of labor to eight, and keeping the 100 men at work, than by discharging 25 of the men and keeping the remainder on for ten hours. Let this principle become understood, and let it be mutually recognized by capitalists and workingmen, and the matter of wages will adjust itself to the changed situation the same as when the ten-hour system was established. The ten-hour system when adopted did not reduce wages, but it soon increased them; and yet payment of wages by employers was less difficult than before.

I stated that "popular and dangerous outbreaks were imminent." The great uprising of 1877, however causeless, and other similar local disturbances, together with the knowledge that human nature is the same now as ever, the same as during the "reign of terror" in France, ought to be a warning that we stand upon dangerous ground. We can easily imagine that as our population becomes dense, and our cities numerous and great, and that as in the past there comes times of depression and distress, and the feeling among workingmen may be that they are wronged, and they thus become desperate and rise in their might any police force that we now have would be but as chaff before the wind. The great fortunes of our wealthy citizens, their palaces and resorts, would be scattered, and even their lives would not be safe. Telegraphs and railways would be destroyed and chaos would reign. Therefore, as we have no standing army, and by the way, if we had it would be useless for the protection of citizens or the enforcement of law, for under the recent decision of the Supreme Court, and the letter of the Attorney-General, the only function of the Federal Government is to collect and disburse revenues, and the only service of our Army is to look after squatters and Indians in our Territories, therefore our only reliance for averting these calamities is to conciliate the masses and to foster patriotism, by such means as is in the power of Congress and of the State legislature. The interests of wage-workers must not be overlooked.

*VIEWS OF MR. E. H. ROGERS, OF CHELSEA, MASS.*

CHELSEA, MASS., *October* 18, 1883.

HONORED SIR: The undersigned, an operative ship-joiner, desires to call your attention to the statement of facts concerning the condition of working people, on pages 17–21 of The Hope of the Republic, which will be mailed with this.

I desire to recommend to your committee the establishment of courts of equity as a part of the judicial system of the country; these courts to have jurisdiction in all questions of hours of labor, wages, and rules of work.

I further suggest that in cases of the magnitude of the telegraph operators that the legal expenses of the strikers be paid by the Government.

Very truly yours,

EDWARD H. ROGERS.

P. S.—You are at liberty to print my propositions, if you please.

E. H. R.

Hon. HENRY W. BLAIR,
*Of the Senate Labor Commission.*

[Inclosure.—Extract from "The Hope of the Republic."]

Our Government, like that of the Hebrews, is the government of a free people. It is a system of self-government. Our constitution, like that of Moses, is pervaded with popular sympathies, and the spirit of liberty. In what respect, then, do we differ from the standard by which we are comparing ourselves? In this, namely, that the Hebrew constitution was not only a government of laws, but of laws *referring directly to the industrial and financial condition of the common people.* We have so far followed in the steps of Moses, that we recognize the theory, in both national and State constitutions, that government should be of laws, and not of men. But we have hitherto not only neglected to apply this theory specifically to the transactions of industry and exchange, but we are stoutly maintaining the right of individual and corporate capitalists not only to lord it as they please, over great bodies of laborers, but also to dictate terms in the matter of railroad transportation to influential mercantile and agricultural communities. We do this in the most thorough and effective manner in conserving "property" as the unit or base of our legislation; whereas the Bible standard is that of manhood, or, more properly, the family. It is true that our laws guard all classes of citizens from personal violence; but the practical effect of the laws concerning property is such as to inure almost exclusively to the trading and moneyed classes, because they do not apply to property until *after* it has been distributed. They make no effort, or pretense even, to shield the producer in his industrial right. Neither the legislative nor the judicial authorities of the State have admitted it to be any part of their functions to provide for equity in *the distribution of labor and its reward;* and in this respect they reverse the Mosaic legislation, which made as ample provision as the age permitted for relief from excessive toil, and controlled the price of labor, land, merchandise, and money, by the application of the highest principles of ethics. Two consequences follow from this disastrous omission—first, the enforced idleness of large numbers of the people, in consequence of the introduction of machinery, averaging at least a third of each year; and, second, an absolute inadequacy of income, not only because of this lack of steady employment, but also on account of the inherent defects of wages as a means of payment, their aggregate amount not being sufficient to purchase the things which the laborers have themselves made, thus causing the strange phenomenon of glutted markets in the midst of a needy and often suffering people. It has been ascertained by reliable statistics that the State of Massachusetts, which probably pays the highest wages in the Union, only averages $418 a year. As it is known that considerable numbers of skilled workmen exceed this average, in prosperous years, by several hundred dollars, what a pinched and narrow living must women and youths, and all who compose the low paid classes, have! These figures might be graded down through the different States until the colored laborers of the South are reached, where the united effort of a whole family only yields about $200 in cash per year. Will the reader pardon me if I point out here an

Digitized by Google

appalling danger? Cultivated society is stupidly arguing against the exercise of violence by laborers, because, having the ballot in their hands, and being the most numerous, they are assumed to have the means of peacefully righting themselves by political action; but I aver that this assumption is not justified by existing facts, and, furthermore, that the governing classes, as long as they deceive themselves by such a specious theory, are in the condition of men who lie down to sleep upon a railroad track. It is now more than fifty years since the labor agitation began in this country, and the results may be briefly summarized as follows:

Our partial and ineffective legislation concerning the hours of labor, and our homestead laws, are all the enactments we have that touch vitally the interests of industry. The ten-hours day was one of the first requests we made; and our whole factory population are still pleading in vain for relief in this respect. Our lien law is a cheat. Suing in court is a mockery; the workman and all his family would starve to death a score of times before he could recover by a suit his wickedly withheld wage, which is his *living*. The law that gave three years for the redemption of a mortgage is repealed; and so is the law limiting interest on money. The national eight-hour law has been treated from the beginning with unblushing contempt, and disregarded by whole classes of officials having in charge large numbers of working people; and, finally, the intelligent, skilled workmen of the navy-yards and arsenals of the country have been deprived of its benefits by proceedings equally arbitrary and unrepublican. It follows, also, as an unavoidable consequence of our unhallowed worship of property, and neglect of the family, that we are rapidly sinking in this respect to the appalling social conditions of the Old World. The sacred privacy which should invest the home has been invaded by the double occupancy of buildings by our respectable working people; and statistics of the most reliable character prove that married women are being more and more forced to add their labor to that of their husbands to gain an ordinary livelihood. As a practical fact, our law system does so work as to enable a few money-holders to keep the people in subjection therewith, and devour their labor; and the case is growing worse and worse every day.

I maintain that the joint influence of the two erroneous theories, viz, that the power of the State should be limited to the protection of property *after* it has been distributed, and that the church has no *direct* control over material affairs, effectually neutralizes whatever political advantages the people possess. We may vote and petition until doomsday; but we shall accomplish nothing until this state of public opinion is rectified. The dreadful scenes which occurred during the Pennsylvania railroad riots will be liable to be repeated as long as the pathway of reform is blocked with such disastrous errors.

The Republic, if it would continue, must remedy these deficiencies. I have shown the germs of the social forces, which, in the various religious communes of the country, give us hope in these directions. It is my privilege now to call attention to the fact that the Plymouth Colony, which was indeed the moral seed-force of our national life, was unmistakably communistic in its origin, and that, in direct connection with this fact, the advantages of reciprocal relations between men in material affairs have been in operation in the New England fisheries for two hundred and fifty years. And what makes this allusion the more pertinent is the fact that these beneficent customs have been indirectly, but very effectively, aided by the natural operation of the marine laws of the United States.

I recollect as one of the most valuable lessons of the early years of my life, that I saw, on one occasion, eighty sail of the most perfectly constructed vessels of their kind in the world riding at anchor in the port of Wellfleet, Mass., a town deeply imbued with the Pilgrim spirit and character. These vessels could not have been worth less than two hundred thousand dollars; and they were owned almost exclusively by their crews, numbering about a thousand men. They were navigated on shares; and the whole business as it was conducted at that time furnished conclusive evidence that the religious spirit may work in harmony with the State in the application of equitable economic law.

But while I believe in the right and duty of the nation to act on those principles of large utilitarianism which would lead ultimately to equitable commerce, and while I feel that a necessity of the most urgent character is upon us to take some of the preparatory steps to that end with reference to the currency, the tariff, telegraphs, and railroads, and also secular education, blended with natural religion, I frankly admit that the obstacles in the way of a full settlement of a question of such stupendous magnitude as this on intellectual grounds and through political forces alone, seem to me to be insurmountable.

*VIEWS OF MR. JOSEPH WESTBROOK, OF SAINT EDWARD, NEBR.*

LABOR AND WAGES.

BOONE COUNTY, NEBRASKA.

Hon. HENRY W. BLAIR,
*Washington, D. C.*

SIR: I will send you a few suggestions concerning labor and strikes, and wages and capital.

WORK AND WAGES IN NEBRASKA.

First. One day's labor in the State of Nebraska for or on railroads is ten hours; the wages paid per day is from $1.25 to $1.40; board per week, $4.50 to $5. The above includes all public works. Farm labor is fifteen hours per day; the wages paid range from $15 to $20 per month. All classes of work is usually paid for in the circulating medium of the county, or, in other words, money.

STRIKES CAUSED BY EXCESSIVE IMMIGRATION.

Second. The whole cause of strikes is too much immigration. Stop all immigration societies and the circulation of all pamphlets that encourage immigration from foreign countries, and the feeding of emigrants after their arrival in this country, and instead, feed our own poor and find homes for them, and this will close the gap between labor and capital. Our Senate can pass an act to prohibit the encouraging or coaxing of foreigners to our shores. We have tramps all over, and they are invariably foreigners. This, I think sufficient on this subject, and will leave it to your more able consideration.

INCUMBERED FARMS IN THE WEST.

Third. The number of families in this part that have no homes is about one in five, and of the four-fifths that have homes, there may be one in forty clear of incumbrance. The liens are for Eastern money sent to the banks here to be loaned only on improved real estate, with interest at 10 per cent. per annum. Our farms here are usually 160 acres. The owner of one quarter-section (160 acres) contracts a loan of from $300 to $500, according to the quality and location of his farm and the improvements. The income from 160 acres will range from $50 to $600 a year; the taxes from $50 to $60; clothing is very high in price, so also are groceries and farming implements and machinery; these are all sold here for twice what they ought to cost. For example, my own farm contains 200 acres of as good land as there is in the State of Nebraska. My sales will average $500 a year; there are nine in my family; we have no Sunday clothes, and spend nothing foolishly, yet it is hard to make both ends meet once a year. My taxes are $60 a year; interest on $600 of borrowed money, $60; that makes $120, which leaves $380 for clothes, groceries, keeping up farm implements, harness, &c. My groceries cost on average $50 per year.

THE TARIFF—HIGH RAILROAD CHARGES—SPECULATION.

