# TESTIMONY

AS TO

# THE RELATIONS BETWEEN LABOR AND CAPITAL,

TAKEN BEFORE

THE SENATE COMMITTEE ON EDUCATION AND LABOR.

## VOLUME II.

NEW YORK, *September 7*, 1883.

WILLIAM WEIHE sworn and examined.

By Mr. CALL:

Question. What is your occupation?—Answer. I am a boiler; commonly called a puddler.

Q. How long have you been in that business?—A. I have worked in the mills since 1862.

Q. That is since you were quite a boy?—A. Yes, sir.

Q. And then you have grown up in the business?—A. From that time I have been continually working in the mills.

Q. Are you connected officially with any organization or association of workingmen?—A. Yes, sir; I am connected with the Amalgamated Association of Iron and Steel Workers, and I am at present a member of the board of trustees.

Q. What other position do you hold in that association?—A. No position except as a trustee at the present time.

Q. Are you not the president-elect?—A. Yes, sir; but I do not take possession of the office until some time in October.

Q. But you have been elected president of that association and will take your office in October. Now, what is the condition of the laboring people, skilled and unskilled, in that pursuit, in respect to their surroundings, their manner of living, and the adequacy of their compensation to provide for them comfortably?—A. To some extent their condition is good, and to some extent it is not. As a rule, we have a scale of prices, and we govern ourselves accordingly during the year; different branches of the work receiving different wages per ton, some more and some less. Some branches are more skillful than others, and get a better compensation.

Q. How is it on the average?

Digitized by Google

THE ADVANTAGE OF REGULAR EMPLOYMENT.

A. Well, on the average in certain sections it is very fair, and in other sections it may not be fair. What I mean by fair and unfair is this: Where a mill runs every day men can make a better living than where the mill does not run every day. It depends upon the orders the manufacturers receive, or the demand that is made on the mill, and, of course, the men employed in a locality where the mills run regularly receive a better compensation, that is, they make more money during the year than other men who are employed where the mills are more idle.

Q. As a general rule is it customary to run the mills only a part of the year, or the whole year.—A. Some firms run only a part of the year, others run them more steadily.

Q. You consider the wages very fair, then, for the work really done?—A. Yes, sir; in view of the prices of iron at the present time.

Q. Give us an idea of the prices paid to the men.

THE WAGES OF IRON-WORKERS.

A. Boilers receive $5.50 a ton, or $2.50 card-rate.

Q. At that rate, how much will they make per day?—A. They make five heats in the boiling department for a double turn and six heats a single turn, and the heaters make eight on each turn. The heaters work the iron that the puddlers have made and make it into the finished bar. In some mills they charge heavier than they do in others, but the average would be between $3.50 and $4 a day for a fair hand in the puddling department. The foremen generally average $25, but they have to pay their helper out of that. The balance remains to the boiler.

Q. What will those rates enable them to average per month?—A. When they work a double turn they work eleven turns in two weeks; that is, provided there is no accident in that time.

Q. What will your wages turn out to you by the month?—A. Well, I don't believe that you can go more than about nine months in the year in a mill that runs very steady. Some mills run less and some again a little more than that; nine months, however, would be the average run per year in a very steady mill.

Q. And $3.50 a day, you say, would be the average wages of a puddler?—A. It might reach a little higher than that where they charge heavier.

Q. Then you say $3.50 a day is a fair average?—A. Yes, sir; a fair average on the $5.50 a ton basis.

Q. What would be a fair average, putting both together? What can a skilled puddler reasonably expect to receive at the present rate of pay, on an average, as the mills run?—A. He could not expect any more under present circumstances. The scale is made for one year and there is no change during the year.

Q. But I understand you to say that one mill will do more than another and that the compensation will vary in that way?—A. Yes, sir.

Q. In the case of a mill running steadily what will be a man's wages in that department on an average?—A. $3.50 a day.

Q. What will it amount to per month—$3.50 for twenty-six days, I suppose, will give it?—A. They could not work twenty-six days a month; they could only work twenty-two days.

Digitized by Google

Q. Then the men would only get $3.50 a day for twenty-two days?—A. Yes, sir.

Q. And that, you say, would be the average wages?—A. A pretty fair average.

Q. Is that a reasonable compensation? Does it enable a man to live comfortably?—A. If a man got work all the year round it would, but the business is very laborious and the men that work at it have to live on substantial food, and in connection with that they must make a little more.

Q. Is that the reason why their wages are larger than the wages of others?—A. Not exactly that. The rollers are supposed to have more of the responsibility on them, and their wages will average a little more for that reason.

Q. The rollers, then, are the highest paid?—A. Yes; that is, they make the most.

Q. What do they make?—A. I could not tell you that exactly. Some of the mills are of greater capacity than others, but the rollers average from $5 to $6, and perhaps $7 a day. But there is only one roller at each mill, that is at one train, and he has a number of men under him that he has charge of.

Q. Then he is a kind of superintendent?—A. He works himself, but the same time he has charge of these men under him.

Q. What other classes of workingmen are there in this business besides those you have enumerated?—A. There are the heaters and the roll-hands.

Q. What does a heater get?—A. For a certain brand of iron 70 cents a ton. Some get more for work such as sheet-iron and plate-iron.

Q. What does that rate yield a man?—A. They generally average 7½ tons a day.

Q. Is that very severe labor?—A. Yes, sir; very exhausting.

Q. Does it require any great degree of skill?—A. Oh, yes.

Q. Then the man has to be a trained, skilled laborer?—A. Oh, certainly; a man could not go to any branch of the work in a rolling-mill and do it unless he had got some knowledge or experience before he went there by working at it.

Q. How do you regard that rate of wages, 70 cents a ton?—A. Well, I think that at the present price of iron it is about fair.

Q. You think that that rate of pay will enable a man to live comfortably with his family, do you, particularly out in that region of country where rents are lower than they are farther east?—A. The rents in the city of Pittsburgh are middling high; outside of the city limits they are not.

Q. They are nothing like as high as the rents in the eastern cities, I suppose?—A. But the eastern manufacturers do not pay those prices in all the mills. The eastern men have an advantage. Their food may be as expensive, but their clothing is a good deal cheaper out this way.

## DESIRABLE LEGISLATION.

Q. Is there anything special which you desire to suggest in the way of legislation or otherwise, for the improvement of the condition of the workingmen in that business?—A. Yes, sir; there can be something done by legislation. During last winter I was a member of the legislature of Pennsylvania, and several laws were passed there that are of benefit to the workingmen, especially the law in regard to convict contract labor and the mining law.

Digitized by Google

Q. Those laws are satisfactory to the people that you represent, are they?—A. Well, the convict contract labor law is not as satisfactory as it might be. The mining laws are in regard to securing ventilation for the miners, to give the miners an opportunity to have better air in the mines.

Q. Then those are laws designed for the preservation of life and health?—A. Yes, sir.

Q. You don't care, I suppose, to state the specific provisions of those laws?—A. They will only become effective at a certain time, and until that time we are unable to say just what their effect will be.

Q. However, you say that is legislation which has been adopted by the State of Pennsylvania in response to the demand of the working people?—A. Yes, sir.

Q. And in the form demanded by the representatives of the working people?—A. Yes, sir.

Q. What else is there in the way of remedial measures that you can suggest?—A. In regard to the truck system, they had a bill which they were trying to pass, but it failed. The workingmen desired that the truck system should be abolished and a pay system established requiring that the men should be paid every two weeks, and paid in United States money. That bill passed one house but failed to pass the other.

Q. And your people still desire the passage of that bill?—A. Yes, sir; for various reasons. There are men in that part of the country that get paid only once a month, and that have to deal in the employers' stores. If a man goes to work on the first day of one month he will have to work until the third Tuesday (I think it is in some places) in the following month before he receives any pay. That is nearly seven weeks. Before that time arrives the men will have had, of course, to deal in the store, and the wages in those places not being so high as in others, it usually takes every dollar that a man earns to pay his bills in the store by the time pay-day arrives, and consequently he never makes one cent advance in the direction of a better condition.

Q. Then that law is designed to require the payment of the men in money, and at short intervals, every two weeks, you say?—A. Yes, sir.

Q. Are there any other provisions in the law designed to carry that object into effect?—A. Yes.

Q. What other suggestions have you to make in regard to any form of action, legislative or otherwise, for the benefit of the working people that you represent?

### A NATIONAL BUREAU OF LABOR STATISTICS.

A. To establish a national bureau of statistics. There is such a bureau in the State of Pennsylvania now, which has worked well. It collects information from the various branches of labor in the State, and distributes that information in its reports.

Q. The laboring people generally in your trade desire some action on the part of the Government looking to the establishment of a bureau of industrial statistics, I believe?—A. Yes, sir.

Q. Is that desire very general among them?—A. Almost unanimous. I have never heard a dissenting voice yet in regard to it.

Q. What other legislation do you think would be desirable for the benefit of the working classes?—A. Well, I could not suggest anything more just now. There have been so many suggested that if we could carry even a few of them into effect it would do great good.

Q. I am asking now only about those which have assumed a definite

Digitized by Google

form in your association—those measures that have been talked about and agreed upon as something that it would be desirable to have done as a means of affording relief from the evils that the workingmen now suffer. Do you think that those measures that you have suggested are all that your association at present think desirable?—A. As far as they have gone in that line they are satisfactory; but certainly they desire to have improvements made in other directions if they see a chance of having the laws properly carried out. The great trouble is that when there is a law there is no one to enforce it in many cases, and the working classes generally cannot enforce it themselves, and consequently the law is often evaded.

Q. How would you remedy that?—A. By labor organizing and educating the members of the organizations up to that point, so that when a law is evaded they can act in harmony to secure its enforcement.

Q. That is a very wise mode of action—by bringing an intelligent public opinion to bear upon the tribunals charged with the execution of the law; that is the idea, is it not?—A. Yes, sir.

Q. Then there is no form of legislative action which you desire in connection with that?—A. No, sir.

Q. In other words, you mean that you want an organization which will createa public opinion which will enable you to hold a judge responsible for any unreasonable judgment or for failing to execute or carry out the law?

### LAWS FOR THE BENEFIT OF THE WORKINGMEN NOT EXECUTED.

A. Yes, sir. You see there is a certain class of unskilled workingmen who never have any power to have laws enforced which concern them, and they are the people that are generally most imposed upon. Laws have been passed for the benefit of the working people, but they have not been generally carried out, and, as I have said, very often the workingmen have no means of having them enforced.

Q. We shall be glad to hear any other suggestions that you may have to make on this general subject.—A. Well, as I have said before, the things that have been suggested here already are perfectly in harmony with our views generally, and we would like to see them carried out, and to see whether by such means the working classes would not be put in a better position than they are in now. At the same time, of course, we cannot go to extremes, and we don't want to do so.

### THE IMPORTATION OF LABOR CONDEMNED.

Q. Have you any suggestions to make in regard to the importation of labor from abroad under contract—skilled or unskilled labor?—A. We have no objection to labor coming here, but we do object to its being *imported* to take the places of citizens of this country. We do not think it is right to import labor from foreign countries to supersede the American workingman.

Q. What is the difference in effect between importing labor and its coming voluntarily?—A. Oh, there is a great difference.

Q. I know there is a difference in fact in the manner of its coming; but in effect, does not a man who comes here voluntarily as much supersede an American laborer as does a man who is imported?—A. But when they are brought here they are brought for that purpose; while on the other hand, when they come voluntarily, you can do something with them; you can educate them. But when they are brought here in

Digitized by Google

the way that has been described to you by other witnesses you cannot educate them until a considerable time has elapsed, and in the mean while the American workingman has suffered a great deal from their competition.

Q. Those whom you represent, as I understand you, have no objection to the voluntary immigration here of people from any country.—A. No, sir.

Q. I have no other special questions to ask you, unless you can give us some additional facts in regard to the general condition of the people engaged in the different trades, their mode of life, and the sufficiency or insufficiency of their wages to give them a comfortable support.—A. Outside of the branches that I have worked in I could not say very much, because I have not given much attention to any of the other trades.

Q. You live in Pittsburgh?—A. Yes, sir.

Q. Do you consider the general condition of the people engaged in the trades and working in the factories there as favorable and comfortable ones?—A. In some branches it may be so regarded. The unskilled laborers of Pittsburgh often are not employed all the year round, and of course their condition is not so good as that of those who receive steady employment.

Q. Well is their condition positively bad?—A. In the winter months it is.

Q. Generally, or in exceptional cases?—A. It depends on the condition of the market generally.

Q. Putting aside the question of the condition of the market, is there or has there been a good deal of want and destitution among those people at any season of the year during the last seven years?—A. Well, I could not say exactly that there was a great deal of want among them.

Q. You think, then, that as a general rule they are not in absolute want at any season of the year?—A. Not in that section.

## CHILD LABOR.

Q. In respect to child labor, is there any particular evil that requires examination and the application of a remedy?—A. Oh, yes. I do not think that children should be introduced into any works until they reach a certain age, say from twelve to fourteen.

Q. What is the practice in that respect now?—A. They bring them there into the glass-houses at eight, nine and ten years of age.

Q. And you think there should be legislation to prohibit those children working in factories before the age of twelve years?—A. Something like that.

Q. How would you do in cases where they have nothing to eat unless they work?—A. Well, if the parents were placed in such a position that they could have a fair remuneration for their own labor they would be glad to provide for their children.

Q. Yes, but would you let the children starve until the parents got placed in that position?—A. No, sir. I would have the Government clothe them and provide for them where it was necessary.

Q. You think, then, that whenever a man is unable to provide for his children, instead of letting them go into a factory the public should educate them and take care of them?—A. Yes; and if those children were kept out of those factories up to a certain age you see there would be more employment for older people, and they would get better compensation and would generally be able to provide for their families.

Digitized by Google

Q. Suppose that a man has a large family and says, "I cannot feed and clothe my children unless I put them into the factory," and you say that he shall not put them into the factory, and prevent it—that, you say, will increase your compensation and his compensation so much, but will it increase his compensation in proportion to the number of children he has?—A. Well, no, not in that case; but such instances are very few.

Q. You think that such a law would have a tendency to relieve your people generally of the evils of which they complain?—A. Yes, sir.

### THE HOURS OF LABOR SHOULD BE REDUCED.

Q. What have you to say in respect to the hours of labor?—A. Well, we think that the hours of labor should be reduced.

Q. How much?—A. Our members in the rolling-mills could not very well do it, but outside of that branch we believe that it might be so managed that the hours of labor could be curtailed.

Q. You think it impracticable in that branch because of the nature of the business, I suppose?—A. Yes, sir.

Q. Then your own idea is that different employments have different necessities in that respect, which cannot be evaded?—A. Yes, sir.

Q. I don't know of any other questions that I desire to ask, but if anything else occurs to you that you desire to submit you may state it.—A. I don't think of anything else just now.

### IMPORTED LABOR AGAIN.

By the CHAIRMAN:

Q. About this imported labor of which you speak, you make a distinction between that which is imported and that which comes here in the way of voluntary immigration?—A. Yes, sir. Generally this labor that is imported is of a bad quality, and good workingmen, I don't believe, will let themselves be imported. It is the scuff, the bad specimens of the working classes, that are usually selected to be imported.

Q. They are not selected, I suppose, because they are bad, but because they are poor and cheap?—A. Yes, sir; and because they probbly can be used for a purpose when they are brought here.

Q. Are those imported laborers, as you have seen them, as a rule, laborers that could have gotten here without assistance?—A. I don't believe they are; there may be some instances of a better class, but very few, I believe.

Q. And therefore, left to the natural laws governing immigration, they would not be here at all?—A. Not unless they came in the way they do.

Q. Those who come naturally, as you call it, must have some means to start with, of course?—A. Certainly. That is what makes me think that these men must be of the lowest grade, when they can be got together in the way they are and brought here in the manner they are. I don't believe that skilled workmen who looked to their own interests could be gathered up and brought over here in that way.

Q. To what extent is that imported labor brought to this country?—A. Well, when a strike occurs, the employers generally go over to Europe or send agents to bring over this labor.

Q. Have these laborers come in large numbers at any time?—A. They

Digitized by Google

have. In 1867 the employers brought quite a number of Belgians over here.

Q. Have any others been brought there that you know of in that interest?—A. Not iron workers. These that I spoke of were iron workers.

Q. What was done with them?—A. There was a strike in the iron mills, and the manufacturers of that district sent agents to Europe and brought over these Belgians.

Q. How extensive was the strike?—A. At that time it was a strike for Pittsburgh only.

Q. How many workmen do you think were on strike at that time?—A. I suppose there were five or six thousand men thrown out of employment by the strike.

Q. How many laborers were imported at that time?—A. The number I could not state, but there was quite a number, perhaps 2,000.

Q. Enough to enable the manufacturers to get along without re-employing the American laborers?—A. For a while they did, but the foreigners did not prove a success.

Q. Why?—A. They were not swift workmen.

Q. Did their importation operate, though, to break down the strike?—A. To a certain extent it did. They were employed until it was found that they were not satisfactory, and then of course the best of the old hands were called upon to work again.

Q. But the average hands that had been in the strike lost their places, I suppose?—A. Yes, sir.

Q. Then they must have been deserted by their leaders, were they not?—A. Well, the organizations at that time were not as complete as they are now.

Q. Do those Belgians still remain in that employment there?—A. I believe there are very few of them there now.

Q. What became of them? Did they go into the iron works or did they go into other pursuits?—A. They went into other work, outdoor work, such as stone quarries and other things out through the country districts.

Q. Then they do not remain permanent competitors with the skilled workmen of Pittsburgh?—A. No; there may be a few of them there yet, but very few.

Q. What sort of men were they?—A. Some were young and some were old.

Q. How were they as to intelligence and as to having some means accumulated?—A. I don't believe they were an educated class of people at all.

Q. They were Belgians, you say?—A. They were Belgians.

Q. Were they a healthy and vigorous people?—A. On the average I think they were.

Q. Physically, where they about the equals of the men who were striking?—A. Oh, yes; physically they were.

Q. Did you ever understand from them or any of them how they got here?—A. I understood that they got here by being imported to take the places of the men who were out on strike.

Q. Who paid the expenses of bringing them here?—A. Of that I have no definite knowledge, but I know it was done.

Q. You only know that the employers got them here?—A. I know they got them here; whether they did it as a body or acting separately as individuals I could not say.

Digitized by Google

Q. Have you known any other instances in Pittsburgh or that vicinity of such importations of foreign labor when American laborers have been on strike?—A. Not any since that time.

Q. Have there been any importations of foreign laborers who have been introduced into the mills in the ordinary course of the business, when there was no trouble among the workingmen?—A. No, sir.

Q. Have you known any other such cases of importation of laborers in any other pursuits or occupation?—A. I believe that at one time they brought some foreigners over to the mining region in Western Pennsylvania; that was six or seven years ago. I believe the men were Italians. Whether those men were imported direct, or whether the employers came to New York and got them I do not know, but at any rate they were brought there from some other place.

Q. Do you know anything of the condition of the miners?—A. Not very much.

### THE SMALL VICES OF THE WORKINGMEN.

Q. To what extent do the evils of drinking, smoking, and other small vices affect the workingmen, to your knowledge?—A. In our association we generally try to prohibit all that. We bring the subject up in the lodge-rooms and warn the men to avoid those things, and we have been successful in a great many instances in getting people who were in the habit of using stimulants to abandon the habit, or to use them to a much less extent than they had been doing before.

Q. Then, the general attitude of your order is favorable to temperance in such indulgences?—A. Yes, sir.

Q. Is your order made use of for the propagation of new and unusual theories regarding the tenure of property?—A. Well, they bring up all questions that pertain to the branches of labor that are engaged in the iron and steel mills.

Q. That is, you discuss those practical questions rather than questions relating to the ownership of land; changing the form of government, or introducing new and untried theories?—A. We do not take those up much; we have not yet at any rate.

Q. You are rather practical than otherwise in your objects and discussions?—A. Yes, sir.

Q. Have you made any statement in regard to the eight-hour law?—A. Yes; Senator Call questioned me on that; as I said before, Mr. Jarrett had gone over all those subjects very fully, and if I spoke of them I would be only going over the same ground.

Q. I understand that you assent to all that has been stated by him on this subject?—A. Yes, sir.

### A TARIFF NECESSARY TO PROTECT LABOR.

Q. What is your view as to the necessity of a tariff to American workingmen?—A. To protect them.

Q. Is a protective tariff necessary in this country, or would free trade be better for the workingman?—A. Oh, a protective tariff is necessary.

Q. Why?—A. To protect the industries of American workingmen.

Q. How many of those engaged in your industry would say that free trade would be better for the American workingman than a protective tariff?—A. I have never heard one that works in the iron or steel mills say but what a tariff is necessary.

Digitized by Google

NEW YORK, *September* 7, 1883.

JOHN I. DAVIS sworn and examined.

By the CHAIRMAN:

Question. Where do you live?—Answer. At Sharon, Pennsylvania.

Q. What is your occupation?—A. I am a puddler, or a "boiler," as we are now called.

Q. Are you connected with the Amalgamated Association of Iron and Steel Workers?—A. Yes, sir; I am a member of that society.

Q. What position do you occupy in the association?—A. I am what is termed vice-president of the district.

Q. Are you one of the delegation appointed to appear before this committee to represent the association?—A. I am.

Q. Just go on and state any matters that you desire to lay before the committee.

THE OBJECT OF THE ASSOCIATION.

A. Well, sir, as a representative of the Amalgamated Association of Iron and Steel Workers, I am here to testify that the object of our association is the elevation of our membership, morally, mentally, and financially. Our cardinal principles are that we ask nothing unjust and submit to no injustice.

Q. You were delegated with others, I understand, to lay before this committee certain suggestions which may be of service to the laboring men engaged in your own occupation as well as to others, but before you do that I would like you to state what is the general condition of the working people in your vicinity and elsewhere in the country as far as you know it.—A. The condition of the members of our association generally, that is the iron workers, is fair; the wages we receive are remunerative according to the selling prices of iron and steel and the general state of trade. As has been stated here, we are governed by what we term a sliding scale; that is we are paid $5.50 a ton when iron sells at 2½ cents a pound, and we receive an advance of 10 cents a ton for every one-tenth of a cent advance in the price of iron per pound.

Q. That is arranged by a permanent agreement between your association and the employers?—A. Yes, sir; a yearly agreement entered into by our representatives with the representatives of the employers. The system has worked very harmoniously so far as wages are concerned after the agreement has been entered into every year. Of course there is some difference of opinion at the time when we are negotiating in regard to wages, but after the agreement is made everything is harmonious.

Q. And both sides observe the arrangement for the year?—A. Yes, sir; the arrangement is faithfully carried out; it has been so all along.

THE CONDITION OF THE MINERS IN PENNSYLVANIA.

Q. The general condition of those in your occupation is good. Now, how about the miners? Do you know anything about their condition?—A. I have some acquaintance among the miners surrounding our vicinity. Their condition is deplorable, to say the least. From the small pay they receive, the frequent lack of work, and the great abundance of labor, there is a great deal of suffering among them.

Q. Of what nationality are those miners usually?—A. They are of all nationalities nearly; in our section they are mostly English and Welsh.

Digitized by Google

Q. Are there native-born Americans among them?—A. I know of none; there are also Scotch among them.

Q. What is their pay, generally?—A. I believe they are paid at the rate of 60 cents a ton for digging coal in that section.

Q. Do you know what wages per day that price gives them?—A. When they work a full day's work 3 tons a day, I guess, is about their average work.

Q. How much idle time do they have?—A. At present one-half.

Q. Has it been so for about a year?—A. It has been so for a long time; I could not state the length of time it has been so.

Q. They do the mining of coal for the heavy iron works, I suppose?—A. Yes, sir.

Q. And for the supply of fuel to the people at large?—A. Yes, sir.

Q. How as to those coal-miners being organized? Have they unions?—A. Not that I am aware of in our section. They are endeavoring to establish unions.

Q. In that effort do they receive assistance from the unions of other trades?—A. Not that I am aware of.

Q. I do not mean pecuniary assistance, but other assistance in the actual formation of their unions.—A. They do, to some extent. They are encouraged to form unions for the bettering of their condition.

Q. How about the privileges that they enjoy in the way of schooling for their children?—A. Well, they have their small school-houses in the sections of country where they are employed.

Q. Do you know anything about the condition of those schools?—A. I do not.

Q. Where the parents are foreigners from some of the continental nations, of course the children must have difficulty in acquiring our language?—A. Yes, sir; as a rule they do.

Q. In many instances the parents, I take it, are not familiar with our language?—A. The Welsh people are more or less familiar with the language before they come here.

### PRACTICAL OPERATION OF THE SLIDING SCALE.

Q. What can you say about the working of your system of agreement or arbitration at any time in the past? I think you suggested to me in conversation that it had helped you through what you called the "boom" in 1878?—A. Yes, sir.

Q. What do you mean by that term "boom"?—A. An advance in the price of iron.

Q. What caused that advance?—A. It appears that the demand advanced at that time and stimulated prices, and as the price of iron per pound rose we received a percentage of advance according to our agreement until we reached, I believe, $7.75 per ton.

Q. From what point did that start?—A. From $5.50.

Q. How long was it from the beginning of the boom until it reached the highest point?—A. If I recollect correctly it was about six or eight weeks.

Q. By reason of your agreement with the employers the advance was made without opposition by them?—A. Yes, sir; without any opposition at all—without question.

Q. When the highest point was reached how was it in that respect?—A. The price was paid as long as iron was selling at the corresponding price.

Q. It went down afterwards, did it?—A. It went down immediately.

Digitized by Google

Q How was it as to your wages then; were they reduced by the same scale?—A. By the same system exactly.

Q. Was there acquiescence or were the men disposed to insist on the increased compensation?—A. There was perfect harmony—not a word, not a ripple. The reductions were accepted cheerfully, and according to the agreement.

Q. How low down did the price go?—A. The price went down to the point where it now is, $5.50 per ton.

Q. Do you remember how long it was in getting back to that point?—A. I cannot remember the time, but it was a very short time. I think six weeks would cover the whole period.

Q. How was it in other portions of the country when this "boom" took place?—A. Well, where our organization existed the same state of things existed; the advanced wages were given during the boom, and the reductions were accepted in the same spirit.

Q. Do you know anything about the state of the case where your organization did not exist—whether there were disturbances at such places?—A. Before the establishment of the organization there was not that equalization of prices—the different manufacturers paid different prices.

Q. I have been informed by Mr. Jarrett that while, under the operation of your agreement in Pittsburgh and that vicinity the advance was paid readily by the manufacturers and then the reduction made and accepted quietly by the workingmen, in other portions of the country (where the same boom was felt of course) there were difficulties between the employers and the employés; do you know anything about that?—A. No, sir.

Mr. JARRETT. I would state in the premises (as Mr. Davis is not fully acquainted with the facts) that the boom in prices covered a stretch of over five months. Iron remained at 4 cents a pound and 4½ cents a pound for two months and a half. On the 8th day of April it began to decline and on the 8th of May it had gone from the top to the bottom, from 4 cents to 2½ cents a pound. So that the advance occupied some five months and the reduction all took place in four weeks; and, as has been stated, there was never a word of complaint, not a ripple in our mills. On the other hand, in those mills not controlled by the organization the advance was in some of them 20 per cent. and in others less. They had not been advanced in proportion as our men were, and when the employers went to reduce those wages, strikes took place all round.

The CHAIRMAN. In how large a portion of the mills?

Mr. JARRETT. In no western mills. They were all in the eastern section of the country. I could name you mills which during that boom did not advance the wages of their men, although iron advanced from 2½ to 4 cents and over 4 cents a pound. When iron was sold at 4 cents in the market they did not advance wages one cent.

The CHAIRMAN. To what do you attribute that fact?

Mr. JARRETT. To the fact that there was no organization among the men.

The CHAIRMAN. So that the manufacturers took all the benefit of the advance?

Mr. JARRETT. They took it all. That was in some mills. Some other mills paid their men as high as 20 per cent. advance, and others as high as 10 per cent.; but some paid no advance.

The CHAIRMAN. What advance was paid where your agreement was operative?

Digitized by Google

Mr. JARRETT. Forty-eight per cent. in some cases. If you will examine the scale you will find that it runs from 30 to 48 per cent. in the different branches; 48 is the highest and 30 is the lowest.

JOHN I. DAVIS, examination resumed.

NATIONAL BUREAU OF LABOR STATISTICS AND COMPULSORY EDUCATION.

By the CHAIRMAN:

Question. Are there any measures of legislation which you or your order would like to see adopted for the betterment of your condition or of the condition of other workingmen?—Answer. Yes, sir; there is one suggestion that our craft would like to see adopted by Congress, and that is the establishment of a national bureau of labor statistics for the encouragement and the education, as I may call it, of the laboring classes. We find to a considerable extent that we are not as enlightened or as intelligent as we would like to be, and for that reason we would wish to see such a national bureau established, and we would also like to see a system of compulsory education adopted. Also we would like to see measures adopted for the care of those who, on account of poverty, cannot educate their children. We feel that that is a necessity, because we feel that as a class we lack the education that we ought to have. Although we have workingmen among us that are men of advanced intelligence, yet as a rule we are not so, and we would like the adoption of some law that would compel men that would otherwise neglect their families to have them educated. Around some of our mills we find little boys employed when they should be at school getting an education. These are things that society should look after, we think, and we would like to have some means adopted to regulate them.

Q. Have the members of your association generally a feeling that there should be national legislation to assist in this matter of educating and disciplining the minds of the growing generation?—A. Yes, sir; as far as I am acquainted with their thoughts and feelings on the subject there is a desire that our people should receive a better education, and that the children should be better taken care of.

Q. I suppose that the local authorities where you live make provision so that the children could be educated if their parents were disposed to have them so?—A. There are in our vicinity good common schools, but the children don't all attend them.

Q. Is it not the fact that many of the parents feel obliged to put their children to work at a very tender age in order to get a support for the family?—A. It is so in some instances, but in others there is no necessity for that.

Q. Then you think that many parents send their children to work when they might have them attending school?—A. Exactly.

Q. Then the people themselves don't fully appreciate their needs?—A. Not in that respect.

Q. Do you know anything about the condition of workingmen in other pursuits, the common unskilled laborers?—A. No; except so far as they are connected with our mills. I know their wages are comparatively small, just bare living wages.

Q. But as a rule working people are better off in your section, I take it, than in other parts of the country?—A. Yes, sir; the circumstances surrounding a place have considerable to do with those matters. The little town in which I am located has some advantages that Pittsburgh

Digitized by Google

has not got. The workingmen in Pittsburgh have to pay high rents, while in our town the rents are moderate, and to a considerable extent the workingmen dwell in their own houses.

Q. About what is the population of Sharon?—A. Between 6,000 and 7,000.

Q. The chief business there is iron working, I suppose?—A. Yes, sir.

Q. Do you know anything about the condition of agricultural labor in that part of the State?—A. I don't know much, sir; that is, to be intelligently acquainted with it.

Q. As a rule, I suppose, the farming population is the best off there?—A. I presume so.

Q. You don't hear anything to the contrary, do you?—A. No, sir.

Q. You have spoken of the desire for the establishment of a national bureau of labor statistics. That seems to be a general demand on the part of the laboring people of the country. Do you hear any discussions among them of the hours of labor—the eight-hour law?—A. I have heard it discussed.

### AN EIGHT-HOUR LAW WOULD NOT APPLY IN IRON WORKING.

Q. But there is no general demand, I suppose, for legislation in that regard?—A. Not in our immediate locality, from the fact that an eight-hour law could not apply to our business.

Q. Why not?—A. From the fact that we would have to quit either before the eight hours were consumed or else would have to work longer.

Q. How is that?—A. Our work is divided off into five heats or charges; each of those will sometimes take an hour and a half and sometimes two hours, just according as the material is at the time. Hence to adopt the eight-hour law in our business would often be to cut off the fifth of the day's work.

Q. You work by the hour?—A. Yes, sir.

Q. How many hours a day do you generally work?—A. We work from nine to eleven hours a day; we average about ten; that is, according to the quality of the material we have to work. Some iron takes longer than other iron.

Q. Is a day's work five charges?—A. Yes, sir.

Q. And each of those, you say, is longer or shorter, according to the quality of the material?—A. According to the quality of the iron.

Q. Your day's work ranges from nine hours to eleven hours, and the average, you say, is about ten hours?—A. That is about the average.

### THE TARIFF NECESSARY.

Q. What is the general feeling of your people in regard to the protective tariff?—A. They are unanimous on the question; that is the iron workers especially. Of course we have differences of opinion. In our society political questions are not discussed.

Q. But this one, I understand, you consider that so much a settled question that parties do not divide upon it at all in your association?—A. We do not divide upon it as iron workers. We deem it essential to the interests of our trade to have protection, and we would be very glad to have more of it, especially on the tin-plate, the cotton-tie and the wire-rod. Our business would then employ a great many men that are now a "surplus" on the labor market; it would employ men not only in the immediate manufacture of iron, but a great many more, also,

Digitized by Google

in the coal regions and in the quarries producing those things that are required in the iron manufacture, so that it would have a beneficial effect upon a great number of men.

Q. Women and girls are not employed at all in your business?—A. Not in our vicinity.

Q. There cannot be much opportunity for female labor in that kind of work?—A. No, sir.

Q. What becomes of the women there?—A. Well, they work as domestics, in the stores, and wherever there is employment for them.

Q. You don't know anything about the wages they receive?—A. I do not.

Q. Are there any other suggestions you wish to make to the committee?

## POSTAL SAVINGS BANKS.

A. There is one suggestion that I heard a gentleman (Mr. Livinton), speak of yesterday in regard to the adoption of the postal savings bank system. I know a little about it from the experience that I had in England, and I believe it to be a great source of help to the people. The deposits that are received in those banks are very small, commencing at a shilling; and I remember how, when I was a boy, I deposited my first shilling in the post-office savings bank, and I remember that it was very gratifying to me the next day or so to receive a communication from London saying that my shilling had been received there. I believe the system is a great help and encouragement to the working classes to save their small earnings. The small deposits accumulate and encourage the working people to save their money. That is a system that I would like very much to see opened up here. It was in that way that I saved a little money to come this country on.

Q. How long ago was that?—A. It is now seventeen years ago.

Q. Then they have had those banks established a long while in England?—A. Yes, sir; twenty years, I think.

Q. Are there savings banks, private or national, in Sharon?—A. No, sir; there are national banks there. We had a savings bank there, but it failed, and a great many of the men lost their money.

Q. You think, I suppose, that there would be complete confidence in a Government institution such as the postal savings bank would be?—A. Yes, sir; I believe that the confidence that the people of England had in those banks was greater than they had in any other banks, from the fact that they felt that the Government was at the back of them and that their money was safe; and that feeling, of course, encouraged them to save.

Q. Do you know whether there have been any large accumulations made in that way by the working people of England?—A. Yes, sir; as I understand it, the accumulations have increased until they have now gone up into the millions.

Q. What does the Government do with the money?—A. That I cannot tell you.

Q. You don't know whether the money is invested in Government funds or appropriated to Government uses, or whether it goes into the hands of trustees who invest it under the direction of the government?—A. I cannot say what use they make of it; but I know that the people have perfect confidence that the money is safe.

Q. The Government guarantees the safety of the deposits?—A. Yes, sir. The interest they pay on the money is small, but still it is sure.

Digitized by Google

Q. What is the rate of interest?—A. It was only 2½ per cent. when I was there. I don't know whether there has been any change.

Q. Do you think the working people of this country would care for the establishment of a system of postal savings banks where the interest would be so low as 2½ per cent.?—I could not say as to the percentage, but as to the security I know they would be satisfied.

Q. Have you ever heard any talk among the working people as to the rate of interest they would be willing to accept if they could make their deposits in a Government savings bank?—A. No, sir.

Q. Do you recollect what is the legal rate of interest in Pennsylvania?—A. Six per cent. is the legal interest in Pennsylvania, although the banks pay only four now.

Q. But the Government is getting on by paying only 3½ per cent. you know?—A. Yes, I know that.

Q. And I suppose the Government would not want to guarantee a much higher rate of interest than it has to pay on its own securities, would it?—A. I believe the working people, from the confidence they would have in the Government and the feeling they would have that their money would be safe in its keeping, would be satisfied with that percentage.

Q. You think that would be satisfactory to them and that they would be willing to take the same rate of interest that the "bloated bondholder" gets, and let it go at that?—A. Yes, sir.

## THE TARIFF AGAIN.

By Mr. CALL:

Q. You say that you and your associates are all in favor of a protective tariff; do you want any more protection on steel and iron than you get now?—A. Well, the people would be better satisfied if it was a little higher; that is, if it had remained at the point where it was previous to the last session of Congress.

Q. What other articles do you want protection on besides those?—A. The tin terne-plate, the cotton-tie, and the wire rod.

Q. Those are all Pennsylvania industries, are they not?—A. Not exclusively.

Q. Largely so. Do you want any more protection on sugar? Do you want to raise the price of sugar?—A. Well, if it would guarantee satisfaction to those that produce it and give them good wages, we would be willing to pay more for it in order that they should have that.

Q. How about clothing?—A. I believe that this country produces clothing good enough for us to wear; at least I find it so.

Q. How much advantage have you and your people if you simply increase the price of all these things? What would be the benefit to you of the tariff on iron if, at the same time, the more wages you got the more you would have to pay for your goods and for your provisions and for everything you consume?—A. Well, speaking from experience in regard to that, we find that when wages are high we can do better.

Q. I am not talking now about any experience. I am talking about just the condition of things that I have stated. Suppose you were to get $5 a day for your work now, but at the same time the prices of everything that you consumed were proportionately increased, how much benefit would the increase of wages be to you?

Mr. JARRETT. If there be no objection, I will answer the question.

Mr. CALL. You may answer it.

Digitized by Google

Mr. JARRETT. When we worked under free trade in this country——

Mr. CALL. [Interposing.] That is not answering my question.

Mr. JARRETT. I will answer it. In 1850 the number of hands employed in our business was 22,370; the capital invested was $16,370,760; the wages paid was $7,165,248; the cost of the materials was $43,797,-854; the value of the products was $83,954,529. At that time you could buy flour, meat, and vegetables very cheaply, but clothing, sugar, coffee, and those articles that were not produced at home were real luxuries. By the census of 1880 it appears that the number of hands employed was 298,862; the capital invested, $416,041,646; the wages paid, $122,-648,191; the cost of materials, $380,304,990, and the value of the products, $604,553,460. Thus it will be seen that wages have increased in much greater proportion than the value of the products, and I claim that that has been largely brought about by protection. I will state further that while the wages given us by protection have increased more than 100 per cent. the cost of living has not increased 50 per cent.; hence there is an advantage to those working in the iron and steel trade of at least 50 per cent., and, as Mr. Davis was going to say, it is a significant fact that when wages are high the men can save a great deal more than when wages are low, even though the cost of living is lower at the same time.

Mr. CALL. When was it that we lived under free trade in this country?

Mr. JARRETT. From 1856 to 1860—free trade virtually.

Mr. CALL. What do you call free trade virtually?

Mr. JARRETT. There was no tariff on iron and steel or manufactures thereof at that time. Just as England to-day has free trade on iron because she produces three times more iron than she consumes; we are protectionists on iron because we consume more than we produce.

Mr. CALL. Well, of course, I do not wish to discuss the general theory of the tariff with you; I simply wanted an answer to my question, how much benefit the workingmen in that business would derive from a nominal increase of wages accompanied by a corresponding increase in cost of all articles of consumption.

Mr. JARRETT. The question put in that way would simply convey the idea that that was the fact in the premises, and that is not the fact.

Mr. CALL. Leave out of consideration the question whether it is the fact or not. There may be many other factors which enter into the question of the general aggregate which you state, and which it will not be necessary to discuss now. According to the theory of many economists these general propositions are liable to be influenced by other causes altogether. The point I wanted to get at was whether your people, the workingmen in your business, limited their idea of a protective tariff to a tariff on the manufactures produced in any one locality in this country; but I understand from what you gentlemen say that it is the idea of the workingmen you represent to have a high tariff generally.

Mr. JARRETT. Exactly. Our idea goes farther. Our idea is that if a farmer thirty years ago sold his wheat for 55 cents a bushel, and he is now getting $1.10 for it, that shows the advantages of the protective system.

Mr. CALL. You think that all that comes from the high protective tariff?

Mr. JARRETT. That would have a good deal to do with it. Another point is this: That what we pay in the markets for our commodities is

Digitized by Google

not dependent altogether upon the question of tariff or no tariff, because speculations will, to a certain extent, govern the prices of these articles. Hence, I say, I do not believe in one man controlling too much, because, if he does, he can fix the price to the detriment of others.

Mr. CALL. I do not wish to discuss the general question. I simply wanted to know whether you entertained the idea that the higher the duties are the better off the country is generally, or whether your idea was that protection was required only for the industries in which you are yourselves engaged; but I understand you to say now that the higher the duties the better off we shall all be.

Mr. JARRETT. No; I did not say that. I said that as to things that we produce here as against those produced in any other country, we were protectionists. England was protectionist as long as she needed protection; but directly she got able to produce more than she could consume she changed to free trade.

Mr. CALL. What does it matter about England's motives? We are talking about present facts in this country, and about the future.

Mr. JARRETT. Certainly; but we believe that a tax on iron, which is paid by the foreigner who places his iron in our market for sale, will not increase the cost generally to the consumer in this country, because he does not pay that tax directly to the Government; it is paid by the foreigner.

Mr. CALL. Then your theory is that the fellow that consumes the iron that you make ought to be made to pay that tax?

Mr. JARRETT. No, sir; my theory is that as labor produces all wealth we ought to produce these very commodities here at home and increase our wealth thereby, rather than increase the wealth of other nations by importing their manufactures.

Mr. CALL. How about the man that makes wheat and pork and sells it to you; your idea is to take from him arbitrarily so much more of his wheat or pork or corn as will pay this tax?

Mr. JARRETT. Oh, not at all; because the price of his commodity will be largely governed by the law of supply and demand.

Mr. CALL. If that is so what do you want a tariff for?

Mr. JARRETT. The tariff is wanted as against other nations. I am in favor of free trade in our own country, but I am not in favor of free foreign trade.

Mr. CALL. I am not talking of free trade now. I don't know that I am in favor of free trade myself. I only want to get at your idea. You think it is a good thing to impose on some branches of industry an arbitrary tax for the benefit of some others?

Mr. JARRETT. I believe it is a good thing to tax commodities brought from other countries so that we may get to producing them here. It will reduce the price of the articles here in the future, and will at the same time place us in a position where other nations will not control our markets in that respect.

Mr. CALL. Then you want to make things cheaper instead of dearer. Now, how are you going to improve wages by making things cheaper?

(Not answered.)

The CHAIRMAN. [To the witness.] Is there anything further that you care to suggest?

The WITNESS. No, sir; nothing further.

Digitized by Google

NEW YORK, *September* 7, 1883.

THOMAS M. MILLER sworn and examined.

By the CHAIRMAN:

Question. You are the general manager, I believe, of the Atlas Works in Pittsburgh?—Answer. I am.

Q. What do you manufacture there?—A. Rolling-mill machinery, glass-works machinery, and other kinds of heavy machinery.

Q. Do you have occasion to employ a good deal of labor, to deal pretty largely with the workingmen, and to observe their condition?—A. To a moderate extent.

Q. Have you been present here during this forenoon?—A. I have. Seeing that some of our Pittsburgh men were to testify, I felt interested in hearing what they had to say.

Q. You have heard the account given by these gentlemen of the relations between employers and employed there, and how they get on under the system they have described. Won't you give us the benefit of your observation and experience of the matter, from your standpoint?

THE IRON-WORKERS' UNION DETRIMENTAL TO THE MANUFACTURING INTEREST.

A. Well, I have not had experience directly in the manufacture of bar iron or steel for some time, though formerly I was proprietor of a large rolling-mill. I think the association of the men together for the improvement of their condition is a very good scheme in many respects, though in others it may not be quite so good. In the matter of making an arbitrary demand for wages, while the manufacturers generally concede to such demand, and as a rule would rather treat with the association than with individuals, still it seems to me to tend to the detriment of manufacture to some extent. I think that as a rule the manufacturers like to pay their men good wages if the state of the trade justifies it; though in some instances of course they do not. They are like other men in that respect, for human nature is about the same on the whole, and some of the manufacturers are liberal while some others of them are close. The liberal men get the best labor, pay the best prices for it. Some of the employers are continually disputing with their men, while others submit to their demands immediately on presentation. In our department of the business we are governed by the association of molders and machinists; they have an association of their own, and as a general rule we let them do as they please. We don't have much trouble, except that we sometimes cannot get our work into the Eastern market, to where labor is cheaper; we have to do without that market, and therefore the men have sometimes to do without work—go idle. The prices they demand do not seem to be extortionate as a rule. They seem to want to meet the market generally, but they do not know as the manufacturers know just what the state of the trade is, and how it is going, though they do seek to know it. I think the sympathy of the manufacturers is largely with their men all through the country, particularly in the iron and steel industries, and that they would like to see the men improve their condition by any legitimate means they can adopt, either by legislation or association, or any other way whereby they can do better for themselves and their families.

### THE LAW OF SUPPLY AND DEMAND.

But the law of supply and demand is the great law that governs the whole business, and in the end all have to bow in obedience to it.

Q. If these unions were more general I suppose it would produce a uniformity in the wages demanded by the men in the same branches of trade, and that, I suppose, would be better for the manufacturers?—A. If the wages were uniform all over the country in any particular branch of business, that branch would be more prosperous for the men employed in it. Whether the people as a whole would be better served it would be difficult to say; but, at any rate, in order to be of any advantage to the manufacturers the rule ought to be universal.

Q. That is the point that I wish to have your opinion about—whether, if trades unions exist at all, it is better or worse for the manufacturers that they should be general throughout the country?—A. Oh, undoubtedly it would be better that they should be general.

Q. Finding them existing in your locality and in your business, you would prefer, if they must continue to exist there, that they should spread and become general?—A. It would be better for us if they were general. I have just come from Washington, where I went to bid upon a Government contract, but the work came East because labor is cheaper in the East. It is not necessarily dearer with us on account of the union, but it is dearer because labor becomes scarcer as you go West and prices are better.

Q. In what way, then, would the extension of the trades unions eastward be better for you as manufacturers?—A. If the men could arbitrarily, by association, make the prices in the East the same as in the west, it would be better for us.

Q. And you believe they would do that if the association were extended to the East?—A. They would try to do it, but whether they would succeed or not I don't know. I think they would fail, because labor is so much more abundant in the East in proportion to the demand for it than in the West.