Fourth. What causes our low priced produce and high priced farm implements, groceries, and clothes? It is high tariff, high railroad freights, and speculations in boards of trade. The Union Pacific Rail-

Digitized by Google

road charges $85 a car to and from Chicago. We ought to get the service for $40. To and from Saint Louis, which is 75 miles nearer, the same company charges $100 per car. What is the remedy? There appears to be three, easily reached:

REMEDIES.

1. Let Congress legislate a tariff for revenue only.
2. An act by Congress to control the carrying of freight and passengers by our public highways.
3. Abolish all boards of trade.

SOURCES OF INFORMATION.

Now I have explained my views, in my feeble way, in as concise a manner as is possible for me. I have gained my knowledge of the facts partly from my own observations and talk with the people of different States and places, while traveling (my personal acquaintance extends from the State of Ohio to the Rockies, in Western Colorado), and from what I have read. I read the Missouri Republican, the Kansas City Times, and the Inter-Ocean, besides what is sent free from the East, say, six to eight papers per week.

SUBSIDIES TO RAILROADS SHOULD BE PROHIBITED.

There is one thing more I will speak of, which is of great importance to the farmers of the West. Congress should pass an act forever prohibiting States, counties, and towns voting subsidies to railways. This is a large item in our taxes, and all voters that pay no taxes will vote the people's money to build railways. We have already too many railways. They go ahead of the improvements of the country. This thing of one man voting away another man's property should be stopped, and, as I have said before, the flood of immigration should be checked at the earliest moment.

Now, the man that will work for the legislation I have suggested will put a crown on his head that will never fade in color or wear away. I want you to mark this down and remember it; it may all come to pass in your time or mine, and it may not.

---

*VIEWS OF MR. T. E. RANDALL, OF CHICAGO, ILL.*

Have the workingmen a grievance? On this turns the whole labor movement. For if they have, it should be redressed; if not, there is nothing to redress. I assume that they have, and offer in support of the statement, 1st, the general acceptation of its truth; 2d, the individual statements of those likely to know the facts and able to judge of them. J. S. Mill distinctly says in his work on political economy that it is very doubtful if invention has in any way lightened the load of the laborer. The Chicago Tribune of March 9, 1882, says editorially, "Men have to work harder and to think harder to get a living now than formerly." Now if this is true, and it has not been contradicted, it not only establishes a grievance but it also defines it. It is this, there has been invention, and consequent increase of production, but it has not benefited the producer. In other words, the workman's share of the product has

Digitized by Google

not kept pace with the increased production. For proof see the following figures from the census of 1870:

BOOTS AND SHOES.

| | 1850. | 1870. | Increase and decrease. |
|---|---|---|---|
| | | | *Per cent.* |
| Number of workshops | 11,305 | 23,428 | Increase 107 |
| Number of employés | 165,254 | 135,000 | Decrease 19 |
| Wages paid | $21,022,658 | $51,872,712 | Increase 147 |
| Value of product | $53,967,408 | $181 644,000 | Increase 236 |
| Average wages | $127 | $384 | Increase 197 |
| Profit | | | Increase 89 |

CLOTHING.

| | | | |
|---|---|---|---|
| Number of workshops | 4,278 | 9,855 | Increase 136 |
| Number of employés | 96,551 | 120,257 | Increase 23 |
| Wages paid | $15,032,340 | $34,234,394 | Increase 161 |
| Value of product | $48,311,700 | $187,503,248 | Increase 265 |
| Average wages | $154 | $284 | Increase 77 |
| Profit | | | Increase 104 |

The figures are copied from published reports. I do not vouch for their accuracy, but assuming their correctness they show conclusively that labor's share of the joint product does not increase in the same ratio as that of capital. Like nearly all public statistics they conceal some important factor in the problem. They give the annual wages, both average and aggregate, but they carefully conceal the aggregate profit, and also the cost of raw material by the aid of which, if given, the profit could be found. On their face they make a good showing; a large advance in wages and a greater per centum increase than in the case of profit, but a little arithmetic shows us that the share of the product paid to the laborer as wages in 1850 in the manufacture of boots and shoes was .389+ of the gross product, while in 1870 the proportion was but .285+ of the whole amount, showing a relative decrease of .104, or a loss of 26 per cent. on the ratio of 1850.

In like manner we find that in the manufacture of clothing the proportion of the whole value produced was .311+ in 1850, while in 1870 it had fallen off to .182, showing a loss of .129, or about 41 per cent. of the ratio of 1850. The census of 1880 presents our manufactures thus:

| | 1870. | 1880. |
|---|---|---|
| Number of operatives | 2,053,996 | 2,738,950 |
| Aggregate wages | $775,584,343 | $947,919,674 |
| Average wages | $374 64 | $346 08 |
| Decrease | $31 56, or 8+ per cent. | |

IRON AND STEEL.

| | | |
|---|---|---|
| Number of workmen | 77,555 | 140,978 |
| Aggregate wages | $40,514,981 | $55,476,785 |
| Average wages | $522 | $394 00 |
| Decrease | $128 | |

Digitized by Google

The increase in cost of living during same period was about 35 per cent. The tariff was protective during the same decade.

The grievance of the laborer is that he does not share in the *profit* of his labor. The claim of the employer is that he furnishes the *capital* and takes the *risk*, and, therefore, is entitled to all the profit. Let us see for a moment. Railways only pay off once a month. The Chicago, Milwaukee and Saint Paul pays off on or about the 27th of one month for the month preceding, thus handing over to a man on pay-day about half what is due him. Does not the laborer furnish capital and take risk in this case? A firm for which I worked in this city for nearly six years, employed about 150 to 200 men. They paid on the 10th of each month. Each pay day each man left in their hands not less than eight days' pay, which at $2 per day would equal $16 each, or a total of not less than $2,500 constantly in hand, and each day thereafter adding to it. We have waited at times an additional week or so, and I have seen my wages lose 40 per cent. of its purchasing power while so waiting, without any remedy. Was there no loss, risk, or injustice to the men here? Yet there are cases worse than this.

I have tried in the foregoing to portray briefly some of the grievances of the workingmen. The truck system, long-pay periods, speculation in labor and the means of life, *contract*-convict labor, and other things of like effect, injure the laborer in many ways, but deeper than these is the principle of ownership which most employers assume in regard to industry—*my* business, *my* capital, *my* world. Employers assume the right to say just when, where, how, and to what extent production shall be carried on, regardless of everything but *profit*. This is wrong. The workman is interested in production as well as the overseer, and he will never be *satisfied* till he is recognized as a partner in the business on a basis of justice to both. *Then* the more the laborer produces the more he will be paid; the more he is paid the more he will consume; the more he consumes the more opportunity for renewed production; in short, man will produce to *have*, not to *sell*. *Now* the wages of labor will not buy the product; a part remains unsold; the market becomes glutted; production stops; labor is idle, starving, desperate; capital is unemployed, unremunerative, reckless. "The times are out of joint."

---

### *VIEWS OF MR. JOHN GLEDHILL, OF NEW YORK.*

**(Representative buyer for the English and Scotch co-operative wholesale societies.)**

#### BENEFITS DERIVED FROM CO-OPERATION.

In co-operation the laboring classes will find the most effectual means of elevating themselves, and will secure greater comfort, independence, and freedom than they have hitherto enjoyed, by studying and putting into practical use its true principles. Co-operation does not want to pull down, but to build up. It is an element for the creation of wealth by the working classes, as it encourages amongst them habits of thrift, honesty, and frankness.

The country is at present agitated by strifes between labor and capital; strikes or lockouts are continually occurring, some of which are brought about by unscrupulous capitalists, and others by unscrupulous competition. When men get together to discuss the relations between capital and labor co-operation suggests itself, and instead of encouraging brute force it appeals to reason and arbitration.

Digitized by Google

Trades unions have hitherto directed their efforts almost exclusively to maintain their rights in regard to wages and hours of labor; when they have been fortunate enough to avoid disputes, their funds accumulate rapidly. The chances are this money will be deposited in some bank at a low rate of interest, the bank will lend it out again at a higher rate, and in some cases probably to manufacturers who employ men connected with the union. The men belonging to the union have to be satisfied with 3 per cent. interest, while in all probability the borrower of their money will secure 10 or 15 per cent. The wonder is why trades unions do not make an effort to establish co-operative workshops, and so enable their members to avail themseves of the profit on their labor. There are numerous trades that would present comparatively little risk, and which, if nursed at first by the union, would in all probability prove successful. If the workingmen were aroused to their own power in this direction and induced to exercise it, they would take the most effectual means of destroying the abusive power exercised by the monopoly of capitalists.

The great success attained by co-operation in England has been by the distributive societies, which, after paying expenses and 5 per cent. on capital and providing reserve funds, &c., have divided the remaining profit among the members in proportion to their purchases at the store. That the system of dividing profits may be fully understood I give below the figures from the yearly report for 1881 of the Equitable Retail Co-operative Society of Manchester, England, which at that time consisted of 11,492 members; allowing $5 to the pound sterling the sales for the year amounted to $1,200,000; the capital was $520,740, upon which the society paid to shareholders $26,037 for interest, being at the rate of 5 per cent. per annum; after thus providing for capital there remained a profit on the year's business of $115,950, which was divided as follows:

| | |
|---|---|
| Dividend on members' purchases | $105,485 |
| Dividend on non-members' purchases | 1,685 |
| Bonus on employés' wages | 3,060 |
| Grant to news-room and library for use of members | 3,060 |
| Annual donations to hospitals, infirmaries, &c | 500 |
| Transferred to reserve fund | 2,160 |
| | 115,950 |

Thus it will be seen the shareholders got 5 per cent. on their capital, and in addition 10 per cent. on their purchases, which if taken together is equal to about 25 per cent. on the amount of their capital invested. Under the old system of trading the store-keeper would have reserved the whole of the profit to himself, but co-operation as illustrated acknowledges the right of consumers to share in the profit, for had it not been for the profit made on their purchases, capital would have made nothing. Specimens of actual results taken from the same society's share ledger could be given showing where members had only at first invested the small sum of $5, but who afterwards allowed their interest and dividend to remain with the society, and by this means alone had in the course of a few years amounts ranging from $100 to $500 standing to their credit. Co-operation is a system by which habits of thrift and economy are encouraged; many are the persons now having funds invested in co-operative societies and elsewhere who would never have had any savings if it had not been for these societies instilling the desire and showing them how to make the first effort to save. As these societies become firmly established on good sound business principles,

Digitized by Google

truly it may be said, they become savings banks for the working classes. Capital has accumulated to such an extent with some societies that the board of managers have found themselves with more capital than they could profitably employ in their business, and rather than take the responsibility of investments elsewhere, they have cut down the largest shareholders by reducing the number of shares held by them. Societies are always ready to issue shares to new members; thus shares never sell at a premium, and a society can never become a monopoly, as the benefits will be equally shared by all who join.

There are in Great Britain 1,300 societies which are classed as industrial and provident societies (being distinct from those classed as joint stock companies); out of the 1,300 societies 934 made returns for the year 1882 as having 613,345 members, with

| | |
|---|---|
| Share capital | $33,470,470 |
| Loan capital | 6,387,265 |
| Total goods sold during the year | 127,762,420 |
| Total net profits during the year | 10,096,810 |
| Total amount applied to news-rooms and libraries for use of members | 76,030 |

In the year 1864 a number of English retail societies entered into a federation by which a co-operative wholesale society was established; in the year 1868 the Scottish societies followed their example by establishing a wholesale society for Scotland. Societies only can become members of these societies. The object is for the purpose of aggregating the purchasing power of the retail societies and to bring them into closer contact with the producer, thus adding the profit of the wholesale merchant to that of the retail trade, and by this means increasing the individual consumer's profit. The wholesale co-operative movement is a bond of union by which the various societies throughout the country are brought into closer contact with each other and thereby have an opportunity of stimulating and encouraging each other; it is a means by which well managed societies are able to direct, assist, and foster young and inexperienced societies. The great success attained by the wholesale societies is shown by the following figures:

| | |
|---|---|
| Number of societies holding shares | 816 |
| Number of members belonging to societies holding shares | 457,690 |
| Share and loan capital | 3,708,050 |
| Reserve fund | 142,175 |
| Marine reserve or insurance fund | 115,435 |
| Goods sold during the year 1882 | 25,694,135 |
| Net profit on sales during the year 1882 | 364,385 |
| Total goods sold since commencement | 194,506,125 |
| Total net profit since commencement | 2,704,475 |

The net profit is the gain after paying all expenses and 5 per cent. on capital, and has been divided among retail societies in proportion to their purchases. The profit may be considered a clear gain after selling goods at merchant's wholesale prices, which under other conditions would have remained in the hands of private wholesale merchants.

It may be said that co-operation has been tried in America, and in some cases failed; but this is no reason why we ought to be discouraged. England at first had many failures, both in productive and distributive co-operation, but there have been no more failures in co-operative enterprises, nor as many in proportion to the business done, as there have been in private enterprises. America ought to profit considerably on the past experience of co-operators, both at home and abroad. It will be well to remember that there are various so-called forms of co-operation; one is that of a few individual capitalists working together with the object of taking all the profit to themselves, but the true form is

Digitized by Google

that in which the rights of capital, laborers, and consumers are recognized; it is this which holds out the prospect of the greatest good to the greatest number; to honest, thrifty workmen it means a mode of escape from present evils and the hope of much future good.

Under the co-operative industrial and provident societies act of Great Britain, an individual member can only hold shares to the number allowed by the rules of the society, which must not in any case exceed a total nominal value of $1,000. It is no doubt owing to this limit of individual investment that large savings belonging to co-operators have found investment in building societies and post-office savings banks. The total amount invested at the end of the year 1881 in benefit building societies was $206,253,200, and at the end of the same year the amount standing to the credit of depositors in the post-office savings banks was $180,972,480.

With these gratifying results before us of what has been accomplished by the laboring classes of Great Britain, it should stimulate us to give every encouragement to institutions whose object is to provide a good, safe, and profitable investment for the savings of the wage-earning classes.

The Government in this country, might by establishing post-office savings banks, bestow a great boon on the laboring classes. The reliability of these banks, and the people knowing they could withdraw their money at short notice in case of necessity, would encourage them to deposit their hard-earned savings, and as their deposits increased, habits of thrift and economy would be encouraged. Post-office savings banks would lead in a great measure to doing away with the great evil of buying furniture, sewing machines, pianos, &c., on the installment plan. The people would prefer to allow their bank accounts to accumulate until they were in a position to treat for these goods upon a cash basis, thus most probably buying cheaper and saving the interest and other expenses occasioned by the credit system and installment plan.

During the past year Mr. George Jacob Holyoake has been trying to induce the United States Government to issue in pamphlet form what may be termed a settler's guide. Such a book would be valuable, both to the workingmen of this and other countries; it would tend to open out vast tracts of unproductive land, and serve as a guide to where Government lands are to be had; this information, with a description of the surrounding country, and railway facilities and other means of approach, would be of vast service in assisting families to select homesteads of their own.

---

*VIEWS OF MRS. IMOGENE C. FALES, OF BROOKLYN, N. Y.*

THE RELATIONS OF CAPITAL AND LABOR.

The chief difficulty between capital and labor is that their relations are improperly adjusted. Though dependent, they are, and have long been, more or less antagonistic. The cause of this antagonism lies more in their respective developments than in their essential natures. Capital has developed rapidly; labor is undeveloped. The former is organized in every regard; the latter completely unorganized. Organization means power, activity, and results. Disorganization implies the reverse. With capital there is working together, *i. e.*, co-operation; with labor it is endless underbidding of man against man, *i. e.*, competition.

Digitized by Google

Labor is but another term for the race; its constant increase means the gradual reduction of a man's work value. This reduction is accelerated by the continually augmenting consolidation of capital. Each new pool and syndicate is a milestone in the history of lower wages and consequent pauperism. What autocracy effected in long-gone years is now accomplished by corporations. The fellah of Egypt, the ryot of India, is reproduced in the laborer of the nineteenth century. In our own land immigration aids natural increase in bringing about these results. The only remedy to the evil is that the work and the workman should no longer be dissociated. The producer should be directly interested in the product. This change can only result from the action of the worker. To adapt themselves to the requirements of the age they must do what capital has done, namely, combine. Their combination should be as complete as the relation of one share of stock in a stock company to another. It should be personal, vocational, social, and political. It should have one basis, mutual helpfulness; and one end, personal amelioration. The employé must become his own employer, either by being allowed an interest in his employment or by funding his earnings with those of his coemployés, and with them engaging in the same industry.

Thus the system of industrial co-operation is instituted. The first step toward it is the classification of industries.

Equally necessary in this land, where immigration pours a half million new citizens each year, is it to have some national institution, something in the nature of a national bureau of labor and statistics, whereby new fields can be opened, old ones developed, and whereby labor can be properly directed and located. By this instrumentality new centers can be brought into being and the old overcrowded cities can be relieved of their overplus of unrequired workmen. When left to hazard, overpopulated New York receives three immigrants to Virginia's one. A properly-managed governmental bureau would reverse this condition, and would in one decade convert a wilderness into a veritable Garden of Eden. Immigrants should have it in their power to know where labor is in demand, and of what character, in order to avoid detriment to their own interests and that of the community. Such governmental action would facilitate the spread of co-operative ideas. Men change from ideas. Conduct in the long run flows from cognition. The appreciation of the fact that government, *i. e.*, the whole body, cares for each individual's welfare, would eventually cause the individual to see his own importance in the State, and to realize that he, by combination and co-operation, could ultimately free himself from the evils of industrial life. That he will see it some time is undoubted, but to see it *as soon as possible* is the condition *precedent* of *modern progress*.

The necessity of the hour is for all wage-earners to combine—to organize, and to become a social and political unit.

---

### *VIEWS OF MR. J. O. WOODS, OF NEW YORK.*

#### CO-OPERATION.

Humanity has always instinctively associated together. Marriage, with home life and rearing a family, is the earliest form of human association known to us. From the family sprang the tribe; tribes formed the nations. Such are the *natural* forms of human association, and the senti-

Digitized by Google

ments and principles underlying them are the *natural* principles which give them life, value, and permanence.

As are the units so should be the mass which they form. The family is a unity from paternal, filial, and fraternal affection. The highest conception of humanity is that of a family, a brotherhood, children of a common parent, linked together by a fraternal spirit, which should prompt loving our neighbors as ourselves and doing as we would be done by. These are the principles of true political economy and the foundation on which society should rest. All contrary principles are false, and fabrics reared upon them will fall before the wind and flood of passion and selfishness. The moral elements must be the basis. The kingdom of heaven—the kingdom of righteousness, right feeling, right thinking, right acting—is the only order of society that can truly live and prosper. Establish first this kingdom of heaven and all else desirable will be added. All history teaches the folly of building upon any other basis.

"Am I my brother's keeper?" was Cain's answer to the inquiry for his murdered brother. "Am I my brother's keeper?" is ever the answer of the egotist to the inquiry for another's welfare. Selfishness is his inspiration. It prompts cheating, robbery, and knavery of all kinds. Slavery was its offspring, as is all oppression, and these react in treachery, falsehood, idleness, shiftlessness, and general demoralization.

To slave labor succeeded wage labor, bought at the lowest market price, with incidents resembling those of slavery. Scant wages result in scant service; poor pay in poor work. The action, reaction, and interaction of wrong are more wrongs. Like produces like in the moral as in the physical world.

Capital, at first the product of labor, has by the competitive system come to oppress labor, which should be its master, as indeed it might be were it as wisely directed as is capital. What would capital be without labor? When Phillip II drove the industrial classes out of Spain, he struck a blow at his country's prosperity from which it has never recovered. When the children of Israel left in a body their Egyptian taskmasters it caused such an industrial panic that an army was sent to bring them back. Labor may do without capital, as it can always produce it, but capital is worthless without labor.

Labor is constantly increasing in knowledge and power. The trades unions are multiplying and consolidating and learning that union gives force. But so long as it remains purely wage-labor the workers will be in a servile position. Men should, as far as possible, work for themselves—the only work befitting freemen. Equitable co-operation would place the workers in their natural relations with each other and upon a basis of true manliness. Their brains would then work with their hands in using their own or borrowed capital and they would be its master and not its slave.

Distributive co-operation has achieved great financial success in England. Its retail sales last year were over $100,000,000, with a net profit of $10,000,000. While the commercial benefits were enormous the moral results are greater, more especially of the Rochdale system. At those stores full weight and good quality of goods are guaranteed, with the effect of eliminating adulterations and improving their quality. No concealment of imperfections is allowed. The seller is servant to the buyer and required to aid the purchasers in selecting articles. A portion of the profits is devoted to libraries, with the best books and journals, reading-rooms, lectures, &c. Social life and a fraternal spirit are also cultivated. These are the features that have so much commended

Digitized by Google

this system to philanthropists. The sole object of the civil service co-operative system is to get goods at the lowest prices.

While distributive co-operation flourishes in England, it has not succeeded so well in America. The explanation is easy. The population there is more homogeneous. They know and understand each other better, have more sentiments and opinions in common, and hence unite more readily for a common purpose. Our nation is heterogenous, being composed of all races of the world. We are a new people and not so well known to each other. Protestantism and republicanism have stimulated individualism so that each is caring for himself and leaving others to care for themselves. Even families disintegrate and scatter.