### COMPARATIVE COST OF LIVING IN THE EAST AND IN THE WEST.

Q. Is the cost of living greater or less in the West than in the East?—A. It is less as regards articles of food, and greater as regards articles of clothing, and in some cases the rents are high in the West. The rents in Pittsburgh are quite high.

Q. Can you tell us whether, on the whole, living is cheaper or dearer in the West than in the East?—A. I think, on the whole, that living in the West is cheaper.

Q. Then, if that is so, the wages of labor, being made uniform by reason of the extensions of those trades unions, would not the tendency be rather to help the West, and would not labor naturally tend to go West, where it would get the same wages as at the East and could live cheaper?—A. There would be that tendency, just as immigration shows the same tendency at the present time. One of the advantages of our protective tariff, I think, is that it brings labor from abroad to this country to build it up. We have an immense amount of virgin soil untouched yet, and the protective tariff brings labor here from other countries—brings the people here to find homes and to help us to build up our country.

Digitized by Google

THE FEELING BETWEEN EMPLOYERS AND EMPLOYÉS.

Q. I suppose that your situation as the general manager of a manufacturing establishment gives you opportunities to know a good deal about the relations between the workingmen and their employers, and to judge whether they are generally friendly or otherwise.—A. I don't think they have been so friendly since the unions have been established as they were before. The employers are inclined to treat the men as an organization and not as individuals. They do not have that personal sympathy that they had before with each individual workingman. That is my idea.

Q. Do you think that change has been the effect partially of the organization of the men, or do you attribute it wholly to that?—A. I think that has been the cause. The employers deal with the men now as a whole.

Q. Have you any doubt that the existence of these organizations of the workingmen gives them some advantage in fixing the prices which they shall receive for their labor?—A. There is no doubt of that, and I think it is proper that they should do all they can for the improvement of their condition, and should get as high wages as they can. Whether that is the best way of doing it, whether that plan will ultimately accomplish it, or whether the question will be determined by the law of supply and demand, I am not certain. The manufacturers don't find fault with the men on account of their organization. They only find fault with them when they cannot meet the market.

Q. A description has been given us of how they arrange their differences by a conference between committees representing the workingmen and the employers respectively. Are the results so attained generally satisfactory?—A. They are so generally, in the iron and steel branches of industry.

STRIKES.

Q. Don't you think that, on the whole, strikes are decreasing in that part of Pennsylvania?—A. Well, I cannot say exactly that they are. They come up every season for a short time, more or less. The coal miners are the most troublesome class in regard to strikes. The iron and steel men are a much more intelligent body, men of more education and better knowledge of affairs, so it is more among the coal miners than in the iron and steel industries that the trouble exists. Among the coal miners there is continual turmoil.

Q. Are there labor unions existing to any great extent among the coal miners?—A. There are.

Q. But the men, you say, are much less intelligent than the iron and steel men?—A. They are much less intelligent.

Q. Are you able to state whether on the whole the coal miners are improving or not?—A. I think they are. I think all the workingmen are improving in this country.

Q. There is not such an infusion of ignorant foreign labor as to keep them at their former level or prevent their improving?—A. No; but I think the greater part of our trouble comes from foreign labor that has come to this country. Foreign labor, as a rule, has more of a tendency to organize into trades unions than native labor has.

Q. Do you find native labor employed to any considerable extent in the manufacturing regions, or to as great an extent as foreign labor?—A. The native labor that is employed there is more prominent among the iron and steel men than among the coal miners. As a rule, the coal miners are foreigners.

Digitized by Google

EDUCATION.

Q. What can you say as to the inclination of those foreigners to educate their children?—A. They have a great desire in that direction. Laborers as a rule have.

CHILD LABOR.

Q. Perhaps you have heard the testimony which has been given here that oftentimes the children of the working people are put to labor at a tender age in order to help to support the family; have you observed anything of that?—A. Yes, sir.

Q. Have you observed that that evil exists to any great extent?—A. It is not so prevalent in the West as it is in the East; in the glass-houses, in the light work there, a great many girls are employed, and it is so in a good many other occupations; but I think they are generally girls who have got a common-school education and feel like working.

Q. They are generally those who have got beyond the age before which it is injurious to work?—A. Yes, sir; I think so; there is not a very large number of them in proportion to the whole number of working people, and then the labor is light.

THE CONDITION OF THE COAL MINERS.

Q. Have you any personal knowledge of the condition of the coal miners?—A. I have not been much among them. I was director in a coal mining company at Castle Shannon, where the men had their homes near the mines, and it seemed to me that they could live well if they wished to. They earned large wages, those who worked steadily.

Q. Can they have an opportunity to work steadily, those who wish to?—A. In some mines they can work all the year round unless they strike. It is a question of health and strength and of the condition of the trade. When trade is dull the men have to be thrown out of employment in those mines that are hard to work, on account of the quality of the coal or the distance from the river. Near the river, with good coal, the men have employment all the time.

Q. What wages do they receive?—A. Three and a quarter cents a bushel now, I believe.

Q. What will that enable a man to make in a day's work of 10 hours?—A. Some miners can mine 100 bushels, and I have heard of men doing as much as 125. I think, however, that on an average they don't mine over 75.

Q. That would give $2.25 a day or over for a fair day's work, I suppose.—A. Yes, sir; I think so.

Q. Is that work that boys can do?—A. No, sir; it requires strong, hardy men to do it right.

Q. Are children worked to any extent in the mines?—A. Oh, no; there are very few of them working there; some boys drive mules—boys of fourteen or fifteen years of age; but it is very rarely that small children are employed; there may be some, but generally they are quite large boys that are employed there.

Q. What mines do you speak of particularly?—A. These are what are called reef mines; the veins along the hillside near the Pittsburgh bottoms.

Q. Operated by large companies?—A. By individuals and companies. There are several companies there at Castle Shannon, and there are a great many along the river. The largest is the New York and Cleveland Gas Coal Company.

Digitized by Google

Q. How many workmen do they employ?—A. I suppose they employ 400 or 500 miners, possibly more.

Q. Of what nationality are those miners that you speak of?—A. The main body of them are Welsh. They are Welsh, Scotch, and English. Americans mine occasionally; when farm work is dull they go in and mine, those who understand it, and it is not a very difficult business to learn.

Q. How continuous is the employment of those miners?—A. I think they work on an average two-thirds of the year.

Q. At $2 or $2.25 a day?—A. Yes, sir. Sometimes they get much higher wages than that and sometimes lower; it depends on the market. They have got as high as 5 cents a bushel, and probably higher.

Q. You observed awhile ago that it seemed to you that they might do well if they saved their wages, or worked industriously, or something of that kind.—A. Yes, sir.

Q. What are the personal habits of the miners with reference to thrift and economy?—A. They are not a thrifty set of people. They spend their money largely for drink.

Q. Do they contract that habit out there, or do they bring it with them from their homes in the old countries?—A. I think it is imported largely.

Q. Does it increase upon them or does it seem to be lessening?—A. I think it is tending to diminish, though the procession that we had the other day in our city would not so indicate. There was a procession of the beer-sellers, which contained about 150 carriages and from 75 to 100 wagons, showing the number of "foreign" beer-sellers in our town.

Q. In Pittsburgh?—A. Yes, sir.

Q. They do manufacture a little beer there, then?—A. This "foreign" beer, as they term it, is Milwaukee and Cincinnati beer. Those beers are in great demand, and the men who sell them and our home beer manufacturers have rival processions, and this one that I speak of was a procession of the "foreign" beer men.

Q. How did the "foreigners" come to be in Pittsburgh?—A. They sent money there to their retail dealers to get up the procession.

Q. Then it was a procession of dealers?—A. Yes, sir.

Q. Do the rival beer-sellers also muster their drinkers respectively?—A. They have the beer on the ground soon after the procession is over.

Q. To be serious about it, what is the origin or meaning of that institution? What is it for?—A. There are brewers of beer in Milwaukee, in Cincinnati, and in Cleveland, and they send their beer to Pittsburgh to be sold. They have established such a reputation for their beer as to sell it very extensively in Pittsburgh. The local brewers some time ago gave a demonstration of their strength and had a procession, in which they had an immense caravan of wagons with their drivers and the parties who sell their beer. The "foreign" brewers determined to imitate and rival that demonstration, and they employed all the carriages and wagons they could get in the city, and had a procession of their own to show the strength with which they were holding onto the Pittsburgh people in the drinking haunts and selling them this "foreign" beer.

Q. How formidable a procession was it?—A. There were about one hundred and fifty two-horse carriages and an immense string of wagons. It occupied the street for nearly an hour in passing.

Q. Are there any further suggestions that occur to you that would be of value to the committee?

Digitized by Google

THE INTERESTS OF ALL THE WORKINGMEN SHOULD BE CONSIDERED.

A. I don't know that I could make you any valuable suggestions. I think the legislative wisdom of the country will take up these questions in their proper light and deal with them. I would like to see anything done that would advance the interests of the American workingmen as a whole—the whole body of them in the country, and not merely the interests of any particular class. I think there is no country where the interests of the workingmen are as well taken care of as they are in this country—naturally so from the nature of the country itself and its necessities. The demand for labor in this country is always as a rule greater than the supply. That is the cause of immigration here. The agricultural interests of the country require to be taken care of as well as the manufacturing interests.

THE TARIFF.

I am a manufacturer, and I believe in the tariff, but I believe only in such a tariff as will properly develop the country without making any class of capitalists too wealthy. I think our tariff on steel rails is about right; the tariff on iron is about right, but not properly placed. There should be a tariff on tin-plate and cotton-ties if there is a tariff on iron at all, because large industries have been built up in those trades which are now idle as a result of the modification of the tariff. I think the time is coming very rapidly when we can do without a tariff and can defy foreign competition; we probably could do it largely now.

THE HOURS OF LABOR.

Q. I would like to have you give your ideas about legislation in regard to the hours of labor?—A. Well, I think that all legislation on that point will be futile. While it might be directory and might indicate to humane employers that ten hours or eight hours a day would be enough, still I think the question should be left to be dealt with by the business people of the country. I don't think that legislation in that line will effect anything substantial, except in a directory manner. Men will work longer hours where they can earn more. Molders get done work now at 4 o'clock and machinists at 6 o'clock. Sometimes, however, the molders have to work until 7 o'clock—they have to work until their day's work is done. But we aim generally at the ten-hour system. I think ten hours a day is about right for a day's labor. I wish the working day were shorter in winter, but for six months in the year ten hours a day, I think, is a fair day's labor. It does seem too hard in winter, however.

Q. From your observation among other classes of people, those in professional life and those engaged in rendering service to the public in the general employments of society, what do you think is the average time per day that they work?—A. It is very hard to tell, sir. When I was a boy I worked from 7 o'clock in the morning until midnight for four or five months in the year.

Q. What were you doing?—A. Manifesting. I was a shipping-clerk. As I advanced my hours of labor were shortened by my securing better positions, but when I quit working for a salary I think I was working about ten hours a day.

Q. You are in business yourself now?—A. Yes, sir.

Q. How many hours do you work daily now, do you think?—A. I am

Digitized by Google

at my work, as a rule, when the men commence work in the morning and I often stay long after they have gone home. I suppose, though, that, as a rule, I work about ten hours a day.

Q. Do you find yourself under the necessity of giving more or less attention to your business outside of office hours?—A. Oh, yes; very often. Once or twice a week I am in at night, meeting parties at the hotels and making contracts, sometimes as late as midnight. It all depends on circumstances.

Q. As a rule, do you think that the working people devote more time to labor or less time than the employers?—A. Less, I think.

Q. On the other hand, I suppose, the working people have less to hope for from the results of their labor?—A. That is true, unless they are skilled and ambitious. I find, at least in our city, that nearly all the men who are now capitalists have been workingmen.

Q. How have they come to be capitalists?—A. By evolution, development, according to capacity and opportunity.

Q. It is the result of thrift and hard work?—A. Thrift, hard work, and economy. As an illustration of that, the present manager of the Edgar Thomson Steel Works, Mr. Jones, was an ordinary workman, and he has now control of those works as general manager, and is receiving a very large salary—$20,000 a year. He grew up from being an ordinary roller. Being more skilled and ambitious than others, he commanded better wages when he was a workingman, and finally he reached the highest position in the trade.

Q. I suppose, however, you would not present such a case as illustrations of what the mass of the workmen can do, because the condition of the mass of the men must be regulated by different considerations. They cannot all expect to be superintendents.—A. No. That is the reason that I think the regulation of the hours of labor will operate against the men themselves instead of being a benefit to them, except where they may have been required to work excessive hours.

Q. Do you think there would be any difficulty in enforcing a law regulating the hours of labor by reason of the unwillingness of the workingman himself to be restricted in that regard?—A. I think there would be. I think such a law could not be enforced. Ultimately I think it would be a dead letter, like the law of 1798 in regard to the observation of the Sabbath in our State. It might be well enough in the abstract, but it would be impossible to carry it out in all cases.

Q. You speak of its beneficial influence being directory; you mean as an indication of the judgment of the community that eight hours is long enough for a day's work?—A. Yes, sir. For instance, in the cotton factories the girls who were working there years ago worked fourteen hours a day. The ten-hour law was passed, and the hours of labor were reduced to ten a day, but, if I am not incorrect (and I don't think I am), they work twelve hours now. While the sentiment is against it, and had the hours reduced from fourteen to ten a day, they have gone up again to twelve.

Q. There has been some testimony before us that in some sections, even where there is no such law, the workingmen, by reason of their having become organized, have been able to establish the ten-hour rule by refusing to work any longer.—A. Well, I think that is very proper if they take that view. They should be the judges of that themselves. I think that is a sufficient length of time. With the modern improvements and inventions and the present advanced state of the arts, I think that ten hours' work a day would give everybody in this country a good, fair living, that is, those who are strong and hearty. The poor

Digitized by Google

and the weak have to go to the wall to some extent, of course. That is one of the natural laws that we cannot get over except by providing for them by charity.

A NATIONAL BUREAU OF STATISTICS.

Q. Have you in view the establishment of such a national bureau of statistics which has been spoken of here?—A. I should think that would be a very desirable institution to establish. Any information that could be obtained that would tend to advance the interests of the workingmen as a mass, as a class, not as individuals, not as iron and steel workers, nor as any one particular class of laborers, but the whole mass of workingmen, the men who dig with the pick, who dig on the roads at 75 cents a day (as they do in many parts of the country) as well as the others—anything that would furnish aid toward the improvement of the condition of labor generally would certainly be very valuable to the people.

THE DIVISION OF THE JOINT PRODUCT OF CAPITAL AND LABOR.

Q. Take those men that work at 75 cents a day, for instance, what occurs to you as a measure that might be adopted to increase the wages of that class of labor?—A. I don't think anything could be done in that way. The lowest class of labor will get the lowest pay inevitably. The law of the "survival of the fittest" governs that. Where labor is very scarce that same kind of labor will sometimes get $2 a day, as it does in some places in the West; but where it is superabundant it will have to accept 75 cents a day, or less. I don't think any kind of legislation will apply to such cases. The best thing that kind of labor can do is to go West, where there is need and demand for it.

Q. If those laborers were organized and in a position to say whether they would or would not work for a given price how would that operate?—A. Then the people must pay more for the products of their labor, and in return must charge more for what they sell. The great mass of the people of the country are laboring men, you know. They can only get a certain amount of food to eat. If crops are poor they will have to subsist on short rations; if crops are abundant it will be otherwise.

Q. But, over and above it all, the country accumulates from year to year, and what is accumulated is invested in business. Now if this lower grade of labor got better pay, and all grades above that at the same time were elevated in proportion, might not the result be that the accumulation of capital would be distributed at the time instead of being saved up for the future?—A. It might be; but the result of the accumulation of capital is new and further developments of industry. Mr. Vanderbilt is building a new road through our State from Harrisburg to Pittsburgh, to which he has subscribed $25,000,000. That capital, which has been accumulated, will give employment to a large number of people, and be redistributed among them, no matter what per cent. the capitalist gets. It might be better if capital got a less per cent. and the balance went directly to the people, but I don't know how that could be accomplished by legislation.

Q. I don't know that it could be done by legislation, but let it be done by whatever means might be found practicable. Don't you think that the more intelligent as a class the workingmen are the more wages they can command?—A. I do. I think the common school system in educating the children of the laboring people will improve their wages, because the difference between common labor and skilled labor, so

Digitized by Google

termed, is really much less than the common laborer thinks. The common laborers are kept by these associations out of many branches which they could go into and in which they could earn large wages.

Q. Do you think that an increase in the wages of the common laborer would necessarily imply an increase in the wages of the classes above him?—A. Unless it were taken off the classes above, which would have to be done in order to benefit the lower classes, I think it could could result in nothing, except increased prices.

Q. But might not some of that increase of wages come from the proportion which capital takes of the joint product, thus lessening the accumulation of capital for the future and distributing it immediately, so as to satisfy the wants of the wage-laborers?—A. If that could be done it would be better. If the parties controlling capital were employed simply as superintendents, simply to distribute the product of labor, it would be better, and probably would be right. But you must have some incentive to action, and unless capital can get a remuneration of 4, or 6, or 10, or 20, or 100 per cent., as the case may be, we shall not have any industrial progress.

Q. No; but don't you think that if the laborers, without whom capital would not be employed at all, were able to make a general demand for more wages and to refuse to work unless the demand was complied with, the result would be that capital would be just as eager for investment at 6 per cent. as it is now at 8; that is, when it was once satisfied that it could do nothing unless it agreed to pay the increased wages?—A. It might be so; but I think the result of the accumulation of capital is industrial development.

Q. Then, in what way do you think that the education of the masses is to be of any advantage to them in giving them higher wages?—A. In the distribution of the wages among the laborers. For instance, the rollers in the rolling-mills, some of them make from $20 to $30 a day; whereas the laborer, his "helper," makes only $2 or $3 a day. There is great complaint amongst them on account of the roller making so much more wages. Now if you could break up that and bring up the general average it would be a good thing. It is not that capitalists live so much better than the workingmen, but it is that some of the workingmen as compared with others live so much better than their neighbors.

Q. My idea is not intended to be confined to any one class of labor, agricultural, mechanical, or any one kind, but is designed to apply to all labor that produces anything. Now, if you improve the condition of the common people, they who are at the bottom will get better pay, will they not?—A. Yes, sir; I think so. I think the common laborer will get better wages when he is better educated.

Q. Then will not the result be that, of the price realized for the joint production of labor and capital combined, labor will be able to take a larger share than it now gets; thus lessening, it may be, the accumulation of capital?—A. Yes, that is true; but they would have to put it in the savings bank. Or else, if the Government debt was paid off, it would have to be invested in development in some way.

Q. I grant you that, if it was accumulated in banks; but I am only thinking of wages increased to such an extent as to be expended in the improvement of the condition of the laborers themselves, giving them better homes, better food, better clothing, and better conditions generally. It would seem that there are vast numbers of laborers who are not able to provide from their wages the comforts or even the necessaries of life.—A. That is true. The fact is that the common laborers of the land are the sufferers from all these organizations of skilled labor.

Digitized by Google

The puddler gets $3.50 a day, whereas the man who works under him gets only $1.25. There is no tendency whatever in the unions to advance the condition of *those* men. The unions are combinations among certain classes of the workingmen to advance their own peculiar interests and wages, and the result is disaster to those laborers who are not so able to combine. In certain callings, like men, that is, men engaged in the same business and in the same branch of the business, get different rates of wages according to their skill; but in rolling iron it is the same as in digging coal, a man gets so much a ton whether he is a good workman or a bad workman. But a good workman will make more than a bad one, by not burning his iron and in other ways.

The CHAIRMAN. We are very glad to have your views on these questions.

The WITNESS. Well, I wish it understood that I did not come here voluntarily as a witness.

The CHAIRMAN. No; you took the stand at the request of the committee because, after conversing with you, I thought you were a very intelligent gentleman who could make some valuable suggestions.

Adjourned.

---

NEW YORK, *Monday, September* 10, 1883.

The committee met at 10 o'clock a. m.

## RELATION OF LABOR TO LAND.

J. K. INGALLS sworn and examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. In the city of New York.

Q. How long have you lived here?—A. I have lived here off and on for the last thirty years.

Q. You present a written memorial or statement to the committee at some length?—A. Yes, sir.

Q. To what does it relate?—A. It relates to the question of the relation of labor to the land.

Q. You may state in brief terms your general views and the substance of the paper you desire to file.—A. We start with the proposition that all sustenance to human life and the satisfaction of all human wants are derived from labor upon the land and the spontaneous productions of the earth; that all social wealth is the product of labor upon land and the opportunities which occupancy of the land affords; that without the land labor is simply an abstraction and can produce nothing; that ownership of the land carries with it the ownership of the persons who must live upon the land; that labor has been burdened and despoiled in all ages of the world; in barbaric times through ownership of the person of the laborer, in more civilized times through the ownership of the land. We deprecate the idea of private property in the land which is not limited to occupation and improvement, and especially such ownership of the land as enables the owner to exclude from access to that which he does not want those who do need it. We regard this question of conflict between labor and its employers as far deeper than the mere struggle between them. That is the point merely on which the friction of our system of trade and industry comes. Monopoly of the land gives power to exclude men from the land and compels men to

Digitized by Google

sell their labor, which is only an abstraction, and in which there can be no freedom of contract, because there is no liberty on the part of the workman to combine his labor with the land or with these elements which enable him to produce. This, of course, involves rent, and by its relationship to money and the circulating medium involves interest. Both of these in this country amount to hundreds of millions of dollars each year, which are abstracted from the productions of labor, and for which no return whatever is made and for which no service is rendered.

We have dealt very unfairly with the public land question in this country; we have taken that which was given to us as a trust for the unborn generations to come, and given it over to rapacious and greedy corporations and speculators and to States. Not only are vast tracts in States held by our own people, but the moneyed nobility of Europe are founding in this country large estates, upon which American citizens cannot enter without the privilege of the foreign, and perhaps the absentee landlord.

Q. What evidence have you of that assertion?—A. I have no positive evidence in regard to the last statement, because I have taken it merely from the reports which I have seen in the papers.

Q. What reports have you seen?—A. That there was a party composed of Lord Dufferin and a number of others, whose names I do not remember, in this country prospecting and taking up lands.

Q. An item that we have seen in circulation in the papers recently?—A. Yes; and also some time ago—some months ago.

Q. Go on.—A. There are many large estates in this country. I would say that there seems to be a sort of superstition that these large estates break up and fall ultimately into the hands of the people; but that is not true at all. Such cases are only the exceptions. The rule is that these large estates are continued and increase in growth constantly.

Q. What illustrations or evidences are there of that assertion?—A. The evidence of the large estates in this city, as the Astor estate, the Lorillard estate.

Q. Those are not agricultural in their character?—A. Not agricultural, but it depends upon their power to monopolize the land.

Q. Do you consider the monopolization of land in the city the same?—A. The same precisely.

Q. The same as the monopolization of agricultural tracts? Which is more hurtful or injurious?—A. I do not think you can distinguish between them—they are parts of the same system.

Q. It depends upon the absorption of values rather than of surfaces?—A. Yes, it depends upon their ability to control what I think Stuart Mill terms the unearned increment, which means the increment that has been robbed from labor.

Q. What instances of such absorption of large unearned increments are there in this city?—A. I was going to mention the Astor estate, the Lorillard estate, the Rhinelander estate, and a large number of others.

Q. How extensive and hurtful do you take these absorptions of the land in this city to be that you have mentioned?—A. I am not able to give you statistics with regard to these estates.

Q. What hurt has the Astor absorption, for instance, done, or what harm does it do; where is the evil?—A. It prevents the workingman from obtaining a home without renting.

Q. Does it? The workingman obtains his home by buying it, does he not? Would not this land have been just as valuable at any given time

Digitized by Google

when the workingman or any other man wanted to purchase it if the ownership had been out of the Astors as in the Astors?—A. With the same system, yes.

Q. I do not mean with the same system; but suppose the Astors had owned only the houses they lived in, would not the concentration of commerce and wealth at this point, which is the result of great events, the development of the whole continent and world-wide changes, have given the same value to the land without reference to the ownership, whether in the Astors or somebody else?—A. No, sir; I think not.

Q. Do you not suppose that to-day all the land in this city would be just as valuable if it was equally divided among all the inhabitants of the city as it is now vested in large tracts in single individuals?—A. That is not the point I make, that it should be equally divided. There are large numbers of lots even in this city which are unoccupied, and they would be occupied but for the power to monopolize them.

Q. You do not contemplate an arrangement by which a man can get a piece of land without buying and paying for it?—A. No, sir.

Q. You say that the fact that the Astors own so much land is an injury to working people in getting houses. I am not trying to controvert your idea, but to see what it is based upon.—A. Without rent.

Q. And your reply is that the Astors have come to hold this unearned increment. That is a value which increases as time goes on, is it not?—A. That depends on circumstances.

Q. It is doing so in this city?—A. Yes.

Q. Now, suppose at any particular time a workingman wants to get a home in New York City, can he buy it just as cheaply of the Astors or of these other large owners as he could if the Astor estate and these other large estates did not exist at all under a single owner?—A. I think none of these estates sell any houses.

Q. If they did not own this land would it not be just as valuable in the hands of anybody else?—A. I think not, because then it would be in the market.

Q. What ground have you for saying it would be in the market at any lower price?—A. It is not in the market at any price now.

Q. I do not know in regard to that?—A. The lands are withheld.

Q. That is the reason you suppose they will not sell the land at that market price which other or smaller holders would be willing to take. Do you say that?—A. Yes, sir.

Q. How do you know that? Do you know individual owners would sell the land any cheaper?—A. I know that from the general law of trade, supply, and demand; where a part of a thing is withheld the price is raised.

Q. Now, assuming that what you state is correct, is it not a fact that the Astors, the Lorillards, and the Rhinelander family own, comparatively, but very small portions of the land of this city?—A. No; the Astor's own a very large share.

Q. Do you mean very large in regard to its surface or only large in value?—A. I mean a large extent of surface.

Q. Do they own one-twentieth part of the surface of Manhattan Island?—A. Yes, sir; far more than that.

Q. Combined, what proportion of the entire surface of this island do those estates you have named own?—A. I have not examined carefully.

Q. Do you feel confident they hold one-eighth?—A. I say I have not examined that carefully.

Q. If they do not hold more than one-eighth part of the surface of the island they cannot do great harm, can they?—A. I think the with-

Digitized by Google

drawal of one-eighth of any commodity from the market would create disturbance.

Q. Here is Brooklyn, with communication by ferry for a great many years and now by the Brooklyn bridge, and here are ferries to the Jersey shore and the opposite side of the Hudson, and even if the Astors and Rhinelanders and other families did not own land here in New York, would it not be the better way for working people to avail themselves of these means of transit and get homes very much cheaper a little further off?—A. That they have done for the last fifty years, and as fast as they have done it the land around them is bought up by speculators and they are shut in again.

Q Through speculators?—A. Nearly fifty years ago the price of land on Long Island was as high as it is now.

Q. That is a fact that you know about, that fifty years ago the price of real estate on Long Island was as high substantially as it now is?—A. In some parts accessible.

Q. What parts do you mean?—A. The parts now occupied.

Q. Of course the thickly settled parts were valuable then as they are now, but how was it as to the suburban parts and the cheaper portions?—A. The price of the land in the suburban parts was about the same as it is now.

Q. Do you mean that the same identical land was as valuable then as now?—A. The same land.

Q. Is not any of the land more valuable now than it was then?—A. Oh, yes; much more valuable where it is built up, of course.

Q. Then it follows that the same land, or some of the same land, was less valuable at that time than it is now?—A. Some of the land was held then at a price equal to what it would now bring.

Q. I suppose the growth of Brooklyn has gone in another direction, and left that land about as it was?—A. No; it is entirely built up now.

Q. Then unoccupied land, or land that was unoccupied twenty years ago, was then held at as high prices as it now brings? Some unoccupied land was then held at as high a price as the same land now will bring, although occupied and improved by city buildings?—A. I do not mean the improvements. I mean the land.

Q. Although the land is occupied?—A. Yes.

Q. But the ground rent would have been the same then as now. How extensive is that fact?—A. I wish to say that that was connected with the line of speculation of 1835.

Q. It was an abnormal state of things?—A. It was probably an abnormal state of things.

Q. And during fifty years the same land has been very much cheaper?—A. At times it has fluctuated up and down.

Q. I was speaking of a permanent state of things fifty years ago as compared with the permanent condition of the present time?—A. There is no permanent condition of the price of land any more than there is of commodities.

Q. You wish to develop the fact that these large ownerships really do mischief?—A. Yes.

Q. If they do not do any substantial mischief the public ought not to get that impression. You may go on further with the other points you had in mind. You were speaking of the absorption of the land in single ownerships, and its injurious effects in city and in agricultural regions alike.—A. The evil lies in the nature of real estate as property.

Q. Is your theory this, that individuals should not own real estate,

Digitized by Google

but that the community should own it?—A. No; my theory is that the individual should own that which he needs; that the use of land belongs to the man.

Q. Would you give him what is called in the law the fee-simple, the title absolute in himself and heirs, according to the rules of inheritance?—A. No; not according to the rules of inheritance.

Q. You would not give him the chance to dispose of it by will?—A. No; I would state in regard to these large estates that some of them are substantially entailed, as far as I am informed (though I do not know of my own knowledge), by this process, by the father deeding to the son while he is yet living, and through family tradition and parental influence insisting that that shall be done again it can be perpetuated to the latest generations.

Q. Assuming that the fathers continue to produce sons, and that the sons continue to do as the fathers have done; but is it not the general fact that real estate, like personal property, under the natural operation of the laws of inheritance and of devise, breaks up and is redistributed?—A. No, sir; those are the exceptions to the rule.

Q. Are you able to mention a great many instances, aside from the Astors and those you have given here, taking the whole country together?—A. I can mention a number in many parts of the country.

Q. Do you suppose you could mention a hundred?—A. Yes, sir.

Q. Or that you could mention a thousand?—A. Yes, sir.

Q. What relative proportion would those thousand ownerships bear to the great mass of real estate in the country?—A. I would say that in cases where those estates are broken up they do not pass into the hands of the people, they pass into the hands of the class to which they belong; they pass into the hands of those with capital and means enough to absorb them into another estate. That is what I mean to say.

Q. What would you do with a man's estate when he dies?—A. I would have his executors given a certain length of time to dispose of that land to those who need it for occupation, of course to be divided among the heirs and legatees, without exceeding the limit.

Q. What would the executors do with the proceeds?—A. The proceeds I should not object to going to the heirs.

Q. Suppose they take those proceeds and buy up more land?—A. They cannot do that under the limitations which I propose. I propose limitations which will not allow that to be done. The difference between real estate and personal property is well known, I suppose, generally. In the first place, land is not property in any such sense as we own personal property; it is not the product of any labor; it is not a subject which can be increased as productions of industry can be increased on demand being made, but is limited, absolutely limited. The domain of every town, city, and country is limited; it is a limited extent which cannot be added to.

Q. But is its productiveness limited?—A. Its productiveness is not.

Q. In the same sense you might say that the size of a piece of personal property is limited; it can occupy only so much space.—A. I do not mean that.

Q. Go right on with your explanation.—A. I meant that there could be no increase of supply, as in commodities. When there is an excessive demand it produces an excessive supply in response.

Q. If you can increase the productiveness of land do you not increase the supply of land, in one sense?—A. The supply that comes from land.

Q. If you make an acre produce twice as much as before you have two acres of land, practically.—A. In that sense it can be increased.

Digitized by Google

Q. Is not that the precise sense in which you can increase personal property?—A. No, sir; you can add another thing of the same size and shape every way.

Q. Precisely; but then you have got two. Have you not got two acres of land by making the one twice as valuable as it was before; and that you can do by combining labor with it?—A. Well, it may be done, but I have not seen it done.

Q. It is a very common thing. They have done it up in New Hampshire by putting manure on the ground, and plowing it in.—A. If that fact, that a man can double his land would prevent his wanting more, or would induce him to part with one-half of it——

Q. That may be, if he had not the means of improving the whole of it—A. In that sense it might be said to be increased.

Q. But suppose that man you speak of, whose estate you are dispersing, sells the land, as you wish to have him or his executors do, when you consider this power to increase the value of the land, should he not be allowed to reinvest in land, buy manure and put it on land that is worthless, it may be?—A. I see no objection to that. I do not propose a limit of that kind.

Q. I thought you proposed a limit on the amount of land a man should occupy. You do not object to the reinvestment in real estate, then, if a man makes it valuable?—A. Not where it is upon the same extent of surface.

Q. Why is it not just as well for him to keep his property in that same piece of land as to sell that piece of land and buy another?—A. It is a great deal better, so far as the public interest is concerned.

Q. Then why is it necessary or right, if you are to allow the reinvestment of the estate in land, to compel the estate to sell that which it already has?—A. Only on a question of public policy.

Q. That is just what I am asking you; why as a question of public policy ought it to be done?—A. It ought to be done because while there are people who need land and have not land, there should be some provision of our public policy by which it could be obtained.

Q. But the same parties who are to buy this estate on sale may just as well take their money and put it into the other land in which the property of the estate will be invested after the sale is made. Unless this is to be a gratuitous distribution or a vesting of the land in the public and renting it out by the public I do not see that anything is gained; but there may be. You can explain it, perhaps. You would have the lands of the estates sold within a limited time. What else would you do in the distribution of a man's property that is different from the present order of things?—A. I would put real estate upon the same basis as personal property is held.

Q. Is it not now?—A. No, sir.

Q. Why not?—A. It requires a certain process of law to be gone through.

Q. Very slightly different?—A. The recording of deeds.

Q. But is there any substantial difference?—A. There is. It is assumed that a man is in possession of that of which he is not in possession.

Q. Is not a man in possession of the land that he occupies?—A. Not unless he occupies it.

Q. Is he not just as much as a man is in possession of a horse he owns but that another man is using and paying hire for?—A. No, sir.

Q. Why not?—A. It is in the nature of the thing itself. The horse is a value which has been produced by labor, by care, by exertion, the

Digitized by Google

putting forth of human efforts. The land is a thing which has not been so produced.

Q. Is there much substance to that distinction?—A. I think there is.

Q. What is the land worth before labor, human effort, has been put on it?—A. It is worth in some places $10 or $15 an acre.

Q. That is because labor has been put on land somewhere else close by?—A. Yes; but it has not been put by the owner who claims the land.

Q. Is it essential who puts it there?—A. Yes; I think it should belong to the one who puts it there.

Q. That may be; but the fact that the value is there does not depend on who did the labor. That is combined with the land. In other words, why is not labor, human effort, just as necessary to make land of any value as it is to make a hoe handle or a plowshare or a domestic animal of value?—A. It is undoubtedly, but the price which land will bring does not involve that, but involves another thing entirely, which is the privilege of exclusion, of excluding the land from occupancy by the people.

Q. It may be easier to avoid the effects of exclusion from the use of personal property because other people can produce like personal property more readily, but in the principle itself is there any difference?—A. I do not see any in the principle itself, only in its application.

Q. Then it is a difference in degree and not in principle, and that is what I was asking you about. We have occasion to use different policies in reference to the one from those in reference to the other, it may be, and our laws recognize it to some extent, but it is a matter of detail rather than of principle. Now, had you other points in your mind that may not be touched upon in your paper?—A. No; I think not. I wish to say that we regard it as possible for Congress to revoke the lands which have been squandered upon the railroads, especially where they have been forfeited by non-compliance with the terms.

Q. But where the grantees have complied with the terms of the grant, do you understand that there is any practicable way of recovering them to the public?—A. Only where these grants were not in good faith to the public.

Q. Where by the statutes that are upon the records of the country, and in accordance with those statutes, the companies have entered into possession and have complied with the conditions imposed, do you underderstand that there is any way to get the lands from them again?—A. I am not a constitutional lawyer, still I suppose that the right of eminent domain would include that—anything which was in the line of equity and justice.

Q. But you know that the right of eminent domain is never exercised but by compensation to the private owner whose land or property is taken for public use. Now, is it any advantage to the public?—A. I understand that, and where these lands are in the hands of innocent parties they cannot be reached, of course.

Q. Suppose that there was fraud in the original grant, which, as a matter of fact, would have to be established, of course, and suppose that the public should have known of the fraud since the statute was passed, and have slept upon the fraud, and meanwhile allowed the Union Pacific Railroad Company to mortgage its lands to other parties, who have advanced their capital in good faith, is there any way of getting those lands but by paying off the innocent mortgagees or holders?—A. No, perhaps not; still, if the principle of limitation could be applied it would remedy these results.

Digitized by Google

Q. It might be applied to all lands which have been forfeited and to all lands remaining in the public.—A. Yes. Our point is specially that the unsquandered lands should be placed under the homestead act wholly. We have petitioned for the last thirty or forty years regularly to Congress, and even when these railroad grants were passed to have the railroads required to sell only to actual settlers, but the whole thing was ignored.

Q We will examine your paper carefully and give it consideration?—A. Thanks.

The memorial presented by Mr. Ingalls is as follows:

87 HUDSON STREET, NEW YORK,
*September* 10, 1883.

*To the Senatorial Committee:*

GENTLEMEN: I am requested by the executive committee of the National Land Reform Association to submit to your attention the following propositions and suggestions:

(1.)—The sustenance of human life and the satisfaction of material wants are wholly supplied by human labor from the land and its natural productions.

(2.)—All social wealth is the product of labor, intelligently directed; but deprived of land and the opportunities which occupancy of the land affords man's exertions can produce nothing or even be put forth.

(3.)—As a necessary deduction from the above axioms, the right of any and every human being to life depends, ultimately, upon his right to occupy the land and to enjoy the opportunities to labor thereon It also necessarily follows that whoever lives without labor of his own lives from off the labor of others.

From the earliest times productive labor has been burdened and despoiled; ownership of the laborer was the method in barbaric days by which the dominant class appropriated to itself the greater share of all industrial production. With the disappearance of that form of servitude, however, the appropriation of the products of labor by those who do no labor has not ceased. For the man who owns the land eventually owns those who live and labor upon it, and is able by reason of his exclusive ownership to appropriate as large a share of the production as if he owned their persons. From our laws of private property in land grows the lordly privilege to exclude all other persons and to prohibit the application of labor except upon such terms as shall please the owner.

The founders of our Government supposed they had remedied the evils attending British landlordism when they prohibited titles of nobility and abolished the right of primogeniture and entail; but the potency of all these still adhere to the system of private property in land, which we have retained, but which is subject to none of the restraints or responsibilities which characterized the feudal system. There are numerous estates in this country of great magnitude, and which are growing larger each year. They date back for a century or more. I may mention as an instance one in this city, which has steadily advanced for three-quarters of a century. It is now in the possession of the fourth generation, and is virtually entailed in the family through a tradition which requires the possessor to deed, in his lifetime, the estate to his eldest or favorite son.

Private monopoly of land enforces rent, and which at the start takes from labor more than twenty-five per cent. of the earnings of labor. Aside from what is usually embraced in rent, taxes, repairs, and improvements, the annual rental is counted by hundreds of millions, and for which no labor or reciprocal service whatever is given in return.

Through laws for enforcing payment of debts, exaction of usury, and a manipulated currency, quite as large sums are constantly absorbed as interest, profits of corners, in trade, stock gambling, &c. These have all to be abstracted from the annual production, often absorbing the whole plant upon which important industries depend, and thus, as in a crisis, throwing much labor out of employment altogether. Then there is the share which falls to the employer and owner of the plant, before it can be determined what wages shall be paid the laborer.

The friction of this whole system falls just here—between the employer and wage worker. The pressure under which both at times suffer, and which begets the antagonism between them, lies far deeper than any disparity of compensation which they respectively receive; for unless the employer is also capitalist or landlord, or combined with them, he cannot, however disposed, greatly wrong the other. The worker could not be seriously oppressed but that he is landless and homeless, because the only recourse for self-employment, the land, is monopolized. This alone produces the constant increase of the class of wage-workers for which there is no corresponding in-

Digitized by Google

crease of the demand. I have found, from some observation, that the employer of a few men obtains just about as much income to himself as he pays in wages to his workmen; but I am satisfied that this disparity in their remuneration alone would not cause the dissatisfaction and depression which exist.

I have thus briefly sketched the causes which operate to produce the poverty and distress of the disinherited toilers, who by patient effort develop from our common patrimony the necessaries and luxuries of life. That personal indolence and improvidence contribute largely to the destitution and suffering which exist I do not deny; but there can be no doubt these are mainly induced by the very system of wages itself, which divorces the worker from any personal interest in that which he produces, and also by the spectacle which our society presents, wherein honest labor is despised and luxury is the reward, not of toil, but of idleness and vice.

I deem it useless to devise schemes to remedy these evils. No league between employed and employer, however cordial and faithfully carried out, could be of more than temporary benefit. Only a return to natural law, a scientific adjustment of the two primal agents in production, land and labor, and the restoration of man to his normal environment, and freedom of action therein, can effect any salutary change.

The domain of our nation is already well-nigh given over to monopoly. Enough to form seven States of the size of New York has been bestowed upon corporations, for no legitimate consideration, and the nations right of eminent domain has been nearly abdicated by our Congress. The roads sell these lands to settlers, it is true, but they also sell to speculators in large blocks. They sell on time at interest, which will keep the settler in bondage from generation to generation. The lands are often taken back with improvements on foreclosure, and when only a part of the purchase-money remains due the entire property, as in times of depression, is taken to satisfy the mortgage.

But in addition to the home aristocracy, who affect land monopoly, we have the titled nobility of Europe founding vast estates, from which the American citizen is to be forever debarred, except as a tenant or serf of a foreign and perhaps absentee landlord.

I hold this tendency even more dangerous to our national well-being than the wild speculations which seized our men of wealth at the close of the last century, and occurred often in the early half of this. Those efforts were intended mostly as commercial speculations and failed, as they were quite sure to do. This, however, is a maturer purpose to establish large family estates, with a general system of rentals, or of bonanza farming or stock raising, and which makes the cultivator necessarily a tenant or wage-worker, with precarious employment and uncertain wages. So far has the system already proceeded to reduce the status of the laborer that our corporation magnates, and even your committee seem to think it worthy of remark, if found that labor is better paid in this country than in the tax-ridden and ill-governed countries of Europe.

That lands may remain cheap in certain localities gives no relief or refutation to our theory. The privilege to occupy land is what makes price. Supply and demand operate here to make that price "all the traffic will bear," and whether the price is high or low makes little difference. The needy are excluded just the same; and it should also be born in mind that the cheaper the lands the more easily are they monopolized by capital, and are usually sold only in large blocks, so that it is almost impossible to buy a small farm at a cheap rate even in the South, where titles are often found defective.

The only legislation we would suggest is the repeal of all land laws which give protection to titles to land not based on personal occupancy. The principle of limitation to private property in land, or its reduction to the same status as personal property, can be realized without any derangement to business or individual distress. It can be made prospective. After a certain date let no title be recorded which does not specify that the said tract is within the prescribed limits, and only required for occupancy and cultivation by the owner. Let this repeal not operate during the lifetime of any present owner as to land already in possession, and let him have the power to transfer his land to others under the prescribed limit. Let the executors, on the death of large landholders, have one or more years to dispose of the surplus, after heirs and legatees have received their proportions under the limitation.

By such a change in the system of land tenure no wrong would be wrought to any. It would secure the greatest benefit to all who are desirous of making for themselves and families independent homes, are capable of self-employment, and are willing to work.

It may be a question how far the reform indicated could be inaugurated by the General Government, but it can, as indeed it already has, recognized the principle of limitation to the acquirement of the public lands, as under the homestead act. Had that act been framed in accordance with our recommendation and been carried out in good faith, the interest of the country and the condition of labor would have been greatly improved The lands would have been taken up consecutively, so that the

Digitized by Google

patient and industrious settler would have been near to markets and all social and educational facilities. Railroads would have been built as fast as needed, without subsidies and without the revolting spectacles of corruption we now behold.

Congress can at least undo some of its unfortunate work. It can put what land yet remains unsquandered wholly under the homestead act. The grants made in betrayal of that trust which committed the patrimony of the coming generations to their care can all be declared forfeited, especially where strict compliance with the terms of the grants have not been complied with, and where the land has not passed into the hands of innocent parties.

In view of the past, however, the outlook is not encouraging, that under the sway of party politics Congress will do anything but foster giant corporations, grant subsidies, and shape legislation generally to favor capitalistic adventurers, who flock to the lobby and cry "give! give!!" but who are first to volunteer the advice that no legislation is required to protect or inform the workingman that he has liberty of making contracts and full freedom to work and lay up his earnings and become a millionaire, and ought to ask nothing more, and that the only way in which he can be possibly benefited is to have the Government secure capitalists and large corporations in their monopolies by high protective tariffs, steamship subsidies, railroad grants and franchises, and privilege to bankers to furnish a circulating medium to the people, &c., while keeping open the doors of the nation to the wholesale importation of the impoverished and demoralized laborers of all other countries, to compete with our own.

It will be well for us to reflect that we are rapidly pursuing the same course which through absorption of the lands debased the citizenship of the Roman republic, and paved the way for the empire under the Cæsars, nineteen hundred years ago. Unless this course is changed the indications are that this country will not pass away before an organized oligarchy will control our Government wholly, or conspire for its overthrow. The heart sickens to contemplate in anticipation the struggle which the misled people are certain to make to regain their sovereignty when they once clearly apprehend the peril to which it is exposed.

All of which is respectfully submitted.

J. K. INGALLS,
*Corresponding Secretary N. L. R. Association.*

## LABOR ORGANIZATIONS.

GEORGE BLAIR sworn and examined.

By the CHAIRMAN:

Question. You reside in this city?—Answer. Yes, sir.

Q. What is your business?—A. I am a manufacturer of packing boxes.

Q. How long have you resided in New York and how long has that been your business?—A. I have resided in this city thirty-five years.

Q. Is that your whole life?—A. No, I am in my thirty-eighth year. I have been in business since 1874.

Q. The same business?—A. Yes, sir. I have prepared a statement that I should like to make in view of the fact that you requested me to call.

Q. You may either read it to us or give us the substance in your own way, as you choose.—A. I thought it was better to cover the ground, as I might not think of all the things here.

Q. Perhaps your better way will be to take your time and glance along and read or state verbally, as you please, the points, as I may want to break in upon you with questions now and then. State preliminarily your connection with labor organizations and with labor movements, and your identification with them as fully as you see fit to give it, and what you may have done from time to time which is calculated to give you a knowledge of the labor system and of the laboring people, the relations between capital and labor, wages and the distribution of wages, strikes, their causes and their remedies, and the like. Give us a full statement in that regard before you proceed with your paper.—A. I have partly covered that in this statement.