The basis of permanent organization for mutual benefits must be a community of opinions and sentiments as well as of interests. When we come to love our neighbors as ourselves, we shall be disposed to do as we would be done by. Hence the first step should be to cultivate and establish fraternal sentiments. The public should be educated to know that there is a community of interests in humanity, and that one part can no more be permanently elevated and happy, while another portion is degraded and miserable, than one part of the sea can be salt water while another part is fresh. Enlightened self-love and social are, indeed, the same. As the wage-workers become more closely associated they will more fully appreciate this truth, and seek each other's prosperity as their own in mutual fraternal co-operation.

Equitable co-operation is not difficult to establish where there is the right disposition for it. As it is a social, educational scheme, it should be begun by the persons interested. The following is a simple illustration of what may be done:

A social circle is formed of parishioners or neighbors, comprising the usual elements of society. They agree on a basis of action in their mutual business relations, viz, to love each other as themselves and do as they would be done by. They meet at each other's houses, or some convenient place, and bring kindred spirits with them until they become acquainted with each other. Moral duties and social relations are discussed, and music, reading, and various recreations introduced.

The next step should be to establish business relations with each other. The members of the circle agree to buy at the stores of the trading members, and to employ its various artisans and professions, provided they can be served as well as elsewhere. As cash trade is thus secured without expense, a discount can reasonably be allowed, such as is customary with co-operators.

To secure funds for trifling expenses, a tithe of the discounts could be retained. Thus, if the discount of 10 per cent. be allowed on a purchase of $10, 10 cents would be returned for the mutual fund. If one's purchase or transactions amount to $500 during the year and an average discount of 10 per cent. be allowed, the personal saving would be $50, of which $5 would go into the treasury. The details could be easily arranged.

In such a case mutual equitable co-operation would be established without any special capital or extra expense. The business would be upon a moral and fraternal basis, and the union might embrace all social and material interests. The members might agree to submit all differences or difficulties between them to the circle or its appointed committees and officers. Each should aid the others in all reasonable ways, as indeed he would if the proper sentiments prevailed.

A mutual circle might be organized in every parish or neighborhood. A germ of this new social order, however small, might be planted and

Digitized by Google

nourished in which week-day business would illustrate the best Sabbath teaching. Alas! how little they now conform.

Possibly and probably in an extended circle of this kind persons might meet in some degree uncongenial, but a common, noble purpose would mold and harmonize them. We are not to avoid people because not quite to our taste. Our mission should be especially to the lowly. They are our brothers and sisters. If above them in character and culture we can educate them, if below, they us. Humility is a spiritual grace, and the noble end in view should stimulate exertion and forbearance.

---

*PLATFORM OF THE AMERICAN ADVISORY CO-OPERATIVE BOARD.*

The American Advisory Co-operative Board declares as the basis of its action the following principles:

1. The true interests of any human community are common, to the extent that no portion of it can be permanently elevated and happy while another portion is degraded and miserable.
2. Enlightened moral and material self-interest dictates a fraternal and equitable regard for the best interests of all.
3. Morality is superior to money, and should not be subordinated to material interests.
4. Wealth is the product of head and hand work, applied to the cultivation and use of the resources and forces of nature, and equitably belongs to the producers—labor and the capital by which labor is made effective.
5. Enough wealth is produced to comfortably feed, clothe, house, and educate all faithful workers, and the social and financial relations of society should be such as to secure them the enjoyment of these necessities of civilized life.
6. Honest, equitable, and fraternal co-operation in the production, distribution, and enjoyment of wealth will secure the best results.

---

*VIEWS OF CO OPERATION.*

A little time ago we visited the large publishing house of Cassel, Petter & Galpin, London. Nearly a thousand men were busy at the presses or preparing woodcuts, giving to the people the great need of the age, cheap yet good literature; all worked with enthusiasm. What was the secret of it; was it because they received fair wages? Not that alone. Was it because they were treated with the courtesy due from one man to another, be he hod-carrier or millionaire? Not that only; they were sharers in the profits of the firm. Every book printed was their book; every hour wasted was their loss. Of the capital, $200,000 is held by about three hundred employés, who have been able to buy stock. Two hundred and seventy-two others, each by the payment of 25 cents weekly, in three years and a half become partners. Those unable to save even this, if their salary be less than $1,500, after five years of service are helped to partnership by the provident society, established for old or disabled employés.

"Profit-sharing" of employés with the employed, is gaining ground abroad. Professor Sedley Taylor, late fellow of Trinity College, Cambridge, who has written much and ably on this subject, has given a detailed account of several of the more than one hundred firms already using this method in Europe.

Digitized by Google

The Paris and Orleans Railway Company, with 15,743 employés, has practiced profit-sharing for forty years. The entire sum allotted the men over and above market wages during this time has been $11,000,000. Formerly a bonus was paid in cash; now it is compulsorily invested for a retiring life pension, when the employé is fifty years old. Messrs. Chai & Co., publishers, give 15 per cent. of the net profits to their workmen. The amount distributed in ten years has been $25,000. One-third is given in money, one-third to their provident society, and the remaining third is received after twenty years of labor. A single incident will show the interest manifested after profit-sharing was introduced. Two workmen setting type had each a lamp; they at once moved their frames together, and blew out one light to save expense for the firm of which they were now a part. The proprietor has also organized a school for his apprentices, where history, book-keeping, drawing, chemistry, &c., are taught. The pupils are promised 2 cents for each attendance, and at the end of the month receive this for spending money.

The Company of General Insurances has for thirty years divided 5 per cent. of its profits among its employés, in proportion to their individual salaries. This is accumulated at 4 per cent. compound interest, until the workman has been twenty-five years in their employ. The sum assigned has been nearly $1,000,000.

I was interested in the immense Bon Marche, after seeing the rooms where the 2,300 clerks take their meals, and where many of them sleep, to learn Madam Boucicault's plan. Her husband and son having died, she is the responsible head. Of the $4,000,000 capital, she holds $2,500,000, while her employés hold $1,500,000. After five years of labor in her house, all share in the profits, the sum being fixed annually by herself. This is put at 4 per cent. compound interest, till the men have worked twenty years and the women fifteen. The labor share since the adoption of this system, seven years ago, has reached nearly $100,000.

In 1878 a company was formed in Paris to study profit-sharing and report its progress. The annual bulletins can be obtained from our National Bureau of Education. The Maison Leclaire with its thousand workmen is well known. The founder, the son of a poor village shoemaker, coming penniless at seventeen to Paris, apprenticed to a hard master, determined in after years to aid those who worked for him. During the first fifteen years of his business they subscribed monthly to a mutual aid society. This fund was then taken into partnership. The profits are given after taking out 5 per cent. interest on capital, one-fourth to the two managing partners, one-fourth to the aid society, and half in money to the workmen. The day before his death, in 1872, Lecaire wrote his partner: "Until sound learning shall have replaced ignorance among the masses, until the disinherited shall have strength to raise themselves to us, we must hold out a hand to them. Otherwise the rooted antagonism between the suffering classes and the more fortunate will never cease." He said: "It is better for me to earn 100 francs and give 50 to my workmen, than to earn only 25 and keep them all myself."

M. Board, in his piano manufactory, has for twenty years, after deducting 10 per cent. on capital invested, divided the profits proportionately with the workmen; one part to the interest already allotted, the other according to the wages paid. Their shares have been already over $240,000. The paper mills at Angouleme, with 1,500 workmen, have a somewhat similar plan. In all these cases the workingman receives his daily wages at market price. If no profits are made he receives no share, but with his employer feels the general disappointment and loss arising from increased exertion with the hope of profit.

Digitized by Google

THE RESULT FROM PROFIT-SHARING

has been excellent. Workmen have become encouraged to save, to do more and better work, to be sober and self-respecting, and to avoid strikes as detrimental to their own welfare. They are no longer eye servants, but responsible coworkers. Ambition is aroused, and they desire homes of their own. Hon. Francis A. Walker says:

Many experiments and probably much disappointment, and some failures will be required to develop the possibilities of this scheme and determine its best working shape, yet in the end I see no reason to doubt that such a relation will be introduced extensively with the most beneficial results.

Postmaster-General Fawcett, in "Pauperism, its Causes and Remedies," page 165, says:

The public press often tells us how some iron master or some manufacturer has become a millionaire, but not a word is said about any advance in the condition of those without whose labor such vast wealth could not be accumulated. All experience shows that there can be no hope of introducing more harmonious relations unless employers and employed are both made to feel that they have an immediate and direct interest in the success of the work in which they are engaged.

A letter received from one of England's largest manufacturers has these words:

I think when the time comes for co-operative production, it will solve many questions and destroy large manufacturing monopolies, raise the laboring slave to an independent and regenerating position in his own and our opinion. I am sure there is a strong feeling, in the mind at least of the intelligent employer of labor, that he owes his work-people something.

Co-operative distribution has already wrought wonders. The story of the twenty-eight weavers of Toad Lane reads like romance. Of course it is objected that such broad partnerships destroy the privacy of business; that workmen are unwilling to share losses—assertions well answered last year by Professor Taylor before the Manchester Statistical Society; and that wages are better in America than elsewhere, therefore labor should be satisfied. The recent great strikes in our own country, saying nothing of the 2,352 in Europe since 1870, show that there is still dissatisfaction, both with length of hours and wages. Doubtless we shall help to save our Sabbath by the adoption of the English half-holiday on Saturdays. The man who works from sunrise to sunset, scarcely knowing that the flowers are growing about him or that the sky is blue above him, must have some time for fresh air and sunshine. Shall we not also eventually help to solve the labor question by "profit-sharing?"

A hopeful sign of that future when, as the lamented W. Staney Jevons said: "The workman's interest shall be bound up with those of his employer, and pitted in fair competition against those of other workmen and employers" rather than workmen banded together and employers together, is the fact that never before were employers building so many tasteful homes for the employed as now. In Sweden model dwellings are erected, with the intention that the workmen, by annual payments, shall become the owners. They are usually designed for two families, three rooms for each, the rent about $16 a year, paid for by their vegetable gardens.

Mr. Krupp, at his steelworks at Essen, Prussia, where 17,000 men are employed, has already built about 3,000 houses for them. He has also established schools and a reading-room. When ill they receive half-pay and are cared for in the hospitals without cost. Saltaire, built by Sir Titus Salt for his 4,000 workmen is clean and attractive with its

Digitized by Google

two-story houses of light stone, its flower beds in every front yard, its handsome hall, used as a library, museum, and for class rooms, its park of fourteen acres, with cricket grounds and lake for boating, and without a single saloon in the town.

The 944 building associations in England and Wales, with a share-capital of $90,000,000, are making many waste places comfortable and healthful. Peabody, with his $2,500,000, set an example that the world will more and more emulate. Fifteen of the worst localities of London have immense brick or stone blocks, with clean rooms and happy children. While each of the nearly 8,000 rooms pays only about 50 cents a week for rent, the net profit on capital is from 3¼ to 3½ per cent. Two other London societies have each spent $1,500,000 for a similar purpose. Some towns in France are thus using their surplus capital, believing it to be a paying investment as well as a humanitarian scheme. The work of Miss Octavia Hill, one feature of which is that wealthy ladies shall each look after three or four houses, collecting rents and giving helpful suggestions as to health and cleanliness, deserves careful study.