Q. Very well, then; go on.—A. I entered the labor movement when

Digitized by Google

I was eighteen years of age, in 1863, or thereabouts. I was made secretary of the Box-makers and Sawyers' Union at the very first meeting, in 1863, or in that neighborhood. I afterwards became president; was delegated to the Trades' Council of this city from 1871 to 1874, and I represented the organized workingmen of this city in the national convention at Rochester in 1873. I joined the Knights of Labor when first organized in 1874 in this city; believe the Knights of Labor is the only movement that can unite all elements seeking the same end. The merchant and manufacturer have the same opportunity to join the order as the mechanic and laborer. I started business on my own account in 1874, and, unlike nearly all who have advanced themselves from the work-bench, I remain active in the work of labor organizations. I employ and paid last pay-day sixty men, my weekly pay-roll being about $800. The average yearly earnings of my employés is about $700. I am now the chairman of the New York State Committee of the Labor Party, which shows about how well I stand in the movement throughout this State.

INCOME TAX.

I recognize that the National Government can do a great deal towards improving the condition of its people. I look upon the legislative branch of the Government as the source from which measures in the interest of the people should spring. You can give us an income tax; it is popular in England; and if the rich refuse to aid in praiseworthy efforts to improve the condition of struggling labor, they should be compelled by law to take from the shoulders of those who can bear the least taxation and place it upon the shoulders of those who can. I would exempt all under $10,000 income; above that, I would graduate the tax, and he or she whose income would be over $100,000 per annum, I would tax so heavily that millionaires would be impossible. I maintain that a person can go through this life with an income of $25,000 per annum very comfortably. Increased wealth tends to aristocracy. Ninety per cent. of those who inherit the same ape the style of the aristocracy, and they despise the laborer, the mechanic, and in some cases the manufacturer and merchant.

Q. I want to ask you if you have in mind and if you treat of it further on, some way to reach the income of corporations. Individuals you deal with, and there is a way we can reach them probably, but take the income of corporations.—A. The individuals who make up these corporations would be reached.

Q. You would not probably make any effort to collect its income tax directly from the treasury of the corporation beyond what ought to go in a fair dividend?—A. I would not interfere with that because that is an institution like any other that is employing labor and distributing money throughout the community, but those who earn so much from those corporations as individuals should be taxed.

Q. You treat what comes from corporate property like any other and as contributing to the personal income of the stockholders?—A. Yes, sir; especially if a corporation is a *bona fide* institution and not sustained by any special privileges obtained from a legislature.

Q. Very well, go on.—A. The reason I referred to the fact that those who inherit wealth despise the manufacturer and the mechanic is that it is well known that the aristocracy of Europe in a great measure refuse to associate even with a manufacturer.

I can see no reason why Government bonds should not be taxed like other property. People who hold these bonds have the protection of

Digitized by Google

police and fire and other departments, to sustain which they contribute nothing. Legitimate business suffers to some extent. Much of these funds are locked up, owners preferring to draw interest instead of investing in business that would employ labor.

### EDUCATION IN DUTIES OF CITIZENSHIP.

You can institute a system of education which would serve to instruct the masses in their political duties and rights. The present school system is silent on educating the future citizen. Neglect upon this subject is now apparent. The man who enters public life has very little encouragement. It requires a man of strong will power to stand the abuse and misrepresentations made daily about his motives. The general opinion is that the man going into public life does it for personal gain. He receives very little credit for patriotism, and his near friends tell him if he is a patriot and an honest man he had better leave politics alone, as it is monopolized by men who would betray him at every turn who are in politics for all they can make. Sometimes I am forced to believe the statement—when it is a notorious fact that many men in public life are rich to-day who were poor when they started in. There are many cases in this city where men spend a great deal more than their salary amounts to to secure their election, and yet take a solemn oath when sworn in that they never spent a dollar. Education will cure this if the aim be to enlighten the citizen as to his responsibilities. The National Government can do little with the question of convict contract labor.

Q. In regard to education, the States, of course, as we all know, are supplied more or less fully with a common school system already. You speak of national help or a national system of education, and, of course, you recognize the intellectual convictions of a great part of our country that the matter of education is a State matter properly; but I see that you hold what I believe, that the nation is responsible, if no one else educates the child, for its education itself. Now, do you think it would be, or not, a proper thing and a good thing to do for the National Government to make appropriations from national funds to assist in the enlargement and extension and improvement of the State systems of common-school education wherever they seem to want it?—A. I believe that would be a very good scheme. Beside, the Government has established the precedent of helping States by giving them land for school purposes. The point I make here is that the schools neglect to tell the boy and the girl that they are a part of a great community, and that when they become of age they have certain responsibilities, and if these responsibilities are not looked after it is apt to react upon the individuals that compose the community, and my point is that through the National Government the State governments might be urged to do something in this direction. It would be simply adding a branch to the existing system. Our school system, with that exception, is excellent, and I consider that it is the great safety for our institutions. They should be encouraged and developed, and especially in the South.

Q. You mentioned the fact that you were chairman of the labor organization of this State. That matter of national aid to education is pending in Congress now; it will be acted upon favorably or unfavorably by the present Congress; and would it not be within the desire, at least, certainly within the power of your organization to make itself felt directly upon Congress with reference to that thing?—A. If I could get the control of the scheme my idea is that there should be some manda-

Digitized by Google

tory provision that would compel the school system to turn its attention to educating the future citizen—not alone an appropriation for school purposes, but that it should also help to educate the citizen in the direction that he has not yet been educated.

Q. Go on.

CONVICT LABOR.

A. The National Government can do little with the question of convict contract labor, as these matters are regulated by the States; yet the Government pays for its convicts in the Albany prison and the same are let out again by contract. Some effort should be made to learn to what extent the laborers or convicts of the South are disposed of. I have it from unofficial sources that the convict labor of several of the Southern States is let out by contract for a nominal sum and that judges sentence prisoners for trivial offenses for long terms in the interest of contractors. I might add here that contract work is in the interest of cheap labor—the lowest man gets the job; hence our opposition to contract work by the Government. Prison contracts give the contractor an advantage over outside manufacturers, and to the extent of the number of convicts employed injures outside labor in lowering wages. We claim that the prisons can be made self-sustaining by doing the work on State account and giving each convict an allowance for his labor and selling the goods made at the same price outside manufacturers charge.

Q. In regard to that matter I would say that I introduced in the last Congress a bill bearing on that subject, and I should like you to look it up and see how its provisions suit you

HOURS OF LABOR.

A. Hours of labor should be reduced to meet the increased power of machinery. No one State can do this. It must be done at one time by the whole country. The buildings trades of this city enjoyed the eight-hour system up to the panic. Since then ten hours has been the rule, except Saturdays. The stone-cutters have maintained the eight-hour system up to the present. These trades have an advantage over manufactures. Just as soon as men engaged in manufactures asked and struck for the eight hours other States secured the trade where ten and twelve hours per day prevailed. No one manufacturer can reduce the hours of labor unless it becomes general, for such man might as well go out of business under the present sharp competition. We have in this State over 50,000 operatives who work nearly twelve hours per day—67 hours per week or eleven hours more per week than the factory operatives of the large cotton districts of England.

Q. From your knowledge of the subject, has there been any difficulty arising in the administration of laws fixing a shorter period of labor than previously obtained, by reason of the inclination of the workers, the laborers themselves, to be employed to some extent beyond the limitation?—A. You mean that some of the men want to work longer hours?

Q. Yes.—A. Well, all reformers know that human nature is selfish, and there is always a certain percentage of men who do not recognize movements for their own benefit. We in this city in 1873 had a Congressional investigation of the work on this building. There was a direct violation of the eight-hour law. We drew out the testimony. The Congressional committee staid here but about eight hours and we had not time to get out all our witnesses, but we drew out at that time a confession on the part of one of the contractors that he charged the Government for eight hours' work and his men worked ten hours. In

Digitized by Google

other words, he got the advantage of two hours. The point we made then was that the Government should not make any contracts that violated the law, but up to the present we have had that difficulty with the Government right through. Wherever the Government gave out contracts they made no provision in the contracts that the eight-hour law should be recognized and sustained. They allowed the contractor to work his men just as many hours as he pleased, and in that way the Government avoided the enforcement of the eight-hour law. There is no reason why the Government cannot do the work on its own account, and then the men would have the benefit of the eight hours, but the very moment the eight-hour system was introduced contracts increased, and possibly the Government had the work done for a little less. Somehow or other it seems to be a fact that Government work done direct by the Government is more costly than contract work and more expensive to the people, but it is largely because men who are employed by the Government are more or less under the control of political organizations, and men who spend their time and money to maintain political organizations and get political place in that way generally make the job last as long as they can. I think there is a radical change needed in that direction before the Government work could be made profitable; yet the Government should recognize the fact that it has passed this law and it should enforce it, and no contract scheme should be resorted to. It is a mean, hypocritical method, to my mind, of evading the eight-hour law.

Q. If the Government finds it an advantage to do its work by contract rather than by itself directly, for the reasons you have mentioned, would it reach the point for the Government still to employ contractors but to make an express provision in the contracts that labor should not work more than eight hours?—A. There would not be any serious objection to that, but on general principles I am opposed to contract work. I have in my own business carried out the day's work system, and mine is the only shop in this city that is run on that system. I do not suppose it could be made to pay unless it was I that conducted it.

Q. State fully, then, your system and your experience of its results. You apply the eight-hour or ten-hour law?—A. I apply the day's work system, whereas all other shops in my line work piece-work.

Q. How many hours a day do your men work?—A. Ten hours. That is the system here, and, of course, the competition of other manufacturers has to be met.

Q. It has been claimed, or at least the opinion has been expressed by many, that eight hours' work gave as much production as ten hours' work. Is that true at the present time, do you think?—A. That was demonstrated some years ago, when that question was up, by the work done in the Government armory, that at certain kinds of work men do as much work in eight hours as they formerly did in ten; but I do not think that that would hold good; in fact it should not, because the aim of the reduction of the hours of labor is to give more employment, and if a man can do as much in eight hours as he formerly did in ten there is no real benefit. The design of the reduction of the hours of labor was to meet the increased production of machinery, in order that the men who are thrown out of employment by machinery can be employed, and if the man who works eight hours does as much as he formerly did in ten, there is no real benefit, excepting to give him two hours more leisure, which, of course is a redeeming feature, and yet the design of the agitation for the reduction of the hours of labor is to meet the increased production of machinery.

Digitized by Google

Q. That, you think, is the principle?—A. That is the principle.

Q. Then, until the rule is general, no individual employer can expect to maintain himself in competition with others who work their labor beyond the eight hours?—A. I would have to go out of business if I worked only eight hours.

Q. I see the point. Go on.

### TRADE ORGANIZATIONS.

A. Trade organizations should be allowed to incorporate under the National Government. I regard them as the most useful institutions in our land, an agency through which the workingmen and workingwomen can make their wants known, and they should receive the same encouragement here as is given them in England. I know they often make mistakes, but men do not drop their tools and the chance of providing themselves and families with the necessaries of life for mere sentiment. They are often carried away by some pretended friend who has a command of language, but has nothing to lose. Such are soon found out, and the movements among the workingmen who succeed are no longer carried away by spread-eagleism. To get a correct idea of the usefulness of unionism you must study the growth and progress of the English trades union, from which the labor movement in this country sprang. There they have been the subject of parliamentary inquiry. The British Government has conceded to organized labor much that is yet to be obtained from this Government, and I question whether there is a public man in England of any prominence but what will agree with me that labor organizations have contributed largely to the well being and prosperity of that country. Labor organizations prevent pauperism and crime; they tend to make patriots of their members by urging legislation in their interest, and such legislation as tends to improve the condition of labor tends to improve the prosperity of the whole people. They help the sick, bury the dead, provide out-of-work relief, and a pension for old age; they abhor strikes, except as a last resort, and I believe that method of settling labor disputes will soon pass away. The point to be reached is to stop competition as to the price of labor. When manufacturers will come down a little in their dignity and recognize that labor is human, and not a commodity like the raw material, there will be few strikes.

Q You are very familiar with the operation of trades unions in this State and in the country, I suppose?—A. Yes, sir; I do not think there is any man more familiar with them.

Q. You know the complaints of employers in regard to them—that they interfere with business, break up private contracts, and ruin those who have entered into them; and there is considerable complaint in this city at the present time. Just how far do you think an organized trades unions has a right or ought to go in the regulation of the price of labor and the control of the contracts or agreements which may have been entered into by employers with those who are directly employed in carrying out their contracts?—A. In the first place, an employer, when he enters into a contract, should take into consideration the men who perform the labor of getting the article on the market; if the contract is of any magnitude, or running into length of time, they should be consulted, especially where the manufacturer happens to be a man who is continually in trouble with his men. If he is a man who is disposed to do that which is reasonable and right to his men, and he makes a contract, he can safely go on without fearing trouble, in nine cases

Digitized by Google

out of ten. The only men in my experience who have ever had any trouble with their men are those who recognize workingmen and workingwomen as mere machines, who have no regard for their feelings, and who say in substance, "I buy my labor in the cheapest market in the same way as I buy my raw material." Those men, when they enter into contracts that are of long duration, and have men working at a very low rate of wages, must expect, if business is lively and they have plenty of it for three, four, or five months, that the men who are getting starvation wages will ask a certain advance; and my experience has been, and I can name you manufacturers all through this State, that it is not so much the question of wages as it is the question of treatment and the question of recognizing the rights of the man who performs labor. Most of the strikes have grown out of certain circumstances that the employer refuses to recognize. There are some exceptions. I know that there are some very good men who sometimes have trouble with their employés, but such generally reacts upon the men and in a little while they learn to appreciate a good man. That often is the case; but the cry against the trade organizations is raised by men who do not desire to develop a sentiment in favor of doing justice by labor. To create a sentiment just the other way is the design of the labor movement in this country, because it tends to prosperity as between them. The more a man receives, the more money he can spend, the larger the number of articles that are manufactured, and the more of the wants of labor supplied; but you reduce wages and you reduce the value of every property in the country.

Q. What interference do the trades unions actually exercise with the business of contractors?—A. The building trades really are the most aggressive, and sometimes make a great deal of trouble for contractors. I think the greatest complaint comes from that direction. A man makes a contract for a building and his estimates are given in and accepted. The architect says "Go ahead." He starts his building, and before it is half-way finished he finds that through troubles with his men his expense is increased by having met a strong organization, and he comes out on the wrong end of the horn. Then, of course, the contractor complains—finds fault with the trades union. If the contractor before making his arrangements had consulted the men, knowing full well that the men in the building trades are the most aggressive trades unionists that we have, there would not be so much trouble; but if you have been in business you must know that the competition among contractors and business men is even greater than among workingmen in cutting down figures. They get the figures down so low that sometimes they are unable to pay even what is reasonable and fair. My experience, and I believe the experience of nearly all in the building trades, is that they have learned a lesson. The building trades have made reductions in the past, and I believe, from what I learned at the last national convention, they propose to make a move next year, and they have already notified their employers as early as this time that next year at a certain time they propose to do certain things, so that the men engaged in the building trades who are making contracts can be governed accordingly.

Q. They will have notice in advance what wages they will have to pay in order to avoid trouble?—A. Yes, sir, and of the hours of labor.

Q. That would give them a reduction in hours without legislation probably, would it not?—A. Oh, yes. The men in the building trades here have more or less secured a reduction even after the revival in business. They have the eight hours on Saturday all through the

Digitized by Google

building trades; but the building trades are altogether different from others. In a manufacturing town, if the two hours are taken off the expense of labor would be increased and another city could manufacture the goods under a ten or eleven hour system and the trade of the town would go away. They cannot bring buildings here. A building that is wanted here cannot be built in Jersey or in Ohio as manufactured articles can be.

Q. The building trades really work upon real estate?—A. Yes.

Q. Is there a tendency among all trades to this unification and general or national action that you speak of as already taken by the building trades?—A. Yes, the Knights of Labor are filling that bill by taking in all trades and operating under one head.

Q. Do they include agricultural laborers also?—A. Yes, and white and black, too.

Q. And yellow?—A. Not exactly.

Q. I understood you to say that they include employers also?—A. Yes, sir.

Q. All classes of employers?—A. Yes, sir, except rum-sellers and lawyers.

Q. Do you consider them employers? There is one other class you have not named.—A. Doctors and bankers. We may gratify them some of these days, but the way we look at things now we think those people have got all the legislation.

Q. The point I want to get at is, the lawyers can take care of themselves.—A. Excuse me for interrupting you. The lawyer generally has his fee fixed by law.

Q. He cannot always collect it. I have noticed that myself. But the point I want to get at is, how in this Knights of Labor organization the employers get on? Do they come in willingly, and are they recognizing it as a good thing for them?—A. In the small towns they do, in the West especially, but here in the East the men look upon employers with suspicion and there is a kind of feeling developed—it is not real or genuine, yet certain individuals are afraid that if some employers get in they will inject some good common sense and their little influence would be wiped out; but we urge that the aim of the order is to get the two together as soon as possible, because we recognize that the interests of both are identical.

Q. Do you think that the Knights of Labor will accomplish that object and secure something like unity of action between employers and employés?—A. It may not in the near future, but it certainly is a step in the right direction, and it is best to go up the hill the right road than to go up the wrong road.

### EFFECT OF MACHINERY.

Q. You may go on with your statement.—A. Machinery has a tendency to cheapen labor. I recollect when men in my trade of box-making received three dollars per hundred making oil cases. To-day, with the aid of machinery, the manufacturer gets one hundred cases made for twenty-two cents. Formerly, ten or twelve years ago, they were paid three dollars per hundred for nailing the cases together. Now, with the aid of a nail machine, they are made for twenty-two cents a hundred. This serves to show that the same influences are at work in other trades. Hence the average earnings of labor are about $400 per year. Men work but half time. I know it is difficult to apply a remedy here, but if the Government was justified in freeing the slaves of the

Digitized by Google

South upon the same ground it should come to the relief of labor. These agencies are more powerful to enslave labor than the slave driver's whip. The machine eats nothing, wears no clothes, yet it does the work almost as good as if made by human hands.

Q. You do not oppose these improvements in machinery?—A. We do not oppose them.

Q. What would you do to enable the laborer to get his increased proportion of the production of the labor of the machine with the employer?—A. Reduce the hours of labor all over this country on a certain day by a national act.

Q. All classes of labor alike?—A. Everything.

Q. If you could make that measure as you think it should be to accomplish the end, to what point would you make the reduction?—A. To just that point that the department of manufactures or labor that I refer to afterwards would be able to designate by a collection of facts to be necessary to give employment to the people of this country.

Q. I suppose as a part of such a law you would introduce a provision that no single laborer should work more than that time?—A. Exactly. I took the ground during the war that the people of the South had no right to buy slaves. It was a radical proposition, yet the people of this country determined that it should be. I know that this is a radical proposition, and there are lots of people who would want to work twelve, thirteen, fourteen, and sixteen hours a day, and if they were prevented by this law those people who are in favor of the free agency of the individual, and all that sort of thing, would protest against it; but it can be demonstrated by an investigation that machinery is displacing labor, and it is the duty of the Government, based upon the principle on which this Government is based, to step in and take care of those people who are thrown out of work. There are other ways of reaching it, but I think that is the most practical way. I recognize that it is a very radical way, however.

Q. You think it the same thing in effect to the laborer to compel him to work and do what labor there is for nothing, that it is to take the labor itself away so that there is but very little for him to do?—A. Yes, sir.

Q. If the improvements in machinery should go on, it would be necessary from time to time to make still further reduction of the hours of labor, would it not?—A. Exactly, and the more leisure the average citizen would have the better citizen he would become by having an opportunity to educate himself.

Q. I believe Dr. Franklin held that four hours was enough time for a man to work if every man did work; but the result would be, if improvements go on, that the period would have to be reduced to six hours and perhaps still lower, would it not?—A. Yes, sir; but I am willing to see something in my life-time. I will let people who come after me fight for what more can be had.

Q. You think they can contrive ways to get on according to their own condition?—A. Yes, sir.

By Mr. CALL:

Q. Suppose we had your idea carried out and we had brought machinery to such a state of perfection that no manual work at all was required, that the production of the country was sufficient for even the comfortable and luxurious support of every man in it, then we should have a question of the distribution of it, how much each man could have or get, should we not? How and by what process would you

Digitized by Google

regulate that? Of course logically it is very clear if these ideas are correct—and I do not dispute them—that the productiveness caused by invention is so great that there is not employment for the manual labor of the country. That is the proposition upon which all these theories are based. Let us suppose, as may very well be if that state of things is to continue until the amount of human labor requisite will be the minimum, there will be a vast number, as the argument now assumes, of unemployed people. The question then, of course, will occur as to the distribution of this production, will it not, so that everybody shall get his share?—A. I do not propose to interfere with the present system of production.

Q. Of course you do not, but your idea assumes and the very proposition you have made here is that machinery has improved so much that it has become a substitute for large amounts of unemployed labor; is it not?—A. Exactly.

Q. That is the foundation of all you say. If it has done so in the past, of course there is every reason to assume it will continue to do so, is there not? Machinery will continue to improve more and more hereafter, it being a substitute for labor?—A. I think it has reached its limit in some branches.

Q. Why and upon what data do you assume that it has reached its limit in any branch?—A. I speak from my own experience. We have a nail machine in our line of business, and they cannot nail the boxes together any faster.

Q. We shall not discuss that; but why could you not nail them any faster?—A. Because the handling is reduced to the minimum and the nailing is just as fast as the machines can be driven.

Q. Is it not possible it might be improved so that you would not have to do any handling at all? For instance, I saw a machine the other day by which you put a blank piece of paper in a press and it came out all beautifully engraved and printed—a new postal note; and the machine is capable of being substituted for the work of thirty people.—A. I presume there is a chance of reducing the handling, but that, I think, has got down to the minimum. If it goes in raw and comes out all right for delivery, I think that has reached its limit.

Q. I do not know; of course we cannot tell about that. I merely mention that as a new thing. I would not like to say that even that had reached its maximum. We might find one perhaps that would make the paper and do this work too. There is a new issue of Government work. A man has invented a machine by which what was put in a blank piece of paper comes out at the rate of twenty sheets of these every minute. [Exhibiting a postal note.] A. It dispenses with several machines.

Q. It is a substitute for thirty hands. I only say suppose it was reduced to a minimum—it does not matter how much—so that there was a vast amount of surplus labor, as you say there is now, and we will assume it to go on, the question will be what to do with that production, how to get it into everybody's hands?—A. I can answer that.

Q. That is what I want to know.—A. If 25 per cent. of the people are out of work, and, under the reduction of the hours of labor, that 25 per cent. get to work and earn wages, they consume that which you claim.

Q. But suppose they are all out of employment?—A. I do not assume that.

Q. It only tends to show the force and correctness of your ideas. The question of distribution, whether there are one-half the people employed or one-third or one-fourth, the question how to get this vast product

Digitized by Google

equally distributed so that every man shall get his reasonable share, is what you are after, is it not?—A. Yes, sir.

Q. You say do it by one hour, two hours, three hours, six hours, or eight hours. If you can get that done it is what you want?—A. We would not disturb the existing methods of distribution; we would simply put more men to work, so that the surplus could be distributed and consumed.

Q. You recognize the fact that it is a question not of production, but of the distribution of production, how to get it so distributed that each man shall have a good house, a good coat, and his wife and children the necessaries and comforts of living. Is not that the idea?—A. But there would be more produced under the eight-hour system.

POWERS OF GOVERNMENT.

Q. I merely wanted to see whether or not the same economics, regulating the distribution, are not the essential part of the problem at last. Now, you recognize the fact that your theory of national legislation, reducing the hours of labor in all private employments throughout the whole country, requires a radical change in our form of government, do you not? You are aware of the fact that if Congress to-day passed such a law as you speak of, it would be utterly nugatory?—A. Unless it came in the shape of a constitutional amendment.

Q. Precisely; a change by constitutional amendment of the existing form of government. Well, do I understand you that you and the opinion that you represent—which, of course, is a very valuable body of public opinion, and ought to be considered and consulted—are in favor of a radical change in the existing form of government between State and Federal power?—A. Under the existing form of government.

Q. You know our existing form of government deprives the National Government of these powers and remits them to the States?—A. We start out with this proposition, that this Government is based on the principle that it is formed in the interest of the people, and that the law under which we live to-day may be so amended as to satisfy the wishes of the people of to-morrow.

Q. I understand that you think that would be best, but I am asking specifically do you think that the public opinion you represent now demands an entire change in the form and structure of this Government?—A. I do not assume that we insist on the immediate step being taken, but we lead up to that point and hope in time to develop a strong enough public sentiment to reach that end. We have sense enough to know that we cannot revolutionize the world in a day or in a month.

Q. I understand; I am only asking as to the opinion. You think then the opinion is growing that a national consolidated and centralized republican government should be created in place of the existing one?—A. That is another question.

Q. What I understand to be a consolidated or centralized national government is a government that has power to legislate in regard to all the relations of the people throughout the whole territory of States. That is the ordinary meaning we give to such a government?—A. But that is not the meaning I desire to convey. I desire to convey the meaning that the people are the power in this country, and that if the Government is centralized under this scheme, as you assume, it would be the wish of the people.

Q. Undoubtedly, but still the idea remains. The people now govern, but they govern in a different way. They govern through States and

Digitized by Google

they govern through a Federal Government. Now, we are talking about a respect in which you propose to change the power of government and confer it on the National Congress and President, to make a law regulating the contracts which shall be made between two individuals. Under our present form of government that power is in your State of New York, if it exists at all; if it is not prohibited by your State bill of rights it is in your immediate legislature. The reason I asked you the question was to know whether or not the opinion that you represent is looking forward to a change of our form of government in that respect?—A. In that respect we claim that the States could pass such laws. We have one in our State, but it is virtually nullified. It is impracticable to make or to compel any State to make this law. It must be a national law, because our interests all over the country are identical. The manufactures of New York and the manufactures of other large cities go all over the country, and it must be a national law. There is no other way to reach it.

Q. You think there is such an opinion growing up favorable to such form of government as will be able to exert that result?—A. Favorable to that proposition. You are trying to get me committed to a centralized government.

Q. No, I do not want to commit you to anything. I am not discussing your ideas. We will use another phrase; we will say "favorable to the exercise of such a power by the National Government as will do that"; you may call it centralized or republican, or anything you please.—A. If the national legislature should pass an act asking the legislatures of the States to vote for an amendment to the Constitution, I would consider that the act of the people, and not the act of a centralized government.

Q. We will not discuss about that. Of course it is the act of the people. We are only questioning how the people choose to bring it about. I am asking what is your idea as to the manner in which the people shall choose to bring about this result?—A. I have just stated.

Q. That, I understand you, would be by the exercise of authority by the National Government?—A. That the national legislature shall say to the various States that a constitutional amendment shall be adopted designating that the hours of labor all over this country shall be so much, or the hours of labor shall be reduced from time to time as a certain department, which would be charged with the duty of investigating the amount of production and the manner of its distribution, should be able to designate. If this department discovered that there was a great deal of poverty and a great many men and women out of employment, it would be in the power of this department to recommend to Congress that the hours of labor should be further reduced, so that the people could be always employed and be comfortable and prosperous.

Q. I go as far as you do, and I sympathize as much as you or any other man to that end, and I am willing to go for anything in the world that will practically bring that about, to wit, the general comfort of every man, woman, and child in the country. Now, I want to show you that I do not mean by this question to discuss or oppose your idea; I only want to find out what the theory is. Would you be entirely willing to commit the welfare of your family and your business to the decision of the commissioner of some bureau as to the amount of work that ought to be done by each man? As an economic matter, would you feel safe?—A. If you were to put that question in another way I might answer it.

Digitized by Google

Q. I understand you are a builder; that is your business. You contract for building, do you not?—A. No; I am a box manufacturer.

Q. Would you be willing to trust any other man but yourself, say a commissioner of the National Government, to say how many boxes you should manufacture, or how much work you should do or should not do? Would you feel satisfied that your business could be conducted with safety by substituting his judgment for yours in regard to that?—A. If I were to be singled out, of course I would object; but if the proposition were general and everybody would be put on the same level with myself, I would not object.

Q. What security would you have that the proposition would be any better generally than it would be individually?—A. By the law declaring it.

[At this point the examination was suspended for the present in consequence of the engagements of another witness, who had been summoned and was in attendance.]

## TELEGRAPH OPERATORS' STRIKE.

DAVID H. BATES sworn and examined.

By the CHAIRMAN:

Question. You are the assistant general manager of the Western Union Telegraph Company?—Answer. Yes, sir.

Q. How long have you held that position?—A. Two years and a half.

Q. State your connection with telegraphy previous to that time.—A. I entered the telegraph business in 1859, and have occupied various positions in it since then, from that of operator to my present position of acting vice-president and assistant general manager of the Western Union Telegraph Company. During the war I was in charge of the War Department telegraph office under Secretary Stanton, with General Eckert as my superior, and I have remained with him practically as his assistant ever since.

Q. With what other companies have you been connected?—A. With the Pennsylvania Railroad Company, the Atlantic and Pacific Telegraph Company, and the American Union Telegraph Company. I have also been connected with various local organizations—for instance, the American District Telegraph Company of this city, of which I am now the vice-president, and also the Holmes Electric Protective Company of this city, a company organized for protection against burglars.

Q. You were with the Western Union Company in the discharge of the duties of your office during the late strike, I suppose?—A. I was.

Q. Give us a history of the strike from your standpoint, in your own way. That is a question calling for as minute a statement as you may see fit to make. You can commence with the origin of the strike and give us its full history, with the causes which led to it, as well as the actual occurrences while the strike was pending.—A. For several years the Western Union Telegraph Company became cognizant of efforts being made by some of its employés to organize themselves with employés of other companies into what is known as the Knights of Labor, the telegraphers' branch being called the Brotherhood of Telegraphers of the United States and Canada, which appears to have been organized as District Assembly No. 45 of the Knights of Labor. It would be difficult for me to make any statement of the causes of the strike, except, perhaps, to relate as briefly as may be the history of the strike as I am aware of it.

Digitized by Google

During May of this year, in the discharge of my duties as vice-president of the American District Telegraph Company of this city, I learned of difficulties that were growing up amongst the men in the discharge of their duties in the line service. In the case of one of the men, William Sullivan, who had been employed by the American District Telegraph Company a number of years ago to perform services as carpenter, he was gradually transferred to regular duty as repair-man or line-man, the carpenter work not taking all of his time. His salary, $75 per month, was greater by $5 or $10 than the regular salary of other line-men in the District Company's service. During the month of May he was called upon to perform duty as carpenter in one of the offices of the company in an emergency. He refused to comply with the order. Upon being asked for his reasons, he stated that he was now in the line service of the company and he did not propose to do any more work for the company excepting in that particular department. Inquiry developed the fact that he was a member of the Brotherhood of Telegraphers, and that one of the principles of that organization was to confine the duties of the respective members to a particular line of duty in their employment. Another of their principles was not to teach others the business so far as they could prevent. Upon being informed that unless he obeyed the order to do carpenter work, for doing which his pay had been fixed at $75 per month, in connection with his other duties he would be reduced to line pay, $5 or $10 per month less, he tendered his resignation, which was at once accepted. In attempting to fill his place by assigning a growing sergeant in the company, who had had some little experience in the business of line work, the foreman in charge of the particular department, Mr. Swanson, declined to give the apprentice any information about wires or the duties of his proposed position, and informed the company that he did not propose to teach anybody anything in regard to line work. Inquiry developed the fact in this case also that Swanson was a member of the Telegraphers' Brotherhood, and upon his absolutely refusing to obey orders he was discharged.

A copy of the constitution and by-laws of the Brotherhood of Telegraphers came into my possession about this time, and in explanation of Sullivan's and Swanson's refusal to obey orders, a reference was made to the by-laws referred to, article 15, section 1 of which says:

No member of this organization shall instruct any person in the art of telegraphy until the local assembly of which he is a member shall have first granted permission to do so, and until said permission shall have been ratified by the executive board of the district assembly.

It was evident that the business of the company could not be carried on if we yielded to the dictation of such absurd and arbitrary regulations, and within a few days after Swanson's discharge, almost the entire line force of the American District Company left their posts of duty without notice, without any application for the redressing of any supposed grievances, and, as was afterwards learned, in obedience to a secret order from the Brotherhood of Telegraphers.

Q. How large a force was this?—A. It numbered from twenty-five to forty men.

Q. Where was the scope of their work?—A. Within the city of New York, and their work pertained to the keeping in order of the American District Company's wires connecting with the offices, houses, and factories of the subscribers to the number of about 12,000. So that it was a very important matter to the company to keep its wires in operation, as you may understand.

Digitized by Google

Q. These subscribers were business men largely?—A. Business men, hotels, exchanges, private houses, all classes and departments of business and society made use of the district service to call messenger boys and policemen, announce a fire, or call for a doctor, or use the signals for innumerable necessities.

After the linemen of the company had left their posts of duty every effort was of course made to fill their places, first by the employment of experienced linemen from other cities, it having been ascertained that the repair men of New York City employed by the various companies and numbering in all three or four hundred men were also members of the Telegraphers' Brotherhood. Almost immediately there ensued a systematic cutting and crossing of our district wires.

Q. What is the effect of the crossing of wires?—A. The crossing of two wires causes the electric current to be diverted from one to the other at the point of crossing so as to either neutralize or confuse the signals. This cutting of wires became a most serious matter to us, and, as stated before, we were compelled to employ a large number of men from other companies, and practically succeeded in overcoming most of the difficulty; whereupon, about the 1st of July, a communication was received from John Campbell, representing the Telegraphers' Brotherhood, addressed to General Eckert, of the Western Union Company, and stating that—

The Brotherhood of Telegraphers look upon the interference of officers of your company in the difficulty happening between the American District Telegraph Company and its employés, the linemen of New York, as unwarranted and unjust. Western Union linemen have been brought from abroad [meaning other cities in the United States] and compelled to take the places of faithful men who are engaged in a struggle to resist an unnecessary reduction of wages.

The only reduction of wages that we had any knowledge of was that of the five or ten dollars per month in the case of the carpenter and lineman, Sullivan, at the time when he refused to do the work for which he was originally paid the larger amount.

Q. Was it distinctly understood with him in his employment that this other duty was included if you chose to devolve it upon him?—A. I should hardly like to answer that affirmatively; but the fact that he was originally employed as carpenter and afterwards assigned to line duty temporarily, and later on permanently, with no reduction of wages, would seem to be sufficient.

Q. Was he receiving more than he naturally or ordinarily would have received as a lineman performing the same work as he did before?—A. Yes, sir.

Q. The five dollars in excess that you speak of?—A. Five or ten dollars. In some cases the linemen were getting $60; in other cases $65 or $70.

Q. What was he receiving as carpenter?—A. Seventy-five dollars, as already stated. Of course, in making that statement, it should be remarked that while he was employed as a carpenter he was not employed regularly at carpenter work at any time. His skill as a carpenter was only called into requisition in making changes or fitting up counters and partitions and benches in our various district offices, and while doubtless for a long time he did little but carpenter work, still there were many hours of many days that he did not do any work at all, but his pay ran along by the month regularly.

Q. At the time of this reduction he had been permanently assigned to duty as a lineman?—A. Not by any formal order, but as a matter of fact.

Digitized by Google

Q. As he understood probably?—A. I cannot tell whether he understood it or not.

Q. He was understood by the company to be permanently assigned to lineman's duty?—A. No; I should not say that.

Q. The point I wish to arrive at is this: Do you think that the lineman himself understood when the reduction was made or proposed, of $5 or $10, that he was then receiving compensation for other than lineman's duty, and was he receiving any more than some class of linemen who performed the same service substantially that he did?—A. I can answer that best by stating that so long as there was no question between him and the company as to the service he performed he was continued at the higher rate of pay. The moment he indicated an unwillingness to do work outside of the mere routine of the line department, then he was informed that he would have to be reduced to the standard of pay given to linemen.

Q. I understand you to say that some linemen received $75, and that he was receiving $75?—A. He was receiving $75 at the time spoken of.

Q. At the time of the proposed reduction?—A. Yes, sir.

Q. And at the time he declined to do other than lineman's duty; and at the same time were other linemen receiving $75?—A. Some of them may have been. I am not informed as to that, but linemen of his class were receiving $5, $10, or $15 per month less.

Q. That is the point; linemen of his class were receiving less?—A. Yes, sir.

Q. Go on.—A. Leaving the difficulty between the District Company and the linemen and the Telegraphers' Brotherhood for the time being, I would add that rumors of an impending strike of the Western Union Company's employés became more and more frequent towards the last of June and early in July, and on the 16th day of July a committee consisting of seven men of the executive board of the Brotherhood of Telegraphers called at the office of the Western Union Telegraph Company in this city, and presented what they termed a "memorial."

Q. Have you a copy of it?—A. A copy of it I will hand you.

Q. Please state the substance of it and then leave the copy with us.—A. This memorial calls for the total abolition of Sunday work as a compulsory duty unless compensated as extra service; demands that eight hours shall constitute a day's work, and seven hours a night's work; that both sexes shall receive equal pay for equal work, and a universal increase of 15 per cent. on all salaries; that linemen shall be allowed two days' extra pay for Sunday work; that the lowest salary paid a regular lineman shall be $65 per month, and helpers $50; that linemen's duties shall be confined solely to their legitimate work; that the salaries of Wheatstone operators shall be increased in the case of first-class men to $75 per month; second-class, $60 per month; and in addition the 15 per cent. increase asked for in the general service. I now present a copy of the "memorial" itself.

CENTRAL OFFICE, BROTHERHOOD OF TELEGRAPHERS OF THE UNITED STATES AND CANADA.

THOS. T. ECKERT, Esq.,
*General Manager and Acting President Western Union Telegraph Company,*
*New York City:*

SIR: The undersigned, the Executive Board of the Brotherhood of Telegraphers of the United States and Canada, acting in accordance with instructions from that body, respectfully petition your favorable consideration of the following memorial embodying the desires of all classes of employés in the service of the Western Union Telegraph Company:

SECTION 1. Believing that man's physical and mental welfare requires that at least

Digitized by Google

one day in seven be accorded him for rest and recreation, we request the total abolition of Sunday work as a compulsory duty, unless compensated as extra service.

SECTION 2. That eight hours shall constitute a day's work, and seven hours a night's work.

SECTION 3. Both sexes shall receive equal pay for equal work.

SECTION 4. That a universal increase of 15 per cent. on all salaries now paid be granted.

LINEMEN'S INTERESTS.

SECTION 1. That eight hours shall constitute a regular day's work, and that compensation at the rate of two days' pay be allowed for all Sunday work; that the lowest salary paid a regular lineman shall be $65 per month, and for helpers $50; that the duties of linemen be confined solely to their legitimate work.

WHEATSTONE INSTRUMENTS.

SECTION 1. That the salaries of first-class Wheatstone operators be increased to $75 per month, and second-class operators to $60 per month, and that they receive in addition the 15 per cent. increase asked for Morse operators.

SECTION 2. That the working hours of Wheatstone operators be the same as Morse operators.

A reply at the earliest possible moment solicited.

Very respectfully,

EUGENE J. O'CONNOR, *Chairman.*
MORTIMER D. SHAW, *Secretary.*
JOHN CAMPBELL,
ROBERT EWING,
HARRY W. ORR,
ROGER J. MULLEN,
JOSEPH H. FORD,
*Executive Board.*

MANHATTAN HOTEL, CORNER BROADWAY AND CANAL STREETS,
*New York City, Monday, July* 16, 1883.

As best explaining the position of the company with reference to this memorial, I have before me a copy of General Eckert's telegram to the general superintendents of the company, dated New York, July 17, the substance of which is that the executive committee of the Telegraphers' Brotherhood, which had called upon him the day before, had been asked if they represented the employés of the company, and, upon replying affirmatively, they were asked to furnish a list of such employés. They were told that the company did not know the members of the committee personally, or whether its members had authority from the Western Union employés to present any demand, and that we could not deal with outside parties.

This is a copy of General Eckert's telegram:

NEW YORK, *July* 17, 1883.

Col. R. C. CLOWRY, *General Superintendent, Chicago, Ill.:*
G. W. TRABUE, *General Superintendent, Nashville, Tenn.:*
C. A. TINKER, *General Superintendent, New York.:*

A committee of six persons called upon me yesterday and presented a memorial addressed to the Western Union Telegraph Company, and signed by themselves as members of the executive committee of the Brotherhood of Telegraphers of the United States and Canada. This memorial calls upon the company for certain concessions in regard to hours and rates of pay, substantially in accordance with the programme with which you have been familiar since their March meeting in Chicago. The parties were asked if they represented employés of this company, and upon replying affirmatively, they were requested to furnish a list of such employés. This they said they were not able to do, stating that it would require a long time to prepare a list, and they were here on expense. They were told that the company did not know the committee, or whether its members had authority from Western Union employés to present any demand, and that we could not deal with outside parties.

Aside from the questionable manner of presenting such memorial, the following remarks upon its terms are sent for your considerat on and suggestions:

One demand is that "both sexes shall receive equal pay for equal work," and another for 15 per cent. increase on all salaries. An operator now receiving a salary of $50 would by this plan get a smaller increase than one receiving $80 or $90, thus widening the differences now existing.

Digitized by Google

An $80 operator at present works nine hours daily, twenty-six days per month, equal to 34.18 cents per hour. Under the schedule in the memorial the same operator would receive $92 per month for eight hours daily, equal to about 30 per cent. increase, in addition to the Sunday allowance just granted under the new rule. This is the smallest increase demanded. In case of a Wheatstone operator now receiving $50 per month for twenty-six working days, equal to 21.36 cents per hour, the proposed schedule would give him 41.46 cents per hour, an increase of over 94 per cent.

Another demand is that linemen shall be allowed two days' pay for Sunday work, and that $65 shall be the lowest rate of pay, regardless of location or importance of service, and that the duties of linemen shall be confined to "legitimate work." Nothing is mentioned about the duties of other classes of employés being restricted to their particular line of employment, but if such concession were allowed one class there is no reason for withholding it from others, and why linemen should have "helpers" is not understood. Again, double pay for Sunday work would offer temptation to the men to slight their Saturday duty to create necessity for Sunday work.

The demand that both sexes shall be paid the same for like service looks to the driving of woman labor from the ranks, as were the company to concede it, it would be to its interest to prefer men operators, who can be availed of for a greater variety of service than women operators who may be equally capable for general duty.

In a published interview with a member of the committee, he stated that since the organization of the Brotherhood petty wire troubles and mistakes in messages have practically ceased, and that business has been greatly facilitated, these results being attributed directly to the fact of the organization. The reverse is the case. Operators declining to join the league have been interferred with in their duties, wires have been thrown out of working condition, and in numerous cases the official business of the officers of the company has been mutilated and seriously delayed.

A strike of A. D. T. linemen, members of the Brotherhood, took place in this city recently, since which time the strikers have been engaged in cutting wires daily, one man now being under arrest and indictment for such lawless work. With thousands of able-bodied men out of employment all over the country, many of them applying to us for work, such a demand is remarkable.

It is known that a large proportion of operators have been led to join the league under compulsion, and others under the belief that the organization was co-operative for legitimate and benevolent purposes, many of whom have stated they will repudiate any arbitrary action of the striking element.

THOS. T. ECKERT,
*General Manager.*

On the 19th day of July a further communication was received from John Campbell, of the Telegraphers' Brotherhood, calling attention to the memorial which had been presented on the 16th, and in terms threatening a strike of our employés. This communication was received at 10 o'clock on the date named, and two hours later the signal was given, in response to which several thousand operators and linemen employed by the Western Union Company, and a large number employed by other companies, left their posts of duty.

This is a copy of Campbell's communication:

On Monday, the 16th, a committee of telegraph operators submitted to your consideration a petition intrusted to them for presentation to you by the Brotherhood of Telegraphers. You expressed your doubts as to the authority of that committee to speak for the employés of your company, and have failed to respond to that petition. Your letter to R. C. Clowry, general superintendent, discloses to the public the fact that you were informed of the nature of your employés' grievances before they were presented. Under ordinary circumstances it would require but a short time to arrive at a conclusion as to what steps you would take. But knowing as we did that this matter had been thoroughly discussed long before we waited on you, it was not unreasonable to expect an early reply. It is due to the interests you represent, to our organization, and particularly to the general public, that this matter be speedily adjusted, and that the responsibility of any future action may rest where it properly belongs. It is with an earnest desire for the harmonious settlement of difficulties and regard for the social and business interests of the people that we send this appeal for the recognition of the rights and redress of the grievances of your employés.

Very respectfully,

JOHN CAMPBELL,
*District Master Workman.*

To THOMAS T. ECKERT,
*General Manager and Acting President of Western Union Telegraph Company.*

Digitized by Google

Q. Where were the men employed who left their posts?—A. In the various offices of the company, here and in other cities of the land, in many cases leaving messages partly sent or recorded with no information by which the company could determine which particular messages had been fully completed before the men left their desks. In the case of the linemen, almost without exception diagrams of the company's wires and poles on the various streets of the cities and along the various routes traversed by the company's lines were taken by the men, leaving the company in the position of being required to instruct new hands and make new diagrams, a labor involving several days, or, in some cases, a week. In the mean time, inexperienced linemen had to be employed to make necessary repairs.

Q. About how many linemen had struck?—A. Probably about eight to ten hundred in the entire country.

Q. About what proportion of them were in the cities?—A. Almost the entire number of those who struck were employed in the various large cities.

Q. Relatively, how embarrassing to the company was this strike of the linemen? To what extent was the cessation of the service of linemen?—A. The effect of the linemen's strike was very small upon the company's business, because we were enabled to employ riggers, house-painters, roofers, tinners, and other men from various lines of business, somewhat familiar with the climbing of poles or buildings, and we were thus enabled to keep our work moving with very little difficulty, especially when taken in connection with this fact, that, for some time prior to the strike, in consequence, as we are informed and believe, of the connection of the linemen with the Telegraphers' Brotherhood, efforts were made by the men to restrict the amount of work to be done by them during any particular time, so that it was found that the company had employed a considerably larger force of men to keep its lines in order than would have been necessary had each man done a fair share of work. In New York City alone, for instance, forty-eight linemen of the Western Union Company stationed in the city joined the strikers, not one of whom has since been re-employed in the city, not more than one-half or two-thirds of as many men having been put on duty to do the work.

Q. Is the work as well done now?—A. We believe it is better done. Leaving out of the question the large amount of trouble caused the company by the cutting of its wires in the city of New York and vicinity, which for several days caused a great loss to the business interests of the country, the wires of the company during the strike and since its close have worked as a rule better than before. Much the same effect, but in a different direction, was caused by the operators belonging to the Telegraphers' Brotherhood, many of whom, according to the best information we have, obstructed our business, declined in numerous instances to work in connection with a non-member of their league, or, if not declining practically, boycotted him, so that our business in very many instances was delayed, badly done, and in some cases mutilated. Since the strike ended, our business has reached and exceeded its former volume, and we are handling it better than ever before, and with a much smaller supply of operators.

Q. You are referring now to operators as well as linemen?—A. Yes.

Q. Can you state about what the reduction in the number of employés, operators, and linemen is with which you now perform the same or a larger business?—A. I cannot definitely. Statistics are being pre-

Digitized by Google

pared in that connection, and I would hardly like to make any statement in advance of their completion.

Q. Very well, proceed.—A. Immediately on the occasion of the strike on July 19, an order was issued by the company authorizing to the faithful employés, both operators and linemen, extra pay for all work rendered, their regular pay being continued as a bonus. This had the effect of drawing into our service from other lines of business a large number of operators who had formerly been in the telegraph business, but had left it to go into business for themselves, or to act as confidential clerks, stenographers, or agents of companies or firms, many of whom have remained permanently with us since the strike closed. The number of these volunteers in the aggregate was very large, and a great disappointment to the leaders of the strike, as well as a gratifying surprise to the officers of the company. For several days after the strike the business of the company between its principal offices was considerably delayed on account of the short force on duty, but by working the faithful men in some cases more than double time, paying them amply and liberally, and furnishing, in many cases, meals and lodgings, we were enabled after a while to handle business as before the strike. One of the efforts of the leaders of the strike was to induce railroad operators to join their ranks.

Q. Please state right there the numbers of those two classes of operators as nearly as you can; those properly known as the operators of the company, and the railroad operators, and about how they are distributed throughout the country.—A. Statistics are being prepared in that connection.

Q. Cannot you give a general notion of it? I want to get an idea of it as we go along.—A. I suppose that more than two-thirds of the operators of the Western Union Company to-day are paid by railroad companies wholly.

Q. In what class of offices; what locations are their posts of duty?—A. In various railroad stations throughout the country.

Q. In thickly settled places, or rather in the rural districts and sparsely settled portions of the country?—A. In both. Take the line of the New York Central Railroad, for instance. All of the operators at the stations on that road between here and Buffalo are paid by the railroad company; so the New York, Lake Erie and Western Road, the Delaware, Lackawanna and Western, and many others, have operators at each of their depots, or station houses, who receive, transmit, and deliver public or commercial telegraph business, the receipts of which accrue to the Western Union Company, the salaries of the operators being paid in almost every case by the railroad companies under our contracts with those companies. The same is true of 95 per cent., I should think, of all the railroads of the United States.

Q. Do you have also operators paid by the company at the same stations in many instances, or is the service exclusively rendered by the railroad companies where railroad operators render any of it?—A. In some few cases the Western Union Company employs separate operators, the terms of contract varying in accordance with the requirements of the business generally. At some stations where the telegraph business largely exceeds that of the railroad company, the Western Union Company employs an additional operator.

Q. Give some instances of stations or offices where that is the case, where the Western Union business largely exceeds the railroad business, if any points occur to you.—A. The Newark, N. J., depot of the Delaware, Lackawanna and Western Railroad Company is one.

Digitized by Google

Q. What circumstances lead to that fact?—A. The passage through that office of a very large number of cross-connecting Western Union wires.

Q. And that is the reason which leads to this fact wherever it exists, I suppose?—A. Generally speaking, yes. I have a copy before me received from President Sloan, of the Delaware, Lackawanna and Western Railroad Company, of the memorial presented to him on August 4 by the Telegraphers' Brotherhood, asking for a general increase of $10 per month on the salaries of all the operators of that railroad company, and that no salary shall be less than $50 per month. This is it:

BROTHERHOOD OF TELEGRAPHERS OF THE UNITED STATES AND CANADA.

MANHATTAN HOTEL, CORNER BROADWAY AND CANAL STREET,
*New York City, August* 4, 1883.

SAMUEL SLOAN, Esq.,
*President Delaware, Lackawanna and Western Railroad:*

The telegraph operators in your employ have instructed us to make the following requests:

(1) That a general increase of $10 per month on all salaries now paid be granted.
(2) That no salary shall be less than $50 per month.
(3) That the above changes take effect beginning Monday noon, August 6, 1883.

A prompt reply is desired.

Respectfully,

EUGENE J. O'CONNOR,
*Chairman.*
J. CAMPBELL,
H. W. ORR,
*District Executive Board.*

Q. As far as you know, was that the first demand made by the operators in the service of railroad companies for any redress of grievances or increase of pay?—A. I do not know definitely. It is the only formal copy of a memorial I have seen, although at the time it was announced in the newspapers that demands had been made upon various Western railroads. I believe such demands were made about this time.

Q. Was there any claim set up by this committee, or by any committee or individuals who claimed to represent the operators of your company, that they also, to a certain extent, represented the operators of railroad companies, or who were paid by railroad companies?—A. I do not know that I get the drift of your question.

Q. Was any representation made to your company by the committee of the Telegraphers' Brotherhood, Mr. Campbell and his associates, that they also represented operators who were employed by the railroad companies?—A. The memorial presented by Campbell's committee on the 19th of July is before you, and, I think, does not mention that fact; but it was generally understood that many railroad operators belonged to the Brotherhood, and that demands upon the railroad companies would be made from time to time as occasion warranted, in the judgment of the executive committee of the Telegraphers' Brotherhood, for increased pay, decreased hours of labor, and other concessions.

Q. Up to the 4th of August, the date of this memorial, do you know whether any such demands had been made upon railroad companies of a like character to the demands made upon your company?—A. I can state generally, yes; such demands were made upon the Chicago and Alton Railroad Company, upon the Missouri Pacific Railway Company and its controlled roads, upon the Chesapeake and Ohio Railroad Company, and upon a number of others whose names I cannot now recall.

Q. And up to that time do you know whether any such concessions as requested were made by the companies?—A. In no case were any concessions made.

Digitized by Google

Q. Before or after that time?—A. Before or after, in compliance with their demands.

Q. I mean before the termination of the telegraphers' strike, so called?—A. No concessions that I know of have been made in any case to any of them.

Q. Either by railroad or other companies?—A. With the exception of one telegraph company.

Q. Which was that?—A. That was the American Rapid Telegraph Company.

Q. With the exception of that company, then, you can make the statement general, as I understand you, that no concessions were made by railroad or telegraph companies to the demands of the strikers before the termination of the strike of your employés?—A. Yes, sir; that is true, and the result in the case of the American Rapid Company, I think, shows the folly or absurdity of their having made any concessions at all.

Q. Were you designing to make some statement in regard to that?—A. No, sir.

Q. Then, perhaps, you may as well give your reasons for this opinion, the facts that influence you to a formation of this opinion, now?—A. Before answering that, and as having it in proper order, I should like to present the reply of President Sloan to the letter of the committee before mentioned, declining their demands.

Q. You can do so.—A. This is a copy of Mr. Sloan's reply:

DELAWARE, LACKAWANNA AND WESTERN RAILROAD CO.,
PRESIDENT'S OFFICE,
*New York City, August* 6, 1883.

SIRS: Your letter of the 4th instant was left at my office on the day it was written. The peremptory tone of the "request" seems to imply consequences which I cannot fail to understand and appreciate, asking for a prompt reply, and that the changes proposed may take effect at noon to-day.

I am not aware that our operators are dissatisfied with their salaries or hours of labor. No demand, so far as I am informed, has been made for any change in either. Knowing as I do many of our operators, I hesitate to believe you fairly represent them all in your letter. Many, if not most of them, have been years in the service of the company, their pay increased, and promotions made without solicitation. An operator has become our superintendent of our telegraph system. In all branches of the service ability and devotion to the interests of the company are recognized. The master mechanics of our shops have risen from foremen and engineers. The general superintendent of the company has risen from a brakeman. Men look forward to promotion, and are not disappointed.

Having for more than thirty years been actively employed, working hard as an executive officer, closely watching all these great interests, sympathizing in the varied changes of labor and capital, I feel the communication you have sent me a mistake on your part. I therefore promptly reply, and decline to accede to your request stated in your letter referred to.

Yours, &c.

SAMUEL SLOAN.

Messrs. O'CONOR, CAMPBELL, and ORR,
*Committee.*

[At this point the examination of the witness was suspended, to be resumed at a convenient time subsequently.]

The committee took a recess for one hour.

TELEGRAPH OPERATORS' STRIKE.

The following letter, subsequently received, was ordered to be added to the testimony relative to the strike of the telegraph operators:

[Executive office, Western Union Telegraph Company, Norvin Green, president.]

NEW YORK, *January* 10, 1884.

MY DEAR SENATOR: In response to yours of 5th instant, I have had the data you asked for gotten up, as nearly as we can estimate, to show the damage done to this company by the strike of its operators last summer.

A singular and rather unexpected feature of the exhibit is that the loss was greater in increased expenses than in reduced revenue.

The strike commenced by the operators' quitting work on the 19th of July, and terminated by their application for re-employment on the 18th of August.

The loss of revenue in July, as compared with the corresponding month last year, was $117,500, and in August $158,800, making together an actual falling off of $276,300. By the same comparison the expenses were increased $197,300 in July, and $235,700 in August, making an increased expenditure of $433,000, which, added to the loss of revenue, makes the total loss $709,300.

There would naturally have been some increase of expenditures with the growth of the company, which cannot well be estimated, and against this would naturally have been some increase of revenues for the same reason; so that the actual loss was probably greater than the figures given in revenues, and less than the figures given in expenditures. But the damage suffered was about $700,000. This was partially made up in the quarter's returns by largely increased dividends accruing to the company from its stocks in telephone and other corporations.

It may appear singular that having considerably less than a full corps of operators in service the expenses should show such considerable increase; but the men in service were paid handsomely for extra hours of service, and in most large offices, in order to get the most possible hours of service, we had to provide to feed and lodge the men in the buildings.

I beg you will consider that this information is for the use of your committee, and not for newspaper publication, except as it may transpire in legislative proceedings.

I am, respectfully and truly yours,

NORVIN GREEN,
*President.*

Hon. H. W. BLAIR,
*United States Senate, Washington, D. C.*

---

NEW YORK, *Monday, September* 10, 1883—2 p. m.

GEORGE BLAIR'S examination resumed.

By Mr. CALL:

Question. Have you anything further to suggest?—Answer. Yes, sir.

Q. Go on with your own statement connectedly.

Digitized by Google

HOURS OF LABOR.

A. I have divided the subject, so that you may question me as I go along. The last point I was on was as to the hours of labor.

Q. I understand your theory to be that a reduction in the hours of labor by any authority, no matter whether State or national, would be efficacious in bringing about a result that would produce a general increase in the comfort of the laboring classes. Now, I should like to know in detail how that would produce that effect. What is your idea? Suppose there was a law to-day by which every man should be required to work only eight, six, or four, or any other number of hours, how would you expect that to influence the amount of compensation that he would receive for those four, six, or eight hours of labor?—A. I hold that by the reduction of the hours of labor a large percentage of those out of employment would obtain employment, and in obtaining employment they would secure the means to purchase those things that we all like to enjoy more or less, the necessaries of life, and as much of them as we possibly can. In that way a large percentage of those out of employment would be benefited directly, and with the department that I speak of afterwards, to ascertain how many hours would be required to keep the people constantly employed at such wages as would tend to improve their condition, it would be a matter to be reached very easily as to the improvement of their condition. If the reduction of the hours of labor to eight would not contribute to giving all employment that are out of employment, you would have to go still lower.

Q. And keep on going lower?—A. Keep on going until you would have the community employed. These may sound rather like queer notions.

Mr. CALL. We want to have all ideas on the subject. That is the only way we can arrive at conclusions.

By the CHAIRMAN:

Q. The practical difficulty, as it seems to me, is this: Eight hours constitute, we will say, a day's work; a man is allowed to work eight hours; but how is it to be arranged that when he steps out the unemployed portion are to step in for that particular day. Take factory work. It might not be so difficult to take work on buildings. Take your own trade; take employment on a farm, and so on?—A. The only seeming obstacle there would be those engaged in the transportation business and in agriculture. Of course both those classes could be taken care of. That is a matter of detail. The general principle of reducing the hours of labor is what I am getting at. The railroad employé is engaged in a concern that must run day and night. Instead of compelling a man to work ten, twelve, fourteen, or sixteen hours, as is the case in this city in many instances, if the day fixed were eight hours there would be a chance for another man to come in; two men would be used where one man is used now, where sixteen hours is the rule.

Q. There would be a much greater production?—A. This extra man who would have employment would receive wages, and consequently be enabled to purchase productions, and that would be money given circulation; and as the number increased all that class who are out of employment would secure employment through the reduction of the hours of labor; it would tend to increased production to that extent. It is as simple as A B C. When a person is getting $3 a day he can buy more than when he is getting two, and he buys with that extra dollar articles that he could not purchase when he was receiving only

Digitized by Google

$2, and those articles are products that could not find a market until he was able by his increased wages to purchase them. Consequently it stimulates industry, and gives increased employment, and circulates money.

By Mr. CALL:

Q. Would you be willing to trust the support of your family to that theory that where a man was getting $3 a day, instead of $2 before, he would have a dollar to spare from his expenses?—A. I do not understand you exactly.

Q. You say that if a man is getting $3 a day where he was only getting $2 before, by virtue of that fact he has a dollar more to spend than he had before in buying what he wants to buy?—A. Yes.

Q. Now, suppose there were enacted some legislation, either State or Federal, to day that every man should get $3 for two, four, six, or eight hours' labor?—A. I do not think such legislation would be practicable.

Q. I do not know that it would, either, but does not that illustrate the idea?—A. We expect the wages question to regulate itself by the reduction of the hours of labor.

Q. We want to know exactly why you think so. We want to hear the details of it.—A. Because it takes so many men out of competition with the men who are at work. It is like an article on the market in competition with something else of the same kind; when there is too much of it, it falls in price. It is the same with labor, and if the article is on the market a long while it depreciates sometimes below its actual cost.

Q. That is what I want to find out exactly, whether it is true in your idea, absolutely true, that because there is too much of a thing on the market, therefore alone it is going to fall in price. Suppose there is not any more of it going to be produced, what then? In other words, do you not have to consider not only the quantity of a thing there is on hand, but the future means and probabilities of production?—A. That sometimes is taken into consideration.

Q. For instance, if there was a vast surplus quantity of wheat upon the market to-day, and it became an ascertained fact that no more wheat would be produced next year, do you think the present surplus production alone would create a difference in the price of the commodity?—A. Yes; but you do not make any distinction between the raw material and human labor.

Q. What is the distinction? I thought you were treating it as a commodity in the market?—A. I was comparing the effect on an article that is on the market and there is a large quantity of it manufactured, which sometimes, by reason of there being no demand for, it falls in price and sometimes below cost. But I did not cite that illustration for the purpose of connecting it with the efforts of the workingmen to protect their interest and to destroy the competition as much as possible by the reduction of the hours of labor. I claim that by reducing the hours of labor you take out of competition so much labor that is competing with that already employed, and in making that statement I desire to be distinctly understood that I do not place labor on the same level as an article manufactured and put upon the market; or, in other words, I do not put labor on the same level as raw material.

Q. You need have no sensitiveness about that. There is nobody in the world who has any sense at all who does not know that a man as a man has faculties and properties that a brick or a piece of cotton has not got. Of course everybody that is not an idiot knows that. The

Digitized by Google

laborer is a man, a human being, and, under our system of government, has a right to all legislation that may benefit him; but in considering the question of economic law which you propose to consider here, of course the question arises whether or not a superabundance of labor in one or another direction can be remedied by this, that, or the other specific means. In all aspects of this question, every reasoning man must assume that a laborer is not a brick, or a stone, or a piece of wood, but a human being with faculties to be improved and educated, and enjoyments to be provided for. Now, the question is, how are we going to do that. I understand you to say that you propose to do it by giving employment to every man in the world, or every man in your own country, or in any community. Now, suppose your ideas are carried out and we have provided by a general law, a change of the government, that nobody shall work more than two, four, six, or eight hours a day, or any other number you see fit to provide; we have a law to that effect that there shall be only that much work done. I ask you to say how that law is going to regulate the price of that labor, the amount that a man shall get for two, four, or six hours' work?—A. That is not the point in this proposition. We expect that the question of wages will regulate itself.

Q. I want to know why you expect so.—A. Because we take that much labor out of competition. We find employment for it by taking that number of hours out of those already employed.

Q. Do you understand it to be a rule of economy that the price of a man's labor increases just in proportion to the quantity of additional labor you give?—A. Somewhat.

Q. These are mere questions for consideration. We all want some practical way of improving the quantity of the comforts of this life that every laboring man shall get. We want him to have better houses, better clothes for himself and family, more healthy conditions of life, better and more abundant food, and to get all these with just as little work as possible. That I understand to be the object that all people of beneficence and with philanthropic ideas have in view. Now, you propose to achieve that result by providing that every man shall work only six or eight or some other number of hours per day. We have got that law in force, we will suppose, and all the people of the United States are subject to it. Now, who is to decide how much of that labor shall be in agriculture, how much in cotton manufactures, how much in iron manufactures, how we shall distribute it?—A. Every man and woman shall be his or her free agent.

Q. Supposing it to be so that every man and woman shall be a free agent and no man shall work more than six or eight hours a day, and every trade shall be open to every man who wants to go into it, how are you going to find out that six hours' or two hours' work, or four hours' work, will be sufficient to fill the needs and give employment to every man who has not got it in these different trades?—A. By such a department of industry as I shall indicate before I get through, whose special business it shall be.

Q. I understand that your idea is to give to some authority somewhere, either a bureau or an individual, or a collection of individuals, the authority to say how many men shall work in this trade, how many in the other, how many cotton manufacturers there shall be, how many spinners?—A. Oh, no.

Q. I would like to know how you are going to regulate that question. Suppose these two laws be carried out, how shall we apportion the labor and distribute it?—A. We shall expect that that will regulate itself

Digitized by Google

largely. If this department learns by the collection of facts and statistics, thorough and complete, no one-sided story, but a complete investigation, that the reduction of the hours of labor to eight is not sufficient to keep the people of this country employed, it shall recommend that they be further reduced.

Q. Now, let us examine that and see how that will come out. An old philosopher said that error always lurked in general assertions, but if you want to find out the truth of a thing you must come down to particulars. Now, take the manufacture of goods out of cotton. Suppose that there are in that pursuit 100,000 artisans—for that will do as well as any other number—and a bureau of industry ascertains that in order to give them work it will be necessary to reduce the hours of labor down to two or four apiece, do you think that those two or four hours each would give a man exactly the same amount of compensation in respect to other industries as if he worked six or eight?—A. If they are all fully employed, there is no reason why they should not be comfortable. That is the point.

Q. Here is a man that is engaged in the hardware industry, and there are just enough men at work to have employment, the bureau of industry decides, at eight hours of labor per day. You are going to have some institution by which you will say that the man who works only two hours a day in a pursuit where there are 100,000 men engaged shall get precisely the same pay, or the same amount of goods, clothes, &c., as the man who works eight hours in the hardware business. How would he like that?—A. We would not do anything like that.

Q How would you regulate it?—A. We would say everybody should work a certain number of hours. We would not single out any particular trade.

Q. But I understand you to say that the bureau of industry, when it found there were more men in one trade than eight hours a day would give employment to, must reduce the number of hours down to six if necessary?—A. No, sir; if those people could not find employment in their trade, let them try their hand at something else. We want to preserve the individual right as much as possible. That is the way I look at it.

Q. You would give that bureau then the authority to say, "You have too many men in the cotton trade; now we will put so many more in the iron trade?"—A. Oh, no; nothing of the kind.

Q. I am only asking how would you regulate that matter?—A. If this department of industry found after a few years that there was a certain discontent and misery, and other difficulty, connected with bad times, that so many people were out of employment, and they had continued out of employment for a reasonable length of time, then there should be some remedy applied to give employment to that element out of employment. I do not mean that because we should have dull times for five or six weeks, and by necessity a large number of people were thrown out of employment, the department should take as much notice of that as if they found that for three or four years men were out of employment, a large number of them, and that wages were so low that they could not buy all the necessaries of life and live as they ought to live, then I say this bureau should step in and recommend that the hours be further reduced.

Q. Would you not have any apprehension that men engaged in the cotton manufacture that might be doing well, and where there were not more employed than were needed, and who were getting rich at the business, would use some influence with that bureau to make it dis-

Digitized by Google

criminate against other industries and in favor of their own?—A. We should have to take a little chance on that, but if we ever succeed in accomplishing this idea, there will be such a high standard of patriotism in the community that it will be impossible for any clerk, or any chief of bureau, or any combination of individuals to do other than that which the people wish.

Q. Does it not occur to you that that kind of autocratic power in any bureau, composed either of one man or many men, is precisely the form of a despotic government, such as has existed for the last two thousand years in many instances?—A. Not if created by the will of the people.

Q. The will of the people created Napoleon the First, you know?—A. Not under our system of government.

Q. He took a vote of all the people and they elected him, and Napoleon the Third professed to do the same thing.—A. I take exception to that. I do not think our people would ever consent to that. As I said previously, if we got to that point where we could have legislation of this kind carried out successfully, I would consider the standard of patriotism so high in the community that it would be impossible for any board to be purchased.

Q. I understand you would be willing to trust your wife and your children and your means of support to the decision of a national bureau over a vast country of 100,000,000 people, saying how many men should work in one trade, and how many in another, and you would have perfect confidence in its just and beneficent discharge of that duty?—A. I do not concede anything of the kind. You are trying to draw me into something that I do not understand.

Q. No; I only want to get your idea.—A. I say the people should be free agents as much as possible.

Q. How much do you say is possible?—A. This bureau would be overstepping its duties if it should dictate to me or my family what I should do; that is, single me out.

Q. No; not single you out.—A. That is the way you put it.

Q. No; I will suppose that this bureau would say: "In the cotton manufacture there are 100,000 employés; 50,000 must get out, and you draw lots; only 50,000 can be supported, working at six, eight, or two hours a day?"—A. That is not the point.

Q. I should like to know what is the point?—A. I have explained it more than once. This bureau, after it discovers that men are out of employment for a long while, and discovers that it is necessary to recommend a further reduction of the hours of labor, should do so, and it should be done. It should not affect any particular trade, and if there are more cotton-spinners, or more men in the hardware line than those particular industries can take care of, it is expected that those people will have good sense enough to go into some other business.

Q. It is to be a voluntary action on their part whenever the bureau recommends that so many shall get out?—A. They do not say "get out," but they say "get in," by reducing the hours of labor.

Q. But suppose the hours of labor are reduced, they will not affect to any extent the demand for so much cotton goods; there may be a market, or there may not be?—A. If the men out of employment get employment, have they not an opportunity to buy more?

Q. Suppose it increases them, it will not diminish the demand?—A. It will increase the demand.

Q. Suppose it increases the demand, still it does not necessarily follow that there might be too much of cotton goods or iron goods or any other sort of goods made for the present. You think, then, that simple

Digitized by Google

thing would measure the quantity of production that would be needed in any kind of manufacture?—A. To a large extent.

By the CHAIRMAN:

Q. You think that their earnings would be equivalent to what they would consume; they would make a market for at least as large an amount of goods as their wages would represent?—A. The more employment the more opportunity to purchase the goods that are manufactured.

Q. If the people that are unemployed earn $100, they take that $100 to apply to their necessities or to consume something?—A. Certainly.

By Mr. CALL:

Q. I may be very dull about it, but I am trying to get at your idea. Suppose you had your law passed to-day, and every man and every woman in the United States was allowed to work only eight hours or six hours, whatever the number might be, would it follow from that fact that the quantity of cotton manufactures made to-day in this country would be decreased?—A. It would increase it.

Q. How would it increase it?—A. By giving so many more men employment.

Q. How would it be to-day? It might in the future. Of course the present supply would be the same?—A. As soon as these men would get money and spend it, they would have the goods.

Q. Now, we will suppose that your bureau of industry says "there are 100,000 men engaged in the cotton manufacture; they were in it at the time this law passed; we produce of cotton goods a very considerable surplus more than the market requires." Your men have not got the cotton goods yet, but now to begin, there having been a reduction to eight hours' labor your bureau says, "the men who are now in these manufactories are sufficient to produce all that is needed and the quantity has not decreased so sensibly as to affect the market; so you have got to reduce the hours of labor still more; there is too much produced; more than we want." Then you must do that in order to give employment to these other men who are out of employment?—A. We cannot produce too much when everybody is not employed.

Q. All are not employed yet. There is a period when they have got to be employed. A man does not become a cotton-spinner right away; he has got to be prepared for it. Do I not understand you to mean that your bureau of industry shall say to these people, "there is too much cotton goods produced; these other men have not learned their trade yet; you must make room for them; you must not work but four hours a day." Is not that so?—A. You mean to single that trade out?

Q. No, I mean it of any trade.—A. I do not propose that any one trade shall be singled out, but it shall be made general; if there is a reduction it shall be general.

By the CHAIRMAN:

Q. The day's work now is ten hours?—A. Pretty generally.

Q. I am assuming that the day's work is ten hours. You would shorten those hours to eight, and allow one man to work eight hours per day. Somebody else comes in and works the other two?—A. We would not have that.

Q. How would you arrange that?—A. Eight hours should be the day's work.

Q. The other man would work eight hours, also?—A. Yes, sir.

Q. Then you would keep the machinery employed sixteen hours in-

Digitized by Google

stead of ten, as now?—A. No; eight hours should be a day's work with the exception of businesses that are extra pushed in busy seasons or transportation, or there might be an exception made of agriculture in certain seasons of the year. They could work a little longer, or average their work the year through at eight hours. I do not think they work more than eight hours the year through, considering the amount of machinery introduced.

Q. Do you mean that you would have the machinery idle all but eight hours of each day? In what way do you give employment to more persons if each man is to work eight hours, or would you change that?—A. By the eight-hour system, by fixing the limit at eight hours, 20 per cent., or certainly 15 per cent., more men would be put to work.

Q. They would be at work during those same eight hours?—A. Yes.

Q. The machinery, then, would run only eight hours of the twenty-four?—A. Eight hours; it runs ten now, except in exceptionally busy seasons. We have seasons here when for four or five months in the year there is hardly anything doing, while in the months of September and October and a part of August they have to work sometimes to 10 or 11 o'clock at night.

Q. If the machinery is worked to its capacity, already working ten hours, how can you work a greater number of hands during eight hours?—A. By the method I indicated.

Q. You would have to put in more machinery?—A. The present machinery would give employment to more men, because we have times in the year when that machinery is standing idle sometimes for two or three days, three-fourths time, one-half time, and so on.

Q. That presupposes then that the time is not now fully occupied. You would work on Saturdays, you would work on holidays, and work all days when by reason of depression in business and the like there is now a suspension?—A. I would not work holidays.

Q. I did not know but that your idea was that by shortening the hours of labor you would work relays of hands; one working eight hours and then another comiing on and working two, four, or six longer, and by keeping the machinery at work double, or a considerably longer time, you would largely increase production. give employment to everybody who wanted employment, reduce the price of goods, and make the necessaries and comforts of life the more abundant. I did not know but that you had that idea, but I see now that your plan is the other way?—A. Eight hours should be the limit.

Q. For machinery as well as men?—A. Everything except in exceptional cases, and I maintain that 15 per cent. more people can be put to work. In the cotton-mills of this State and Massachusetts it would cut into them fearfully—not so much in Massachusetts as in this State. We have 50,000 operatives, largely children, in this State that work twelve hours a day, or near ten hours a week more than the factory operatives of England.

Q. It would liberate those children and give employment to grown people?—A. Yes, sir.

By Mr. CALL:

Q. Would you have the children out to-day?—A. We are trying to do that now in this State. We succeeded in getting a bill ordered to a third reading, and then the manufacturers got to work and brought their little influence to bear.

Q. Suppose you had a law and took them all out of the factories, would not that produce a difference? Have you the skilled labor to

Digitized by Google

step in their places right away? Suppose you take them all out to-morrow, have you got the skilled labor ready to step in their places, grown adult labor?—A. With the reduction of the hours of labor we would, and in a very little while there would be sufficient.

Q. If you reduced the hours of labor, and reduced the quantity and number of the laborers at the same time, does it follow that the proportion can be kept up so as to keep up the status of supply of manufactured goods just the same?—A. Oh, yes.

Q. Suppose the labor of children makes 15 per cent.?—A. It is more than that in this State.

Q. What is it, 20 per cent.?—A. In some lines of goods more.

Q. Twenty-five or 30?—A. More.

Q. Forty?—A. Yes, over 40; between 40 and 50.

Q. Say 50?—A. I speak of children fourteen years old and under.

Q. The proportion of children's labor then is 50 per cent.?—A. I would be safe in saying 40 per cent.

Q. Say 40. To-morrow we take out 40 per cent. from the labor that produces the present gross amount of manufactured articles. Now, we will take out in addition to that two or three hours of labor, or one hour per day, or any quantity you choose, from the adult laborer; does it follow that the status of production, the quantity of manufactured goods of that industry will be the same after that great reduction that it is now?—A. Yes; the reduction of the hours would offset what you would take out in child labor, and we would not object to half time as they have in England for children of a certain age and that would meet that reduction, and still the factories make the same amount of goods. I do not say they could make the same amount of goods in the short hours as they could in the long hours, by taking the children out, but it would eventually come to that by their being compelled to employ adult labor. The capacity of the mills would be only temporarily affected.

Q. You think, then, in the course of time it would come to that result, but what will you do in the mean time with these people until that comes about?—A. All great changes involve some little suffering. I think we could provide for that without any very serious misfortune. It is a matter of detail. This is only a general principle that I am asserting. The matter of carrying it out and providing for details, is a matter that will be necessary to consider in carrying the measure into effect.

Q. Does any further way suggest itself to you of providing the additional adult labor for that particular branch of business, and also of taking care of those that are thrown out of employment, the children?—A. I would do as we have done in the suppression of the cigar tenement factories in this city; I would fix a certain time, and after a certain time have the law take effect. Then the manufacturer could shape his arrangements accordingly,

Q. But who is going to support these people?—A. The mills go right on until that day.

Q. How are you going to support these children?—A. You are speaking of the child-labor question. We want to get the condition of the working people in that shape that a father and mother can take care of their children without sending them to work. I find that is the greatest opposition with me in this child-labor agitation, that the father and mother want the labor of the child.

Q. We are agreed about that; but the question is, if to-morrow the law took them out, or a year hence, or two years hence, they are without any present means of support; these children who have been earn-

Digitized by Google

ing their own living have no longer that means; they cannot labor. Now, do you contemplate that their fathers and mothers would of necessity in that time be in a condition simply by virtue of a change in the hours of labor to take care of them and support them without any other assistance?—A. I think by the fact that the competition with outside laborers would be removed to a large extent; their wages would be increased; they would be in a position to take care of their children where they are not now.

Q. Do you propose to prevent competition with labor?—A. That is our point. I do not hesitate to say it.

Q. Of course you do not propose to prevent it in one trade only, but in all, clothes-making and everything else?—A. Everything.

Q. So that the price of clothes, and the price of provisions, and the price of everything shall be regulated in some way you do not explain?—A. That will regulate itself.

Q. But in which competition shall have nothing to do?—A. No. I mean to destroy competition in human flesh; that is the point.

Q. We will call it "human flesh" then?—A. In clothing, let that regulate itself by the market value.

Q. If we can get at facts it does not matter by what name we call them. I understand the fact that you propose in this new society is that there shall be no competition in respect to labor?—A. We want to destroy that competition as much as possible. We do not say that in periods of depression the law may step in and furnish a remedy immediately, but if that depression were continued, and certain influences were continually at work to keep a large number of workmen out of employment, and thus render them competitors of those that are at work, we say some power should step in to take care of that competition.

Q. That is all very good; and I say so, too, if we can find out the power. Now, let us suppose the law adopted, and there is no competition in respect to labor or the things made by labor, and we have the things all made. Here a man has a clothing store, and he says, "I have managed, by being a little sharper in trading and dealing than other people, to get a pretty good stock of these things on hand; I will sell these things a little cheaper than anybody else."—A. That is his business.

Q. Here is a fellow over here who says, "You forbid competition; I have got a lot of these goods; I have not worked my hands but two or three hours, and I have paid them their wages under the law."—A. We do not fix wages.

Q. "This fellow is sharper than I am, and he has beaten me trading." You fix the number of hours he has to work, and you say, "That is a day's work." I do not see what good it will be unless you fix the wages and say they shall be the same for six hours' work as for eight. But leave that out of view; this fellow says, "The other fellow has undertraded me; he is sharper, and has broken me up." Has not the fellow who has broken him up a monopoly of the market, and can he not charge what he pleases?—A. We do not want to interfere with that kind of competition. Any one can sell at a loss if he pleases.

Q. Then the competition you propose to destroy relates only to the hours of labor?—A. That is so.

By the CHAIRMAN:

Q. I understand, then, that your position is this: that before capital is allowed to accumulate, as a primary condition labor shall be reasonably cared for.—A. That is the point.

Digitized by Google

Q. First, there shall be a reasonable provision for the laborer and his family, distributed in the form of wages, before there shall be an accumulation for capital.

Mr. CALL. He does not mean that; he means there shall not be competition in hiring.

The CHAIRMAN. I think that position involves what I say, that the laborer shall be taken care of; that the human being who has sense, and body, and soul, shall have a chance before there is an accumulation beyond.

Mr. CALL. Why not have a law, then, saying that every laborer shall have a good house to live in, good clothes to wear, and good food to eat, and whatever amount of money represents that.

The WITNESS. This proposition is the most direct way to reach that result in my mind.

Mr. CALL. If you can make such a law, and make it work, it ought to be passed, but that has nothing to do with the means you speak of, preventing competition, to bring about that result. If you employ a laborer you shall give him enough money to buy him a good house to live in, good clothes to wear, good food to eat for himself and his family, and his house shall be a healthy one; it shall not be surrounded with bad air or any of the concomitants that produce pestilence and ill health. If you could have a law directly to affirm that, of course we should have that question settled without relying on economical and political questions as to competition, or supply and demand.

The WITNESS. I want to make a correction there. You assume that I stated that I was in favor of regulating the price of clothing and the price of everything.

Mr. CALL. Oh, no; I do not. I do not assume that you are in favor of anything.

The WITNESS. You made the statement in such a way as if I was responsible for it.

Mr. CALL. Not at all.

The WITNESS. I do not want it to go down in that way.

Mr. CALL. I am not looking at you as an individual; I am asking you as to these ideas which you think are afloat and are influential amongst the working people.

PUBLIC TELEGRAPHS AND RAILROADS.

The CHAIRMAN. Proceed with your statement.

The WITNESS. The tendency to monopoly in all branches of trade is growing more rapidly here than in any country in the world. I question whether there are men in the Old World, with all their accumulations, that possess the powers which our chiefs of railroads and telegraphs possess, yet some people are willing that such power be continued. I believe the great majority of our people would favor the building of independent telegraph lines and railroads, while the objection to this comes mainly from those who fear an extension of public patronage, yet I can see no reason why that should be an objection as the people could better control a responsible rather than an irresponsible institution, especially when the cost of service would be largely reduced without reducing the pay of the employé.

By the CHAIRMAN:

Q. You propose to invest an additional amount of capital equivalent to that already invested in transportation, telegraphy, and the like, to be owned by the public, and operated by the public?—A. Yes, sir.

Digitized by Google

Q. That would be equivalent then, would it not, to the destruction of the existing facilities?—A. No; I would not interfere with the present roads or with the existing telegraphs.

Q. If those facilities for transportation, telegraphy, and the like, are now sufficient to transact the public business, would it not be better, instead of investing as much more which all comes out of labor in the end, for the public to take possession of existing facilities, making fair compensation for them and run them in behalf of the public, or to, by legislation, limit the fares and the freights, the taxes, which these private agencies may impose on the public for their service in such way as to reach the result which you have in view?—A. I would have no objection to that if the Government would pay for the actual cost, considering wear and tear, &c.; and it strikes me, taking the broad view of this question, and the manner in which these institutions have possession to a more or less extent of legislation, or the means of legislation, that it would pay better in the end for the Government to build these roads and these telegraph lines, from the fact that a price would be put upon the existing companies that would be, in my opinion, five times greater than the original cost.

Q. Do you not understand that the Government, if it can legislate on the subject at all, may condemn this property, and pay what it is reasonably worth?—A. I believe it has that right.

Q. But suppose it is thought best to let these agencies continue in private hands; would you not reach the same result by limiting the charges by law which may be taken from the public for service?—A. I think it would be better to make no half-way move in that direction, but to either take possession on paying what the roads and telegraphs originally cost or to build them by the Government direct.

Q. Do you think the Government could operate the lines of transportation by land and water, telegraphy, and the like as cheaply as private corporations can do it?—A. I have not taken in the water-ways.

Q. Well, I will leave those out then.—A. I consider that the Government could do it much cheaper.

Q. Not much cheaper than these companies actually render the service for. It might be reduced by law, but do you not understand that as a rule a private individual can do a certain piece of work more cheaply than it can be done by the public?—A. Yes; if it is a legitimate business, not deriving any special privileges; but when we take into consideration that these companies pay extravagant salaries, issue unlimited passes, and have fine, expensive buildings, and carry a large amount of stock that represents nothing, it strikes me that when they ask 5, 6, or 10 per cent. on that it would seem that the cost of service could be considerably reduced by the Government taking hold of the matter themselves and working a telegraph system or building a railroad that would cost about one-fourth or one-fifth of what these roads are represented to be worth.

## WAGES IN EUROPE.

I believe your committee should have a complete knowledge of the rate of wages paid in Europe as compared to this country, and its purchasing power. Much has been said that our work-people are no better off than the work-people of Europe. I was determined to find out if such was the case, and issued a circular to our consuls in Europe last July. I have received replies from nearly all the principal points whence our immigrants come, and find that the countries from which we receive the largest number of immigrants are those where the wages

Digitized by Google

are lowest and population thickest. The factory operatives of England are better off than here, but it is the only exception. I am preparing a table upon this point. Mr. Joseph Nimmo, jr., chief of the Bureau of Statistics, acknowledged in a letter to me that Congressmen, Senators, and committees were continually asking him for information relating to rate of wages paid in Europe as compared to this country, and he confessed that the Government had no such information, never having appropriated a dollar for the purpose. I asked the State Department to urge the consuls to get the information I was after, and the Department replied that they were about to issue a circular covering the whole subject. Where the wages and purchasing power of money are equal there should be free trade, but no article should be put upon the free list manufactured in a country where the wages are so low that it would drive our goods out of our own market. Our own markets should be protected, and a number of articles now on the free list should have a duty high enough to keep out foreign-made goods. No agent should be allowed to bring immigrants unless they come of their own free will and pay their own passage. Germany, Italy, Sweden, Denmark, Switzerland, Austria, and England can all successfully compete with us with free trade, to the extent of their manufactures, unless wages are lowered here to the same level that they are in other countries, cotton goods excepted. Canada, since it has become a protectionist country, has grown wonderfully. Under free trade England supplied Canada largely with everything; now they supply themselves with nearly everything. The manufacturer, in many instances, takes the lion's share of the protection, but as fast as labor becomes educated it secures its share besides employment, which the American workman would not have if the goods were made on the other side.

Q. Did you get data of much value to you from the other side?—A. Yes, sir.

Q. You have not got them so that you can give them to us.—A. I have them not complete, but I find that England is the only country where the workingmen are reasonably well off, and you find by the immigration that there are not many coming direct from England.

Q. Could you give the committee, at a later time, the benefit of those data?—A. Yes, sir.

Q. Perhaps you desire to make use of them in some special way in the first instance?—A. I propose to make use of them, and very effectually, because I consider it as a labor question in which I am interested.

Q. When do you think they will be available to give to the public?—A. I have so little time, and I am receiving replies every day, that it may be two or three weeks yet.

Q. When you are able to give them to the public if you desire to give them in some form to your own organization first we have no objection, but we should like to place them on the records of the committee.—A. I find in Germany that the workingmen's agitation there has forced a pretty good system of statistics. They have issued there every month in some parts of Germany full and complete statistics of the condition of the working people, wages earned, cost of provisions, rent, and all those items which were forced, no doubt, by the agitation of the workingmen of that country. There are some special trades that are better off in Europe than here, but I have not had a chance to investigate; but I know the cotton operatives are better off in Europe than here.

Q. All classes of cotton operatives?—A. Nearly all classes; and especially as to children the law is very severe. Under a certain age no

Digitized by Google

child is allowed to work in the factories, and between certain ages there is half-time. The factory inspection law is enforced pretty thoroughly, and the Government recognizes prominent men in the labor movement over there by appointing them factory inspectors, and in that way those who are interested in having the law enforced are placed in those positions, and that is the reason why I referred in my earlier statement here to-day to the fact that we have yet to receive from this Government many things that the British Government has conceded to labor organizations.

Q. Do you understand the condition of the factory operative to be better than in this country anywhere save in England?—A. Only in England.

Q. It is not better in France, or in Germany or Belgium?—A. No; I think there is a little better situation in France, but the fact that the men who bring labor over here in large numbers have gone to Sweden and to those countries indicates that they could not get English operatives. You will recollect that somewhere in the neighborhood of your home, or close by, they have had an importation from Sweden. We would like to strike at that system of immigration too.

Q. How extensive an evil do you understand contract immigration to be?—A. It is growing every day. Ever since the workingmen have been beginning to organize and become active, and business has stirred up a little in this country, the demand in some of those lines is such that they would not ship labor, and whenever there is any trouble with operatives they send over to Europe, or telegraph to some reliable party to get them people, and they are willing to advance the money to pay their fare and make contracts with them over there.

Q. Have you known that to be done in this State?—A. I do not know of my own knowledge in this State, but I presume if you would call some of the operatives in Cohoes, or in the Utica district, you would get some information on that point.

## EFFECTS OF A PROTECTIVE TARIFF.

Q. You made an allusion to protection as it has operated in Germany. What are your views, or the views of those you represent, on that subject in this country?—A. When I spoke of Germany I said that there was a system of statistics gathered there for the benefit of their own people.

Q. It was Canada as to which you spoke of benefits of protection. How is it in regard to that matter in this country?—A. I know manufacturers that cannot sell any goods in Canada since they have put duties upon several articles. Of course I did not inquire very fully, but it indicates that it is pretty general. Besides, trades organizations over there are growing very rapidly, and that always indicates that there is some prosperity. There are some towns there that had been doing hardly anything for over eighty years that are now growing up very rapidly since the protectionist policy has been introduced.

Q. You do not understand that Canadian goods are brought to this country to any extent?—A. No.

Q. What are your views as to the effect of the tariff upon our own industries and the interest especially of working people?—A. You mean a tariff on foreign-made goods?

Q. Yes; customs duties.—A. As I stated, where it is discovered that a certain manufactured article is made in another country that may be made here the duty should be so high as to keep that article out and

Digitized by Google

give our own people employment. There are lots of articles on the free list now that could be manufactured here and would give employment to perhaps three or four hundred thousand men. The store-houses in this city are increasing every year where goods are put in bond and remain sometimes three or four months.

Q. Goods that might be manufactured in this country?—A. Yes, that might be manufactured here.

Q. You would not, of course, impose a tariff upon raw materials which cannot be produced in this country?—A. Oh, no.

Q. Go on.

LAND GRANTS AND LAND TAXES.

A. I believe the National Government should stop giving away any more land, except for actual settlers, and should recover all lands forfeited by the railroads. Unimproved property should be taxed the same as improved. This would drive the idle lands into the market.

Q. Do you mean that unimproved lands should be taxed so much per acre, or so much in proportion to the surface of each ownership?—A. Either it should be used by the owner or it should be put on the market for sale, so that people can use it.

Q. Or become vested in the Government? Do you not think that the operation of that would be to vest large tracts of land by tax sales in the Government itself?—A. So much the better; then the Government could dispose of the lands to parties who wanted them.

Q. Suppose that to be done; in what way would you have the Government dispose of the lands?—A. To actual settlers.

Q. By rent or sale?—A. Sale.

Q. Giving fee-simple titles, as we call them?—A. Yes, sir; I would not want the Government to sell more land to one individual than just enough to give him a chance to make a good living on it, and, if it is a city law and the city government is compelled to take it by reason of the tax not being paid, let it be sold to an individual for his use as a home. Let there not be a large accumulation of lots and acres of land in a few men's hands. We are growing to that pretty fast in the West.

Q. Have you any data on that subject of the increase of what one witness called bonanza farms, large ownerships in private hands?—A. I have read a good deal on that point, and we have some people who are pretty well posted on it, but I have not had the time excepting to notice that there is a great deal of land in the hands of a few men, and a great deal of land getting into the hands of foreigners, lords and dukes, the aristocracy.

Q. I have seen that statement, and have made some effort to ascertain whether it is true or not. I am not in possession of any very definite data of that kind.—A. I suppose the Land-Office Commissioner could tell.

Q. The land might not be patented to foreign owners, and probably would not be, and so the records would not show it?

DEPARTMENT OF MANUFACTURES AND LABOR.

A. In view of the fact that the product of manufactures is three times greater in value than that of agriculture a department of manufactures and labor should be created, if for no other reason than to furnish information not now in possession of the Government. The Department of Agriculture was formed for the same purpose. The department I propose would not be so expensive. I have referred to this department

Digitized by Google

previously on the question of the hours of labor. It would have great influence in collecting facts and figures, and giving our people information, not only workingmen but manufacturers.

Q. Do you mean to include in that what other witnesses include in a statistical bureau?—A. Yes, sir; exactly.

## OVERCROWDING OF LARGE CITIES.

The overcrowding of large cities, especially the city of New York, should receive the attention of health boards. There is a splendid opportunity for rich men to do some good for mankind here. The labor problem must largely be settled by the people themselves. A disposition on the part of those who are better off to help their more unfortunate associates in building homes, rented, or sold at a small advance above cost, and exempt from taxation the home of the workingman, valued at $2,000 to $5,000, the same as in Massachusetts, would be, in my opinion, something that, while this committee has no power in the premises, its recommendation would, I presume, attract attention and help the cause.

Q. You would exempt the homestead to the amount of from $2,000 to $5,000?—A. Yes, sir.

Q. Would you exempt the personal property? I think you suggested earlier an income tax?—A. Yes, sir.

Q. To offset for the increase that the public treasury received in that way you would liberate the smaller properties of the poor?—A. Yes, sir.