Neat, skilled, and able-bodied workmen cannot come from squallid homes, where food is poorly cooked and ventilation and drainage unknown. A pot of flowers in the window of shop or home, and a picture on the walls are wonderful educators. All through Scandinavia one sees flowers in every window, be the home ever so modest. What wonder that the people are honest; the doors of a Norwegian never being locked, and that they are most tender, alike to children and to animals.

Whatever may be thought of profit-sharing and home-building, humanity, as well as self-interest, must enlist employers in the *education* of the employed. The workingman has become an important factor in our civilization. Through his increasingly strong labor organizations men will be sent to Congress to represent his interests. Power will not be wanting, but the wisdom of the legislation thus affected, with regard to monopolies, taxes on land, eight-hour system, &c., will depend largely on the education of the constituents. John Stuart Mill said of education as a remedy for the ills of the working people, "It is indeed not the principal, but the sole remedy, if understood in its widest sense." Said Jules Ferry recently, "Labor and schools—that is the law of the future. It is by these that the great American democracy is daily taking gigantic strides toward the almost incalculable greatness of its destinies." France herself is nobly doing her part. There are more than one hundred art classes for adults in Paris alone, all numerously attended and chiefly by workingmen. There are also free courses of elementary and advanced lectures in every branch of literature, art, and science, including modern languages, biology, and mathematics, given by men of national reputation, to large audiences, composed mostly of workingmen. Especially does one see this at the College de France and Conservatoire des Arts et Metiers. Similar courses are given in all the chief towns. This is a feature America might well copy for her adult population. Where is our South Kensington Museum, with its science and art schools all over the United Kingdom, with evening classes for artisans at 75 cents a month?

The workingmen's colleges of London, the first organized in 1854 by Rev. Frederick Denison Maurice, assisted by such men as Ruskin, Rossetti, Cave Thomas, and others, are not only the best possible prevention of socialism, but the best aid to good citizenship. Thomas Hughes, M. P., is president of one college with seven hundred students, and Rev. Stopford Brooke of another. The course is so thorough that some of

Digitized by Google

the students have taken the B. A. degree of London University. The charge for tuition is small—25 cents a term for Greek or Latin. Each Saturday evening free popular lectures are given by eminent scholars. Dr. Birkbeck began a somewhat similar work thirty years before, and his institute has become the parent of one thousand others in Great Britain.

The "Workingmen's Club and Institute Union" is an association of five hundred and fifty clubs for mutual improvement by lectures and libraries and for recreation. Mr. Hodgson Pratt is its leading spirit. Only recently one thousand of its seventy-five thousand members were entertained at the South Kensington Museum by the president and his wife, Sir Thomas and Lady Brassey. How different the position of the intelligent workingman of to-day from that of the Helots of Sparta, put to death at will, or the Roman peasant, sold like the ox, with the land on which he labored!

We visited with great interest many workshops abroad, always finding where most was done for the employed, there most was also done for the employer. In the large engineering works of Messrs. Tangye, in Birmingham, with two thousand men, lectures are given twice a week during the dinner hours on political or general subjects, the men often suggesting the topics. Evening classes are held, a library provided, and a visitor for the sick. Breakfasts and dinners are furnished, the latter costing from 12 to 16 cents. It is a comfort to see the men eating this rather than a cold dinner from a tin pail. Perry & Co., pen-makers, have a dining-hall, with complete kitchen apparatus. They loaned the committee having it in charge sufficient money to purchase food at the start. The firm also fitted up a theater and purchased a lantern for dissolving views. Several firms have bought brass instruments for the bands organized among the men.

At Liverpool and London, cocoa rooms are provided, where cocoa or tea are served at a cent a cup, a bun at the same price, with jam, meat, &c., at low rates. The profits made on the refreshments are distributed by a committee of the work people as they see fit. At the end of these rooms there is a stage for concerts, private theatricals, or bowling. A piano is also furnished. De La Rue & Co., printers and lithographers, some thirty years ago organized a Factory Tea Society, to give tea with the evening meal at 5 o'clock daily, with tea and sugar to be taken home on Friday evenings. These being purchased at wholesale, were sold to the workmen at a fair profit, and the money put aside for their provident fund. Last year the profits were $2,500. More than twenty-seven thousand gallons of tea were sent in hot cans to the workmen. They pay weekly at the rate of 2 cents a pint. The fund is used in sickness or death.

James Smeiton & Sons, near Dundee, employ about five hundred persons in weaving. They provide a piano and harmonium in a hall accommodating six hundred, used as a school-room during the day, and for classes and lectures in the evening. They pay a librarian to take charge of a good library. Samuel Morley, M. P., a man of great wealth and great charities, is at the head of the Providence Society among his men. In a letter he says: "In a large number of cases libraries with reading-rooms have been established by firms for their young men, and these are well used and appreciated. The best way to promote benefit and provident societies is, I believe, to second the efforts made by the men themselves." How nobly he has done this the figures in last year's report abundantly testify. In Switzerland the workingmen, in their associations, provide lectures on social and political questions. In re-

Digitized by Google

mote communes, if there is no one else to do it, the workmen themselves prepare the lectures.

Cadbury Brothers in their large cocoa works, covering three acres, employ over five hundred persons. Especial attention is paid to ventilation and proper light. A cricket and foot-ball ground is provided for the men, and a play-ground with swings, &c., for the women and girls. Large dining-rooms are furnished for both sexes, where they can warm or cook their dinners over gas stoves; eighty chops can be cooked in ten minutes. From 9.15 to 9.30 every morning, the work people meet for a religious service. The wife of the leading minister of Birmingham gives most interesting health lectures to the wives of workingmen. Three firms in Manchester have institutes attached to their works. Others every pay-day give each of their three or four thousand men a paper or magazine. Penny biographies and histories are scattered widely. Rev. H. R. Haweis, the well-known author, has been an ardent promoter of this. The man who works ten or twelve hours a day has no time for two-volume novels or six-volume histories. The man or woman with leisure owes it to humanity that he or she use it for those who are obliged to toil.

Somewhat similar work, collated in our own country from Pullman, Fairbanks, Wanamaker, Waltham Watch Factory, Pacific Mills, Lawrence, Passaic Rolling Mills, New Jersey, and elsewhere, would be helpful. Every State, and the nation as well, needs a labor bureau as ably managed as that of Massachusetts. Then we should know how long our work people labor, in what homes they live, and whether or not justice is done them. The State should be interested in the best good of every citizen. It is superfluous to say that a more general education is one of our greatest needs. Mormonism would die were it not for ignorance. The population question needs but the light of political economy. The masses are led by the unscrupulous. Dr. Haygood, of Georgia, rightly says, "A man who does not know that voters ought to be able to read and write does not know enough to be argued with." And yet we have in this country 3,000,000 whites over ten years of age who cannot write, and a larger number even of colored in the same deplorable condition. In Germany, in 1870, only 12 per cent. were illiterate. In the United States that year there were 20 per cent. In the last sixty years over 11,000,000 immigrants have come to us. Last year the average was over 2,000 a day. Professor Walker says:

> If the state will see to it that the whole body of the people can read and write and cipher, that the common air and common water are kept pure; and that the first feeble efforts of the poor at bettering their condition and "saving for a rainy day" are guarded against official frauds and speculative risks, it may take its hands off at a hundred other points and trust its citizens in the main to do and care for themselves.†

Postal saving banks, such as England has tried so successfully for twenty years, with life annuities, will remedy "frauds and speculative risks," and be of great value to the poor. The Government must do much for education, and yet we shall doubtless be obliged to have many Peabodys and Slaters before the work is accomplished. The elevation of the world comes largely from individual effort. I know a minister who teaches large classes in botany, gratuitously, that his people may have minds above the trivialities of life, as well as honor the Maker of the plants and flowers about them. The Chautauqua course of reading, started by Dr. Vincent, is doing incalculable good among the people. The country has also much to hope for the higher education of women, because of the consequent elevation of society and a race of educated men born of educated mothers. Common-school education would be a blessing, if for no higher reason than that it increases the income of the

Digitized by Google

laborer from 20 to 50 per cent. In the near future technical education will fit men and women to earn their living. Each large city can do at least what has been done by the business firms of Cleveland, Ohio, in its educational bureau during the past two years. Mr. C. E. Bolton, after several trips abroad, determined to enlist the city in more general education for the working people.

For six weeks, each noon and night, he visited nearly every mill and factory among our two hundred thousand people, and with the hearty concurrence of employers gathered the men around him for ten minutes, speaking from box, counter, or anvil. Twelve entertainments were offered them one for dollar, eight cents each, with the gift each time of a condensed graphic book of forty pages. Over four thousand took course tickets, among them four hundred teachers in the public schools. Fortunately a wealthy and generous man, Mr. W. H. Doan, had built a plain tabernacle for the use of the people, and this was packed every Saturday evening, hundreds going away, unable to gain admittance. After a half-hour concert by a trained orchestra, the people stood for five minutes, and then listened to a lecture by Beecher, Gough, Tourgee, Joseph Cook, and others. The books were on astronomy, geology, histories of England, France, or the United States, health, manners, &c. Crowds came in from the suburbs. One man who had walked six miles, only to find the doors closed, said, "I don't mind the loss of the lecture so much, if I can only have the book sent me;" and he left 2 cents with a stranger for postage. On the last night, which is made a special occasion, the tabernacle being trimmed with flags and flowers, little tickets called "red options" are sold for 25 cents, transferable some months later for a regular ticket. One sick workman, out of money, offered to give his note for the 25 cents, because he could not bear to lose the lectures.

The second year twenty entertainments were given for $1.50; ten indoor lectures, preceded not only by a concert, but by a half hour prelude on the eye, architecture, glaciers, or other useful subject, often illustrated, and ten outdoor concerts on the public square, under an electric light of 32,000 candle power. The people, therefore, had concerts, preludes, and lectures in winter, and also in summer, with nearly 5,000,000 pages in the books, for 7½ cents each evening. After paying all expenses, $1,000 were put in the bank the first year, and over twice that amount the second, to be used, it is hoped, towards a people's college, a large public building, with hall, art gallery, and institute where drawing, wood-carving, telegraphy, &c., may be learned, and many of the things made or grown in Ohio exhibited. This self-supporting educational bureau is upheld by a committee of one from each of the leading firms of the city. The president, Gen. M. D. Leggett, is also president of the Brush Electric Company. Hon. John Eaton, Commissioner of Education, who, as well as the press, has given the plan his hearty commendation, opens the course the coming winter. Last year a debate on free trade *versus* protection, by Professors Sumner, of Yale College, and Denslow, of Chicago, drew an immense audience. This winter woman suffrage will be debated. A course of lectures on cooking will be open to the wives of ticket-holders. Over two hundred letters of inquiry have been received from cities and firms, showing that there is deep interest in whatever elevates the people. Does the work pay? Ask anybody who has watched the four thousand eager faces as they listened to every word of the speakers, or carefully read the little books, having them bound at the close of the season for 25 cents each. Ask those who work sixty hours a week by a heated furnace, or an oil tank, eating a cold dinner, and going wearily home by gaslight.