Q. In personal as well as real estate?—A. Well, to that extent; efforts should always be made by men of influence to show that the workman is the greatest sufferer by bad laws. I have been told that, by laborers increasing their wages through organization, the result is to increase the cost of the article. Granted that that is so, does not that give the maker a chance to sell an article that he otherwise could not, and thus give employment to labor? The man with $2 per day can buy more than with a dollar, and if the wages of 1,000,000 workingmen are increased $1 per week, it increases the circulation, or the life-blood of the nation $52,000,000 per year; and if 5,000,000 secure an advance there is the same benefit to the country in the same ratio. Decrease wages as they were during the panic, under the contraction hard-money policy, and every property in the land feels the effect. I think there is more money in circulation to-day, growing out of increased wages, than at any time during the history of the country.

## POLITICAL PARTIES.

In conclusion, I desire to say that working men and women and the friends of such are organizing in this country very rapidly. Many years' experience has taught them a lesson. The policy of the future of these organizations will be to defeat their enemies and sustain their friends. They are beginning to learn that this Government was created for the benefit of the people, an issue the two great parties avoid except when they find that the sentimental cry will not work. The Republicans raised the cry of protection for labor at the last national campaign, yet placed on the free list many articles that could be manufactured here instead of in another country. The Democrats promised to wipe out convict contract labor in this State and failed to keep their promises. The organized movement will recognize no party, but strike at men who betray their pledges. In this wise we expect—not in the large cities—to

Digitized by Google

bring out a class of men long ignored by the machine politicians, who will stand by the people's interests, who will legislate for the masses and not the few.

Q. Are you a member of the Knights of Labor?—A. Yes, sir.

Q. Have you any further statement to make, or any other suggestion to submit?—A. I think I have covered the ground pretty fully. I hope some good will result from investigations, and that my little effort will contribute in helping to solve this great problem. I realize that it is a great question, and one of the questions that must be met in the near future, and as I look at it it is the only live question that is before the people to-day.

Q. You consider, I suppose, that the trades unions, which represent the organization of working people, are your chief agency in bringing about results?—A. Yes, sir; I think that through the trade organizations and the Knights of Labor, properly handled, public sentiment can be developed in favor of many of these propositions. We all have our ideas, and I may entertain some that a practical test might upset altogether; yet I think I reflect very strongly the sentiment of most of the men who are associated with me and who have been in this movement for many years, and when we urge legislation in the interest of the people we expect to have the support of the people in whose behalf we labor, and as the labor movement aims to educate the masses it should be encouraged in every way possible instead of being discouraged. I stated in the beginning that among manufacturers and among business men there seems to be a deep-rooted prejudice against any effort that is being made by workingmen. I recollect in my own history very often a man goes among my customers and says, "Well, what is Blair driving at now? He ought to attend to his own business." The impression is that I am neglecting my business. The fact is I am always on hand and attending to business. About four or five years ago a mercantile agency of this city tried to suppress me, whether it was intentional or not I do not know—by exhibiting a statement about my efforts and saying, "Mr. Blair is a man who is a prominent man in the labor movement." I saw this report by one of the leading mercantile agencies four years ago. "Mr. Blair is a man who is prominent in the labor movement, neglects his business, and it suffers considerably on account of his activity in the movement;" and it wound up by saying that they did not consider I was a safe man to trust. At the same time I never asked any one for a dollar's worth of credit from the day I started to the present. This only indicates how deep a prejudice exists and how quick people assume certain things that refer to a man's conduct and action which are not true. If that agency would have taken any pains they could have found out from my neighbors that I am always in my shop and I am always attending to business; and perhaps I spend four or five days in a year, sometimes ten altogether, away from my business, distributed through the year, in this movement; and when I leave I leave my business in such shape that I am hardly missed I have a class of men, with one or two exceptions, that work harder when I am away than when I am around. I simply make this statement to show how deep-rooted a prejudice exists in the community; and sometimes it is done with a motive, too, to strike down a man who is aiming to organize a sentiment that they, in some way, do not care to recognize or appreciate. While I had a pretty hard struggle to lift myself up, considering the competition and my anxiety to treat men strictly in accordance with my views. To have an agency circulate lies about me made me feel pretty bad at the time, but I have managed to live through it, and

Digitized by Google

I can say now that I am the second largest manufacturer in this town in my line, and I had all that to combat.

Q. You employ 60 men, I think you said?—A. Some 60 men.

## LAND TAXES AND RENTS.

EDWARD KING recalled.

By the CHAIRMAN:

Question. I think you were asked to prepare an answer to a certain question. What was the point?—Answer. It related to the land question. I was asked if a unified tax on land would not compel the producer of food to pay all the taxes. That, I believe, was the question put to me by one of the members of the committee.

Q. Which member; do you recollect?—A. I think it was Senator George. "Is it not a fact that the rent, which is now the heaviest tax on producers, is for city lands, mining lands, and lands used for manufactures; and would not the appropriation of all rent to public uses relieve actual producers of all kinds?" The question is put in the form of an argument in favor of Mr. Henry George's theory, which was being attacked at that time, I believe, by a member of the committee, a weak point in his theory being shown up. The gentleman who wrote the question desires me, I presume, to say what I think of that argument—would not that be the case? From my personal point of view I would say that it would be the case if it happened exactly as described, but it is a question which I regard as a purely relative question; and when I was speaking of the matter before the committee I was stating the views that I understood to be held, indeed that I know to be held, regarding Mr. George's theory, the progress it had made so far as it was accepted by organized workingmen with whom I acted, and was not then stating any individual views of my own. Therefore I will simply continue that. I find that Mr. George's views are making very rapid progress; that in the organized bodies of labor which are not regarded as strict conservative trades unions the ideas are accepted with very little discussion. It is a general sentiment simply, and so widespread is it that a public speaker in New York City—I have found it the case elsewhere—if he desired to stand well with his audience at the start, could not do better than to start with a quotation from Henry George's "Progress and Poverty." I am not prepared to state that the acceptation is based upon a thorough understanding and study of the book; but I do mean to say that the organization of the labor movement, in the broad sense which it has now assumed, is very much affected by the feelings and opinions of a large body of people in this country organized in the form of land leagues; that the increase in the perfection of that organization and the increase of the agitation is affecting a large part of the labor movement, and must be taken account of. Not only so, but I find that in the middle classes and in the occupations not generally acknowledged as laborers, the views of Mr. George are receiving a more thorough welcome than they are in the strict trades unions. Just let me say here that when we speak of the strict trades unions we mean organizations of labor which for purposes of stratagem exclude not only the land question but every question that is not specially connected with some branch of their labor or their special interest as a labor union. Therefore, the rejection by two bodies of workingmen in this country of what was called a land plank, with a resolution in favor of the land question, might lead to misunderstanding on that matter.

Digitized by Google

It is simply the policy of all well organized trades unions to exclude as far as possible all questions upon which there is not a thorough understanding and some decision come to to take action upon. Therefore, for strategic reasons, it might appear that the organized workingmen, the trades-union men of this country, were not as much in favor of this idea of Henry George as the laborers are. Now, in England Mr. George's theories were accepted very rapidly, and are making very great progress, his book being published at the price of 9 cents, and selling like hot cakes in London. Its acceptance would be accelerated by the land agitation in Scotland, where there were so many evictions, and quite an enthusiasm created on the very same question as is touched by Mr. George's book. The general feeling within the last ten years in England amongst the working classes has been very much in favor of such broad remedies, and with a socialistic tendency; not socialistic in the specific sense of any party organized on a platform, but in the sense in which John Stuart Mill described himself as a socialist, who, nevertheless, believes in the value of competition and its power as an educator, and regards the advocate of any practical form of socialism as being somewhat in the distance, but yet always to be kept in mind and worked for. In that sense, within the last ten years, such has been the tendency there. Mr. Swinton, who was on this stand, has put on record his opinions and his observations in London. When I was in London there was nothing of the kind except one little hall in a public alley-way; I forget what they called themselves, but they were so very small in number and so insignificant that it would form an object of ridicule for any writer on the press who wanted a good subject and had nothing else to do. Now, I say that to-day, according to Mr. Swinton's testimony and that of others, and what I know from other sources, there has been a very rapid change of opinion, a very rapid change in the point of view, and that must be reckoned with because it affects opinion here to a very remarkable degree. The international spirit is abroad, and it cannot be laid at rest; it has got to be reckoned with.

Now, in relation to this particular aspect of the land question amongst the workmen that I associate with, I find that among all of them here, while not prepared to go the length of Henry George's unification of taxation, they still believe that some modified form of his doctrine must be put in force. For instance, some I have heard advocate at a meeting that the principle should be simply applied to a municipality, and that the city land, the land on which such high rent is paid, should be the land that should be covered by any such legislation. Then another view has been partially expressed by Mr. Blair in the same spirit; that is, that there should be a modification in the direction of relieving farms or land up to a certain valuation from taxation, in the same spirit in which the English Government relieves workmen with wages under a certain amount. I forget now what the amount is, but the income tax in England is of no force below a certain yearly income. I never knew any of my acquaintances to pay any income tax; it did not come down our length. In the same spirit as that I have found that that is a modification of Mr. George's views which is favorably received; but there is no use concealing the fact that those opinions are making very rapid progress, and that some men who are leaders and have responsibility do not desire to place themselves on record, because they do not desire to create division in the ranks of organized labor; but this desire, which is a very worthy one, to preserve the continuance and unity of all organizations so far as they exist, and to avoid the intrusion of questions that divide them or give a reason for pushing other questions into their

Digitized by Google

organization—I say that while a good spirit must not be allowed to deceive any person as to the spread of those views of Mr. Henry George, I believe as a reason—one of the principal reasons—why they are so acceptable, according to a fact referred to here several times, is that a large part of the land of the United States is passing into the hands of foreigners. It is believed by large masses of the working class here that the following gentlemen possess the following amounts of land: that Sir Edward Reed, a member of Parliament, holds 2,000,000 acres of land in this country.

Q. Do you know that?—A. I do not know exactly that, but I saw it stated in the public press here, and, of course, the press never lies, as was said the other day; it has been copied in England, and is accepted in England, and it certainly would have been contradicted if it were not true. A very reputable English magazine copied the statement that Sir Edward Reed, M. P., has 2,000,000 acres of land; the Duke of Southerland 400,000 acres; Lord Dunmore 100,000 acres; Lord Dunraven 60,000; and a gentleman by the name of Dalrymple, not a foreigner, and I believe a lawyer, is charged with having 300,000 farms which have fallen to him by foreclosure and other means in Dakota.

Q. Three hundred thousand must be all the farms there, and probably more.—A. I understand that. He is supposed to be the largest land owner in the world.

Q. It must mean surface sufficient to make 300,000 farms, because it is a question whether there are as many as 300,000 people in Dakota, men, women, and children.—A. These foreclosures happen when people have left the land, and the improved land falls into the hands of somebody who can get it.

Q. It would be very difficult to suppose 300,000 farms had gone over to the sheriffs to be sold—A. If it is an error it should be corrected.

Q. The number stated would be several farms for every man who has been there with a family. It is doubtful whether they have 300,000 people in Dakota, including men, women, and children. I believe they claim 350,000 people in Dakota. Do you know where this Mr. Dalrymple lives?—A. No. I certainly would like to find out myself.

Q. He must be a prominent real estate lawyer. I should be glad to have him brought in here.—A. I know I have heard his name held up to execration in many places, and so many times that he would not feel comfortable.

Q. There has been testimony here in regard to a Dalrymple bonanza farm in Dakota or Minnesota. Mr. Moody testified in regard to it.—A. It is quite probable that he has acquired this property, and has acquired what originally were separate farms, simply making one large wholesale farming business of it.

Q. It is a great mistake, of course.—A. The simple fact is that when statements such as these, whether they are true or false, are made, they are believed.

Q. Do you think that the last statement is believed?—A. Oh, yes; the gentlemen who told me believed it very much; thought he could prove it, too.

Q. If he is able to produce the proof, we shall be glad to receive it.—A. The importance of the statement is this, especially regarding the foreign class of whom it is believed; no refutation has been made of these statements publicly, and when anything of that kind gets abroad it is copied all over the press of the United States; it is copied in Europe, and it has its effect, false or true. The influence of foreign capital on corporations in America and on land is one of the features, one of the

Digitized by Google

points, in which agitation mainly dwells on the land question in this country, and successfully. I do not think it needs much speaking on my part to show how in the present state of opinion and the condition of the laboring class all over, an agitation of the land question which utilizes facts like these or statements such as these is apt to make very great progress indeed, and to arouse that kind of sentiment which is necessary for the adoption of any distinct views on a question like the land question. As for the correctness of these statements of course I have no knowledge myself. I simply testify that they are widely believed, that they are reiterated over and over again, week after week, and month after month.

Q. Do you not think that those who make the statements and those who reiterate them ought to take some pains to verify them?—A. Yes; I should think so; but they are trained in the habits of political agitation, and up to this period there has been very little conscience on such matters. In agitation in politics the people are imitating all the time. Our greatest trouble in organizing the working classes is to break them off their bad habits learned in political agitation. Of course I hold that the labor movement is not responsible for anything they catch like a disease.

Q. Why do you say that you do not hold men who are concerned in the labor movement responsible for statements they make like other people? They have been here and they seem to be as intelligent—you appear to be as intelligent a man as any one who has been on the stand; and do you not hold men responsible for anything you assert as a fact?—A. Oh, I never was in politics in this country.

Q. You think anybody who has been in politics and does that thing is not responsible?—A. I believe the influence of political life in this country has a most corrupting effect on the moral character of all men engaged in it, and where a good man is in it his reputation is utilized by a hundred villains and traded upon, and I say in the labor movement we have the greatest struggle to antagonize habits of exaggeration, gross exagergation.

Q. Do you find any tendency among those who lead the movement to correct that habit in their own cases?—A. Undoubtedly.

Q. Then the folks who make these statements and repeat them, on your own theory, should take some pains to verify them, should they not?—A. Undoubtedly.

Q. Do the leaders in the labor movement give currency to these statements without taking any pains to ascertain whether they are true or not?—A. No.

Q. Do not your followers believe in their leaders?—A. Not entirely.

Q. Why should they not?—A. Because they would throw a so-called leader over in a week.

Q. Would they throw over a leader who should try to verify these statements and say they were false if they were?—A. If he were able to prove it.

Q. Do you mean that they believe the statements he makes, and if they are exaggerations they believe the exaggerations too, but they would not believe him if he made a contrary statement?—A. Undoubtedly.

Q. They are inclined to believe exaggerations?—A. If they go with their feelings. For instance, you have an intense antipathy just now abroad on this land question. I am only testifying to the existence of a most intense antipathy.

Q. And tendencies of mind.—A. Yes, sir; as I find them. I find

Digitized by Google

that facts like these are repeated in magazines of such reputation as the North American Review.

Q. Was that statement in regard to Mr. Dalrymple in the North American Review?—A. Not that, but similar facts which at first glance I would myself regard as gross exaggerations. I should have to make very strict inquiry before I would assert them as facts, but then what I claim is that men who are supposed to be leading men in the labor movement have not the time to make the investigation necessary to find out that this Sir Edward Reed, M. P., does not possess two million acres of land.

Q. It might be very difficult for them to learn that was not the case, and the assertion does not seem to be so unreasonable. I am only speaking of the Dalrymple assertion which seems to be one of its own kind altogether.—A. And he being a native, of course the objection to his possessing so much land is not so great. I speak of it simply as an example of the concentration of power and wealth and swallowing up the land, the land being regarded as the source of all our subsistence. If I were to read to you the platform of the Socialistic Labor Center, the platform of the Knights of Labor, and the platform of the Central Labor Union, you would find that there is a recognition of the doctrine, fundamentally a doctrine, that the Government or the people, the whole people, own the land. That is an idea which may be safely said to be accepted very widely.

Q. You may put those platforms in evidence, if you please, without reading them.—A. Here is a copy of the Socialistic Labor Center's platform.

Q. I think that was given us.—A. And I think the platform of the Knights of Labor was put in evidence by Mr. McClelland. I do not think you have that of the Central Labor Union, but you are to have the secretary before you, Mr. Matthew Maguire.

Q. You can go on with your statement.—A. In relation to the labor movement, and the press, and the pulpit, I have already stated that the middle classes are now falling in with the anti-monopoly movement, and that very large class of ideas is finding great acceptance amongst the middle classes. Quite recently a labor paper was started, and it was asserted by the editor of that paper in this city that the paper was supported not by the trades unionists and the so-called workingmen so much as by professional and middle-class people. The paper advocated very largely the views of Henry George, and gave great prominence to the land question, and to the attack upon the power of concentrated wealth, monopolies, &c. This has a very great encouraging effect upon the strict labor movement, and has to be taken account of. The strictly Irish movement in this country is also of the same kind. It trains men in organization; trains them to habits of discipline and by the logic implied in the principles which are accepted by respectable people and people who are regarded as sober-minded people, as the middle classes and professions, generally are regarded by the working classes, there will be and there is a very great disposition now amongst people who have held back from any association with those broader and deeper questions—quite a disposition now to favor them and take part in the movement. That, of course, has to be taken account of also in dealing with the labor movement, strictly so called.

### RELATIONS OF THE PRESS TO LABOR MOVEMENTS.

The relation of the press to the labor movement of course is a very bitter one. The laboring classes, as has been already testified here,

Digitized by Google

have great antipathy to the newspapers, and not only those of New York City, but I interrogated several of those who were present at the labor conference in the city here to see if the same spirit was in the other cities, and I found it was the very same. The view that the course of the press is deliberately the result of purchase money, I believe myself to be an exaggeration, and I think also that it is perhaps an exaggerated form of that opinion. The general belief is that it is the result of prejudice, that the interests of newspaper proprietors are against favoring any kind of organization which may put them in the same place some of these days as it places some of the manufacturers and employers who are not in the newspaper business. It is also a very widespread belief among the working classes that you should not believe anything you read in the newspapers. The want of that faith in the veracity and truthfulness of literary men is one of the phases of the labor movement that I consider very remarkable indeed. The feeling is away beyond what could be accounted for by anything else than very gross cases of misrepresentation, and very exaggerated cases of opposition, and the laboring men transfer a state of feeling which belongs to a past period of newspaper attack to the present. I believe that at present the newspaper press, as it has for some time back, is taking quite an advanced position on the labor question, and that it is only in some signal cases of misunderstanding or misrepresentation in the press that the working classes will resolve to boycot a newspaper, as they frequently do.

Q. What is done when they boycot a newspaper?—A. They organize committees in every district of the city, exercise their influence as purchasers upon news stands—the men who own news stands—and they also resolve not to purchase such papers as are boycotted, but resolve to read them without purchasing them. It is believed, I know by the workingmen in this city, that they have brought newspapers to terms once or twice by that process; that is, they have brought them from blackguarding them in the most disgraceful and ridiculous wa around to a state of mind where they evidently fished for their pennies or their influence, whichever it was, and that state of mind amongst the working class causes them, of course, to take very strong opposition now and again against the press. It is very natural that the press should adopt the same spirit; it is quite natural that they should be irritated by what they regard as a gross misrepresentation of the case; but I say that it is a most unhealthy state of things that a power such as the press should be believed by the working classes to be warring with them and against their interests.

Q. To what extent is the labor movement developing a press of its own?—A. One newspaper lost 24,000 subscribers.

Q. Is that a well-authenticated statement?—A. I think it comes from one of the men who did it, and I think that is pretty good authority.

Q. Has your informant any objection to the paper being mentioned?—A. I do not know; I believe not; I believe they are rather proud of it.

Q. What paper was it?—A. The Staats-Zeitung was the paper that lost the 24,000, and the organization of a socialistic newspaper might never have taken place if there had been a decent, what one might call a strategic, recognition of the labor movement. I have myself had very great difficulty in keeping a moderate tone and holding a Christian state of feeling regarding newspapers. The general mistake is that it supposed that the thing is done from malice, whereas I believe that it is caused by the exigencies of space, which is an important thing on a newspaper; by the fact also that reporters sometimes make out as long a report as possible in the hope that it may be accepted, and their pay

Digitized by Google

for a day's labor may be something decent; but "the fiend with the blue pencil" who presides in nearly every newspaper office cuts it down considerably, and not being present on the occasion when the sentiments are reported, cannot be expected to know the general drift of what a speaker may have been saying, and when the abbreviated report of the reporter has been handed in "the fiend" naturally makes some errors when he reduces that to a still less compass. I believe, however, that there is a certain element of opposition in the press, and it comes from the business part of the concern. The influence of capital upon the fourth estate I regard as most corrupt and fatal, and a thing very much to be regretted, because when you recognize the fact that these influences have not that hold they once had on the formation of the opinions of the people, and when you remember that the press is rapidly taking the place of what the pulpit once did, I think it is a matter of very grave concern that any large body of the people should lose faith in the veracity and justice of a power like the press.

Q. To what extent has labor a press of its own, and what is the tendency in regard to its providing itself with organs?—A. The tendency is that they must do it. The fact is that they cannot do it to any decent extent. It demands now co operation. At one time it would have been possible for a single man well known in the labor movement so to be befriended by some benevolent capitalist as to be furnished with funds for starting such a newspaper; it might have been floated, and it might have succeeded; but several newspapers have been started and stolen, at least that is what the working class who started them believe, and the tendency now amongst the people is to believe that all efforts in that way must be failures except co-operative, under a law which prevents the capture of the paper by the shareholders, and prohibits any person from having more than one share, &c. Such a law is held as guaranteeing that if in a co-operative way any body of working people can start a newspaper and keep it going for a certain length of time, they believe it will succeed; but unfortunately they cannot keep it going for that certain length of time with the exception of one or two very signal cases. The Volks-Zeitung, of course, appeals to a special nationality; it is printed in a foreign language, and that nationality are distinguished for their cohesiveness, distinguished for their disposition to gather together and hold together; and workingmen who desire a labor newspaper acknowledge that they do not see how it is to be got. When you mention the success of the Volks-Zeitung to them they state as its cause that the paper had peculiar circumstances in its start, and also has peculiar circumstances in favor of its being sustained. Now I believe beyond question that the working class believe they must have papers of their own.

Q. To what extent have they papers of their own?—A. I have not the statistics and am not very well posted. A gentleman who is connected with the Volks-Zeitung states that there are thirty-five papers altogether that may be regarded as workingmen's papers in this country. It is a sample of the disposition to frown on any effort except a co-operative effort in the newspaper line.

Q. Have they any daily newspapers?—A. The Volks-Zeitung is a daily paper. In Chicago I think there are one or two dailies, and in Saint Louis there are several daily papers.

Q. One of those papers it seems is in the German language.—A. Yes.

Q. Are there any English dailies?—A. I am not aware of any myself.

Q. Can your friend state?—A. I am told there is; the Albany Union, also the Utica Daily Press.

Digitized by Google

Q. Do you know anything of the extent of the daily circulation of any of them?—A. The Volks-Zeitung, I am told, has 30,000; the Philadelphia Tageblatt has 22,000; the Chicago Arbeiter Zeitung, 20,000.

Q. These are in the German language?—A. Yes, sir.

Q. Have the trades unions organs as a rule?—A. There is a trades union organ in Paterson, printed in English. There are a great many workingmen who do not take any stock in it. Still it must be assumed to be an organ of trades unionism of a certain phase of opinion.

Q. With the exception of the papers mentioned, I suppose most of the remaining thirty-five are in the English language.—A. The Germans out West are very strong, and I think you will find that the English-speaking papers are in the minority, and that a case where they are able to hold up a daily is a very rare case indeed. It must be apparent that the working classes want the news and you cannot find the news in a paper just started. It is not easy to get into the Asssociated Press, as has been testified here already. While the working classes want their trade news, want a labor paper, still they have a burning desire to know what has happened connected with other affairs besides trades affairs, and workingmen cannot be counted upon as willing to throw over their interest in everything else for the sake of a trade paper. The want of capital sufficient to advertise a daily labor paper is the point at which the effort generally fails.

Then the influence of the other organs of public opinion, such as the pulpit and lecture platform, literature, magazines, &c., will probably be very great. I believe myself that in the agitation of recent years there were very extraordinary socialistic sentiments expressed by clergymen. Within she last five years there have been works published with such tendencies. Dr. Rylance, of this city, an Episcopalian minister, has a book on communism and socialism; also Heber Newton, another Episcopalian minister. Dr. McGlynn, of St. Stephen's, has taken part in various public meetings and pronounced himself a disciple of Henry George out and out, and has expresed himself on the labor question in such a way as to encourage other clergymen of less caliber so far as standing in the church is concerned; and there are indications that a large section of the working classes who have held aloof from organized efforts at the labor movement, very sober, very conservative, religious men, are now being inoculated; and the phenomenon appeared in this city quite recently of a clergyman appearing before a large body of workingmen and inviting them to go to church as he was going to preach on the short-hour movement; and he himself happened to put in a few months every year as a machinist and the rest of the time as a preacher, combining in his own character the two functions. That was commented upon and its example must be counted upon. I believe myself that the moment the labor movement in its organized condition solves the problem of co-operation without compromise, that is solves the problem of recognizing the differences of opinion amongst the various sections of the working classes, arranging some method by which those who actually do agree upon anything can act upon that without being compromised in any other respect, there will be a large accession, and a religious element will enter into the movement that I regard of very great value, although it is not so regarded by the vast majority of people in the labor movement. I believe that if you desire to ascertain the real depth and extent of the antipathy felt to capital, the antipathy to the upper classes, so called, and discontent with their condition, it is perhaps better mirrored in its effect upon religious organizations than in any other way. The belief amongst many, many large masses of men

Digitized by Google

who nominally belong to different Christian denominations, of the power of money as a corrupting influence upon their church is very wide indeed; and the faith in the, I would not say veracity, but in the courage of the belief, is at a very low ebb. I regard that as of very great importance myself, although it is not so regarded by workingmen generally.

Q. Do you understand that that extends to both Catholic and Protestant organizations?—A. Yes.

Q. In about the same degree to each?—A. No.

Q. Does it dominate in one more than in the other?—A. I believe the charge against the Methodist, Congregational, and what were once regarded as democratic religious bodies, democratic form of religious organization, is that the influence of wealth is disappointing in its relation to those denominations, and, as you might observe, there is a great effort being made by the highly organized Christians, such as the Episcopal Church and the Catholic Church, to place themselves on the side of the people. In an Episcopalian convocation last year, I think, or the year before last, the question of socialism and the labor question was a matter up for discussion legitimately before the convocation, and in England, when Henry George went over there, his great address was made before a convocation of Episcopalian clergymen.

Q. At what place?—A. In London.

Q. Do you know whether it was a sympathetic audience or otherwise?—A. I understand it was. I understand that Mr. George was highly delighted with the reception he met. It might be that he was oversanguine, as authors generally are.

Q. You have in your remarks on the press and pulpit used the expression of "labor movement" many times. What is the labor movement? I should like you to define it as you understand it.—A. I believe the labor movement includes all these forces in society which are first of a religious kind and which publicly place themselves on record on all occasions of a crisis and a combat between labor and capital as modifying the power of capital, or seeking to help labor to combat capital.

Q. To combat capital in what way, and for what end?—A. For the end of obtaining economic justice.

Q. What do you mean by that?—A. A sample of that will be taken from a sermon preached by the Rev. Dr. Pullman, of the Universalist Church in this city, on the telegraphic strike, who stated that the telegraphers' strike was sympathized in, that the strikers were sympathized with, by a large number of individual capitalists with whom he had taken the trouble to speak during the week. The ground on which they sympathized with the strikers was that the struggle of the telegraphers was with a corporation, and that as individual employers of labor, as manufacturers, they regarded themselves as in another category altogether, and they sympathized with labor when it was combating the corporate power of wealth, but that it was a different matter altogether when they were united, as they held the interests of the employé and the employer as the same. This reverend gentleman stood up on that occasion for what he regarded as justice to the laboring man, that he should have a fair day's wage for a fair day's work.

Q. And that he was not getting it now?—A. In the case of the telegraphers the reverned gentlemen did not state what a fair day's wage was, and they never do. As a general rule they are very careful to avoid stating anything like that, because that of course would place them too definitely on record; but they have courage enough to say this

Digitized by Google

much in the face of the wealth represented in their pews, and churches mainly depend on it, for they have to be run now on business principles; at least so we are told. I say that the courage implied in a statement like that by a clergyman I regard as a very great advance indeed upon what might have been expected some twenty-five years ago.

Q. Have the working people an impression that there is more money put into churches than there need be; I mean into the edifices and devoted to the maintenance of the ordinances of religion administered there?—A. Of course, they have that impression. The impression generally, as I believe in a most exaggerated degee, is opposed to the power of wealth in the management of churches. I believe that in the present state of affairs religious organizations are of great value.

Q. What proportion of the people in New York City, in your judgment, attend religious services on the Sabbath?—A. I have not the slightest idea.

Q. Of the working people what proportion?—A. I have not the slightest idea. The working people that are active in the labor movement may be fairly charged, I think, with being very bad church attendants.

Q. Why is that?—A. As far as I have investigated the matter, I believe it is because they consider that the pulpit is not free to state the truth on the labor question.

Q. Do you think there are such accommodations in the way of houses and pews and so on as they desire?—A. Oh, yes.

Q. Plenty of them?—A. There are plenty of churches where you can put your umbrella, and your hat and your coat, in a separate pew, and have room left. There are only a few churches where clergymen have talent for drawing crowds.

Q. There is not any lack of church accommodations, in your opinion?—A. No.

Q. Is the lack of attendance because there is any unpleasant comparison in the costumes?—A. There is a great deal of it owing to that I believe. I think the fact is that the working classes are getting new ideas and getting a more independent spirit, and if they go anywhere where they are compared to other people they desire to be just as well fixed and look as well as other people. I think that has a great influence, especially on women and children. You will observe that that must be true when you take into consideration the progress of the Sabbath-school movement in the city as compared with the progress of the churches, so far as they are attended by the working classes. Some of the churches have very popular Sabbath-schools, and the parents lavish all they can on the children who attend them; they like to be dressed as well as other children, and they go to Sunday-school, and every effort that can be spared is made to have the children so that they can go to Sunday-school. Large numbers of men and women who never go to church at all and who are opposed to it, are still in favor of the Sunday-school and like their children to go to Sunday-school. They believe it has a very good influence and that it is justice to a child.

Q. You mean that they find their means adequate to send their children, but do not feel able to clothe themselves in such a way that they would feel at home in church?—A. Yes; and then there is the desire for taking a day's rest. You must not leave out of account the large decay of belief in the theological conceptions underlying those church organizations. That has a very great deal to do with it also.

Q. What, in your opinion, leads to that decay of faith in the ordinary tenets of the evangelical churches?—A. I believe the newspapers have had more to do with it than anything else. I believe that the publica-

Digitized by Google

tion of extracts from scientists and from men of philosophical repute and learning on the various questions that lie at the bottom of church dogmas, that the wide-spread system of quotation and the cheap reprints of all the works bearing on these matters have had a great deal to do with creating something more than mere skepticism—in fact, I think a decided unbelief—in the fundamental ideas upon which evangelical churches rest.

Q. How largely do these ideas of affirmative unbelief, if I may so express myself, prevail; how extensive is that getting to be?—A. I do not think that it is so extensive as appearances would indicate. I regard myself as not a competent witness on that question.

(The examination of the witness was suspended at this point to be resumed hereafter.)

The committee adjourned until Wednesday morning next at 10 o'clock.

---

WEDNESDAY, *September* 12, 1883.

The committee met at 10 o'clock a. m.

JOHN ROACH recalled.

By the CHAIRMAN:

Question. Please resume your testimony and go on in your own way. If there are any misapprehensions of your statements the other day which you would like to correct, you can do so first.

MISAPPREHENSIONS CORRECTED.

Answer. After giving testimony before your committee last week, I found, on taking up the morning papers the next day, many incorrect statements made. Among those statements was one that I had said ships could be built in this country as cheap as they could in any country of the world. I did not say that. What I did say was that the coal, the ore, the limestone in the mine, and the timber in the forest were as cheap in this country before labor was applied to them as in any other country in the world, and that no country had opportunities better than we had for the building up and development of an interest of that kind; but this raw material of which I spoke, while in the mine and the forest, only formed 10 per cent. of the value of the ship complete, and 90 per cent. had to be added to that, which was entirely labor; that while you gave from 60 to 70 per cent. more for that 90 per cent. of labor than was paid in any other country, the finished ship cost more. When we pay 70 per cent. more for 90 per cent. of what composes the value of the ship that is a difficulty we encounter; but from the fact that our labor is better paid, better fed, better clothed, more intelligent, and that there is less of combination here than exists in other countries, each man is ambitious, and is willing to perform a fair day's work for a fair day's pay; and the intelligent workingman knows that; he has come from all parts of the earth to better his condition here; he is conscientiously willing to perform more for the compensation he receives than he does in other countries. By that and by means of improved machinery we reduce the cost of the finished ship down to the point where the difference between the first cost of the ship when complete, in this country and in Europe, only forms 20 per cent. So much for the improved condition of labor from its ambition and its hopes of the future.

Digitized by Google

Then it is not the first cost of the ship that prevents us from being ship-owners. It is the increased cost of capital in the investment; it is that during the construction of the ship, from the mine to the finished ship, the number of days' labor is only three times the amount of one year's labor in running it. Yet we are twenty-five years running the ship and paying American labor on the same conditions, and, therefore, the cost of operating the ship after she is built, in the labor question alone, is what weighs us down. Unless you reduce American labor on the sea to the same condition that it occupies in other countries, it is impossible for you to run the ship. The ship, after she is built and put into commission to do her work, is a factory to all intents and purposes. The manufacturer here cannot go to work and take a factory, if you give it to him for nothing, and fill that factory up with American-paid labor, and run it in competition with a man who pays for his factory and gets his labor for half the price. That is my correction there.

## PROTECTION.

To speak now of protection, to encourage labor to that development of natural resources of which I have spoken, a law comes into existence which has been used and applied by almost all civilized nations—the law of protection. Protecting what? Protecting labor. The most plausible and fit manner to put that in at first was to put on a tax by which a revenue for the support of the Government might be collected, and apply that as a protection for the development of industry. That system of protection was applied by almost all the civilized nations, until they were in a position where they could meet competition. We have tried that, and the simple question then is, will that protect American labor in the condition that it occupies? I say no; and let me give you my reasons.

I do not wish to intrude on the committee, and I do not wish to have it understood that I am here as the advocate of any mere theory or any individual interest. I come here taking a broad view of this whole subject, looking at all labor, and I will not make a single statement in my testimony that has been taken from any visionary ideas of mine, but will keep to the actual record of what is taking place every day.

## IMPORTATIONS OF FOREIGN GOODS.

There has been testimony given here that there was a great deal of depression in the country at present, that labor was depressed, men were out of employment, a surplus product of manufactured goods was in the country, that there were more goods manufactured than our own people could consume, and that our only opportunity or chance was to seek a foreign market. I have taken three industries, so as not to burden the committee by going over all, to show what has taken place in those industries, and why men are idle.

In 1880 we imported of cotton goods into this country $29,929,336; of woolen goods, $33,911,093; and of iron, $53,714,008, under our present law. In 1881 we imported $31,219,329 of cotton goods; of woolen goods, $31,156,426; of iron and steel, $46,439,747. In 1883 we imported $36,853,689 of cotton goods; $44,274,952 of woolen goods; and of iron, $40,000,000.

There are three industries, and for the past ten years we have imported something like $11,000,000. Here were millions of money sent out of this country to purchase what I might call clothing to clothe the

Digitized by Google

American people. Would you consider that there was an overproduction if we required twelve millions' worth of grain here to feed our people and only raised ten and had to buy two? Would that be overproduction? What, then, would you think of the condition of things, whether we were doing what we ought to do in that great interest of bread, if we had the most fertile prairies, and yet something or other was transpiring by which we did not raise our own bread? Can you say that there is overproduction when we raise the cotton in the American cotton-field, when we cut the wool from the American sheep? Can you complain, then, that there is overproduction when we have been buying these millions of dollars' worth of clothing to clothe our own people? This money went to employ foreign labor, while you are complaining to-day that your own labor is idle; and you are talking of what? You are talking of "revenue reform"; you are talking about cutting down. Why was not this made at home? Where is the monopoly when $1,000,000,000 of merchantable articles have to be imported where God had given you all the raw material to make it, where you had the clearest heads and the brightest mechanics in the world to produce it? Why, then, are you complaining that there is a monopoly? Money was seeking an investment at 5 and 6 per cent. and a lower rate of interest. Why did it not go into this investment? Simply because there has been a terrorism—and I will trace where that comes from—that held the ax to cut down. Every year the ax was held over the enterprising capitalist and workman and he was threatened with "revenue reform." Reform, indeed! If you reduce the tariff you would only bring more money into an already overflowing Treasury and make more idle workingmen at home, because you would import more. When away from conditions called a monopoly, that he was laboring under, he could not keep that foreign article out of the market, and labor was given to other men. The whole cry of this "monopoly" to-day is to hold up a monopoly that I will state. The workingmen are divided; they do not see their own interest. That policy, which is ready to be sprung upon him, is what the workman has to fear, and to-day it robs him of his labor, because they think he is too well paid. A man leaves his home abroad if he can get the money to come to this great country where he is paid, and then he gives his money to purchase the products of labor brought in here from abroad!

### NO MONOPOLY.

I deny that there is any monopoly. What is this monopoly of the manufacturing interest? From the very foundation the law is that these industries are open for all. Are not the mine, the forest, the workshop as free to day for capitalists to enter as are the prairie and the cotton-field? It is only a matter of choice, and there is no more monopoly in one than there is in the other. The difficulty to-day is that in one we have the advantage: we raise enough to feed our own people, but we do not clothe them.

### WHAT THE WORKINGMAN SHOULD FEAR.

I am now going to point out what, in my view, the workingman has to fear. There is a blow to be struck at him that he does not understand; and the eight-hour law, which I will call attention to, and all these things are kept up as a bugbear before him. The great monopoly that is going to slaughter him is hid by directing his attention to that. There is a great upheaving of the labor question all over the civilized world to-day, and the light that is thrown out by this country, unfortunately, I may say, is not quite as brilliant as it should be.

Digitized by Google

I have made it my business to see many of the letters written by immigrants, and to see thousands of immigrants who have come here, and who describe the advanced condition they occupy here over that which they held abroad; and that great light, the position the laboring man of America is holding, is revolutionizing the whole outside world, more particularly those nations where civilization is most advanced. This revolution is going on quietly, and this great country is the light of the workingman of all nations.

### FREE-TRADE ARGUMENTS.

Now, my own convictions are that we should do nothing that would lower the condition of the laboring man here. I shall hold up both arms for free trade with any nation that first established a form of government similar to our own in the interest of labor, and that will raise the laboring man straight up and give him the same pay he gets here, feed him as he is fed here, educate his children as they are educated here. I shall be willing, then, to go into that fight, certain that the American man will win; but I am not willing to see the American workingman and the enterprising men who venture out to give employment to that workingman brought in competition with what? With an aristocracy of the older nations who are the owners of the forest, the owners of the soil, the owners of everything.

The workingman has there no voice in the law that is made, but yet, from the influence of this great country, he is rising and pressing forward and making his demand; but we are estopped. This aristocracy will never give him an iota; they will try all other plans first to elevate his condition before they give up any of their own wealth. What is their plan? To-day, whoever will watch the progress of things and watch the mighty movement that is on foot, will find that there is war, the most fierce war that ever took place; but it is a war of diplomacy, it is a war from the pulpit, it is a war of false preaching, it is a war by which fortunes are spent to give tone to a condition of things which suits them. Each of the nations is making a desperate struggle to preserve its own market for its own labor, and they are all reaching out with all that diplomacy of which I spoke, with all their skill to grapple and get hold of as much of their neighbors' market as they can; but this is the great market, the battle-ground of all. The great attack is made in the interest of all foreign labor, and for its elevation attack is made on this great republic and the position that we occupy. It is made in a thousand ways that you cannot understand. They buy our cotton, our bread, our petroleum; they buy those things which they cannot produce themselves, and which man cannot exist without. Necessity compels them to buy such articles; but we hear the very flimsy argument given in some of our New York papers occasionally, "If we do not buy from them, they will not buy from us." Will any man of common sense believe for one moment that the produce merchant of Liverpool who buys our bread, our meat, our butter, our cheese, and our petroleum will go to the iron-maker of Great Britain, and say to him, "If they do not buy your iron in the United States, I will not buy their bread from them"? Do you believe, gentlemen, that is the rule of trade? What sense is there in such an argument? Do you believe they will go to the man who supplies the cotton factory, and say to the cotton manufacturer, "Unless the American people buy your cotton goods, I will not buy any bread from them"? Gentlemen, they have got to have our bread, and we do not thank them for buying it; they have got to have our food;

Digitized by Google

they cannot live without it, they cannot raise it themselves, and they cannot to-day produce their own cotton, and they must have ours. We do not want their woolen or cotton goods, or iron; we want their gold, until we get such a surplus in the country that money will be as cheap here as it is in England; then the workingman will get cheaper rent and clothing, and can afford a reduction of wages.

A very significant thing took place the other day, when France was on the point of getting into trouble in China, and the English Government came forward and said, "What effect will this have on our cotton business? We must look into that."

England's great purpose now may be expressed in this way: "We would like to pay you back for all the bread and all the products we buy of you in the products of our factories; take them in exchange;" that tells it all. England is overstocked with these products to-day. That is the policy to get them into this market, and there is a powerful influence brought to bear on this country in that direction. This influence it is that floods the country with free-trade documents, Cobden Club pamphlets, &c. Free-trade clubs abroad and advocates at home have spent more money every year than would be needed to organize a company to put up a cotton factory in Alabama or any other State where abundance of coal and water power could be had, and the raw cotton, all free of duty, with a home market at hand. The greatest argument these free-traders could get would be to subscribe enough to start such a factory, pay American wages, and at the end of the year report their profit and loss. But these men will not risk their money. It is cheaper to talk nonsense. Coming down to our present condition, I believe this doctrine; it may be an extreme one, but I am as satisfied as that I am sitting in this chair that if the experiment is tried it will come to what I am going to say—that if a syndicate of capitalists were to come together, and out of pure gratitude for the wonderful wealth they had accumulated within this republic, were to buy and store up the Government bonds, so as to give them as a donation to the working-people of the United States; if they should pile up enough capital to pay all the revenue we are talking of, and the expenses of this whole Government, in order that no man should be taxed, and should say, "This meets all the demands of all your revenue laws; we will blot out the idea of a tax for revenue or anything else for all time;" if this were done, I believe that inside of two years from that day a powerful cry would come from the farmer, the cotton-grower, and the whole mass of the people, "We cannot live under those conditions; our country will be flooded with the products of cheaper nations, and our own labor has got to be reduced, and we will not go into the American mines." What would be the result? It would bring forth a calamity that would be worse than all the plagues or wars the world ever saw; it would drive this great mass of people back to the prairie and to the cotton-field, and we should be reduced to such a condition as I have spoken of before, a nation of cotton and corn growers and an overproductive agricultural nation that would be robbed of all its wealth in gold taken out of the soil, and by and by our whole development would stop.

### COST OF COTTON MANUFACTURE HERE AND ABROAD.

Here we are to-day complaining that we have idle workmen. Some man said to me not long since, "Why, if we only had free trade in wool we could make this woolen business so that it would be a great benefit." "But," said I, "you have free trade in cotton, and you have imported

Digitized by Google

more cotton goods during the last year than you did woolen goods, and it took about the same labor to produce them. That has nothing to do with the question." "But," a man says, "we ought to be able to compete with all nations in the product of articles made from cotton because we have the cotton at home." That looks very plausible on the surface; but this is a question that is of great importance to the nation, and every man who offers an opinion on it should go way down to the bottom and get the bottom facts. I have not got a dollar in the cotton business; but what is the advantage to the American manufacturer that the cotton is grown at home? One advantage is that in peace or war he has his supply at home; and that is about all. All the other advantages do not amount to anything. Why? When that question came up I took the pains to weigh a yard of cotton goods to find its actual weight, and I found that a yard of ordinary cotton goods weighed three ounces and a fraction, or at least it took five yards of cotton goods to make one pound. A bale of cotton is 560 pounds, and it would make 2,800 yards of cotton goods. The cotton grower in the South produces the cotton; it is brought to New York for distribution, and it costs the American cotton-weaver something to take it from New York to New England, and it costs the English manufacturer something to take it across the ocean. That cost is about $5 a bale. Deduct from that the cost of transporting it up to New England, and the New England manufacturer has got an advantage over the English cotton-weaver of about $3 a bale. Divide the 2,800 yards of cotton made by the bale of cotton and look what a small fraction the manufacturer at home has got by reason of the cotton being grown in this country, outside of the positive knowledge that he can have it in peace and war. It is an item that would not begin to make up the difference between capital invested in this country and in England, without taking at all into account the higher cost of labor.

Now let us take up the subject of a "tariff for revenue only," and apply it to those industries. I have shown you under the present law the enormous amount of money sent out of the country to give employment to foreign labor. I have shown that there is no law to prevent capital being invested in those products at home, but it is found that it is not profitable. I will take for the basis of an argument, which is very near correct, that there is about the same amount of capital invested in the manufacturing interest in the United States that there is in Great Britain, and I will take the figures according to the last census, which are very near correct. There are $4,000,000,000 invested in the plant and working capital of the manufacturing interests of Great Britain, and say a similar amount in the United States. Now I am talking not for one particular State, nor for any one particular location, but I am talking for the interests of all the States, and more particularly for the development of our undeveloped States. I wrote to the sections of the country where some of these articles that I speak of could be profitably manufactured, and I found that there was a disposition to pay almost any fair rate of interest for the capital required, 8 or 10 per cent., if necessary, in the South and younger States, and those are the States we have to take care of. Others have grown up so that they are a power in themselves—I refer now to the Eastern and Middle States—but we must take care of the South; we must take care of that section of the country which is yet undeveloped, and if we can get along with less here, we must take care that we give them a chance equal to the chance we had in our early effort to develop. That four thousand millions of capital would be worth in this country on the

Digitized by Google

average in those States 7 per cent., which would make an interest annually of two hundred and eighty millions of money. Two hundred and eighty millions of money would be the interest at 7 per cent. paid upon a capital of four thousand millions invested in our factories both in capital and plant. It may be a great deal more than that. I am speaking within the figures; four thousand millions of money in the old developed country of England, that has accumulated this enormous wealth and has no outlets for it, would cost 3 per cent., or $120,000,000. Deduct the $120,000,000 from the $280,000,000, and you have the sum of $160,000,000 a year in the rate of interest alone against the American manufacturer on the capital invested.

Take, then, the amount of money that is necessary to pay the expenses of the Government, $130,000,000 a year; raise this $130,000,000 a year from the articles that you import, put that as a duty upon the manufactured article, to be paid before it enters our market; add that to the $120,000,000 they pay in interest, and you have $250,000,000 as the duty and interest on the English article according to the notions of a tariff for revenue; yet there is on the item of interest alone $30,000,000 a year against the American manufacturer, and the workman, whose condition you are trying to elevate to-day, is entirely left out. It might be said that in that tax some discrimination should be used, and it should be applied to certain articles which would need protection; but whoever investigates the great articles which we need and import will find that there are very few of them where 90 per cent. of their value when produced is not labor, and it shows that it is impossible to have competition under these conditions of which I speak; yet the workman whose case is brought up here to-day is left out in the cold and receives no consideration in that calculation at all. The mere interest on capital alone disposes of the whole subject. A tariff for revenue only would make competition with foreign producers impossible.

### CONTRAST AS TO LABOR.

Now, I will look at the workman's side of the question. Take those three articles I have named, which are woolen goods, cotton goods, and iron goods. Suppose that three establishments under this law are started in this country and in England, with the amount of protection afforded by a tariff for revenue only. One is started without taking into consideration the difference, as I have shown before, in the interest and the plant, but the mere actual pay of the workmen. From all the testimony that I have seen here the average pay of the skilled labor of this country has been about $2, and 1,000 men employed in a woolen factory or cotton factory, a ship-yard or an iron establishment, would get $12,000 a week. The average pay for the same class of labor in Sheffield or any part of Europe would be, say, ten shillings a day. That is the largest average that I understand they are able to earn. This would make $7,200. So that in the American factory there would be paid to the same number of men $4,800 more per week than would be paid on the other side of the water for doing the same thing.

Q. How much difference?—A. A difference of $4,800 in one week. At the end of the year the account in each factory would stand thus: $249,600 a year more paid in the American factory for labor than was paid in the foreign factory. If the American factory has got to live, what has to be done? You have got to meet this labor question square in the face; and if my convictions were that the workingman's position ought to be no better here than in any other country of the world, I

Digitized by Google

would go manfully before him, call a meeting in the Cooper Institute or elsewhere, and say to him, "God has given us all the great advantages he has given any people on earth; all the raw materials that are necessary to give us all the comforts of life; but you occupy a position that does not belong to you as a workingman, a position not occupied by any man of your profession elsewhere; and in order that we should make use of the field of open competition with the nations of the world, you have got to come down to their condition. God has given us all this material to do with, but your false notions and ideas are in the way; you have too many of the good things of life, your children spend too many days in the school-house, your wife is too well dressed, and you eat too good food; you have got to come down to the condition of the men of other nations of your class, and then we can compete." I am not talking here in the interest of any particular class, creed, or political party, by advocating these principles. The man who publicly advocates these principles, which I speak for, let him be a Democrat or Republican or what not, is the man for me, because I believe he is the man for the country. Time will prove these principles to be right, and when this whole thing is unveiled all public men will have to come to them.

If free trade is to prevail and the American factory to remain open, the workman has to come down to the condition of and take the same pay as the foreign workman. I have looked at this subject with an unprejudiced mind, and there is not a single instance in all my life where I belonged to the party that the man belongs to who advocates that doctrine of crushing down labor.

I have shown by figures why men are idle. I suppose it comes within the scope of the resolution under which you are acting, that wherever development can take place by which labor can be employed in place of being idle, it is proper for you to hear the testimony which points it out. The figures I have given dispose of that subject as to three great industries.

### SHIPPING—STEAM MARINE.

Of all interests that call for the greatest amount of labor and bring the greatest amount of wealth to a country without impoverishing its soil, the shipping interest stands first. I am going to be careful; whatever testimony I may give here to-day, I have been careful to get the official facts to sustain me, so that there shall be no doubt about the assertions I make. The last census shows that Great Britain had one thousand millions of money invested in her shipping; and to show you the wonderful wisdom of her policy looking away off into the future, and seeing the true way to occupy her proper position, I will give you the official figures. In 1850 she had 142,730 men employed in sailing-ships; the same year she had only 8,700 in steam—142,730 men in sailing-ships and 8,700 in steam! I will jump figures for the sake of saving time. In 1882 she had 166,000 men in steamships. Look at the wonderful stride, the great revolution, and England was the only nation in the world that foresaw that steam was going to do the work.

The single question, then, is, what was her policy in making that mighty revolution, changing the steam from 8,700 men in 1850 to 166,000 in 1882? She has, as I have stated, $1,000,000,000 of capital invested in her shipping; and, first, what is this $1,000,000,000 of capital composed of? That brings us down to the labor question again. All that was in that $1,000,000,000 of wealth was not taken from her corn-fields, her cotton-fields, or her grain-fields; she impoverished not one acre of her

Digitized by Google

soil to produce it; she went away down into the earth, where the sun never shone, but where the clear-headed men of Great Britain pierced, and she brought out the material to produce this with, and from the knowledge I have of this material in the State of our friend from Alabama to-day, Great Britain has nothing at all to compare with it. There that wealth lies buried away down, and until very recently men scarcely knew that it existed. Then, to put that $1,000,000,000 into ships—all that this mineral was worth was probably from 5 to 10 per cent.—it required $995,000,000 of labor. Look at it! $995,000,000 of labor produced for the workingmen of Great Britain out of that one idea alone—$995,000,000 of labor! Who, then, will reckon up the profits of producing that thing at home and selling it to other nations or using it herself? She has used it herself principally. Who can tell the school-houses and churches and public buildings and other things that have been created out of the profit and the expenditure of that $995,000,000? That constitutes the profit. There, after man is fed and clothed, is what constitutes the wealth of a nation, and the nation that tries to keep that at home is the nation that is rich; and the nation that tries to send its money abroad and will not produce is the nation that is always a beggar and a borrower. It is a good deal like a man. The man who does not help himself, but always looks to somebody else for help, is always poor and a beggar of money or something else. England's shipbuilding gives employment in the construction, and altogether it gives permanent employment to 240,000 men regularly in connection with the running of the ship after she is built.

Again, in 1880 the gross earnings of that fleet were $350,000,000 of money—$350,000,000 of money earned without impoverishing the soil, in doing the business of her own and of other nations. In 1881 the gross earnings were $376,000,000, and in 1882 $400,000,000—$400,000,000 of money earned by that one industry. Out of that whole $400,000,000 of money, less the dividends paid to capitalists, all went back to labor or the products of labor; it went into the oil factory, it went into the coal mine, it went into every industry. It was all expended with the exception of the dividend and went back to labor again. What a wonderful idea that is that these people have conceived!

Further than that. What next? Under the usual customs of commercial nations and safe business people, those ships are insured, and for what? On an average the insurance is 5 per cent., and if they were all insured the insurance would be 5 per cent. on $1,000,000,000, or $50,000,000 insurance alone. This insurance is charged to the people of other nations which she does business for, and all that capital comes home to England. It makes English capital cheap, and cheap capital enables the undeveloped country to develop itself.

What is the next great advantage? The necessity of reconstructing and keeping this fleet in operation every year, to make up for vessels that are lost, to keep up with the modern improvements and the expense of repairs, requires an expenditure of 10 per cent. more, every bit of which goes back to labor except 10 per cent., the value of the material in the mine, and to supply it, to feed all that labor, and to keep it in employment, and to bring home to that one country this enormous wealth is the policy of England.

### ENGLISH AND AMERICAN ADVANTAGES CONTRASTED.

The question then comes up, What were her advantages over other nations in doing that? What were the advantages that she had over

Digitized by Google

all other nations in producing that result? None whatsoever. Her advantages are less than those we have. There are only two advantages she had, cheaper labor and cheaper capital; but that cheap capital is produced by the very policy of which I have spoken.

Our advantages are superior to hers; we have the coal, the ore, the forest, the cotton, the bread, and the intelligence. We have not only the things to build the ship, but the freights to load it. Why, then, has England accomplished this wonderful result while we are as we are? Where are we? A few years ago we were a nation, the proudest on the earth, the second upon the sea, and rapidly aspiring to be the first. To-day in the foreign trade, comparatively speaking, we are nowhere. What is our policy? Somehow I do not understand it, and I never could understand why the press of this country has not done its duty in this respect, more particularly the press of New York, which ought to be the guardian of the nation, looking out and showing where advantage is to be taken for our own country and its development and the support of our own labor. The course the press does take must be taken because it has not investigated the subject. We have had dust thrown in our eyes; all the little shilly-shally means have been adopted to try to deceive the people when they ask, "How did England accomplish this great result?" When a man by long study and perseverance, giving a life to it, risking his life, doing everything to accomplish an object, reaches and gets fast within his clutch the power he has been after, you must mark that man, and if you want to get your share of the riches he has laid up by unscrupulous means and taking advantage of you, you must allow that you have got to prepare yourself, and no shilly-shally, small, twopenny idea will make him surrender to you.

First, to accomplish the result I speak of, history tells the tale. For two hundred years English statesmen have watched the world. It has been their dream, their ambition, their aim to control the sea. They have made war upon other nations for that purpose. They tried it on us—and no man will deny that they tried it—in 1812. It was the issue here; it was the position that we were rapidly gaining upon her, and whoever will look upon history will find that her statesmen saw that and told the plain truth, that they must not let that young giant rise and crush them out on the ocean, and all pretexts were put out for the purpose of making a case to make war upon the young republic. England sacrificed her millions in that war, and yet she accomplished nothing. What is most humiliating to this great country is the fact that we have sacrificed our lives and our millions, too, rather than surrender to her what she has complete control of to-day—the ocean—and there it is. To-day history and the facts tell you that she marches forth and says, "Under my flag is one-half the commerce of the whole world carried." She has been reaching out and trying to establish a policy in this country, telling a nation that has all the genius to build ships, that has better material than hereself, "To my workshops must any nation come to get the tools if it intends to occupy God's ocean and participate in it with me."

Dust is thrown in our eyes here. If any vital or any great pressure is brought to bear in wrenching that commerce from her, who will contradict me in saying that she is going to make a desperate fight for it? One hundred millions of money will make itself felt. I can go within ten minutes' time from the place where I am now sitting and walk into offices and count where $100,000,000 of money are invested in that interest, while scarcely anything is invested in our own by Americans. Who will tell me that that $100,000,000 of money where it sees fit to

Digitized by Google

be felt cannot make itself felt? Who will tell me that when you strike at that $100,000,000 of money and undertake to depreciate its value by competition, there will not be a powerful interest brought to bear on the community on that subject? The easiest way of all to deceive the American people is to feed up their ideas with small trifling things to catch the mind of the man who has not investigated the subject.

We are told that the right to purchase ships in the cheapest market will do all that is needed to regain us our place as carriers on the sea. I have shown you conclusively that the man who pays 7 per cent. for his capital cannot enter into competition with the man who pays 3 per cent., and that the man who hires labor, where it is required, at 60 per cent. more than the man who pays that much less, cannot enter into this competition.

ENGLAND'S POLICY.

Now, what did England do when she had 8,700 seamen in her steamships? England could build an iron steamship cheaper than any other nation in the world, and at that time she was the only nation that was building an iron ship. She had cheap capital and cheap labor to operate and run the ship, but she found that France had cheaper labor than she had; she found that Germany, Norway, and Sweden had cheaper labor to run the ship upon the water than she. She knew that it was not the first cost of the ship that had anything to do with it; it was the running of the ship for all time after, and she made her provisions to meet that contingency. She started out with the purpose, "I will rule the sea; I have tried it by armies, I have tried it by wars; they were the most costly experiments that could be tried; but I have never succeeded. I will try another policy." And she struck out that great policy of peace by instituting legislation which held out encouragement to her capitalists; which said to them, "You put the capital in there and I will give you such legislation as will guarantee you dividends that will pay so that you can cut the rates of freight and break down any opposition that comes; and I will give you such a policy that the civilized world and the merchants of all nations will distinctly understand that whoever fights Great Britain on the sea does not fight British merchants, but does fight the English treasury."

I have the papers containing those very identical laws, and proving that these things I have stated to you were the statute laws of Great Britain, and showing the spirit in which they were carried out. I will send the papers to any of you gentlemen who may wish to examine them.

The CHAIRMAN. File them with the committee, and we will make them a part of our record.

The WITNESS. All right, sir. At the commencement of her career with a steam marine, in 1850, England saw that that was the policy to pursue, and between the years 1850 and 1882 she has paid to subsidize—I use the word in the very language of the law, without fear of being contradicted; it was not for this service or that service, or the other service, but it was that we require you to do certain things and we will subsidize you and give you certain amounts of money to enable you to put ships upon the sea that will drive the ships of other nations off. That is what it meant—"subsidize"—and I can show you the figures of the amounts paid in order to accomplish that thing, because a revolution was going on between sail and steam, and men did not want to throw away the old-fashioned ship and take the new, and England wanted to get that new tool in possession of the British nation before other nations

Digitized by Google

saw her policy. She actually did go to work, and year after year for the first twenty-five years, while that experiment was going on, she paid more than 25 per cent. out of the English treasury upon the capital invested in every iron steamship she had afloat. To get them afloat she paid it, and she used it with the same military discipline that she used her guns. Where the opposition was most fierce, there went the most money; where the opposition was least, there went the smallest sum, and where no opposition at all existed to her getting control, none went.

Not only that, but France began to see that the road for her manufactured goods to the markets of the world lay on the sea, and under this very argument used in the English Parliament, that France was going to outstrip England—I will send you a copy of the laws—a commission was appointed to investigate the condition of certain ports where English shipping was running, to get possession of their books, to inquire into what they got for freight, what they got for passage, what it cost to run the ships, and their earnings. "Strike the balance, and then we will give you a guarantee of 8 per cent. dividend on all the capital you invest, under a contract from the English treasury, and whenever the dividend is beyond 8 per cent. one-third of it has to go back to the treasury." That blow struck terror to the capitalists of the world about entering into competition in that trade.

Besides that, to show you the wisdom of the policy, between those years that I speak of alone she paid one hundred and sixty-three millions of money—from 1848 to 1882, $163,653,356. In addition to that, we paid to her for mail service, $6,000,000, making over $169,000,000. That $169,000,000 looks like an enormous sum to pay out of the English treasury for the encouragement of one branch of industry, but from the figures I have shown you that $169,000,000 of money is less than one-half the earnings in one year of that fleet which she has built up by that policy. In 30 years these $169,000,000 were paid in subsidies by a nation that could build the cheapest ship.

## AMERICAN IMPOLICY.

Now, the question is—and it ought to be looked at—what is the matter with us; where are we? A nation having more coal, more ore, more iron, more forest, more surplus products to send into the markets of the world than any other nation on earth, yet the whole surplus product of this nation is going abroad in foreign ships, and should a foreign war come up or a crisis occur, the very ships that are carrying these products are liable to be destroyed and you have no means of going to market yourself. When any man attempted to go to work and show how we were robbed of this, how by a policy after the war this business was wrenched from us, what was the opposition that he met with?

Let me picture what we have been doing while millions have been paid out on the other side. We are as though we never knew anything about trade; we have been loading down and crushing any enterprising man who undertook to do anything with this thing. We had first a series of laws by which the American ship was taxed by State laws 700 per cent. more than the tax upon any other ship that floats. The tax upon the American ship under our State laws was 2½ per cent., and that tax she had to pay whether she earned $1 or not. The State of New York repealed that tax the year before last; but it exists in other States. The repealing act should be a national law. While the American ship pays 2½ per cent., the English ship is only paying a tax of 1

Digitized by Google

per cent. upon her dividend, if she earns one, and if she never earns a dividend she is free from all taxation. The American ship is loaded down under our system of measurement, which the other civilized nations blotted out long ago, by which the whole inside of the ship is measured, the space for machinery, coal bunks, the officers' quarters, and all, and the American ship was charged with that measurement and a tonnage tax laid on the whole size of the ship. To illustrate it more plainly, a 2,000 ton American ship was charged equal to the tax on a 3,000-ton English ship, the difference being 33⅓ per cent. That law was repealed last year, but we have been handicapped with it while England was getting all this advantage. When you sent your consul abroad he went there to represent the shoe trade; he went there to represent every American citizen and all interests, but his salary was paid and charged by our statute laws to the ship in the foreign trade; the little foreign trade we had, had to pay the consul fees. While Great Britain's foreign trade was 700 times larger than ours, her consul fees were less than one-third.

Then, when we desired and made an effort to establish trade with foreign countries where no communication existed, and capital was put into the shipping business, under one of our statute laws that ship engaged in the foreign trade was boarded at its wharf, before it could depart, by a Government officer; I might say the ship was seized. "You cannot get the protection of this Government and your ship cannot sail until you take the mail matter from the United States post-office and put it on board your ship, and at whatever port you may stop where there is an American consul you must take this mail," and you must take it for what? For three cents a letter. When you go to that port you cannot clear from it without the permission of the American consul, and you have got to take the mail again.

In my experience between here and Brazil, when I looked at the humiliating condition we were in, and saw the minister of the United States with his staff and baggage going on board an English ship to go to England in order to get back to America, because there was no communication between his own country and Brazil; and when I tried to establish a line by putting all I had into it to build it up; and when I tried the experiment and asked—I defy any man to say I ever asked this Government for a subsidy; I am opposed to that—that the law should be repealed which compelled me to do this thing; that if the Government and the people of the United States wanted that service they should throw it into competition; when I did this, who has not read the New York papers and seen me hounded down for it as a "subsidy beggar"? Was it a subsidy for me to ask that I should have the same right that the woman having a peanut stand has? Was it a subsidy that I should ask the repeal of this law which compelled me to do a service I did not want to do, and which it was a loss for me to do, as shown by the actual records of my own books which I produced? In the line I have now to Havana I am compelled to do the same thing—to take those mails, swear my captain that he will faithfully perform the service, and when the quarantine season comes I have gone to Washington and gone to the Post-Office Department, and I have laid the question before the Committee on Post-Offices and Post-Roads, and said, "There are my bills paid to a tug from New York to bring the mails from quarantine and deliver them in this post-office;" and my bills have been larger than the sum the United States Government has paid me for bringing the whole matter from Havana, and I have been the loser.

Is it not strange that this great press of New York, in the interest of

Digitized by Google

building up this great commercial city, could not see that it was nothing more than fair play that communication should reach those countries? That was called "subsidy." At the same time I had capital invested in ships in the coastwise trade, and to show you the injustice that was done to my capital and my enterprise on one side, and the fair play that was done on the other, I may mention that when the ships in the coasting trade before the introduction of railroads and since then were required to carry the mail where postal communication was necessary in our country, immediately the service was advertised for and given to the lowest bidder, and a fair compensation was allowed for the service; but where a foreign country had to be reached and where American capital was in competition with foreign capital the right was denied and we were compelled to perform the service for nothing, though at the same time the very capital invested in the ships of other countries was subsidized by the postal contracts of which I have spoken.

I am interested probably in more ships in the foreign trade than any one man in America, and I think it is a great wrong to compel me to perform that service. While the law compels me to do this, it does not trouble the merchant. The merchant does not take any interest in it; he gets his mails carried; but repeal this law, and when the Government comes to me and says, "I want you to take this mail," I will answer, "I will not do it; put it up for competition to the whole United States and let the lowest bidder in the whole United States get it." Then the merchant will come forth and make his demand for the extension of the trade by fast mail. The Government must provide it. The compensation paid for that service has been a loss to every person who has performed it. England wisely went to work, and when she got the complete control of a trade like the North Atlantic, she said, "I do not want any more contracts; we can do away with the subsidy; the competition between Englishmen themselves will do." It is like our coasting business. They were expending their capital in competition with one another under the same law, under the same rates of taxation, interest, and labor.

## GROWTH OF COASTWISE TRADE.

There is no business to-day, not even the railroad business, for instance, or the manufacturing business, which has had any such growth in proportion as the shipping business on our coast, and I have something further to say to you with regard to the great advantage to the consumer the producer, and the merchant from the revolution that has taken place in the character of vessels put into our coasting business. To-day, though it is not generally known, we have more iron screw ships of great speed, more in number and tonnage, all fitted for ocean service, than any nation in the world outside of Great Britain. Take Galveston, Savannah, all the Southern points; look at the lines which have been built up here which have reduced the cost of transportation through American competition. A business was begun by me ten years ago that did scarcely exist before. When the ships that are in my yard (one of which I will launch to-morrow) are completed there will be 100 ships in that trade. Those vessels are making all the connections between the South and the Eastern cities, and to my own knowledge, by the competition they have brought out, the improvements made, the cost of transportation has been reduced in ten years over 200 per cent. When I began there, there were two or three little ships running that would carry about 1,500 bales of cotton each. Now there are ships running into Galveston that bring away 6,000 bales at one load.

Digitized by Google

Everybody had an idea that with the wonderful growth of the South, with Texas multiplying, a powerful monopoly would grow up in the trade with the North, but to the surprise of everybody the monopoly has not grown up, but the improvements have been such that a great reduction has taken place of from 200 to 300 per cent. in the cost of transportation, and if ever that cost of transportation was completely solved it was by competition between the American people themselves. Whoever investigates that subject will find that there is no chance to sustain a monopoly for any time among these fifty millions of people. The moment it is found that there is money to be made in any particular business, capital will come forth and it will be done.

What is the result of what has been done? Ninety per cent. of these 100 ships and 100 more built by others is labor, taking it from the mine to the ship. The cry to-day is about building up a navy. A year ago when persons were brought before the Naval Committee and asked whether the proposed ships could be built in our navy-yards they answered, "No, they could not be built in our navy-yards very well without going into a large appropriation to get ready." Were it not for that start which was made ten years ago, when you wanted a navy a few years ago and started it, you would have had the streets on the Clyde placarded inviting men to come to this country, because the skilled labor did not exist here. Gentlemen, in ten years the skilled labor has been educated here. From my own single yard—and others can do nearly the same—last year there was one ship delivered in the city of New York nearly every month. The same will be done this year. We have now got the labor at home. This labor has been educated. We have got the forests and the mines, and we have to-day a power built up in this country in case of an emergency, in case of war, in the private workshops of this nation, which has cost the Government nothing, worth in skilled labor more than the whole one hundred millions you have invested in navy-yards. I ask the question if these school-houses for labor were not started, what would be the value of your navy-yards? Until you put labor into them you might as well have so many churches as to have these navy-yards, and where would the labor come from if these schools did not exist to educate it? Are they not, when the crisis comes, of as much importance to the nation as skilled soldiers for an army?

## THE EIGHT-HOUR LAW.

Then coming to the question of the eight-hour law, I think I solved that question with my workingmen 15 years ago to their entire satisfaction. I went into my workshop one morning and I saw a quarter of a million dollars' worth of tools and machinery standing idle. There was no more productive power in them than there was in so many tombstones. The idea struck me most forcibly, "Where did all this wealth come from, and what are all these tools and machinery worth without labor?" I went out of the shop with my head down, and I looked around the corner of the street and I saw from five to six hundred men sitting down. They might as well be the corpses buried under the tombstones, for they were not producing anything. There was the chasm—labor and capital at war, neither producing anything. It has been stated that I said labor must not antagonize capital. I say labor must not antagonize capital, and capital must not dare antagonize labor; each must have that right which belongs to it. I called a few of the leading men together. The issue was not wages; it was who had a right to rule;

Digitized by Google

whether these men were to work for me ten hours or whether they were to work eight. I said, "I will adapt myself to suit your condition for an experiment." I found that the only way to get along with labor was to be kind and gentle and to discuss subjects without feeling or passion; discuss them with the idea that they might be right, and were certainly going to have fair play. "I shall, then, for an experiment, ring the bell for quitting work twice a day for the future. Go back to your work. I shall ring it at eight hours, so that you can quit at eight hours, and I shall ring it at ten hours, to give every man his choice who wishes to quit at the end of ten hours, but I shall pay by the hour. I shall give eight hours' pay to the eight-hour men and ten hours' pay to the ten-hour men." They would not accept that proposition; they must have the ten hours' pay for the eight hours' work. I explained to them, "You are only selling two hours of leisure time to increase the cost of your living 20 per cent.; you are only asking me to concede to you two hours more leisure time and adopt a policy that would make you pay 20 per cent. more for all your living." "How is that?" I took up a paper similar to that I showed you here, giving a statement of what was imported into this country—it was true 15 years ago as it is now—and I pointed out to them the hundreds of millions of dollars' worth of foreign manufactured goods, such as I and other manufacturers were making, that were coming into this country at that time under the then existing law. "If," said I, "by your eight-hour law you add 20 per cent. more to the cost of the home production, how much more will come in? The very idea of that eight-hour law, unless our revenue laws were changed, would close every factory in the land. It could not be otherwise. It would add to the cost of the article, and if you institute this eight-hour system, you must call for another law that will give you protection against the increased cost of what you are producing. If the carpenter, the mason, the laborer, the painter, the plumber, and the gas-fitter who do the work upon your house only work eight hours and demand ten hours' pay, will not your rent increase?" "Yes." "Will not the cost of the clothing on your back increase?" "Yes." "While you are talking of the wonderful improvements made by machinery, take into consideration that the farmer's man has as much of a right to this law as you. Can such a law be made expressly for a minority of labor, or shall it be made for all labor? Then suppose you demand that the man who cultivates and works on a farm shall be reduced to the eight-hour system, simply because the mowing-machine, the thrashing-machine, and the reaping-machine have done the work of lots of men, will not that increase the price of your food?" "Yes."

The question was left an open question with them, and after the matter was explained I had no more trouble of that kind, and have had none since. The men went to work and they preferred working ten hours, and the better class of them are very anxious to work twelve hours, if they can get twelve hours' pay for twelve hours' work.

Now, coming to the bottom of this subject—to the question of labor—the amount of labor that claims to be dissatisfied is only a small minority of the whole labor. I say now from my own experience, confining myself to the labor from the mine to the manufactured article, that all the men who are engaged in that occupation do not believe that it is well for them to have only eight hours. So that out of that class of labor alone there is only a small minority in favor of eight hours. Taking the labor class of the United States in 1880, there were on the farm, engaged in cultivation, 7,670,493 laborers, while in every manufacturing interest from the mine up to the cotton factory there were 3,837,112.

Digitized by Google

Here was less than one-half of the whole laboring population engaged in manufacturing industries, and more than one-half of that minority to-day does not believe in this great outcry about making laws to suit labor. It is only in the end a small minority of the class supposed to be aggrieved that is asking for legislation on the question of labor, and then if you analyze and investigate and go through them as a class you will find that many of those who cry out against great land monopolies and all those things are the last people on earth who ever want to go and occupy the land anyhow. I would use all the influence I have got in urging the Senators and Representatives from this State to secure the passage of a law to appropriate and give 160 acres to men who would settle and work on the land; but my honest opinion is that the fewest of the men who would be found to take that land for nothing and work it would be from that class who cry out "land monopoly."

## THE WORKINGMAN'S DANGER.

The greatest danger the workingman of this country has to guard against is the wonderful war I spoke of that is now inaugurated all over the civilized world, the mighty uprising of labor, and the pressure that is brought to bear on the aristocracy of the older countries who own the mine, the forest, and the soil, and particularly among those nations where the people have no voice in the law. That influence is reaching hither, and is bringing about a mighty upheaval of labor, and something has got to be done. Foreign nations are reaching out with all their ingenuity, with all their diplomacy, with all their influence, to the different markets that are suitable for them to reach, and through the public press and otherwise they are getting up plausible arguments, which very often are honestly expressed publicly by our papers, that fall into the trap because the real motives are not understood. They are contending with one another; each nation is striving and struggling to control his own market for his own labor; he is using all manner of diplomacy to control that market for his labor; and this is the great battle ground, the market they would all like to get, and they would all like to pay for this enormous amount of raw material, of bread and cotton and other products, which they must have from us, in the goods of their own country, in place of sending us their gold.

## ENGLISH SHIPPING DRAWBACKS.

There is one thing more in regard to English shipping that I would like to suggest. To show you what England has done to establish her shipping, besides what I have already mentioned, she paid out in one year, 1867, over two and a half million dollars in drawbacks. Drawbacks have been talked of to aid our shipping. The drawbacks on imported goods obtained by the shipping of Great Britain in 1867 amounted to $2,638,762. This large sum was taken by England from her treasury and given as a special privilege to her shipping engaged in her trade with foreign countries. It was as much a system of protection against the nation she was running in competition with as our protection on the land. While she taxed her workman for the use of it, while she taxed everybody of her own population, yet to aid that shipping she gave out in that year alone $2,638,762 in the following articles: Cocoa, coffee, currants, raisins, rum, brandy, sugar (refined), molasses, tea, tobacco, &c. While the workman could not take his cup of coffee without paying a tax upon it, yet he cheerfully paid the coffee duty. That was

Digitized by Google

in fact a law to aid the English ship-owner to feed his crew cheaper than the same number of men could be fed in any other occupation. She conceived the idea of maritime supremacy, and war and diplomacy were to be used, wealth and everything were to be sacrificed to accomplish that object. She left nothing undone to attain it; she has attained it, she has got it, and she will not let it go, and the shilly-shally talk of giving a little pig-iron, or angle-iron, or some other kind of iron to a man here duty free, to build a ship to enter into competition with her, is all nonsense. We cannot run the ship in competition with her cheap capital and cheap labor.

By Mr. CALL:

Q. What do you understand the meaning of the word "drawback" in the English law to be?—A. This is what was done under the "drawback" law: Goods required for ships engaged in the foreign trade on which there was a duty to the amount of $3,638,762, were taken from bond free of duty to enable the ship-owner in the foreign trade to feed the crew and passengers cheaper, and thus sail the English ship cheaper than other nations could sail their ships.

Q. Does it not mean for re-exportation? He was allowed to take it for re-exportation out of England, not for home consumption.—A. No; it was taken for the use of the crew of the ship. The ship presented its requisition that she wanted under proper guarantees given that amount for the use of the crew.

Q. But it could not be used for home consumption?—A. It would be no advantage for England to import that from a foreign country, bring it into her custom-house, take care of it, and reship it duty free.

Q. England would not allow her ship-owners to sell it in England?—A. Oh, no; of course not.

By the CHAIRMAN:

Q. It was to save so much of the running expenses of the ship?—A. It was actually a bonus given to aid in competition with other nations when they had all the advantages of which I have already spoken.

## COMPARATIVE COST OF SHIP-BUILDING.

By Mr. PUGH:

Q. It was not my good fortune to be present when you were first examined. I do not want to discuss with you the correctness of any of your opinions on these important subjects, but I desire to ask you a few questions to get the benefit of your opinion and of your information for public uses. I understood that you stated when you were first examined that you could build a ship in this country and put it afloat ready for the carrying trade as cheap as they could in Scotland. Did you make that statement?—A. No, sir.

Q. It was published that way?—A. I corrected that here to-day. What I stated was that we had the coal, the ore, the limestone, the forest, and all the materials to build the ship in their natural state as cheap as any other country in the world and of better quality, but that raw material before labor was applied to it was only 10 per cent. of the value of the completed ship, and that to make it a ship we had to add 90 per cent. of labor, and that 90 per cent. of labor cost us 70 per cent. more than it did any other country in the world; consequently, when the ship was complete and finished she cost more money here than in any other country of the world; but by the character of our labor and the

Digitized by Google

disposition of our people, many of them coming from the other side of the water, I put it in this way, that they consider themselves better fed, better educated, and better clad, and they are willing to do what is called a square day's work for a square day's pay. As I showed here a few days ago, most of the men working for me own their own houses. They have that as an object. By the superiority of our labor we reduce the cost of the completed ship down to a margin, so that there is only from 15 to 20 per cent. difference, though paying these large wages, between the cost of the finished ship in this country and in Great Britain.

Mr. PUGH. That is as to the actual cost of the labor. Now, are there no credits growing out of American advantages that you are entitled to on that labor cost?

The WITNESS. No, sir; no more than the superior quality of the material when it is produced. Our iron is better. It might be well, however, for me to show you a disadvantage we labor under. I am satisfied that the people of your State (Alabama) will be very much interested in the explanation I will give you on that subject.

## COST OF IRON PRODUCTION.

Previous to the meeting of the Tariff Commission, in order that I might have accurate information on that subject, and that I might be able to give correct information, I sent a competent engineer abroad to investigate the iron interest, the location of the coal, the ore, the limestone, and the means of transportation, to see what advantages, if any, Great Britain had over us in the production of iron. I have taken a great interest in the production of iron, for the reason that I believe it is one of man's four great necessaries, and it is important to have the material at our own command and easy of access to us at all times. Man wants bread, he wants clothing, he wants fire and shelter, and the next thing he wants is iron; and it is an important question to ask what had iron to do with aiding him to shorten the hours of labor and to produce all these other things. Man, before the discovery and the application of steam and iron—I was living before that time—was a good deal of a slave to laboring and toiling, when he had only his old plow-share, and when his wife had to tread away all day at the spinning-wheel.

Well, I sent abroad to get those facts to see what the relations were, to see the advantages that country had over this in an article that was so important to the development of this great country, for iron has a great deal to do with the development of the country. I had that survey made; I had then the official geologists to certify to it. I found that the deposits of coal and iron and limestone in Great Britain were most remarkable, and the same condition of things does not exist, so far as has been developed, in any part of the world. It is in your State (Alabama) to some extent, but it is not developed. We have it here, but we have yet to reach it. What did that discovery result in? It showed the fact that the coal, the ore, and the limestone were found so closely piled together within a narrow section as though designed to be the corner-stone of England's wealth. If all the coal and iron of Great Britain to-day were piled up within the State of New Jersey, free of access to this town, what a wonderful place New Jersey would be! Taking seven of the largest iron-producing districts in Wales, Scotland, and England, I found that the average distance between where the coal, the ore, and the limestone were found to the tunnel-head of the furnaces where it was to be smelted was not over 7 miles. The furnace could always be located so that those three materials need never be hauled more than 7 miles.

Digitized by Google

That was the average. Then the distance from where the pig was made to the factory where it was worked up to the muck-bar, and from the muck-bar to the plate or the rolled-bar for merchant use—from the tunnel-head of the furnace to where that was made was not over 5 or 6 miles; in fact the ore from the mine itself was converted into the watch-spring within 7 miles of where the ore was found. That I found one important thing to be observed in regard to this iron interest—the cost of transportation. It takes 2 tons of ore of the average quality, 1 ton of limestone, and a ton and a half of coal or coke, or 4½ tons altogether, to produce 1 ton of pig-iron. These 4½ tons have got to be hauled from where the material is found, and the average cost of that in Great Britain was only $2.50 to the 4½ tons. Then it was put into the furnace and smelted, and the average cost of transportation to the great market where it was consumed was not over 50 cents, so that the grand total for transportation from the mine to the furnace where the pig was made and from there to the ship-yard was only about $3. Making the same investigation in this country, and looking over my own books to ascertain the cost of these materials in my own blast-furnaces, I found from the manner in which these deposits are situated in the United States that the average distance they must be transported is from 30 to 40 miles, and the cost of bringing the 2 tons of ore, the ton of limestone, and the 1½ tons of coal to the furnaces in the United States was over $9.50, or nearly three times as much as in Great Britain. Deduct the cost of transportation in Great Britain from the cost of transportation in the United States and the whole protection on the pig, then, is only about equal to the difference in the cost of transportation.

Q. What is the cost in England of a ton of pig-iron?—A. About $13.50 to $14.

Q. Where is pig-iron made the cheapest in this country?—A. I have an interest in North Carolina where it can be made for $16 a ton. I have an interest in Virginia in a large enterprise started there a year or two ago, where they are going to be able to make it for $14 a ton.

Q. Do you think that is as cheap as it can be made anywhere in this country?—A. It cannot be made for less than that, and it cannot be made for that except in a very few places. If you had one acre of land producing 40 bushels of grain to the acre, and had another acre that only grew 30, it would never do to say we will cultivate only what produces 40 bushels. We must average it all around.

Q. You would be surprised to learn that they can make pig-iron in Birmingham, Ala., at $10 a ton, would you not—that they can do it? I do not know whether they do it or not.—A. That is discussed and talked of a great deal. There may be cases of that kind, and I am discussing that subject a great deal with Mr. Shelley. What are the advantages that point has got?

Mr. PUGH. The proximity of the ore and the limestone and the food and the cheapness of rents.

The WITNESS. What is the condition of labor there?

Mr. PUGH. I do not think there is much difference between the price of labor there and here; but I am not well enough informed as to the facts to state.

The WITNESS. Suppose I concede for argument's sake that we find a place in this country that has all the advantages of transportation and otherwise that Great Britain has in making iron; I will then reduce it down to the cost of labor; take it that I concede all but one thing. I will concede that you have the coal, the ore, and all the materials as closely together and have as cheap transportation to the furnace, I will

Digitized by Google

concede that the cost of labor is the same, and then I will come to the disadvantages that you labor under in getting the plant. A modern furnace so built as to have all the economical advantages of labor to produce a large quantity of iron, cannot be built in Alabama or anywhere else under the present prices of our labor short of $250,000. I built one two years ago, and it cost that. This furnace in my location was composed of stone, iron, brick, and a little timber. Where lay this stone when I commenced to build my furnace; where lay this brick, this iron? The iron was in the mine; the stone was in the quarry; the brick was a mass of clay in the lot. Each had a merely nominal value of probably not over 5 or 10 per cent. of the cost of my furnace. I then began to apply labor to these materials, and I began to apply labor on the American principle. That labor first began with the commonest workingman to dig out the clay. It went from there to the brick-yard, from the brick-yard into the brick, and from there to be located in the furnace. The stone was a rock in the quarry, and the iron was in the mine. The whole production, like the ship, probably was 90 per cent. of labor. Where I am located—and I do hope that labor will rise to that dignity in Alabama, for I want to see the workingman come up, and you are going on very well there now—that is the condition, and when you come up to that condition the labor will be the same.

Q. We want you to come down there and help to instruct us.—A. I will. I am going to make you a visit. Ninety per cent. of this whole $25',000 was labor, and I ask you to-day would not your people in Alabama be glad to borrow money on the security of the furnace to construct and develop that iron and pay 7 per cent. for it?

Q. I suppose that would be a very cheap rate of interest in Alabama?—A. Then, on the $250,000 of capital in Alabama you would be willing to pay $17,500 a year, giving the furnace as security for the money. You want to enter into competition and have all the other things equal, except that, with the man on the other side of the water. There the same identical kind of furnace, owing to the cheapness of labor, costs him about $140,000, and he pay, 3 per cent. interest on that, or $4,200 a year. There you have a dividend on that capital alone of $13,000 against you in the mere matter of interest on capital. How, then, are you going to compete with him?

Q. You are speaking of borrowed capital, but suppose the owner of capital wants to invest in iron making, where had he better go to do it?—A. He had better go to Alabama.

Q. That is my opinion.—A. But unless he can go to work and get a remunerative interest for his capital he will not go to Alabama.

Q. What, in your judgment, would remunerate capital in that industry?—A. There is another question, then, that has to come in. Where is your market in Alabama for the iron you make? That you have got to take into consideration.

Q. The same as Pittsburgh?—A. How far is it from Pittsburgh to Alabama?

Q. To the mining region of Alabama I suppose it is about 500 miles.—A. It is safe to say that no man should complain of a transportation cost of $1 a ton for a hundred miles. That would be $5 for the transportation of a ton of pig-iron from Alabama, where you made it, to the market of consumption. The modern furnace that I spoke of has a capacity for making 100 tons a day, and say that the freight alone on the product of Alabama, sending it to this market, would be $500 a day against a freight in England of 50 cents a ton, which would be only $2.50. If you multiply the difference each day by the number of days in the

Digitized by Google

year you will find where the Alabama man's profit would be at the end of the year.

Q. Can we not increase the lines of transportation and lessen the cost of it?—A. I never saw that question more thoroughly answered than by Andrew Jackson. First reading one thing that he said caused me to look into this matter. At a State fair in Tennessee, addressing his neighbors, he said: "Build your factories as close as you can to your plantations, supply your own wants to your own people, keep all the money you can within the circle of your own location, and you will confer a great blessing on the human race." That was spoken some fifty years ago. Now, to apply Andrew Jackson's idea to Alabama—never mind Pittsburgh—if you cannot build up a big furnace at first that makes 100 tons, build one large enough to make the iron for every railroad in Alabama; build one large enough to make every plowshare; build one large enough to make every wagon-tire; have all this done at home and save the $5 a ton to Pittsburgh.

Q. Is the difference between the cost of pig-iron in England and in this country owing entirely to the difference in the cost of labor?—A. Principally to the difference in the cost of labor and cost of capital.

Q. You say, then, that in England it is worth from $13 to $13.50 a ton?—A. And from that up to $15 a ton.

Q. You say it can be made for from $14 to $16 in this country?—A. In certain locations; but laboring under the difficulty I have spoken of, that there is no market for it in those very few locations where it is made so very cheap.

Q. You started out, I think, with the cost of ship-building in this country?—A. I did not take that up first, because I did not care to talk upon a subject that I was specially engaged in myself, but I took up the cotton goods and the woolen goods.

[The committe here took a recess for one hour, at the expiration of which the examination of Mr. Roach was resumed.]

## COST OF TRANSPORTATION.

By Mr. PUGH:

Q. Can you give us the general rates on a ton of pig-iron shipped by rail in this country?—A. I cannot positively give you that, though I pay a great deal. I suppose from Pittsburgh to New York it might be $3.50.

Q. Is it not about 75 cents for every hundred miles?—A. From that to a dollar; probably a dollar for every hundred miles.

Q. Where the transportation is by water is there any difference; and, if so, what is it?—A. I cannot say in regard to pig-iron, but I should judge that, with proper facilities, the cost of water transportation would be less than half.

Q. What would it cost to bring a ton of pig-iron from Mobile, Ala., to Wilmington, Del., by water?—A. That would depend a great deal on the amount of trade built up. If a vessel could be sure of a full cargo both ways the freight would be much reduced.

Q. Much less than half the cost by rail?—A. There has been in my own experience within the last twelve years a steady reduction in freights where a trade has been built up so that vessels can get cargo both ways.

Q. What is the difference between the cost of carrying a ton of iron ore and a ton of pig-iron, by rail, if there is any?—A. I do not know that there is any. I am a purchaser of ores, and if there is any man in

Digitized by Google

my business that should be a free-trader I am the man. Last year I purchased over $2,000,000 worth of material of one kind and another, upon which our present tariff laws lay a heavy duty, which could have been purchased by me abroad much cheaper than in the United States, but I will give you my experience on that subject, showing why it is preferable to me as a consumer of large quantities of material to know that I can get it at home. I would not invest a dollar in a ship-yard to-day if I knew that I had to depend upon a foreign product for my material. I should be subject to the contingencies of war; I should be subject to the contingencies of the elements; I should require at least to double my capital for the reason that I can make use of my own credit at home to a better advantage than I can abroad, and I save commissions by purchasing here. To illustrate to you now what has taken place within the last two years I have lost over $60,000 by depending on a foreign market under certain circumstances for materials I wanted. I have a large mill for rolling rails. I made a contract with the Northern Pacific Railroad Company to furnish them 15,000 tons of steel rails; and that one transaction compelled me to put a plant where, if that circumstance ever took place again, I should know what I was going to pay at home. At that time I got the price of blooms in the English market, and I made my contract for 15,000 tons of blooms in England. I got the price before I made the contract, supposing I could always obtain them at that figure. I had a hope that I could get the blooms at home, in America, but the steel business is in its infancy and the bloom-makers of the country who have the facilities for making steel blooms had all their own mills going and could make no blooms for outside parties. At that time there was a deficiency in America in the capacity to make 15,000 tons of blooms. That was soon discovered by foreign agents here. I made my contract, and without any change in the English market, without any reason for it under heaven, only that they knew blooms were scarce in America, I had to pay for the 15,000 tons of blooms $4 a ton more than the price I was first offered them for. The blooms cost me $60,000 more than I could have got them for one month before. That led me to a further inquiry as to the cheapness of money in England. The making of iron is like the sowing of a crop of grain. You cannot bring forth the crop of iron in a day, or in a week, or in a month. You have got to go down into the mine and mine the ore, and you have got to mine the coal, and you have got to be sure that you have a stock on hand before you put your furnace in blast. This requires large capital. That capital we have not got. They have it on the other side. We go from hand to mouth mining what we want, both in coal and ore, and when the furnace blows out there is not ore on hand. The man who uses the ore has not the capital to buy it and store it up, and the man that mines it has not the capital to dig it out and have it ready for him. By and by, in a new country like this, full of vigor, when we get over a little panic we bring into play all our energies to build more railroads, and then comes a demand for iron and steel. It is not in hand. It takes a year to bring it up. England has studied that matter thoroughly, and there is no time that she has not a full supply on hand. When the market is flooded with iron, capital being plenty there, she can go to work digging out the ore, and the man who makes the iron can go on and make it because he can convert the ore into iron, and when the iron is made he can hypothecate that iron for three-quarters its value to a banking-house on his note, giving him time to sell, and he pays but 3 per cent. interest. Thus he is able to carry that iron until a demand for iron

Digitized by Google

comes from America again. About 1873, to my own actual knowledge, the profit made by the English iron-master by having stock on hand to supply the American market, was over 30 per cent. About every seven years they make up in one year a dividend for the seven years, because of the increased price in consequence of the scarcity in the American market. This market is closely watched on everything, not only now, but before we got to be as strong as we are in the manufacturing interest. The English policy is to combine, and each mill-man puts forth a share of capital to send goods here, under our tariff laws, to sell them lower than they could possibly be produced here, and thus break our market. There is no end to the ingenuity of traders in trying to sustain their business.

Q. Going back to the cost of transportation, is it the same on pig-iron as on iron ore, and if so, how is it that the furnaces in the Northern States are able to bring a large quantity of iron ore from Alabama to their furnaces, make iron of it, and sell it?—A. I have not known of any large quantities coming from there. I have known of some quantities coming from there of a peculiar character, that is to say 10 or 15 per cent. of those ores was requisite to mix with some other ores that were very cheap at home to make a peculiar class of iron.

Q. Do you say it is limited to that sort of iron?—A. I think it is limited to that kind to make up a mixture.

## RESTORATION OF AMERICAN SHIPPING.

Q. Now I wish to come to ship-building, with which you are so familiar. You have thought a great deal about the legislation that would aid our ship-builders in restoring American shipping upon the seas?—A. Yes, sir.

Q. Congress has repealed the law in reference to ascertaining the tonnage of a ship by measurement, so that the tonnage is ascertained now by the same rules here as in England, and the State of New York has repealed the State tax upon ships. Now what proportion of the carrying trade of this country, in and out, is done by this city?—A. I should say probably more than half. I cannot speak positively, but I should judge about that.