*VIEWS OF MR. F. P. BROOKS, OF WATERTOWN, WIS.*

HOW TO PREVENT "STRIKES"

Is a problem over the solution of which abler pens than ours have been wielded in vain, but being of a somewhat sanguine temperament we tackle the subject without fear. We believe that education is one of the principal causes of the discontent of late years manifesting itself among the laboring classes, and would therefore favor the abolishment of the public-school system. And to illustrate this point we will use for our purpose an imaginary employer and an imaginary employé. The two have been schoolmates, the latter being rather the better scholar; the former is possessed of a little gold and much brass, the latter of no brass but good health and willing hands. Be it remembered that we do not single out an isolated case, but that our illustration is intended to cover employers *as a class* and the employed *as a class*. Well, the two young men start out as employer and employé. Business flourishes and more help is needed. In a few years—or many—a large manufacturing establishment has been the result, and the employer is reputed wealthy. The employé has received his pay as agreed upon and finds no fault, still, he cannot help to note the difference in his own situation and that of his employer, and he gets to thinking. The tenor of his thoughts is about as follows: Twenty years ago to-day I began work for this man; he has paid me all he agreed to, as an honest man should; he has always treated me kindly and I have no cause to find fault; but, after all, I cannot quite understand why there should now be such a difference in our worldly affairs, when but a short twenty years ago we started out on an equal footing. I have certainly worked as hard as he did during that time. My family expenses have no doubt been much less than his. During all this time he has been smoking cigars while I have been content with a pipe; he has drank wine while I have been satisfied with beer; he resides in a large, magnificently furnished house of his own, while I am still compelled to rent; his wife and children are dressed in silks and velvet, while my poor wife and children must wear calico and faded shawls. I have been sober, industrious, and prudent; the health of myself and family has been good, and yet I have been unable to lay up a cent. But, let me see. Have I received as much pay as I have *earned*, or my employer could afford to pay? He can read, and goes to studying the quotations on the raw material; he knows to a dot the cost of manufacturing, and also the proprietor's price. He has not forgotten figuring entirely (though he has had little practice for twenty years) so he borrows a pencil and proceeds to demonstrate. And what does he find? Why simply that where he has received $1 as wages the employer could well have afforded to pay him $2 and still have a handsome profit. The retailer has made no complaint about the price of the goods; and why should he? The consumer has to foot the bill finally. In this frame of mind, and with the quotations, figures, &c., in his pocket, he calls a meeting of his shopmates in some *secret place*—to do this publicly would subject them all to discharge—and lays the result of his investigations before them. With one accord they say: We will stand this injustice no longer; our wives and little ones shall be fed and clothed as becomes the sons of honest toil.

We will demand a fair share of the result of our labor. The proprietor fumes and tears, inveighs against the rascally conspirators for meddling with his business, but all to no purpose. The "conspirators" have formed a "union," under written constitution and by-laws (they can

Digitized by Google

write), to stand by each other as long as one of them has a penny left, or until the proprietor is willing to pay fair wages for good work. And the worst of it all is, that the same state of affairs exists all over the country, and to discharge these men means a closing of the establishment.

The reader is by this time probably ready to admit that the public school is a fraud. You see, the parents of this employé were too poor to educate the boy at a private institution, so that only for the much-vaunted public school he would have remained a docile, dutiful workman, asking no questions, doing no thinking, making no tell-tale figures and behaving generally as becomes a worthy human machine. We have no objection to the education of rich men's sons—too proud to work and too lazy to steal—at private schools and colleges, to become lawyers, doctors, preachers, or what not, but an education totally unfits a man to become an obedient, reliable laborer. The Southern slaveholder understood this question to perfection. Instead of a school teacher, a preacher was employed on every large plantation to preach to the darkies from the text: "Servants obey your masters." Slave labor was reliable until the fanatical Northern schoolmarm was permitted to poison the minds of the negro with the desire for an education, and the idea that "the laborer is worthy of his hire." Next, the Northern abolitionist, slowly and stealthily, but surely, taught the "contented and happy" slave that it was wrong for capital to *own* its labor; and the consequence was, frequent "*strikes*" for freedom, and at last a bloody and costly war. To make labor reliable in the Northern States we would recommend that the whole public-school system be abolished, so that none but those who are rich enough to live without work shall receive an education. Turn the school fund over to the churches, and make attendance at divine worship, of the laboring classes, compulsory. Compel clergymen to preach principally about Lazarus and the rich man; about the camel trying to crawl through the eye of a needle, &c.; that Vanderbilt, Jay Gould, Alexander Mitchel, and all rich men will surely go to hell when they die; that the pay of "skilled workmen" at the building of Solomon's temple was one penny a day and no grumbling allowed, and that every poor man who puts in six honest days' work in a week, and is willing to take whatever his employer has a mind to pay him, without fault-finding, shall have a reserved seat in Abraham's bosom, by the side of Lazarus. Why should the laboring man wish to lay up something for wife and children, or for a spell of sickness, or for old age, when he is no longer able to work. Poor-houses have been established in every county for him and his, so that the desire for more than a bare living is both foolish and pernicious. Believing that we have accomplished what we started out to do we now bring our article to a close, promising, however, that if we discover a fault in the workings of the plan, we will suggest necessary alterations and improvements in our next.

---

*VIEWS OF JAMES H. BLOOD*

*To the honorable chairman of the Congressional Committee on Education and Labor:*

As a fundamental proposition, and as one by which all social and industrial problems must be solved, I think your honorable committee will agree with me that there is an "irrepressible conflict" between right and wrong; between justice and injustice, at all times, among all peoples, in all countries, which will never cease; which can never be suc-

Digitized by Google

cessfully repressed by compromise; which will continue to wage until right and justice shall be triumphantly enthroned as the sovereign ruler of the peoples. And by the term "the peoples" is comprehended not the inhabitants of any State, any country, any continent, any hemisphere, but the world. Any proposals for reform that do not rest upon the Fatherhood of God and the brotherhood of man, must fall short and fail. Right and justice are universal, and must come to rule universally; as universally as man inhabits the earth.

What is wrong as between individuals, is also wrong as between nations. A nation can no more be rightfully prospered at the expense of another nation than can an individual at the expense of another individual. What one person or class of persons detains from another without rendering an equivalent is robbery, whether it is by stealing direct, by driving a sharp trade, by interest, *rents*, or profits, by the terms of law, by the decisions of events, or by the arbitration of nations—there is no difference in principle between taking a cent and taking a continent.

These propositions are self-evident, and require no argument to sustain them. It is only necessary therefore, to determine what are equivalents, in order to establish a basis for the settlement of all questions of right and wrong; all questions of justice and injustice. Like causes produce like results. If all persons were born and raised under the same conditions, and were surrounded by the same influences, they would be alike in all things. That they are not so born, reared, and surrounded is determined by circumstances over which the individual has no control. That is to say, that one is born to luxury and another to poverty; that one inherits the taint of crime and another the perfume of goodness; that one is feeble and frail and another robust and strong, is no choice of the individual, but, is determined by a multiplicity of causes so broad and complicated as to involve the entire community. That is to say, further, that if one person by his superior capacities and opportunities secures to himself all the comforts and luxuries of life, all the posts of honor and preferment that his next-door neighbor wholly fails to reach, it is *not* to be placed to his credit, since his superior capacities and opportunities are not to be credited to him, but to the circumstances of his birth, education, and surrounding influences.

Justice is all-sided; it takes into consideration everything that is involved in the subject of a question. Now, what is justice between individuals, whose circumstances of birth, education, and surroundings consign them to wholly different stations? Clearly this: That what one individual or class of individuals secures by virtue of superior capacities and opportunities, above the general average of the comforts of life, belong of right to the other individual or class of individuals failing by lack of capacity and opportunity, to secure an average. To make this clear, take an illustration from the present common practice. A person born a cripple, or with disabilities that make it impossible to support himself, is taken care of by the community as a matter of right. Having been given life without his own consent, and a life incapable of maintaining itself, he has a right to claim support for that life. Now, what is true of a case of complete disability is equally true of all grades of disability up to that which admits of an average acquirement. Even energy, as opposed to indolence, is not to be excluded from the list of capacities and disabilities since both are as much an inheritance as are the other individual characteristics. It must be remembered that we are arguing to determine what justice *is*, not what custom has established; nor what theories and religions have sought to teach. Without regard or reference to any existing thing we want to determine what is absolute jus-

Digitized by Google

tice between individuals. In no other way can we expect to organize society in which there shall not be an irrepressible conflict going on; on no other basis can we expect to correct all the evils and abuses that now afflict the peoples of the earth; by no other practice can we live the doctrines of the Nazarine: "Love our neighbors as we do ourselves," and obey the new commandment: "Love one another," which superseded all other and elder commandments held to be divine and supposed to be humane.

Let every person who is discussing the problem of industrial justice ask himself or herself, Can there be a brotherhood of man outside of a community of interests? Is a palace on the one hand and a hovel on the other an evidence of brotherhood; of love of neighbor as of self; of loving each other? Is a people among whom there are the upper-ten millionaires on the one side and the lower million toilers for a bare subsistence a Christ people? And yet these same millionaires would have God recognized in the Constitution. It is but a step between modern Christianity and consummate hypocrisy.

Holding in view the principles above annunciated, in what sense are existing things right or wrong, just or unjust?

The Declaration of Independence, on which our Government is supposed to be founded, and by which its laws are supposed to be administered, holds "that all men are created equal, and are endowed by their Creator with certain inalienable rights, among which are life, liberty, and the pursuit of happiness." The right to remain as they are born, *seems* to be a natural sequence, while the right to life carries with it the right to the unrestricted use of the elements necessary to maintain it. These elements are the common gift of the Creator to man, and belong of right to all. No man or class of men has a right to seize upon them, and, holding them as their own, deal them out to the less fortunate for gain. These elements are the earth, the air, and the water, each of which is interchangable into the others, and, therefore, in reality, one. The water and the air have so far *evaded* the avaricious clutch of man, but not so the land. Notwithstanding it is an inalienable right of man to have the use of as much of the land as is requisite to support his life, the whole world is practically in the hands of speculators, who not only assume to own it, but excluding others from its use, put their own price upon it. There can be no such thing as rightful ownership of the soil. All ownership enforced by law or might is war levied against the common rights of man.