Q. Then there can be a great benefit derived from the repeal of that tax in a State where more than one-half the shipping is owned?—A. Unquestionably, one-half the shipping is not owned in New York State, but one-half the shipping is done in New York; but I want to make a remark there. One thing you must observe, there is a great determination on the part of men who have possession of a trade to hold on to it. One of the great difficulties in getting capital to go into the foreign carrying trade is the fact that foreign capital, and especially English capital, already has so complete possession. Yet I believe capital could be found to make an entering wedge in the way of competition, even on the North Atlantic, if our Government were to pursue such a policy as England pursued toward her shipping when she aided the great steamship lines to establish themselves. Nor need that much be done. We do not want to subsidize lines, nor to guarantee a Government dividend. The French Government just this last year voted a subsidy of $500,000 a year to the Transatlantique line, to increase its ships on the North Atlantic, and that line is growing. If our Government were simply to pay a fair mail compensation, and give a mail contract for a term of years to a line that should come up to all the requirements of speed, safety, and accommodations that are met by any foreign lines, I believe capital would be ready to put a first-class line of American steamships on the North Atlantic; while the same just and wise policy would put

Digitized by Google

American ships on the South Atlantic and the Pacific, to the great advantage of this country in every way. Stop making the American ship carry the mails except by voluntary contract, pay as fairly for service rendered on the sea as on the land, and that is all the legislation necessary. Then let it be known that the matter of "free ships" is settled for good, so that capital may feel the surety of a fixed policy, and American shipping will have a chance. To build the railroads and to build up the factories we have taxed the people. All we want is to protect capital and labor upon the sea as we have protected it upon the land. Would not our people willingly stand such a tax to secure us the safe carryings of our products to market and all the advantages accruing. The people would reap benefit a thousand fold from such an investment.

Q. Then that is your remedy in the line of legislation?—A. Yes; all things being equal the American citizen does not want any favor; he is willing to take his chance in the competition of the world. I have just received the official documents which show the policy that England has pursued to build up the shipping interest. If I see a man in my own business who is eclipsing all competitors, and I want to learn something that I do not know, the first thing I would do would be to study that man's course and I should get the practical information. Let us look at what free trade in England has done through her laws. I have here official copies of the actual laws.

The CHAIRMAN. We should like to have all that English legislation put at the service of the committee. If you cannot give us copies of it now let us have them later. We should like to have it go into the record, where it may be available to the country in permanent form.

The WITNESS. I will only give one quotation out of the whole, which will settle this question. England is a nation that has cheaper capital than we have, a nation far in advance of all nations in the world in the construction of ships, and that can produce them cheaper. Her labor was cheaper than our labor. And yet before she could gain that wonderful position which I have described, doing one-half the whole carrying trade of the world, what did she have to do? Somebody may tell you she built the ship a little cheaper, and that her people had the right to buy ships in the cheapest markets in the world, but they never bought any from the time she began to build iron ships. Before that she bought ships from us, and bought them from others for a brief period, and we were driving her from the sea under those conditions; but when she discovered that she could build a ship cheaper she discovered the grand secret of all, that she could not enter into competition with cheap labor to run the ship, and she knew the wonderful advantage of cheap labor in running the ship, and therefore she at once became the most determined protectionist of all nations on earth. No other nation ever went so far in protection as she went in the protection of her own ship after she built it cheaper than other nations could build it.

How was this? She first began by the system of subsidy. They were not afraid there of the word "subsidy." The language "subsidy" is used in the law. What else did she do? I will read:

By the terms of this contract concluded with the Peninsula and Oriental Steam Navigation Company on the 17th day of November, 1867—

At that time she had risen to her highest position; she had swallowed up all our trade during the war—

for the East India, China, and Japan mail service, of which copies are inclosed, the subsidy to be paid—

The subsidy is put down at £400,000 a year, or $2,000,000 to one

Digitized by Google

company, or a sum equal to 22½ per cent. on the whole capital invested, with a stipulation on the one hand that whenever the annual income of the company from all sources, including this subsidy, does not admit of the payment of a dividend of 8 per cent. on the capital employed, the subsidy shall be increased by so much, subject, however, to a limit of £100,000, or $500,000 more; and when a commission appointed by Parliament shall examine the company's books and decide that there is a surplus over 8 per cent., one-third of that 8 per cent. goes back into the treasury.

When they found that all their laws did not answer, that capital would not go into the business, then they guaranteed a dividend on the capital that would go in, and it was a notice that struck terror into the capitalists of all other nations when they discovered that it was not the private enterprise of Great Britain they had to contend with, but it was the Government of Great Britain, with the treasury of Great Britain at the English capitalist's back.

I can show you in another part of these contracts that they actually paid so much a mile for the number of miles a steamship ran, and it amounted to over $400 a day, which was equal to the cost of running the ship; but under the conditions of that stipulation the ship had to run between certain longitudes and latitudes at certain seasons to move certain crops, so as to break up the trade of other nations.

That is the English policy. That is the policy of her every legislative act. With $1,000,000,000 of money, the invested annual earnings of this great fleet, with from $350,000,000 to $400,000,000 a year more given to labor than in all the other industries, how proud must the English workingman be to know that he had a press, that he had legislators who studied the subject and knew how to take care of him?

By Mr. PUGH:

Q. You say that by this system of governmental aid England has got possession of the ocean carrying trade?—A. Yes, sir.

Q. I understood you to say that the advantages which England has now in the number of ships, and in the possession of all these lines, and all the other advantages she has, enabled her to overcome the benefit to our shipping of a repeal of the State tax in New York?—A. Oh, yes, sir.

Q. You say that England has possession of the carrying trade on the ocean. Now suppose we entered upon that line or system of legislation which enabled her to attain it, what power would England have now to prevent the success of any aid we could furnish from the Government of the same character?—A. I will tell you what I think she would do. If she made open war upon you with her guns, and if she only had as many guns as you, and found she had not enough, she would most assuredly get more. That is about what she would do.

Q. How much aid has the British Government attempted to give by what is called subsidy legislation?—A. I will give you that to a fraction. From the commencement and introduction of steam on the ocean up to the present time, in that one item of subsidies alone, without any regard to the dividend contract, without any regard to the other great advantages she had, England has paid out from 1850 to the present time $163,653,356 in money.

Q. How many lines did she give it to?—A. She used it precisely as I stated before, the same as she used her military power. Wherever it was necessary to defeat opposition to English interests a large sum she paid there.

Digitized by Google

Q. How much benefit did the general shipping interests get from the subsidies paid to given lines?—A. She paid subsidy until very recently on the North Atlantic until she got complete possession. Besides that, we have paid to her ships $6,000,000, making $169,000,000. Under these contracts, which I have tried to establish in this country, she sent out her enterprising men, her pioneers, who went into the countries of South America and there tried to establish trade and build up steamship lines. In every one of those countries which wanted communication with the outside world and had it not her enterprising people got contracts as in Brazil. Those lines were established. I tried the same plan, and supposed our country would do it. We have wonderful advantages in developing a trade of any kind. For instance, I am now interested where there is a line of steamers running from here to Havana, and we get nearly all that trade. The nearness helps us to send out our manufactured goods there in advance of England. I entered into an arrangement with the Government of Brazil for the purpose of establishing mail communication between the United States and Brazil. I got a conditional contract. I came to our own country, and if ever a man was vilified by the New York press and by speeches made in Congress—called "a jobber," called "a subsidy lobbyist"—I was that man. I put my money into that line to Brazil. started the line, and made it a success; but the very speeches made in the House of Representatives in Washington against me were translated into the Brazilian language and copied into the Brazilian papers, and when the appropriation bill came up to pay me my money it was laid on the table, and the contract was withdrawn, the supposition being that the American people wanted nothing to do with Brazil, though at the same time we were purchasing $60,000,000 worth of coffee from Brazil; and it is to the shame of this great nation that you cannot buy a single bill of exchange and send it to Brazil direct and get it cashed there. If you want to buy coffee from Brazil you must send your money to England and there draw a bill. The commissions paid and the exchange across the water would pay for the mail service five times over, but I was defeated. All difficulties possible were put in the way of legislation. So I withdrew my ships, sold them at a sacrifice, and dropped the enterprise. I made up my mind, how ver, that I would establish that trade yet. I took those ships and bonded them to myself at half what they were worth. My credit was attacked in this very city, because it was said I was engaged in a wild scheme that no man could succeed in. Finally, when the enterprise was withdrawn the old circular route was resorted to again, so that the American Minister had to go from New York to Liverpool and from Liverpool to Brazil. He had to go out of America to get to America, and our own Government was paying more by sending passengers connected with the Navy, and its supplies, across the ocean to go to the squadron in South American waters—paying double freight across the ocean—more than would pay for the whole mail service! Then a few slow steamers were put on, so that they took flour out there and nothing else, but in the time those slow steamers made a man of business could go to Liverpool and get to Brazil before he could reach there direct from here. The Brazilian people saw the mistake that was made, and I entered into new arrangements with them, got up a line, and that line is running to-day. I have seen many a man in Virginia in the flour business come up here with 5,000 to 10,000 barrels of flour, and if he had to put his flour on board a little sailing vessel, or to send it to Liverpool in order to go to Brazil, he would have been kept out of his money; but I have seen the advantage that that line is to him. He can

Digitized by Google

bring his 5,000 barrels of flour to New York in three days, paying the freight up from Richmond to New York; here put it on board ship, get a receipt for it, and go back to Richmond in less than 48 hours with his $20,000 in money, getting an advance on his bill of lading! Now that the line is started and running again, look at the competition there is to break it down again, and to lessen the compensation that I with my associates get for bringing that freight. There are what is known as tramps put on the docks. I brought coffee to New York from Brazil for 25 cents a bag—$3.75 a ton for 5,000 miles—and a barrel of flour from New York, 5,000 miles, for $1! I am going to appeal to the American Congress. I do not ask for a subsidy, but I do ask them to repeal that obnoxious law which lets a United States officer come on board my ship and make me carry the mail, and say: "This ship cannot clear unless you take the mail at that pay which I choose to give you."

Q. Now suppose Congress should repeal that law; you say that the mail service ought to be put out to the lowest bidder?—A. Certainly.

Q. When the lowest bidder gets it there will be one line to each port that will carry the mail and get the benefit of this legislation. How will that benefit American shipping generally and aid the restoration of American shipping?—A. That is only actually a compensation for doing a service that the nation wants. I do not look upon it as any aid at all. The fast line is a means of communication necessary to facilitate trade, just as the lightning train on the land carries the orders and mail from New York to Chicago, by which the freight trains are loaded. Stop the mail train between two great cities and will you not stop trade?

Q. Suppose it is just compensation for actual service done, that service will be done by one line of ships to each port?—A. Probably if that service was compensated there would be two lines inside of a year.

Q. How would that affect the power of the line that carried the mail to root out the other ships?—A. It will affect it in this way: The four-horse wagon on the public road is done away with. The railroad does the business, and I believe nobody complains of that. Does the fast mail train on the land do away with the freight train? Some men seem to think we do not want fast mail and passenger accommodations for trade on the water, while the trade on the land cannot do without it. In 1850, before England fully commenced the introduction of steam, she, far-sighted, saw that steam was going to take the place of sail. She went on, and actually subsidized steam lines against her own sailing-ships. She had 142,730 men engaged in sailing-ships, but she saw that if she did not start a new policy some other nation would get ahead of her. Then she had only 8,700 men in steam vessels. Now, by the encouragement of steam, she has over 106,000 men employed in steam vessels and but a very small number in sailing-ships. She has actually legislated her own sailing-ships off the ocean, but the benefit has all come home to England in the end. What she lost on one side she gained on the other.

I remember once a man coming to me in a ship-yard and wanting more actual protection for the building of wooden ships, but he had a man in the saw-pit, and one man on top of the log, and another one running that saw up and down. I said to him, "Come and get a steam-engine and put it there." He said, "That will knock all the fellows that work up and down out of their work." That was his idea. So there is the cry, that if you encourage steam you will interfere with sailing-ships. There can be no monopoly here for certain reasons. The minute you make a thing profitable other people will step into it.

Digitized by Google

The ship that carries the mail has to perform a service that an ordinary carrying ship does not. She has to have greater speed; she has to make stops at certain ports whether she has trade there or not, which might be required in giving a mail contract. You impose duties upon her that you do not upon the other ship. All great commercial houses have their traveling agents to drum up trade. The fast mail ship is the trade drummer of the nation. If the fast mail line was started the trade would increase, and the increased trade would increase the demand for ships.

Q. Now, suppose we restore our shipping, what are we going to carry on the seas to other countries; how are we going to freight the ships?—A. I will give you my experience. I am engaged now in this Brazil line, and I will give you a record of the cargoes back and forth. The cargoes out are composed of flour and general merchandise.

Q. What sort of merchandise?—A. Boots and shoes, dry-goods, iron work, &c.

Q. Are we exporting those things?—A. Yes. The Fairbanks Company, I believe, supplies almost all the scales used in Brazil and Buenos Ayres. We bring back coffee, rubber, dye-woods, and sugar. It would be an advantage to our country if we could pay for the $50,000,000 of coffee we buy in Brazil in flour and general merchandise. It would bring that much more money home; it would put so many more of our own people at work to produce these things, and eventually by that policy, carried out for a certain number of years, you would break down the great difficulty in the way of cheapening money.

## THE IRON AND STEEL INDUSTRY.

Q. You mentioned this morning three of our industries, the woolen, the cotton, and the iron and steel. You stated that it was very important to keep the money that was paid by the consumer for what he had to consume in this country by paying it to American producers. Now, take the iron and steel industry. What is our capacity to-day compared with the consumption? How do our production and our consumption compare?—A. We have facilities to produce what we should want if we did not import. There would be no over-production if we supplied our wants at home instead of buying iron and steel abroad.

Q. Why was the iron industry depressed much more from 1873 to 1879 than it is now, when there was in operation a tariff entirely satisfactory to the iron producers?—A. A business could not be depressed when its product increased 100 per cent. in the time you speak of.

Q. It went on and prospered up to 1880, when so many railroads were being built in this country?—A. I had the number of tons produced, and it increased in the period you speak of very nearly 100 per cent. A business could not have been in a very depressed condition when it grew up so as to increase 100 per cent., employing 100 per cent. more labor and more capital.

Q. What was the amount of iron and steel production in this country last year; do you know?—A. I have not the figures here, but I can get them.

Q. The statistics have been published lately, and the amount is 4,600,000 tons, and a little over, of pig-iron, say, of which over a million tons were unsold. There were a million tons more produced than were sold in the market last year?—A. I do not question your figures as to the over-production, but I do know this, that we imported last year 1,335,371 tons of iron in form of pig-iron, railroad bars, of iron and steel,

Digitized by Google

steel ingots, &c. This represented a labor value on the other side the sea of above $67,000,000. The pig-iron is the basis from which all the other products come. If we had used our own pig-iron instead of having a million tons of over-production, we should have simply met the demand, and kept American labor well employed and regularly paid. It is better to have over-production than under-production, for surely there can be no monopoly where over-production prevails.

PRODUCTION AND CONSUMPTION AS AFFECTED BY TARIFFS.

Q. If it be true that our capacity to produce iron and steel excels the consumption, how would that affect the ability of the producer of iron and steel to pay the laborer?—A. The capacity to produce is greater than the capacity to consume, as long as you allow $67,000,000 worth to come in here, but why is it that $67,000,000 worth was not made at home? Simply because, under your present laws, it could not be made here with our rate of wages.

Q. Then you want the duty on it increased so as to prohibit the importation of the $67,000,000 worth?—A. No; but I do want some settled policy by which we can know what is to come, and keep a stock on hand from a falling to a rising market. Iron will not spoil. But what company will go to work to-day and make a million dollars' worth of iron if it thinks that Congress is going next year to reduce the tariff?

Q. The tariff that was revised by the last Congress, you say, is not high enough, and ought to be increased to enable the manufacturers to sustain these industries.—A. Yet the next Congress talks of taking up the tariff again for further revision. It is the uncertainty as to what the result of tariff tinkering will be that unsettles trade and weakens confidence.

Q. I want to know how the power to produce affects the ability of the manufacturer to pay even the present rate of wages. If this ability to produce goes on increasing by protection and by inducing investment, will not the production be increased so that it will run ahead of consumption more than it does now, and reduce the price of production and affect the power to pay wages?—A. There would be no over-production if we were not importing, as I said; capitalists do not want to invest capital in a thing that is going to be legislated about next year. On the tariff capitalists want some settled policy so as to know what they are doing. The growth of the country will more than keep up with the increased investment.

Q. Is it your opinion that the woolen and cotton and iron and steel industries of this country can prosper by being confined alone to American markets?—A. To meet that question we should at least be able to supply our own wants first. If you do something that will enable us to supply our home wants you will give labor to thousands of men who are complaining of idleness, and you will call forth thousands of capital for investment, and you will get it in Alabama—capital that is crowding itself to-day in Government bonds at a low rate of interest. If you will do something of that kind you will bring forth that condition of things; the millions' worth of iron, cotton, and woolen products imported last year would be made at home, and our idle labor be employed.

Q. Have we not power enough now in all these cotton, woolen, and iron and steel industries to produce abundantly all that we need?—A. No, sir; not if we do not import.

Q. You say then that the woolen-mills, the cotton-mills, and the iron and steel-mills, are not able to supply American consumption?—A. I

Digitized by Google

have a statement, sent to me from the Treasury Department since I was here last, certifying that that condition of things has taken place. Taking the average for ten years on those three industries it would make an expenditure of $1,187,000,000 of money sent out of this country to buy iron and cotton and woolen goods to clothe the American people. If those $1,187,000,000 were spent at home how many churches, school-houses, towns, and cities, would they have built up, and in the building given employment to thousands of people? I cannot illustrate this any more forcibly than by pointing to two sections of the country, one where the policy I speak of was adopted as a policy, and comparing its wealth and the amount it has piled up with that section of the country which thought it was a better plan to buy in England the ploughshare that ploughed its own soil, rather than to encourage the making of it at home out of its own iron. There is a striking fact before us, and it comes down to the very first principles, that where you have the raw material if you do not apply labor to it there comes no wealth. In that section of the country called the South the more labor that is applied to what God has given it, and which is buried in the earth, the sooner it will become wealthy and rich, because labor applied to your natural resources is the foundation of your wealth. Your mountains of ore in Alabama are worth little or nothing to you unless something is done that will give labor with capital encouragement to go in and develop it.

POLICY AS TO SHIPPING.

By Mr. CALL:

Q. You will not let us have any ship-yards down there. You have taken away the only one we had at Pensacola?—A. How many ships did you ever build there? They gave you a fair chance and you did not do anything.

Q. You would not come down there and help us.—A. Oh, yes, I would; but I am too old a man to get replanted. I do not like to dig up old trees and replant them; I have tried it.

By Mr. PUGH:

Q. It is dangerous to transplant an old tree?—A. It is. Now I will make a suggestion. I would deal more with the shipping question, but I think I have said enough about it. But would it not be wise for our nation to look at what England has done; would it not be wise to look at other nations which have made the effort after they had studied her policy? France had the privilege of buying ships in England in the cheapest market. She bought them, brought them home, and tried the experiment of running them; she did not succeed; and England could not succeed in running them after they were built until she adopted the policy of protection to the ship on the sea. France then passed a law to meet the case. I do not want to see any law passed by which the ship-builder is going to get any bounty. He does not want it. You may give all the bounties in the world to ship-builders and ships will not be built. The demand has got to come for them first. The man who wants the aid is the man who owns and runs the ship, and who puts his capital into the ship for the twenty-five years of her life. The American ship is built with dear capital and operated with dear labor, and must be protected against cheap capital and cheap labor, the same as our factories.

France has passed a general law, leaving it open to all citizens offering to engage ships for a certain number of years to run in the foreign trade and develop foreign commerce for France, opening markets for

Digitized by Google

French manufactured goods in South America and other countries, and bringing back their products, giving so much a mile. England went into this matter and taxed her own people, and she has paid out the $169,000,000 I have already spoken of within the last thirty years. It was not a bagatelle; it was only half what she earned last year. She paid $169,000,000 to build the trade up, and she brought back last year $300,000,000 of earnings to her working people. Look at it and see if you can adopt any policy wiser than that, according to the last year's statistics, encouraging capital to go into shipping, giving so much a year, paying in thirty years $169,000,000, and out of that policy has grown up a fleet that brought her back $300,000,000 last year. This is the result of England's radical protection to her capital and labor on the sea. When the question comes up with regard to cheap money there is the grand secret of it—$300,000,000 of money every year drained into England's treasury out of that one identical interest alone, whereby she does not impoverish her soil one iota for what produces it, and it gives employment to her own people. Suppose that England was paying out $100,000,000 of that for doing her carrying, as we are doing each year, would money be cheap in England? I know we often hear of money being cheap in England because England is free trade, and dear in America because America is protection. I will answer that. England was a protective country of the most rigid kind until she made money cheap. In 1680 she had a tax upon every ton of pig-iron that came into Great Britain of $20 a ton, which is now very near double what it costs. She followed that policy of high protection until 1857. She became a free-trade nation then. Why? She had her iron interest, which is the corner-stone of all her wealth, developed to such a condition by the advantages of which I have spoken, of low transportation, of convenient raw material, until she could produce cheaper iron than any nation in the world. Then she was for free trade in iron and free trade in ships when she could build ships cheaper than any other nation, and for free trade in bread when she could not raise enough to feed her own people and had no more soil to develop, and when a high price for bread would increase the cost of manufacturing. She was for free trade in bread and free trade in cotton when she had her countless millions invested in cotton mills, because she could not raise the cotton herself. It was a matter of necessity with her. She was for free trade in lumber when she could not produce lumber herself. She is for free trade in anything and everything that England cannot produce, and for free trade in all those things that she can produce cheaper than other people. She was for the most rigorous kind of protective policy in those things where she could not compete with the other nations. Her wealth has come from protection. She has guarded it by that policy. It is like sowing a crop of grain. A man carries around on his shoulder a half bushel and scatters it on the ground, but when he comes back on that same ground to thrash out his grain, look at the crop. The few millions England paid out to subsidize her ships was soon to be a productive crop. She never did a single thing in the interest of any country but England. When I sent to get the information to which I specially refer I obtained the most interesting information you could probably have. I went over the old statutes of Great Britain and her policy towards this country. I defy any man to say that she was not our deadliest enemy in all our struggles. I can produce to you a statute whereby it was a penal offense to send modern machinery to America; the machinery was confiscated from the owner and he was sent to jail under a penalty of 100 pounds for committing the crime. I could point

Digitized by Google

out all manner of legislation that was instituted for the purpose of preventing this country from being able to supply its own wants. I can tell you to-day that this great hue and cry that is got up about "monopoly" in this country is part of the same policy. There is no monopoly here. The cry is got up to hide the great blow that is going to be struck at the industries of this country by the English policy. It was made a crime for an enterprising mechanic in England to put on board ship bound for America an improved machine for fear he would teach Americans to make it. I have seen in my own days the first little turning lathe and the first little planing machine brought to America, and we imported the man to run it, and that man came over and we paid him double pay for attention to the two machines. A schoolboy who comes out of the public schools to-day and goes into my workshop, with one or two years' experience can do as much as that man whom we imported at that time.

Q. You are a friend of the English system of protection, but you are an enemy of the English system of free trade?—A. The moment that England establishes a form of government whereby the workingman is brought up to the same plane that he is here, then I am ready to hold up both hands for free trade with England, but I do not approve of a policy that allows the products of that country, of which 90 per cent. is labor, produced by that ground-down labor, to enter into competition in this market with the products of our own workingmen.

Q. When will that condition of things cease; when will the necessity for this protection cease in this country?—A. That will cease when we hold firm just where we are now and by the great light we have thrown out educate the great mass of the people all over the world till they come up to that standard where they will demand the same rights as the workingman has here. The time will come then.

## PRICE OF MANUFACTURING LABOR.

Q. I will trouble you with a few more inquiries on another matter. I understood you to state that in the woolen mills the price of labor paid was $2 a day?—A. No, sir. I spoke of the average price of labor in about that proportion in the iron interest.

Q. Do you say that in the woolen mills the average wage is $2 per day?—A. No, I do not think that is so in the woolen trade, because there are many females at work there. The average in the iron industry I said was $2 a day here as against $1.25 in England. The average would hold good in the cotton factories in the same proportion. It may not be as high as the highest.

Q. I happened in a very large woolen mill the other day at Woonsocket, and I think you will find that they pay there for weavers and spinners about a dollar and a quarter a day.—A. That is correct, but the same class of workers in Europe work for 60 cents a day.

Q. And it was not more than a dollar and a quarter a day in the silk manufactory of the Cheneys in Connecticut.—A. The same class of labor is working in Europe for 60 cents.

Q. You say that the operators getting $2 a day in the iron and steel industry and running it, out into woolen and cotton industries, and there getting $2 a day enables them to have better houses, better clothing, to be better fed, and to have more comforts than similar laborers get in England. Now will $2 a day in this city enable a man to live outside of the tenement houses?—A. A man does not work for $2 a day

Digitized by Google

here. I produced my pay-roll here last week, and the average wages of a mechanic here, taking the whole scale, is from $4 down to $2.50.

Q. If you have read what they state, they all say that they are not able to live on the wages they get any better than they do live, and that is in tenement houses, with no ventilation, no comforts, no luxuries. They tell us that the absolute necessities of life cannot be procured in this market with what they get; that is what they all say.—A. With my experience I will try to explain that. I believe that a prudent, saving man can live more comfortably in this country than anywhere else in the world, and with care can save money. There is no better system of education in the world than is offered to the humblest man's child in this country free to all. To show you what an improvement our system is over and above what I got when I was a boy, I will tell you what is done in my workshop. When I went to learn my trade in New York I got 12 shillings a week till I was twenty-one, and I had to work overtime and otherwise to try to pay my board. I give now to an apprentice when he comes to work $3.50 a week. The idea was to establish such a policy as to allow the boy to be no burden on his parents during his apprenticeship, but a help. Then he receives an advance every year of $1 till he is twenty-one, from the time he is sixteen, so that really the average of his pay during the five years he is learning his trade is $5 or $6 a week. That enables him to pay all his own expenses, so as not to be a burden, and in fact it enables him to help his parents.

Then, here is an idea which it would be a wise thing to promote through the press and pulpit. This afternoon I suppose there will be 100,000 evening papers sold in the city for a penny each, mostly to the working-men. That press has a wonderful chance to do good. If in it the people could only read something like this: "At the age of sixteen every young man should make up his mind that he is going to be old; that old age must come on; that rainy days will come; that bad health will come, and he ought to think that he must accomplish something." Thousands of young men think of it. I know that many undertake to get an education beyond what our public schools give them. If that picture was drawn for them it might do a great deal of good. Before a man has to go to a tenement house to live he ought to have made some provision, he ought to have had something saved up. A great deal of the troubles that are complained of come from idleness and want of economy; and if you were to go among these men who make those complaints you speak of you would find out that there is one little extravagance and another little extravagance that ought not to exist. I will illustrate that by two boys, common shoe-blacks, coming across on the ferry-boat from Long Island. I met a little boy, a shoe-black. Of course he came up to seek employment. Said he, "Boss, a shine." I put out my foot and he laid down the traps that he had. He had a cigarette in his mouth smoking. While he was shining I asked him, "How old are you?" "Thirteen years of age." "Have you been to school?" "Yes, I was at school till I was twelve." I pulled out of my side-pocket a large white envelope and pencil, and said I, "How far have you advanced in your education?" Said he, "I have learned to figure." "Well, I want to put some questions to you; answer the questions." The boy thought he was losing too much time on that one shine, and so I said, "I will pay you and make it as profitable as any work you have done for a long time. Now, how many cigarettes do you smoke in a day?" "I smoke four." "What do you give for each cigarette?" "One cent." "Multiply that by 4 and that is 4 cents. Now, how many days are there in a week?" "Seven." "And

Digitized by Google

you smoke Sundays too?" "Yes." "Multiply that by 7 and that is 28 cents. Now, how many weeks are there in a month?" "There are four weeks in a month." "That is $1.12 cents. How much are all the clothes you have got on your back worth? You are the poorest dressed boy almost I ever saw." He said, "Not over a dollar," hanging his head. "Then you smoke out a whole suit of clothes every four weeks?" "Yes." "Now," said I, "I want to enter into a contract with you." This is not the way with all the shoe-blacks; there are other clear-headed shoe-blacks, but I said to this one, "I want to enter into a contract with you," and I put my hand into my pocket and I fortunately had a big round dollar. I gave him the dollar and said, "Now, this is the condition, that you will smoke no more cigarettes. If you do not keep your contract I will see if there is not a law to put you in jail." He grabbed the dollar and went. Next morning I came along and I will show you what he learned, as young as he was. Next morning when I came on the boat again I saw him. While I was at one end of the boat he was at the other, but he had a cigarette in his mouth. I went to him and took him by the shoulder and said "I am going to look for an officer to send you to jail; you have committed a crime; you entered into a contract which you have not kept." "Well," said he, "I had some left." "Then I will let you go if you will promise me you will not buy any more." He went off. Next day I caught him again, and then I was determined to frighten him. Said he, "I do not know what to say." "Well," said I, "give me my dollar." "I have not got it; it is gone." "What did you do with it? If you made good use of it I do not know that I shall be very hard on you." Said he, "I went down to the minstrels and took two other boys, and I spent 50 cents, and gave the other 50 cents to my mother." "Then," said I, "I will only inflict one-half the punishment on you. Give me half a dollar and I will let you go." Of course he went. I have come over on that boat every morning regularly, and I asked the man on the boat if the boy was there as he had been before generally as a shoe-black. He said he had been all the summer, but now he had deserted the boat and gone away and sought another boat rather than face me or give up the cigarette. If he only has the constitution to stand it he is going to be a wonderful complainer about legislation after awhile.

Then, crossing the Jersey City ferry a year ago, to go down to the ship-yard where I go every week, I met a shoe-black there, an intelligent, bright-looking lad about sixteen years of age. He wanted a job to shine my boots. Of course I gave it to him, and he went to blacking them. While he was at work I asked, "How old are you?" Such an age. "You look better clothed than the most of shoe-blacks. Have you been to school?" "Yes." "Why do you follow this occupation?" "Because I can make more money out of this than I can out of anything else." "Why do you want this money?" "I have a poor mother and a little sister." "Well, how much do you make in a week?" "I average a dollar a day, and I cannot get a dollar a day at anything else, but I do not intend to stick to this all my life." "Now, tell me what your stock in trade is worth. This is a wonderfully profitable business, a dollar a day for a boy of your size. I want to see what capital you have invested in your stock." He sat down and put down his box, and gave me the price he paid for the box, and the price that he paid for his brush, and the price that he paid for blacking. I asked him then how many shines he made out of one box. He told me, and it showed the sharpness with which that boy watched the business he was engaged in. I am going to watch him. I am going to see him

Digitized by Google

occupy a different position during life. He said, "I can make a hundred shines out of that box of blacking; that box will shine a hundred pairs of boots." Said I, "That is an enormous profit on a five-cent box of blacking; it is as profitable as a drug store." "But," the boy said, "I do not make that on all shines. Once in awhile, almost every day, some of these men from the interior that come here have a great big flat boot, that has not had a bit of blacking on it from the time I shined it last, if it was a month ago, and once in awhile it takes a whole box to get such a man right, and I do not make any profit on that."

Here were two boys in the same business in life. One was able to tell a lie and gave up the boat he was working on and went off somewhere else to avoid facing me. The other made a careful investigation of facts, studied out what he was making, knew all about the business he was in. Will you tell me that without any advantage on earth, with only a fair chance, that one boy will not get along, and will you tell me whether, with all the advantages you can pile up, this other boy is not going to be found in the very reverse condition, and at some future time be found calling for legislation and demanding a fair division of the profits?

Then, again, look at the test of honesty. The Evening News comes to our workshop every afternoon, and I get a deal of information by giving my attention to the newsboys. They generally come with twelve papers each. They start out with twelve papers. They give for those twelve papers, as they tell me, 10 cents. There is a profit of 2 cents on the twelve papers if they sell all out. I forgot to ask whether the surplus stock on hand was taken back. Once in awhile I buy the whole twelve and give the boy 12 cents. Then he has made his transaction, and I say to him, "Now, I want you to take these papers and sell them, and I want you to bring me back one-half my money and pay it to me, so that it will be a dead certainty that you have a sale for the whole stock at a profit." I have had boys come back and pay me the money, and I have had boys that did not come back, and never appeared there any more to sell any papers.

## NEEDED LEGISLATION.

Let there be some general law passed that will hold out encouragement to the shipping interest. Capital is cheap now to the capitalists of the nation who are desirous of using it. Give them a chance to develop trade. I ask no subsidies or privileges for any class. Pass some general law by which you can give capital and labor on the sea the same protection you do capital and labor on the land, and bring into requisition one hundred millions of capital to open to the country new markets; put everything up to competition; invite the whole nation to compete; and some of those people who are willing to invest their money in Government bonds at 3 or 4 per cent., which is not much of a profit, will be willing to embrace the opportunity that you will offer them by opening up and developing new markets if there is any kind of a fair chance given; and I can assure you that in one year, outside of the opening of trade, outside of giving employment to people, outside of bringing out from United States bonds millions of money that will open up mines and build up labor, there is another great saving that will be accomplished. You will create a power upon the sea that will in the hour of need and trouble be far superior to the Navy you have at present. If an individual enters into a mighty conflict in a branch of business, or in anything you may name with an opponent of great power, his first

Digitized by Google

idea, if he is a wise man, is to study the power he is going to contest with. "I will not measure swords with you until I know I can hold my own." That is the idea. It is for this nation to show a power that will compel the nations of the world to look at it and say they will not dare strike it because it is prepared. Now the great question is to prepare, to put ourselves in that condition without a great cost to the Government.

I am not speaking this with the idea that there is going to be any war. I hope in God no blood will ever again be spilled in war, but I say it is wise to be prepared against such a time, and wise to be prepared with a condition of things that costs our people nothing. Take England to-day; all men who have read history know that she was a nation that was much involved in war up to a certain period. To-day she is the most peaceable nation on earth. With all her wonderful power, there is no nation that uses more influence to prevent any war in Europe that would draw her in, than she does. Why is all that? It is wise for us to see that we can protect ourselves against that wonderful power by knowing her weak position and at a small expense to ourselves protect us against her. She has a thousand million dollars' worth of ships on the ocean to-day. It is not so much the value of a thousand millions in ships, but it is her only road to market. Her road to market is on the great ocean that belongs to all nations. The bread that feeds her people has to come through that channel. The raw materials to give work to her factories must come through that road. The product to keep her thousands of artisans at work and keep her great factories in operation has to come over the same road. It is a dangerous position. She keeps up to-day 400 great war-ships to overawe other nations so that they shall never feel that it is safe for them to strike her trade. Our eyes are dazzled here because we see a few great steamships of great speed and great size and great magnitude. We see them all described in the press of New York, but 80 per cent. of that whole power which carries back and forth the products upon which her existence must depend, consists of ships that have not a speed of over eight or nine knots. If we had a merchant marine to-day, which might be called the "militia of the sea," what greater power could you want than to know that every week there was a departure and arrival of a number of ships manned and equipped, and that all you wanted was to put the guns on board them and say "go strike this commerce;" when you put yourself in that position nations will respect you.

If you will hold out encouragement you can create a power upon the sea. It costs you nothing, and through the little encouragement you give, the result is the opening up of new markets, digging out your mines, tearing up the raw material that is only worth 10 per cent., and, putting it by labor into a hundred per cent., giving employment to your people. It is only securing you against a terrible calamity that may strike you at any moment. The best authorities in Europe to-day, watching the tones of the highest statesmen in those lands, tell you of the numbers of millions of men that are paid for doing nothing but drawing swords and carrying muskets. There is only a military truce. You do not know when the day of action will come, and when it does come there may be a great European war, and you may see the navies of England the navies of France, and the navies of Germany knocking one another's ships to pieces. You may see them outside of Sandy Hook here on the great thoroughfare of the ocean where your merchandise is going.

You see now that your whole surplus product is carried in foreign ships; you see that your flag does not float at its mast-head; you see

Digitized by Google

that you have no right to cry out for protection for your property, because you do not own the ships; and you may see the very ships in which your surplus product is carried, by the whim of European powers, to morrow rendered useless to you by a great war. Then I should like to know who is going to suffer. Then what will become of your immense crops of corn along the line of your roads? They will perish. Then what will become of your cotton? It may go down to the bottom of the sea. And yet you depend upon a sale for these surplus products in the markets of the world for the whole financial condition of your country to-day. Destroy this, break it up for one year, and what will happen? Men are talking about "subsidy," and talking about "bounty," and talking about this foolish thing and the other, and they do not take into consideration what that wonderful nation England has done. She has not cotton nor corn, but she has coal and iron. The policy that she has pursued with coal and iron is the policy for us to study.

I have often heard the suggestion thrown out that the men there are as well off as ours are here. What is meant by that? Is it meant that the foreign workman is as well off in his own country as here? If the English workman had not a Government at his head that stopped at nothing, that respected no rights, that had no regard for truth or anything else where England's interest was at stake, the workingman of England would be a poor man, for the last statistics show that England governed a population of 362,000,000 people. She went to work and conquered and took a hold on colonies that she might get a market for her products till she maintains a population of 362,000,000; and yet England, Wales, and Scotland together have only 27,000,000. I will not put Ireland in. God knows there is no colony governed worse than it has been. Take out the 27,000,000, and, with the exception of the colonies in America, where the Canadas have profited by the example we have set, the bulk of that whole population is ground down by her law to a condition of things where everything they had has been screwed out of them in order to keep the 27,000,000 population of Great Britain in its present condition. Three hundred and sixty-two millions of people are legislated for in the interest of 27,000,000. All these people are governed in the interest of Great Britain. There is free trade with all these nations, and vast lines of steamships are subsidized to make the communication between Great Britain and the colonies such as no other nation could confer—subsidies given to England's ships running to her own colonies, so that her ships may carry freight cheaper than those of any other nation can carry it there to control that market. Well may the manufacturers of England submit to a tax to subsidize ships to force their goods beyond the possibility of competition, almost equal to a prohibitory law, into those nations which she governs.

PROTECTION TO LABOR.

By Mr. CALL:

Q. I do not wish to intimate any opinion about what you have said, but you have made some points that there may be some inquiry in regard to. I understand you to maintain the opinion that there can be no adequate compensation to the American artisan or laborer without a system of protection; that is to say, you cannot pay him good wages without a tariff?—A. That is my belief.

Q. What is the precise effect which you consider the tariff to have upon the American laborer; is it to give more ability to the manufacturer or the employer to pay, by getting a higher price for his goods?—A. Yes.

Digitized by Google

Q. How are you enabled to pay better wages to your laborer with a tariff than without it?—A. Because 90 per cent of the goods I make is labor; I pay that labor 60 per cent. more than is paid to the same class abroad; without a tariff the foreign maker could undersell me and there would not be a workshop in the land, and I should not be in the business at all.

Q. Do you mean to say that you could not make goods at all?—A. I could not make them at all and pay the present prices of labor. When 90 per cent. of an article is composed of one commodity and you want me to compete in that article where I have to pay for that 60 to 70 per cent. more than anybody else, how can I do it? That is the whole secret.

Q. You mean to say that you cannot make goods at the same price they make them abroad?—A. I cannot.

Q. Then the effect of a tariff is to enable you to get a better price for goods than they get abroad?—A. The general idea is that protection is in the interest of the workingman, and that the manufacturer, as a general thing, only receives fair compensation on his capital, because the minute he goes beyond that, unless there are patent rights or something else coming in, competition springs up, and there is no sharper competition in the world than there is between the American manufacturers themselves.

Q. Then the idea is that that protection will enable the American manufacturer to get a higher price for his goods than he could without?—A. The protection will enable him to get an enhanced price in proportion to the amount that he pays for the labor to produce the article.

Q. And thereby he is enabled to pay better wages?—A. He is enabled to pay a better price for labor.

Q. I understood you to say this morning that under the general economies of England her manufacturers were in a very prosperous condition and made a good deal of money—more than was made elsewhere; that money was low there, and they made iron so much cheaper than anywhere else because they could get capital cheaply and easily. Is not the Englishman, under a system of free trade, able to pay his workman better wages, even, than we are with a protective duty?—A. No, sir; now you are referring to the cheapness of capital.

Q. I am referring to the general condition of the economies of business in England, which make it the general manufacturing center of the world.—A. If you were to take from England the market which she controls by being the ruler of those colonies and compelling 200,000,000 of people in India to work for her at the rate of $3 a month in the interest of the Englishman, then you would take from her a large portion of her present manufacturing interest. She legislates for that interest. Take that away from her, take away that portion of shipping that she sends there, and you take from her a large portion of the position she occupies. If you were able to confine England to her own resources and the government of her own people proper, and make her treat all her people alike, as we do here, she would not be what she is to-day. She makes slaves of seven-eights of her population in the interest of the other eighth.

Q. Still, as a fact, I understand you to say that from some cause her ability to pay a high rate of wages is unquestionable?—A. No, sir; the average wages she pays, at least in ship-yards, is 70 per cent. less than I pay here; and I think it is safe to say that 50 to 60 per cent. is the difference in all other business. Therefore she does not do it.

Q. I am not asking about the fact, but about her ability. I under-

Digitized by Google

stand you to want a system of protection here in order to increase the ability to pay good wages, and I ask you whether, under the present prosperous condition of English trade and manufactures, she is not able to pay any rate of wages that might be within the limits of profit?—A. No, sir.

Q. Why?—A. Under the present condition of things, I think if you were to advance the wages in Great Britain 20 or 30 per cent. above what they are to-day you would find that a great many of her factories would close. She would be shut out from many markets.

Q. I do not understand, then, why it is you insist upon it that there can be no competition between this country and her if that small margin of 20 per cent. is taken off?—A. I cannot understand really what you want to get out.

Q. I do not want to get out anything, I only wish to know your idea?—A. My idea is simply this, as far as protection is concerned, that the moment any nation changes her laws and institutions so as to bring her laborer to the same level that the workman occupies here, and to pay him as we pay him here, then I do not think we shall need any protection against that nation.

Q. Then I understand you to think that we are pretty nearly on an average with Great Britain in our ability to manufacture cheaply?—A. No, sir, by no means.

Q. What struck me was that you wanted a system of protection, in regard to which I have no opinion now to express, in order to enable manufacturers and others to pay a high rate or a reasonable rate of wages here, and then I wanted to know, if the ability to pay was all that was necessary, why the English people did not do it?—A. I will now put the question in the most practical way I can. Take two farmers, the soil being equal and all things the same, and they are both raising crops to go into the same market. If one man pays 70 per cent. more for labor on his farm than his neighbor, how long can he compete with him in the market?

Q. I only wanted to know if the two made the same profit, why one could not pay the same wages as the other?—A. Suppose the condition of law, the condition of society was such that there was a line drawn between the two farms?

Q. That is just what I want to know, how the condition of society is going to affect it.—A. If you will get Great Britain to encourage all her working people at home and in her colonies, and legislate in the interest of labor, and pay them the same as we do, we should want no protection.

---

*APPENDICES TO MR. ROACH'S TESTIMONY.*

THE LAW OF FRANCE UPON SHIPPING.

[It will be noticed that France for sixteen years prior to the passage of this act had tried the policy of "free ships" and "free raw material," and found the policy to be a failure, although her labor is cheaper than ours.]

*Commercial. No.* 8 (1881). (*France.*) *Further correspondence with Her Majesty's Embassy at Paris relative to the French mercantile marine bill. Presented to both houses of Parliament by command of Her Majesty,* 1881.

[Translation.]

The Senate and the Chamber of Deputies have adopted,

The President of the Republic promulgates the law of which the text follows:

ARTICLE 1. The right of free pilotage is granted to all sailing vessels not measuring over 80 tons, and to steamers whose measurement does not exceed 100 tons, when-

Digitized by Google

ever they run regularly between port and port, and habitually frequent the entrances to rivers.

Nevertheless, at the request of the chambers of commerce, and after an inquiry in the usual form has been made, public administrative regulations shall determine the modifications of the existing rules which may be considered necessary in the interest of navigation.

ART. 2. For foreign-going vessels the visit of inspection prescribed by article 225 of the commercial code for a fresh cargo loaded in France shall not be obligatory unless more than six months have elapsed since the last inspection, unless the vessels shall have sustained damage.

ART. 3. For the official documents or *procès-verbaux* showing the changes of owners of the ship, either total or partial, a fixed charge shall be made for registration of 3 francs. Article 5, No. 2, of the law of the 28th February, 1872, is repealed so far as it is contrary to the present provision.

ART. 4. To compensate ship-builders for the charges fixed by the custom-house tariff the following allowances shall be made to them:

For iron or steel vessels, 60 francs per ton, gross measurement.

For wooden vessels of 200 tons or more, 20 francs.

For wooden vessels of less than 200 tons, 10 francs.

For composite vessels, 40 francs.

For engines placed on board steamers, and for auxiliary apparatus, such as steam-pumps, donkey-engines, winches, ventilators worked by machinery, also their boilers and pipes, 12 francs per 100 kilograms.

Ships planked with timber, having beams and ribs of iron or steel, are to be considered as composite vessels.

ART. 5. Every change in a ship by which an increase in measurement is gained shall give right to a bounty, based on the above tariff, according to the increase of tonnage gained.

The bounty shall be granted for driving-engines and auxiliary apparatus placed on board after completion of the ship.

On change of boilers the owner shall be allowed a compensation allowance of 8 francs per 100 kilograms on new boilers, weighed without the tubes, if of French make.

ART. 6. The allowances granted by articles 4 and 5 shall be paid, on delivery of the French register, by the receiver of customs at the nearest place of construction.

ART. 7. The system of admission duty free, fixed by article 1 of the law of the 19th May, 1866, and by article 2 of the law of the 17th March, 1879, is abolished.

ART. 8. Ship-builders shall receive allowances for vessels on the stocks at the time when the present law shall come into force, as stipulated in Article 4, after deducting the amount of customs dues fixed by the conventional tariff on foreign imports which may have been entered free of duty for ship-building purposes.

ART. 9. As compensation for charges imposed on the mercantile navy for the recruitment and service of the military navy, a navigation bounty shall be granted, during ten years from the date of publication of this law, to all French vessels, sailing or steam.

This bounty is applicable only to foreign-going vessels.