In the place of ownership there should be a system of allotment, by which each person should be secured in the inalienable possession of a certain quantity, for which, so long as Government is maintained as a substitute for industrial organization, a certain tax should be required. Such a division of the soil would be infinitely superior and more advantageous to the people than ownership, since it could not be sold, lost my mortgage, given away, or alienated by any other means. Such a system would make a surety of the homestead that no shylock could ever infringe upon and over which no red flag would ever hang.

Ownership of the land is one of the most serious evils with which the future will have to deal, and yet it might be settled easily. Let it be enacted that on the death of individuals owning land it should revert to the people, and in a single generation the evil would be removed without any violent commotion or disorder, and without doing harm to any one. As rapidly as the land should be thus surrendered to its rightful position it should be alloted to the people as above provided. Of course, all the special wealth, such as gold and silver and other min

Digitized by Google

eral mines, and coal and oil, should be reserved and worked for the public benefit, without profit, and, ultimately, without cost; for, ultimately, the industries will be organized and the whole land worked for the public benefit. Then, in place of isolated homesteads, there will be vast associative homes; in place of the small, inconvenient, and unhealthy farm-houses, there will be vast industrial palaces, containing everything that can minister to the comfort, health, and happiness of man, socially, intellectually, and morally. There is enough in the world to give to each person all the comforts and luxuries that the most favored now enjoy. The difficulty is that they are not equally distributed. The future will see that this is remedied.

Competitive industry is simply industrial war, in which the stronger in any sense prey upon the weaker in every way. The great error that has been committed is that the evolutions of the various departments of society have not gone on together. The original condition of the race was one of family government. The father was the arbitrary head of the family, with none to question his authority or dispute his right. In this condition the stronger families came to oppress the weaker and reduce them to slavery. To resist them the weaker families combined, and, in turn, becoming the stronger, forced all families into tribes. In time, the combination continuing, tribes ceased their wanderings and builded cities, and ultimately cities united and gave birth to nations, extending their sovereignty over the intervening country. Finally, under Cæsar, Rome became mistress of the then known world, the evolution of government in that direction ending in the concentration of arbitrary power in the hands of one man—one man ruling the whole, every other.

From this concentration of power began a redistribution, through limited and constitutional monarchies and dictatorships to republics, in which is exemplified the theory of each one's ruling through representation in the general government. When this form of government shall become a fact, instead of a theory, then will be exemplified the opposite extreme to Cæsar, and governmental evolution culminate to develop into industrial organization, which shall take the place of political combinations.

Now, had these evolutions of political government been accompanied by industrial evolution—had the tribes, cities, nations, monarchies, dictatorships, and republics been industrial as well as political, there would have been no conflict between the two systems—the more highly developed political organizations could not have been used as instruments of oppression to the industries. But during all the vast period of time that government has been evolving, from the rudimental form to its present far-on development, the industries have remained in the rudimental form. The head of each family contends with every other for industrial supremacy, just as formerly they contended for governmental supremacy.

There are, however, illustrations in industry of the development conforming to tribal, city, and national government, and they have the same effect upon rudimental industry that those governments had upon the rudimental government of the family—they reduce them to slavery. In one way or another the family is enslaved industrially by these more highly developed forms of industry. The principle involved is the same in each, and it will develop in industry as it did in government, unless, learning a lesson from government, the people shall lift industry to its proper place.

The common copartnership is the tribal form of industry; the incor-

Digitized by Google

porated monopolies are the industrial cities, and the railroad system of the country, when it shall become under a single management, will be a national industry, and being the most far-reaching, intricate, and intimately connected with all other organized industries, will become the Cæsar or the Rome of the industrial world.

Then will begin the redistribution of the industrial power, and it will continue until each individual will be equal to any other industrially, as in theory each is equal to any other politically in republican governments. There will be no escaping this consummation. It is the course observed in governmental evolution; it will be the course observed in industrial development. Why cannot the people be wise? Why may they not avoid all the war and strife incidental to this development and at once place their industries on the same plane that their government occupies?

All this, however, is a problem for the future to solve, but it has been introduced here to show the natural order of industrial development; to show what must be when that development shall have taken place. The question remains to be considered, what can and what ought to be done now to benefit those who are oppressed by the evolutionary processes that are going on? Those or the wiser of those who hold that competitive industry is not the ideal order of civilized life do not desire to overturn it and set up a community of interests through anarchy and revolution. They desire, if it be possible, that the necessary reforms shall be made through the means already provided; that is, the ballot. They are aware, however, that the chances for doing this are becoming fewer year by year as corporations acquire more and more the control of the votes of their *employés*. But they do not yet despair of seeing the producers unite *en masse* and assert their interests and their rights despite the intimidation to which they will be subjected.

There is one stern necessity that in the name of a common humanity cries out for relief. That there should be a large class of willing workmen in a country like this who cannot secure labor enough, or at wages enough to supply themselves and families the commonest necessities of life is a disgrace that every one who has a spark of humanity in him should desire to have wiped out. Our system of competitive industry makes no provision for this class, but on the contrary produces it. The most comprehensive charitable movements are no cure for the evil—are at best a mitigation; and they all prove that people who have some self-respect left, prefer to starve rather than accept as charity what they know belongs to them of right. There is but one way to meet this question and that is by Government employment. The General Government should institute industries in which every person willing and able to work, who cannot secure it otherwise, may earn an honorable livelihood. Colonization on public lands ought to be included in this scheme. Thousands of able-bodied men hang about our large cities who might become profitable citizens on the almost unlimited wheat lands of the Far West. This scheme should be conducted upon the plan of a community of interests for those who are colonized. The success of such a scheme would, it is believed, be so very marked as to induce thousands, if not millions of wage-laborers who now scout the idea to turn their backs upon the competitive system of industry, desert the ranks of the army that is waging industrial war, and seek shelter within the arms of the more humanitarian system of mutual interests. For my own part I believe that if a scheme of this kind was introduced into this country it would not be ten years before the present monopolists of the rights of labor would be compelled to take their employés

Digitized by Google

into partnership and share their profits with them equally, or else be left with their business plants lying idle upon their hands.

This system of Government employment and colonization of the people should also include, in a proper way, that of our prison discipline. Our present system of criminal jurisprudence and the methods by which justice is administered and punishment meted out, is another blotch upon the pretended Christian humanity of our civilization. Criminals, so-called, are still men and women and ought to be treated as such; but the effect of present methods is to make them feel that they are outcasts and beyond the pale of reform. Indeed "a single term" is often sufficient to make its subject a hardened criminal. All this is wrong. Penalties ought never to be inflicted as punishment. Who among the best of us can assume to judge the unfortunate and say that, under the circumstances—all the circumstances—any of us would have done better than he whom we send to the gallows or to imprisonment for life or a long term of years? All that we have the right to do is to protect ourselves from those whom we have reason to believe are dangerous, and while so protecting ourselves, taking care to do no injustice to them; taking care to allow them all possible personal rights and privileges, prominent among which is the right to support themselves and families by some chosen labor, which right is entirely ignored by our present system. By such a system that would show them that their weaknesses are pitied instead of their misfortunes aggravated, the criminal class would gradually disappear.

The next step that ought to be taken should be to abolish all laws for the collection of debts, as much as a matter of economy as of justice. The public, not being taken into the negotiations preceding the contraction of debts, ought not to be called in to compel their payment. People who sell property or loan money to be paid at some future time do so expecting to reap a benefit, and often grant the credit when they would not do so if the law didn't stand behind them to enforce their claims. The abolition of such laws would greatly curtail the credit system, and put it out of the power of usurers to gradually absorb the accumulated wealth of the country. It would, besides, render unnecessary a large proportion of our legal tribunals; return to productive industry the army of lawyers, court officials, and officers of the law and take the wind away that triumphantly fills the sails of so many merely speculative enterprises. It is said that in the State of Wisconsin, for a period of ten years, the costs of attempting to collect debts were twice the amount actually collected. No doubt the same is true of all other States for all decades. If this be so it would be better for the public to guarantee all debts than to attempt to enforce their collection, and this would be as near right as anything can be in a competitive system of industry.

The next evil that should claim attention in a palliative system of reform—in a step-by-step scheme of progress—is the abolition of usury—interest. An interest that exceeds the average increase of wealth allows the usurer to not only acquire all that increase, but to gradually absorb the accumulated wealth as well. According to the best authorities the increase of wealth is from 1½ per cent. to 2 per cent. per annum; that is to say, the wealth of the world doubles, say, every forty years, but the usurer's money at only 6 per cent. per annum doubles every eleven years, while at 10 per cent. it doubles every seven years, and at 12 every six years. In many parts of the country the last two rates prevail. From these facts it is easy to see why the wealth of the country is rapidly passing into the hands of capitalists, so rapidly that in five decades ending in 1880 the proportions of wealth held by capital-

Digitized by Google

ists and producers has been reversed. In 1830 the former held about 30 per cent. to the latter's 70 per cent. of the accumulated wealth of the country, but in 1880 these proportions had been transposed. How much to be preferred is the clutch of usury upon the throats of the producers in this country to that of the landlordism of England and Ireland upon those of the tenants there?

Besides, the rates of usury in a country determine also those of rents and profits. If the money-lender receive 10 per cent. per annum net for the use of his money, so must the landlord for the use of his houses; and so must the merchant that rate of profit every time he turns his stock of goods. In short, everybody who deals in the products of labor desires to make as much net as does the usurer, and so the blight of interest overshadows labor everywhere, taking the lion's share of its result and leaving it the merest means of sustenance in the best of times, and in the worst to beg, to steal, or starve.

Nor is it difficult to account for the pretty nearly regular ten years' panics that affect this country. A single illustation will show the process clearly. In a small inland city where there had never been any bank accommodations, near the end of the late war there was established a national bank having a capital of $100,000. With its $90,000 of circulation it began to make loans upon the real estate upon the county in which it was located. Within two years it had over $500,000 in mortgages. It is a well-established fact that money paid out by a bank to any one within its natural deposit limits is returned to it again within a month. The bank loans to a contractor or a builder; the builder purchases material and pays his laborer; the latter pays his landlord and his grocer, and all these recipients deposit in the bank, and the bank loans again. And so the process is repeated until the bank has mortgages on all the desirable property to five times the amount of its circulation.

In the mean time the contractor, or the builder, or whoever else may have had loans from the bank, has not made as great profits as expected, and has not been able to meet his interest regularly, and the amount of interest on the five times loaned circulation is greater than the profits of industry can pay; and as the bank does not make any more loans, all the money in the country is soon locked up within its vaults. Great and greater sacrifices are made by the debtors to tide over the hard times, but they only get more deeply involved, until finally, when the bank has got all the money and claims on all the property, it begins to foreclose its mortgages, and sells the property at just enough to pay its claims, or else bids it in and becomes its owner. This is the process by which, through usury, the capitalists are rapidly becoming possessed of all the accumulated wealth. The outlook from this stand-point alone is threatening enough to demand the abolition of interest, for, sooner or later, revolution must ensue unless the tendency to millionairism on the one hand and pauperism on the other is diverted into more healthful channels.

But how shall interest be abolished? Easily. Let the Government loan to the people, on ample security, without interest. Supposing the average rate of interest paid to be 6 per cent., and that the Government should take up all the mortgages, it would require but about eleven years for the people to liquidate their debts, by simply making annual payments on the principal to the amount of what they would have to pay usurers as interest. Just think of it. The whole country out of individual indebtedness in ten years simply by the Government loaning money without interest! And when it is remembered that this

Digitized by Google

would also stop the accumulation of wealth in the hands of the already rich, and allow labor to retain the total results of its toil, it becomes a question of the grandest magnitude and gravest importance, worthy of the consideration of every humanitarian and reformer, and especially of your committee, who have under advisement the condition of education and labor in this country.

Another step in the direction of right and justice to the masses of the people would be taken if the Government should take possession of and run in the interest of the people, and at their expense, publicly, all public methods of travel and commerce—the street railroad, the stage-coach, the steamboat, and the railroads—to include, of course, the post-office and the telegraphs. "But this is communism," says the upper ten. Well, suppose it is, what, then, if it be right? The best institutions that we have are essentially communistic. The public highways are constructed and maintained at the public expense. Upon them the lowliest wage-laborer has equal rights with the Vanderbilts, Astors, and Goulds, and yet he may not contribute a cent directly to their expenses. His children also go to the public schools, and are equal to the children of his millionaire neighbor. And still nobody seems to be alarmed by the examples of these specifically communistic institutions, or even to think of them as being communistic; but, on the other hand, they are everywhere acknowledged as among the very best parts of our civilization. Nor would anybody think differently if other institutions were to be fashioned after them. The bugaboo is in the *name* of communism, which means, to the average citizen, a division of the wealth and a life of indolence for the shiftless, and of extra labor for the industrious and thrifty—the silliest and most baseless arguments possible to be conceived.

The principle upon which the post-office service is conducted is also essentially communistic. The excess of expenses over receipts in various sections of the country are made good by the excess of receipts over expenses in various other sections of the country; and if the general expenses exceed the general receipts they are made good from the public Treasury.

Now, why should not the poor, who have no property upon which to levy taxes, use the public mails as well as the highways and the schools? and if the mails, why not the public conveyances? I think there are conclusive reasons why they should, simply as an act of justice.

And these reasons are that, behind the fact that the rich pay taxes to the tax-gatherers, stands the other, though unrecognized fact, that the laborers furnish the funds, the people who are assessed and who hand the money into the treasuries, being their self-appointed agents. The proof is simple and complete. Nobody will deny that the rich grow richer and fewer in number, and the poor poorer and more numerous every year. All the increase in accumulated wealth goes into the hands of the former class. There are individual cases of the rich becoming poor and of the poor rich, but these are the exceptions that prove the rule. Now take a case under the rule to illustrate the whole class: A is a large manufacturer of cotton cloth, employing five thousand men, women, and children, not one of whom is taxed at all. A's property, invested in the manufacturing business, is $1,000,000, upon which the taxes are assessed, say at 2 per centum, $20,000. At the beginning of the fiscal year A has this property, with his usual stocks of manufactured and unmanufactured material, and a balance in the bank of $100,000. The business for the year goes on as usual; he buys more raw cotton, employs and pays help to manufacture it, and sells the cloth.

Digitized by Google

In the mean time he has paid the taxes. At the end of the year, with the same amount of stock on hand, his bank account shows a balance of $150,000. Now who furnished the money that paid those taxes and swelled the bank account $50,000? Did A produce it? Most emphatically, no. But those whom he hired and paid just enough to maintain their lives did. They made the property that sold at a profit, produced the increase; they took the raw material and put their labor into it and increased its value to the amount for which it was sold, while A claimed and kept everything above the cost. It cost him something to keep his factory and machinery in running order, but he expended no more on his help. Indeed, they were only a part of the machinery by which he manufactured the goods; *i. e.*, they were made so by the unjust system that allowed him to grow rich at the expense of their toil, while they remained poor.

If it should be replied that those who purchased the cloth for consumption paid the profit, it doesn't alter the argument. It only extends it to embrace all laborers; since, if it were consumed by other laborers, then, of course, their toil produced the profit and paid the taxes. If it were consumed by other rich persons, then the money that they paid for it was the profit of other laborers' toil. So look at it as we may, it was labor at last that gave him the money to pay the taxes and to increase his bank account. Had the business been conducted upon the principle of the exchange of equivalents, the people whom A employed would have given him the money to pay the taxes as a part of the expense of carrying on the business and have kept, or at least shared, with him the $50,000 increase in the bank. I hold that this is simple justice; but since it was not meted out to them, they are entitled to the benefit of whatever those taxes go to maintain. Therefore I repeat that the productive labor and also the labor employed in distributing its products is entitled to the free use of everything supported by taxing the property of the country, which is a misnomer, for property can't pay taxes. Only productive labor can do this. In this way all means of transportation are constructed and maintained; therefore the labor of the country is entitled to their use just as they are to use the highways and schools, and as they ought to have the right to use the mails.

"But," says the advocate of competitive labor, "if this be true, why have individual property at all?" That is just the point to which it is desired that the attention of the people should be drawn. Why, indeed? I repeat, had the industries been allowed to keep pace with Government in its evolution, there would have been no such thing now as individual ownership of property, which is the rudimental industrial condition. Is the republican system of government an improvement on the family system? Is a government in whose construction and administration every person within its jurisdiction has an equal share, an improvement over a despotic monarchy that holds the lives and services of all its subjects at its disposal? If so, then also would an industrial system fashioned after it be an improvement over what now obtains. There is no escaping the logic of the law of evolution; everything that is must yield to it. Industrial war must cease. The industries must be organized, and when they shall be, they will take the place of political governments.

With the replacement of the competitive system of industry by the organic system of labor, almost all of the incentives to crime would disappear; and if this system were national, not only would the incentives to crime be done away, but all the illegitimate kinds of money-making,

Digitized by Google

all occupations now carried on outside of or in spite of law, would necessarily cease; there would be no room for such occupations, for all people would belong to the grand organized army of labor. Tippling shops would form no part of such an organization, nor would hundreds of thousands of women be compelled to sell themselves to vice for the means wherewith to live, nor would other hundreds of thousands sell themselves in the same way to secure means with which to compete with their more wealthy or fortunate sisters, for with the disappearance of the great inequalities caused by individual wealth accumulated by the robbery of labor, the rivalry in dress would also disappear. All the caste that could exist in such a society would be in merit. The best people would naturally rise to the best positions—to the positions of honor—for there would be none of trust. The incentive of wealth would be replaced by the desire to secure the most honorable positions, which are now largely controlled by the power, influence, and use of wealth. It seems to me that the people who cry down organic labor and uphold the present systems are responsible for nearly all the crimes and quite all the misery there is in the world, and that the Christian ministry is blind when it denounces the principles that underlie the very system indorsed by their professed Master. An universal brotherhood is impossible under any other system than organic co-operation; then all systems that stand in its way or make it impossible, are not only unhumanitarian, but, being so, are also unchristian.

"But," continues the above advocate, "it would be utterly impossible to have an orderly society after that system." Not at all. We have only to conceive of the present system going on without the intervention of money, to see that a system of organic production and distribution might be inaugurated by which nearly all the evils of the present could be cured—indeed, all the evils that have their basis in want, or in the desire for gain. If the labor of the country were organized to supply the needs of the people and working in concert, the number of hours per day that it would be necessary to labor to produce as much as is now produced would be reduced at least one-half at once, and ultimately to no more than two hours per day. Besides, the different kinds of labor would be localized where the least effort would produce the most results.

The difference that there would be would, however, be immense. Those who now produce the luxuries that the non-laborers consume would retain at least their equal shares of them. Production would become universal, and distribution would become equalized among all, in which case the necessities of distribution would become the accessories of production, and therefore its allies instead of its despoilers. The humblest toiler would be entitled to every necessity, comfort, and luxury that the most favored would enjoy, though it is fair to concede that there would be some "pomp and circumstance" connected with the positions of honor that would not attach to the more modest callings, just as the public buildings would be more magnificent than the organic homes of the people. But everything could then be magnificent, since fully one-half the labor now devoted to production of crops and merchandise, designed specially to secure money, would then be turned to the production of permanent wealth. All buildings would be made castles and palaces; all highways would be bordered by everything to please the eye and satisfy the taste for the beautiful that could be secured, and ultimately the whole world would become a paradise of use and beauty. And what is more than all the rest, poverty and misery and want would be abolished; malice, hate, and crime replaced by sym-

Digitized by Google

pathy and love and good will, and disease, physical, mental, and moral, would gradually disappear from the face of the earth, and purity and happiness and peace and joy become universal; the Kingdom of Heaven would be inaugurated on the earth. And this is the aim of industrial communism; this is communism.

Very respectfully, your obedient servant,

JAMES H. BLOOD,

*Formerly Colonel Sixth Infantry, Missouri Volunteers.*

GOVERNOR'S ISLAND,

*New York Harbor, N. Y., December* 10, 1883.

---

*VIEWS OF MR. C. A. TRIPP, OF BUTLER, MO.*

CONDITION OF FARMERS AND LABORING MEN.

I am a farmer. One-half of the headsof families only have homes of their own in this locality. One-half of remainder (one-fourth of all) have their farms mortgaged, and are paying interest at the rate of from 8 to 15 per cent. annually. Rents of land one-third of crop, or $2.50 per acre. Taxes 1½ per cent., nearly half of which is school tax. Wages of farm hands are $18 per month, with board, eight months in year, paid monthly, cash. Rich Hill, Mo., coal miners receive $2 per day, and board themselves; they are paid monthly. If paid before the end of the month there is 10 per cent. off, or trade at the company's store, and a man who does not trade at the company's store is not wanted, you see. Farmers and laboring men generally just barely make a living; that is, coarse, substantial clothing and food. Those that are in debt are getting behind more and more every year. The Missouri Pacific Railroad system has managed to set the price and control the freight traffic, regardless of law. Immense amounts of tobacco and alcoholic and malt liquors are used.

REMEDIES.

Now for remedies. Let the tariff alone. Pay the national debt as fast as possible. Tax the national banks out of existence, and substitute in their stead full legal-tender (greenbacks) notes. Allow no foreigner to own real estate. No man to own or acquire in the future more Government land than 160 acres. Establish the postal telegraph as soon as possible. Pass an interstate commerce bill, and 15 years from now own or build main railroads of United States. When you read this don't say "lunatic," but think.

C. A. TRIPP.