It is fixed at 1 franc 50 centimes per register ton and per 1,000 miles' run for vessels of French construction fresh off the stocks, and decreases annually by 0.075 francs for wooden vessels, 0.075 francs for composite vessels, 0.05 francs for iron vessels.

For foreign-built vessels the bounty is reduced to one-half of the above assigned amount.

Vessels taking out French registers before the promulgation of the present law are assimilated for bounty purposes to vessels of French construction.

The bounty is increased by 15 per cent. for steamers built according to plans previously approved of by the Marine Department.

The number of miles run is calculated according to the distance from the point of departure to the point of arrival, measured on a direct maritime line.

In case of war merchant ships can be requisitioned by the state.

Vessels engaged in the foreign and home fisheries ("a grande et la petite pêche"), those belonging to subsidized lines and yachts are excepted from receiving the bounty.

ART. 10. Every master of a vessel receiving one of the bounties fixed by article 9 of the present law shall be obliged to carry, free of charge, mails put under his charge by the post-office authorities, or to be delivered to that administration, as prescribed in the consular decree of the 19th Germinal, year X.

## ENGLISH CONTRACTS.

Following are extracts from some of the laws passed by the British Government to establish its merchant marine, as referred to above. The laws were varied according to the conditions of the routes. Where the competition was great the aid was proportionately large. The quotations given from the laws are but characteristic samples of many that were passed.

The Oriental Steamship Company (English) owned thirty-seven ships and had a subsidy amounting to $2,250,000 a year, or 12 per cent. on their whole capital, but this was not sufficient to meet the French opposition. The company decided to withdraw their fleet and surrender the trade to France. The English Government at once ordered a commission to investigate the affairs of the company. This commission reported that to make the company's business pay a guarantee must be given to pay them 8 per cent. during the French opposition. The great line was saved and the company's ships kept in commission. This was a notice to the capitalists of the world that the English treasury was at the back of her ocean carrying.

Let us take the official documents in support of this. The one, for example, with the Peninsular and Oriental Company made with them in 1853 for an annual subsidy of $2,500,000 was to expire January 1, 1867. February 27, 1866, a new contract was made. Under the contract the company agreed to submit its plans to the Government commissioners, and to construct the hatchways and other parts of its ships as might be necessary to the carrying and firing of a heavy armament. That made the vessels immediately available for naval purposes and for defense, and they were at the Government's disposal in case of need, and were used in the Crimean war in a way that opened the eyes of the French to the great importance of the merchant marine manned and equipped and at the Government's disposal. This merchant marine, made a part of the Government as it actually was by the terms of contract, added a wonderful strength to its naval force in case of extremity.

Digitized by Google

With the same company a new contract was made in 1870. In "articles of agreement made this 6th day of August, 1870, between the Right Hon. Spencer Compton Cavendish, commonly called the Marquis of Hartington, her Majesty's Postmaster-General, and the Peninsular and Oriental Steam Navigation Company," I find that for carrying the mails at a speed not exceeding 10 knots an hour "the Postmaster-General doth hereby covenant that there shall be paid to the company (out of such aids or supplies as may from time to time be provided and appropriated by Parliament for that purpose) the sum of £450,000 [$2,250,000] per annum." And in section 46 the contract of 1867 is declared annulled, "all claims of the company in respect to the subsidy therein mentioned having been fully satisfied by the payment of a subsidy after the rate of £500,000 [$2,500,000] per annum."

A DIVIDEND GUARANTEED.

In an official report, dated July 20, 1870, I find this significant passage:

By the terms of the contract concluded with the Peninsular and Oriental Steam Navigation Company on the 19th of November, 1867, the subsidy to be paid the company is set down as £400,000 [$2,000,000] a year, with a stipulation on the one hand that whenever the annual income of the company from all sources does not admit of the payment of a dividend of 8 per cent. on the capital employed the subsidy shall be increased by so much—subject to a limit of £100,000 [$500,000]—as is required to make up such a dividend; and, on the other, that whenever the income is sufficient to allow a dividend exceeding 8 per cent. to be declared the company shall pay to the Postmaster-General one-fourth of the excess.

NOT ONLY SUBSIDY BUT DIVIDEND.

Here is not only a subsidy but a Government guarantee of an 8 per cent. dividend to the company's stockholders. The company estimated that "the receipts from the passengers and cargo must, for a long time to come, be greatly below the expenditure absolutely necessary for the maintenance of the service" against the yet more highly subsidized French line; and the Government promptly raised the annual subsidy back to £450,000 ($2,250,000). How could the American Pacific Mail Line compete or increase its fleet against this line, which was guaranteed 8 per cent. by the English Government, while our Government compelled the Pacific Mail to carry the mail against its will for the postage, under the following statute:

[United States Revised Statutes, section 3976.]

The master of any vessel of the United States, bound from any port therein to any foreign port, or from any foreign port to any port in the United States, shall, before clearance, receive on board and securely convey all such mails as the Post-Office Department or any diplomatic or consular agent abroad shall offer; and he shall promptly deliver the same at the port of destination, to the proper officer, for which he shall receive *two cents* for every letter so delivered; and upon the entry of every such vessel returning from any foreign port the master thereof shall make oath that he has promptly delivered all the mail placed on board said vessel before clearance from the United States; and if he fail to make such oath the vessel shall not be entitled to the privileges of a vessel of the United States.

The case of the English Government's contract with the Royal Mail Steam Packet Company to Brazil, dated June 26, 1868, is still more striking. That contract guaranteed subsidies sufficient to yield 8 per cent. dividend on a capital of £900,000 ($4,500,000). An extension of the period of the contract was asked for, in consequence of serious loss

Digitized by Google

to the company by hurricane, in order to enable it to get on its legs again. In view of the French competition, the Government readily granted it. The fact was frankly admitted by the company's secretary in 1867 that "during the American war, and before the competition of the highly subsidized French company, this company earned sufficient to yield a satisfactory dividend to its shareholders, but the case has been very different during the last two years."

I call your attention to a feature in the Royal Mail Steam Packet Company's contract, herewith submitted, ordered by the House of Commons in May, 1852, and executed by the Commissioners of Admiralty. It is for a term of eleven years, and calls for a payment to the company by the Government of a subsidy of $1,370,000 per annum. By the terms the company was compelled when called on to furnish steamers to travel between certain degrees of latitude, the pay for every mile so traveled to be $2.50 per mile besides the subsidy. At this rate if a vessel steamed 8½ knots an hour she would earn $500 a day, exclusive of subsidy or mercantile business. This contract was equal to 40 per cent. per annum on the capital invested. And when a serious disaster befell the company as the result of a hurricane, the contract was extended two years; also allowing $225,000 for insurance and working expenses. (See contract "West India and Brazil Mails," dated June 26, 1868.)

## SPECIMEN CONTRACTS.

### PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY.

*Return to an order of the honorable the House of Commons, dated 13 February, 1879, for copy "of contract dated the 7th day of February, 1879, entered into with the Peninsular and Oriental Steam Navigation Company, for the conveyance of the mails between this country and India and China, together with copy of a Treasury minute dated the 12th day of February, 1879, thereon."*

TREASURY CHAMBERS, 13, FEBRUARY, 1879. HENRY SELWIN-IBBETSON.

PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY.—CONTRACT OF 7TH FEBRUARY, 1879.

EAST INDIA AND CHINA MAILS.

ARTICLES OF AGREEMENT under Seal made and entered into this Seventh day of February 1879 between the Right Honourable John James Robert Manners (commonly called Lord John Manners) Her Majesty's Postmaster General for the time being on behalf of Her Majesty (the said Lord John Manners and his successors Her Majesty's Postmasters General for the time being being hereinafter included in the term the Postmaster General) of the one part and the Peninsular and Oriental Steam Navigation Company (hereinafter called the Company) of the other part. These presents witness that Her Majesty's Postmaster General for himself and his successors Her Majesty's Postmasters General for the time being (as to the covenants agreements and stipulations hereinafter contained on his and their parts) doth hereby covenant and agree with the Company and their successors and the Company for themselves their successors and assigns (as to the covenants agreements and stipulations hereinafter contained on their part) do hereby covenant and agree with the Postmaster General and his successors Her Majesty's Postmasters General for the time being in manner following (that is to say):—

1. For all the purposes of these presents the term "mails" shall be understood to comprehend all boxes bags or packets of letters newspapers books or printed papers and all other articles which under the regulations of the Post Office for the time being are transmissible by the post without regard either to the place to which they may be addressed or to that in which they may have originated and all empty bags empty boxes and other stores and articles used or to be used in carrying on the Post Office service which shall be sent by or to or from the Post Offices in any country or place to or from which mails are to be conveyed in pursuance of this Agreement.

2. The Company will at all times during the continuance of this Agreement convey on the several routes and between the several places specified in the Schedule here-

Digitized by Google

under written and at an average rate of speed of 11 knots per hour between Brindisi and Alexandria and between Suez and Bombay and at an average rate of speed of 10½ knots per hour between Suez and Shanghai all mails which the Postmaster General or any of his officers or agents shall from time to time and at any time or times require to be conveyed in either direction between Brindisi and Bombay or between Brindisi and Shanghai and generally between any of the ports or places mentioned in the said Schedule by means of vessels of the Company plying between Brindisi and Alexandria and between Suez and Bombay and between Suez and Shanghai in connection with the land conveyance of mails through Egypt.

3. The Company will at all times during the continuance of this Agreement or so long as the whole or any part of the services hereby agreed to be performed ought to be performed in pursuance thereof provide keep seaworthy and in complete repair and readiness to the satisfaction of the Postmaster General for the purpose of conveying as hereinafter provided all mails which the Postmaster General or any of his officers or agents shall from time to time and at any time require to be conveyed as herein provided a sufficient number of good substantial and efficient steam vessels of adequate power and speed and supplied with first-rate appropriate steam engines and in all respects suited to the performance of the services herein agreed to be performed within the respective times herein stipulated.

4. The Company shall land and embark at Bombay all mails conveyed or intended to be conveyed by them in pursuance of this Agreement by means of a small steam vessel and accordingly the Company shall in addition to the vessels hereinbefore mentioned provide at Bombay a small steam vessel hereinafter called the Bombay subsidiary steamer which shall be so constructed as to be able at all states of the tide to land and embark the mails at Bombay and shall at all times keep such vessel in complete repair and ready for landing and embarking the mails accordingly.

5. The Company shall at their own costs land and embark all mails conveyed or intended to be conveyed by them in pursuance of this Agreement at all ports or places at which such mails are to be landed or embarked and shall accordingly at their own costs provide suitable means for landing and embarking the mails at all such ports or places.

6. The vessels to be provided under this agreement shall be always furnished with all necessary and proper tackle stores lamps oil tallow fuel provisions machinery engines anchors cables boats fire-pumps and all other proper and requisite means for extinguishing fire lightning conductors charts chronometers proper nautical instruments and all other furniture and apparel and whatsoever else may be requisite and necessary for equipping the said vessels and rendering them constantly efficient for the said services and shall be manned with legally qualified and competent officers with appropriate certificates granted pursuant to the Act or Acts in force for the time being relative to the granting certificates to officers in the Merchant Service and also with competent engineers and a sufficient crew of able seamen and other men and with a competent surgeon to be subject to the approval of the Postmaster General.

7. If the Postmaster General shall consider any of the Company's vessels unfit for the conveyance of mails he may by writing under his hand or under the hand of one of the Secretaries or Assistant Secretaries of the Post Office require the Company to show cause why such vessel should not be withdrawn from the service and unless within six weeks after such requisition the Company shall show cause to the contrary to the satisfaction of the Postmaster General he may at any time after the expiration of the said period of six weeks by writing under his hand or under the hand of one of the Secretaries or Assistant Secretaries of the Post Office declare such vessel to be unfit for the conveyance of mails and after such declaration shall have been made it shall not be lawful for the Company to employ such vessel in the performance of this Agreement and in order to determine whether the Postmaster General shall be justified in declaring any vessel unfit for the conveyance of mails or whether the Company shall be able to show cause to the contrary a special examination shall be made of the hull and machinery of any such vessel by such person or persons as may be selected for that purpose by the Postmaster General.

8. The equipments officers engineers and crew of each vessel when such vessel is in any British Port shall be subject at all times to the inspection of the Postmaster General or of such other person or persons as he shall at any time or times authorise to make such inspection.

9. All mails conveyed from Brindisi to Bombay in pursuance of this Agreement shall be conveyed by the Company from Brindisi to Alexandria and from Suez to Bombay and the voyage from Suez to Bombay shall be completed in 368 hours from the commencement of the voyage from Brindisi to Alexandria and the said period of 368 hours shall include 17 hours for the conveyance of such mails by land from Alexandria to Suez and 6 hours for the stoppage at Aden of the vessel by which the same shall be conveyed from Suez to Bombay.

10. All mails conveyed from Bombay to Brindisi in pursuance of this Agreement shall be conveyed by the Company from Bombay to Suez and from Alexandria to

Digitized by Google

Brindisi and the voyage from Alexandria to Brindisi shall be completed in 423 hours (during the prevalence of the south-west monsoon) and in 375 hours at all other times from the commencement of the voyage from Bombay to Suez and the said periods of 423 hours and 375 hours shall include 6 hours for the stoppage at Aden of the vessel by which the same shall be conveyed from Bombay to Suez and 24 hours for the conveyance of such mails by land from Suez to Alexandria.

11. All mails conveyed from Brindisi to Shanghai in pursuance of this Agreement shall be conveyed by the Company from Brindisi to Alexandria and from Suez to Shanghai and the voyage from Suez to Shanghai shall be completed in 947 hours (during the prevalence of the north-east monsoon) and in 875 hours at all other times from the commencement of the voyage from Brindisi to Alexandria and the said periods of 947 hours and 875 hours shall include 17 hours for the conveyance of such mails by land from Alexandria to Suez and 6 hours for the stoppage at Aden 24 hours for the stoppage at Point de Galle or Colombo 6 hours for the stoppage at Penang 24 hours for the stoppage at Singapore and 24 hours for the stoppage at Hong Kong of the vessel by which the same shall be conveyed from Suez to Shanghai.

12. All mails conveyed from Shanghai to Brindisi in pursuance of this Agreement shall be conveyed by the Company from Shanghai to Suez and from Alexandria to Brindisi and the voyage from Alexandria to Brindisi shall be completed in 1,006 hours (during the prevalence of the south-west monsoon) in 910 hours at all other times from the commencement of the voyage from Shanghai to Suez and the said periods of 1,006 hours and 910 hours shall include 48 hours for the stoppage at Hong Kong 24 hours for the stoppage at Singapore 6 hours for the stoppage at Penang 24 hours for the stoppage at Point de Galle or Colombo 6 hours for the stoppage at Aden of the vessel by which the same shall be conveyed from Shanghai to Suez and 28 hours for the conveyance of such mails by land from Suez to Alexandria Provided always that three additional hours shall be allowed for the conveyance of the mails from Brindisi to Shanghai and from Shanghai to Brindisi respectively if and whenever Colombo shall be substituted as a port of call in lieu of Point de Galle.

13. The several periods of 368 hours 423 hours 375 hours 947 hours 875 hours 1,006 hours and 910 hours hereinbefore mentioned are hereinafter called periods of transit and shall in all cases be reckoned from the commencement of the voyage of the vessel by which the first part of the transit shall be performed to the completion of the voyage of the vessel by which the last part of the transit shall be performed and the times of the commencement and completion of every such voyage shall be ascertained and recorded by officers of the Postmaster General in pursuance of arrangements to be from time to time made by him for such purpose and the decision of the Postmaster General as to all questions relating to periods of transit shall be final and conclusive.

14. With respect to voyages commencing or terminating at Bombay a voyage commencing at Bombay shall be deemed to commence when the Bombay subsidiary steamer with the mails on board arrives alongside the vessel by which the voyage is intended to be performed and a voyage terminating at Bombay shall be deemed to be completed when the Bombay subsidiary steamer arrives alongside the vessel by which the voyage has been performed and with respect to voyages commencing or terminating at Brindisi or Shanghai a voyage commencing at Brindisi or Shanghai shall be deemed to commence so soon after the time appointed by the Postmaster General for the commencement thereof or after the completion of the embarkation of the mails on board the vessel by which the voyage is intended to be performed whichever shall last happen as (having regard to practical considerations) the anchor of the vessel can be weighed or the vessel can be loosed from its moorings and a voyage terminating at Brindisi or Shanghai shall be deemed to be completed when the vessel by which the voyage has been performed has arrived at a position in the port of final destination from which the mails can be conveniently delivered and has dropped its anchor or been attached to its moorings.

15. The conveyance by land between Alexandria and Suez of mails conveyed or intended to be conveyed in pursuance of this Agreement shall be under the direction of the Postmaster General and whenever the time occupied by such land conveyance shall exceed the time hereinbefore specified in that behalf an equivalent addition shall be made to the period of transit during which such excess shall have occurred.

16. One of the vessels to be provided under this Agreement shall at such intervals as are specified in the Schedule hereunder written and on such days of the week and at such hours as the Postmaster General shall appoint (either by a time table or time tables to be from time to time approved by him in accordance with the terms of this Agreement or otherwise as he shall think fit) and immediately after the mails are embarked put to sea from touch and arrive at the several ports or places respectively mentioned in the said Schedule and all the stipulations matters and things therein contained shall form part of this Agreement and be observed and performed by the Company accordingly And the Company shall convey in such vessels to and from and cause to be delivered and received at such of the ports or places mentioned in

Digitized by Google

the said Schedule from or at which the said vessels are to start touch and arrive in the performance of this Agreement all such mails as shall or may be tendered or delivered to or received by the Company or any of their agents officers or servants by or from the Postmaster General or any of his officers or agents.

17. Should it be deemed by the Postmaster General his officers or agents requisite for the public service that any vessel to be employed under this Agreement should at any time or times delay her departure from any port from which the mails are to be conveyed under this Agreement beyond the period appointed for her departure therefrom the Postmaster General his officers or agents shall have power to order such delay (not however exceeding 24 hours) by letters addressed by him or them to the master of any such vessel or person acting as such and which shall be deemed a sufficient authority for such detention and in any such case an equivalent addition shall be made to the period of transit during which such detention shall take place.

18. If at any time or times the Postmaster General shall either on account of any alteration in the ports of call or for any other reason whatever desire to alter the particular days times or hours of departure from and arrival at any of the ports or places to or from which mails are for the time being to be conveyed under this Agreement he shall be at liberty so to do on giving to the Company three calendar months' notice in writing of such his desire provided such alterations do not necessitate a rate of speed beyond the rate of 11 knots per hour between Brindisi and Alexandria and between Suez and Bombay or beyond the rate of 10½ knots per hour between Suez and Shanghai.

19. If at any time or times the Postmaster General shall desire otherwise to modify the services hereby agreed to be performed (as for example to increase or decrease the frequency of the conveyance of mails between any of the ports or places to or from which such mails are to be conveyed under this Agreement or to extend the conveyance of such mails to any other ports or places not specified in this Agreement or to discontinue the conveyance of such mails to or from any port or place specified in this Agreement) he shall be at liberty so to do on giving reasonable notice to the Company and from and after the expiration of any such notice the subsidy hereinafter agreed to be paid as the consideration for the performance by the Company of the services hereby agreed to be performed shall cease to be payable and the Postmaster General shall thenceforth during the continuance of this Agreement pay to the Company in lieu thereof a subsidy in consideration of the performance by the Company of such modified services of such amount as shall be agreed upon between the Postmaster General and the Company or failing such Agreement of such amount as shall be determined by arbitration in manner hereinafter provided and this Agreement shall thenceforth operate and take effect in the same manner in all respects as if the amount of such altered subsidy had been inserted in this Agreement instead of the subsidy hereinafter agreed to be paid.

20. The particular days times and hours of departure from and arrival at any ports or places or of other services (if any) which may be appointed under the preceding clauses or any of them shall for the time being be deemed to be the days times and hours of departure and arrival of mails and other services under this Agreement and shall be observed and kept by the Company accordingly.

21. The Company shall receive and allow to remain on board of each of the said vessels while employed in the performance of this Agreement between Suez and Bombay and also while remaining at Suez and whether such vessel shall be with or without mails on board an officer of the Indian Post Office to take charge of and sort the said mails And the Company shall receive and allow to remain on board each of the said vessels while employed in the performance of this Agreement between Singapore and Hong Kong an officer of the Hong Kong Post Office to take charge of and sort the Hong Kong mails.

22. A suitable first class cabin with appropriate bed bedding and furniture shall at the cost of the Company be provided and appropriated by them for the exclusive use and accommodation of every such officer and every of the said officers shall be victualled by the Company as a chief cabin passenger without any charge either for his passage or victualling.

23. The Company shall also receive and allow to remain on board each of the said vessels while employed in the performance of this Agreement to the east of Suez and also while remaining at Suez or at any port or place east of Suez and whether such vessels shall be with or without mails on board in addition to the officer in charge of the mails such a number of officers in the service of the Post Office as shall be reasonably required for the purpose of sorting and making up the mails conveyed or to be conveyed by such vessel and shall without any charge provide suitable accommodation and victualling for such additional officers either as chief cabin passengers or as fore cabin passengers at the option of the said Postmaster General.

24. The Company shall at their own cost provide on each of the vessels to be employed under this Agreement a separate and convenient room for the convenient and secure deposit of the mails under lock and key and shall also at the like cost if and

Digitized by Google

when they shall be required so to do by the Postmaster General erect and provide on each of the vessels to be employed under this Agreement between Suez and Bombay a separate and convenient room on the uppermost deck and on each of the vessels to be employed under this Agreement between Singapore and Hong Kong a separate and convenient room for sorting and making up the mails and shall provide in every such room all such furniture lamps fittings and other conveniences as shall be necessary or convenient for the purpose of sorting and making up mails and all such furniture lamps fittings and other conveniences shall be from time to time cleansed and kept in repair and the oil for the lamps supplied by the servants and at the cost of the Company and the services of the crew of every such vessel shall from time to time be given in the conveyance of the mails between the mail room and the sorting room.

25. At each port or place where mails are to be delivered and embarked the officer having charge of mails shall whenever and as often as by him shall be deemed necessary for the public service be conveyed on shore and also from the shore to the vessel employed for the time being in the performance of this Agreement together with or (if such officer shall consider it necessary for the purposes of this Agreement so to do) without mails in a suitable and seaworthy boat of not less than four oars to be furnished with effectual covering for the mails and properly provided manned and equipped by the Company.

26. The master or commander of each of the said vessels employed in the performance of this Agreement shall whenever required by the Postmaster General or his agents without any remuneration other than the subsidy herein provided to be paid to the Company take due care of and the Company shall be responsible for the embarkation and delivery of the mails.

27. Each of such masters or commanders shall make the usual declaration or declarations required or which may hereafter be required by the Postmaster General in such and similar cases and furnish such journals returns and information to and perform such services as the Postmaster General or his agents may require and every such master or commander or officer duly authorised by him having the charge of mails shall himself immediately on the arrival at any of the said ports or places of any such vessel deliver all mails for such port or place into the hands of the Postmaster or other person at such port or place whom the Postmaster General shall authorise to receive the same receiving in like manner all the return or other mails to be forwarded in due course.

28. The Company shall not nor shall any of the masters or commanders of any of the vessels employed or to be employed under this Agreement receive or permit to be received on board any of the vessels employed under this Agreement any letters for conveyance other than those contained in Her Majesty's mails and such letters as are not required by law to pass through the Post Office nor shall the Company or any such master or commander receive or permit to be received on board any of such vessels any mails for conveyance on behalf of any colony or foreign country without the consent of the Postmaster General.

29. The Company and all commanding and other officers of the vessels employed in the performance of this Agreement and all agents seamen and servants of the Company shall at all times punctually attend to the orders and directions of the Postmaster General his officers or agents as to the mode time and place of landing delivering and embarking mails.

30. The Company shall and will when and so often as they or the Masters or Commanders of their vessels shall be required in writing so to do by the Postmaster General or by any officers or agents acting under his authority (such writing to specify the rank or description of the person or persons to be conveyed and the accommodation to be provided for him or them) receive provide for victual and convey to from and between any of the ports or places to from and between which any of the said vessels are to proceed in the performance of this Agreement in addition to any officers of the Post Office employed in connection with the mails conveyed or to be conveyed under this Agreement any number of naval military or civil officers in the service of Her Majesty not exceeding eight in any one ship with or without their wives and children as chief cabin or first class cabin passengers and any number of non-commissioned and warrant officers not exceeding four in any one ship with or without their wives and children as fore cabin or second class passengers together with servants of both chief and fore cabin passengers and any number of seamen marines soldiers or artificers in Her Majesty's service not exceeding 10 in any one ship with or without their wives and children as deck or third class passengers to be always provided with effectual protection from rain sun and bad weather and not exposed on deck without such competent shelter and to have hammocks or bunks (subject to the approval of the Lords Commissioners of the Admiralty) placed between decks.

31. The passengers who shall be conveyed in pursuance of the last preceding clause (who are hereinafter designated Government passengers) with their families shall be treated in no respect whether as regards food cabin or other accommodation or aught else in a way inferior to that of ordinary passengers of the same class or that re-

Digitized by Google

quired by the Regulations of Her Majesty's Transport Service. The messing of the first and second-class Government passengers shall include in each day an imperial pint of good sound bottled or draught ale or beer and that of the first-class in addition an imperial pint of good foreign wine. The several classes of passengers shall mess in separate places and medical attendance medicine and medical comforts mess utensils and fittings cooking utensils articles for table use and mess places fuel lights requisite articles of bedding and all other necessaries shall be provided for them in like manner as for ordinary passengers of the like classes respectively.

32. The passage-money for Government passengers and their families respectively shall be the same as that charged by the Company for ordinary passengers for the same class and shall include all the particulars mentioned in the last preceding clause and whenever any alteration of rates for ordinary passengers may be made the Postmaster General and the Lords Commissioners of the Admiralty shall be immediately appraised of such alteration.

33. Returns of the embarkation and disembarkation of all Government passengers shall be furnished to the Director of Transport Services immediately after the departure and arrival of each vessel.

34. Payments for passage-money for Government passengers shall be applied for by invoices according to a form to be obtained from the office of the Director of Transport Services and shall be made upon the production to such Director of the orders for the passage together with a certificate under the hand of the Commanding Officer specifying the number of the third-class passengers (men women and children) conveyed with the ages and sexes of the latter and stating the periods during which they have been respectively regularly supplied while on board with provisions and also of a certificate under the hand of each first and second class passenger of his or her having been landed at the place of destination and of having been properly accommodated and messed during the voyage and specifying the dates from and to which they were so messed computed from the first to the last dinner meal.

35. The Company shall convey for every Government passenger free of charge the quantity of baggage (whether such quantity shall be estimated or ascertained by bulk or weight) to which he is entitled under the Regulations of Her Majesty's Transport Service for the time being in force and freight shall be payable for any extra baggage of a Government passenger after the same rate as the freight payable according to the Regulations of the Company for the time being for extra baggage of an ordinary passenger of the same class.

36. The passage-money for the wives and families of commissioned and civil officers when not ordered to be conveyed at the public expense shall be paid to the Company by the officers themselves.

37. In all cases where an officer in the civil naval or military service of Her Majesty who may not be entitled to a passage at the public expense shall require a passage on board any of the vessels employed in the performance of this Agreement the Company shall be bound to provide a passage for such officer in preference to any private passenger and shall charge no higher rate for such passage than is chargeable for an ordinary passenger.

38. The Company shall receive on board each of the vessels employed in the performance of this Agreement and shall convey on behalf of the Lords Commissioners of the Admiralty any small packages which may be ordered for conveyance and also (on receiving from the Postmaster General or his officers or agents or from the British naval officers in command of any naval station two days previous notice) shall receive on board any naval or other stores not exceeding 10 tons weight or 15 tons of 40 cubic feet each in measurement at any one time in any one vessel and shall convey and deliver such small packages and stores at the lowest rate of freight charged by the Company for private goods of a similar character or description and the Company shall give immediate notice to the Postmaster General and the Lords Commissioners of the Admiralty of any alteration in such rate of freight and shall in all cases be responsible for the custody and safe and speedy delivery of such packages and stores.

39. It shall be lawful for the Postmaster General at any time and from time to time to delegate any of the powers vested in him by virtue of these presents to such person or persons as he shall think fit.

40. The Company shall not convey in any vessel employed by them in pursuance of this Agreement any nitro glycerine or any other article which shall have been legally declared specially dangerous.

41. The Company shall undertake for themselves all arrangements relative to quarantine.

GOVERNMENT POWER TO PURCHASE.

42. The Lord Commissioner of the Admiralty shall at any time during the continuance of this Agreement if they shall consider it necessary for the public interest so to do have power and be at liberty to purchase all or any of the vessels for the time being employed or intended to be employed under this Agreement at a valuation or

Digitized by Google

to charter the same exclusively for Her Majesty's service at a rate of hire to be mutually fixed and agreed on by them and the Company or in case of difference be determined by arbitration and every or any difference as to the amount of valuation or rate of hire so to be paid shall be determined by arbitration in manner hereinafter provided And the said Commissioners in the case of hiring any such vessel shall return the same to the Company in the same state and condition as the same was in at the time of any such hiring reasonable wear and tear excepted And if any difference should arise upon that point the same shall be determined by arbitration in manner hereinafter provided And it is further agreed that in the case of such purchase or hire the services hereby contracted to be performed shall be performed by other vessels of the Company of a similar description to the vessel or vessels purchased or hired if they can in due and proper time furnish them And in the event of the Company being allowed by the Postmaster General to continue to perform only a portion of such services there shall be paid to the Company such annual sum of money as shall be agreed upon by the Postmaster General and the Company and in case of their differing as to the amount the difference shall be determined by arbitration in manner hereinafter provided.

THE RATE OF SUBSIDY.

43. In consideration of the due and faithful performance by the Company of the services hereby agreed to be performed by them there shall be payable to the Company during the continuance of this Agreement (out of such aids or supplies as may from time to time be appropriated by Parliament for that purpose) a yearly subsidy or sum after the rate of 370,000*l.* per annum or (in the event of any such default or failure as hereinafter mentioned) so much of the said subsidy or sum as shall remain payable in respect of any year after making such deductions therefrom (if any) as hereinafter in that behalf mentioned in respect of any such default or failure.

44. If at any time the Company shall fail to provide an efficient vessel at Brindisi Bombay or Shanghai ready to put to sea on and at the appointed day and hour then and so often as the same shall happen there shall be deducted from the subsidy which would in the absence of such default be payable to the Company for the current year the sum of 500*l.* and also the further sum of 100*l.* for every successive 24 hours which shall elapse until such vessel actually proceeds to sea on her voyage in pursuance of this Agreement Provided always that the total amount of the sums deducted as last aforesaid shall not in the aggregate exceed the part of the said subsidy of 370,000*l.* for the current year which shall be applicable to the voyage reckoned from the first port of departure to the last port of arrival in respect of which default shall have been made by a sum greater than the sum of 1,000*l.*

45. If at any time or times Her Majesty's mails shall not be conveyed from Brindisi to Bombay or from Brindisi to Shanghai within the respective periods of transit hereinbefore stipulated in that behalf then and so often as the same shall happen there shall be deducted from the subsidy which but for this provision would be payable to the Company for the current year a sum of 100*l.* for every complete period of 12 hours by which the time actually occupied in the conveyance of such mails from Brindisi to Bombay or from Brindisi to Shanghai as the case may be (reckoned from the commencement of the voyage from Brindisi to Alexandria to the completion of the voyage from Suez to Bombay and Shanghai as the case may be) shall have exceeded the period of transit hereinbefore stipulated in that behalf.

46. If at any time or times Her Majesty's mails shall not be conveyed from Bombay to Brindisi or from Shanghai to Brindisi within the respective periods of transit hereinbefore stipulated in that behalf then and so often as the same shall happen there shall be deducted from the subsidy which but for this provision would be payable to the Company for the current year a sum of 200*l.* for every complete period of 12 hours by which the time actually occupied in the conveyance of such mails from Bombay to Brindisi or from Shanghai to Brindisi as the case may be (reckoned from the commencement of the voyage from Bombay to Suez or from Shanghai to Suez as the case may be to the completion of the voyage from Alexandria to Brindisi) shall have exceeded the period of transit hereinbefore stipulated in that behalf Provided always that in the event of the late arrival of a vessel at Brindisi having on board mails conveyed from both Bombay and Shanghai one deduction only at the rate aforesaid shall be made under this clause although the times atcually occupied in the conveyance of such mails both from Bombay to Brindisi and from Shanghai to Brindisi may have been in excess of the respective periods of transit hereinbefore stipulated in that behalf and such deduction shall be calculated on the longer of such periods of excess.

47. Provided always that the total amount of the sums deducted in respect of any such default or failure as hereinbefore mentioned in the delivery of mails shall not exceed the part of the said subsidy of 370,000*l.* for the current year which shall be applicable to the voyages both east and west of Egypt which have or ought to have been performed in the conveyance of such mails.

48. Each of the deductions hereinbefore mentioned shall be made and the yearly

Digitized by Google

subsidy of 370,000*l.* be reduced accordingly from whatever cause the default or failure in respect of which the same are made shall have arisen and although such default or failure shall have arisen wholly or in part from any cause or causes altogether beyond the control of the Company and although no damage or loss shall have been sustained by reason or in connection with such default and no such deduction shall in any case be waived or the payment thereof remitted by the Postmaster General or be deemed to be a penalty or in the nature of a penalty and the payment by the Postmaster General of what shall from time to time remain due in respect of the said subsidy of 370,000*l.* after making any such deduction as aforesaid shall in no case prejudice the right of the Postmaster General to treat the failure of the Company to provide an appropriate vessel at any appointed place or time or to perform any service at or within the appointed period as a breach of this Agreement.

49. All accounts in relation to the said subsidy and the deductions therefrom shall be made out and settled up to and on or as soon as conveniently may be after the 31st day of March the 30th day of June the 30th day of September and the 31st day of December in each year and the amount or balance if any which shall be justly due to the Company on each such quarterly account shall be paid by the Postmaster General out of such aids or supplies as aforesaid upon the settlement thereof and for the purposes of such accounts the said yearly subsidy of 370,000*l.* shall be deemed to accrue from day to day subject to the liability of the same to be reduced by such deductions as aforesaid.

50. The Postmaster General may at any time before the 1st day of February 1880 elect by notice in writing under the hand of one of the Secretaries or Assistant Secretaries of the Post Office to pay during the continuance of this Agreement a yearly subsidy after the rate of 360,000*l.* per annum only instead of the subsidy of 370,000*l.* hereinbefore mentioned or so much of such reduced subsidy as shall remain payable in respect of any year after maki g such deductions therefrom (if any) as hereinbefore in that behalf mentioned in respect of any such default or failure as aforesaid Provided always And it is hereby declared that in the event of the Postmaster General making such election as aforesaid no deduction shall be made from the said reduced subsidy by reason of any such default or failure as in Articles 45 46 and 47 respectively mentioned which is proved to the satisfaction of the Postmaster General to have arisen wholly or in part from any cause or causes altogether beyond the control of the Company.

51. This Agreement shall commence on or as from the 1st day of February 1880 and shall continue in force until the 31st day of January 1888 and shall then determine if the Postmaster General shall by writing under his hand or under the hand of one of the Secretaries or Assistant Secretaries for the time being of the Post Office have given to the Company or if the Company shall have given to the Postmaster General twenty four calendar months' notice that the Agreement shall so determine but if neither the Postmaster General nor the Company shall give any such notice this Agreement shall continue in force even after the said 31st day of January 1888 until the expiration of a twenty-four calendar months' notice in writing as aforesaid which may be given by either of the parties hereto to the other of them and which last-mentioned notice may be given on or at any time after the 31st day of January 1886.

52. If the Company shall fail to commence the performance of the services hereby agreed to be performed on the 1st day of February 1880 or on the first day thereafter which the Postmaster General shall fix as the day for the commencement of the performance of such services the Company shall pay to Her Majesty Her heirs or successors as stipulated or ascertained damages in respect of such default the sum of 100*l.* and also the further sum of 100*l.* for every successive period of 24 hours which shall elapse before the Company shall commence the performance of such services Provided always that the total amount which shall become payable by the Company in respect of such default as aforesaid shall not in the aggregate exceed the sum of 40,000*l.* Provided also that the payment by the Company of the aforesaid sums by way of stipulated or ascertained damages in respect of any default in the commencement of the performance of the said services shall not prejudice the right of the Postmaster General to insist on any deduction from the said subsidy of 370,000*l.* or 360,000*l.* as the case may be to which he may be entitled in respect of the same default under the provisions hereinbefore contained.

53. If on the determination of this Agreement any vessel or vessels shall have started or shall start on any voyage or voyages with the mails on board in conformity with this Agreement such voyage or voyages shall be continued and performed and the mails be delivered and embarked during and at the termination of the same as if this Agreement had remained in force with regard to any such vessels and services. And with respect to such vessels and services as last aforesaid respectively this Agreement shall be considered as having terminated when such respective vessels shall have reached their port or place of destination and such respective services shall have been performed but the Company shall not be entitled to receive any payment or compensation for the same.

Digitized by Google

54. All notices or directions which the Postmaster General his officers agents or others are hereby authorized to give to the Company their officers servants or agents other than any notice of termination of this Agreement may at the option of the Postmaster General his officers agents or others either be delivered to the master of any of the said vessels or any other officer or agent of the Company in the charge or management of any vessel employed in the performance of this Agreement or left for the Company at their office or house of business in London or any other place and any notices or directions so given or left shall be binding on the Company Provided always that any notice of termination of this Agreement shall be served on the Company their officers servants or agents at their office or last known office in London.

55. The Company shall not assign underlet or dispose of this Agreement or any part thereof without the consent of the Postmaster General signified in writing under his hand or under the hand of one of the Secretaries or Assistant Secretaries of the Post Office and in case of the same or any part thereof being assigned underlet or otherwise disposed of or of any great or habitual breach of this Agreement or any covenant matter or thing herein contained on the part of the Company their officers agents or servants it shall be lawful for the Postmaster General if he shall think fit and notwithstanding there may or may not have been any former breach of this Agreement by writing under his hand or under the hand of one of the Secretaries or Assistant Secretaries of the Post Office to determine this Agreement without any previous notice to the Company or their agents nor shall the Company be entitled to any compensation in respect of such determination and such determination shall not deprive the Postmaster General of any right or remedy to which he would otherwise be entitled by reason of such breach or any prior breach of this Agreement and in case any difference shall arise between the parties hereto as to the sufficiency of any such breach as aforesaid to justify the Postmaster General in determining this Agreement such difference shall be referred to and determined by arbitration in manner hereafter provided Provided always that in case within seven days after service on the Company of a notice determining this agreement on the ground of any great or habitual breach or breaches thereof the Company give a notice in writing to the Postmaster General (by delivering the same or sending the same by post to one of the Secretaries of the Post Office) that they dispute the sufficiency of such breach or breaches to justify the Postmaster General in determining this Agreement such dispute shall be referred to arbitration in manner hereinafter provided and in such case this Agreement shall notwithstanding such notice of determination continue in force unless and until an award shall be made to the effect that such breach or breaches was or were sufficient to justify the Postmaster General in giving such notice of determination as aforesaid.

56. All matters which in pursuance of the provisions hereinbefore contained are to be determined by arbitration shall be referred to two arbitrators or their umpire pursuant to and so as with regard to the mode and consequences of the reference and in all other respects to conform to the provisions in that behalf contained in the Common Law Procedure Act 1854 or any then subsisting statutory modification thereof and upon every or any such reference the arbitrators and umpire shall respectively have power to examine the parties and witnesses upon oath or affirmation and every or any such reference may be made a rule or order of any division of Her Majesty's High Court of Justice on the application of either party and such party may instruct counsel to consent thereto for the other party.

57. In pursuance of the provisions contained in an Act of Parliament passed in the 22nd year of the reign of King George the Third intituled "An Act for restraining any "person concerned in any Contract Commission or Agreement made for the public "service from being elected or sitting and voting as a Member of the House of Com-"mons" no Member of the House of Commons shall be admitted to any share or part of this Agreement or to any benefit to arise therefrom contrary to the true intent and meaning of the said Act.

58. This Agreement shall not be binding until it has been approved by a resolution of the House of Commons.

59. And lastly for the due and faithful performance of all and singular the covenants conditions provisos clauses articles and agreements hereinbefore contained which on the part and behalf of the Company are or ought to be observed performed fulfilled and kept the Company do hereby bind themselves and their successors unto our Sovereign Lady the Queen in the sum of 40,000*l.* of lawful money of the United Kingdom to be paid to our said Lady the Queen Her heirs and successors by way of stipulated or ascertained damages hereby agreed upon between the Postmaster General and the Company in case of the failure on the part of the Company in the due execution of this Agreement or any part thereof.

In witness whereof the said John James Robert Manners commonly called Lord John Manners Her Majesty's Postmaster General hath hereunto set his hand and seal and the Peninsular and Oriental Steam Navigation Company have caused their common seal to be hereunto affixed the day and year first above written.

## MAIL CONTRACTS (INDIA, CHINA, AND JAPAN).

Guarantees a dividend of 8 per cent.

Subsidy, $2,500,000 per annum.

If the subsidy of $2,250,000 is not sufficient to pay a dividend of 8 per cent. a further allowance is made to the company.

Contract commenced first day of April 1869 and continued in force until first day of April 1880.

*RETURN to an Order of the Honourable The House of Commons, dated 8 August 1870; for copy "of New Contract with the Peninsular and Oriental Steam Navigation Company for the Conveyance of Mails between this Country and India, China, and Japan; together with Copy of Report from the Postmaster General relative thereto."*

EAST INDIA, CHINA, AND JAPAN MAILS.

ARTICLES OF AGREEMENT made this 6th day of August 1870 between the Right Honorable Spencer Compton Cavendish commonly called Marquis of Hartington Her Majesty's Postmaster General for the time being of the one part and the Peninsular and Oriental Steam Navigation Company of the other part Witness that the Company for themselves their successors and assigns hereby covenant with the Postmaster General his executors administrators successors and assigns Her Majesty's Postmasters General for the time being in manner following (that is to say):—

1. For all the purposes of these presents the term "mails" shall be understood to comprehend all boxes bags or packets of letters newspapers books or printed papers and all other articles which under the existing regulations of the Post Office are transmissible by the post without regard either to the place to which they may be addressed or to that in which they may have originated and all empty bags empty boxes and other stores and articles used or to be used in carrying on the Post Office service which shall be sent by or to or from the Post Office.

Digitized by Google

2. If at any time the Postmaster General shall desire to modify the existing regulations as to articles transmissible by the post either by prohibiting the transmission by the post of the articles which are now transmissible thereby or by authorising the transmission by the post of articles which are not now transmissible thereby he shall be at liberty so to do on giving reasonable notice to the Company and in case the effect of such modification shall be to diminish the burden of the services hereinafter agreed to be performed a deduction shall be made from the annual subsidy hereinafter stipulated to be paid to the Company and in case the effect of such modification shall be to increase the burden of the services hereinafter agreed to be performed an addition shall be made to such subsidy and the amount of such deduction or addition as the case may be shall be settled by agreement between the Postmaster General and the Company or failing agreement by arbitration in manner hereinafter provided.

3. The Company will at all times during the continuance of this agreement or so long as the whole or any part of the services hereby agreed to be performed ought to be performed in pursuance thereof provide keep seaworthy and in complete repair and readiness for the purpose of conveying as hereinafter provided all Her Majesty's mails which shall at any time and from time to time by the Postmaster General or any of his officers or agents be required to be conveyed as hereinafter provided on all the routes specified in the first Schedule hereunder written a sufficient number of good substantial and efficient steam vessels of adequate power and speed and supplied with first rate appropriate steam engines and in all respects suited to the performance herein agreed to be performed within the respective times herein stipulated.

4. The vessels to be provided under this Agreement shall be always furnished with all necessary and proper tackle stores oil tallow fuel provisions machinery engines anchors cables boats fire pumps and all other proper and requisite means for extinguishing fire lightning conductors charts chronometers proper nautical instruments and all other furniture and apparel and whatsoever else may be requisite and necessary for equipping the said vessels and rendering them constantly efficient for the said services and manned with competent officers with appropriate certificates granted pursuant to the Act 17 & 18 Victoria cap. 104, or to the Act or Acts in force for the time being relative to the granting certificates to officers in the Merchant Service and also with competent engineers and a sufficient crew of able seamen and other men and with a competent surgeon to be subject to the approval of the Postmaster General.

5. The Company shall land and embark the mails at Bombay by means of a small steam vessel and accordingly the Company shall in addition to the vessels hereinbefore mentioned provide a small steamer which shall be kept at Bombay in complete repair and ready for landing and embarking the mails.

6. If Her Majesty's Postmaster General shall consider any of the Company's vessels unfit for the conveyance of mails he may by writing under his hand or under the hand of the Secretary or one of the Assistant Secretaries of the Post Office require the said Company to show cause why such vessel should not be withdrawn from the service and unless within six weeks after such requisition the said Company shall show cause to the contrary to the satisfaction of the said Postmaster General he may at any time after the expiration of said period of six weeks by writing under his hand or under the hand of the Secretary or one of the Assistant Secretaries of the Post Office declare such vessel to be unfit for the conveyance of mails and after such declaration shall have been made it shall not be lawful for the said Company to employ such vessel in the performance of this Contract And in order to determine whether the said Postmaster General shall be justified in declaring any vessel unfit for the conveyance of mails or whether the said Company shall be able to show cause to the contrary a special examination shall be made of the hull and machinery of any such vessel by such person or persons as may be selected for that purpose by the Postmaster General.

7. The equipments officers engineers and crew of each vessel when such vessel is in any British port shall be subject at all times to the inspection of the said Postmaster General or of such other person or persons as he shall at any time or times authorise to make such inspection.

8. The Company shall convey the said mails at a speed which on the average of each voyage of each vessel shall not be less than 10 knots per hour on the routes west of Alexandria and not less than nine and-a-half knots per hour on routes east of Suez.

9. One of such vessels shall on such days of the week and at such hours as the Postmaster General shall appoint and immediately after the mails are embarked put to sea from touch and arrive at the several ports or places respectively mentioned in the said first Schedule hereunder written and all such vessels shall convey the said mails as mentioned in such Schedule and all the stipulations matters and things therein contained shall form part of this Agreement and be observed and performed by the

Digitized by Google

Company accordingly And the Company shall convey in such vessels to and from and caused to be delivered and received at such of the ports or places mentioned in the said first Schedule from or at which the said vessels are to start touch and arrive in the performance of this Agreement all such mails as shall or may be tendered or delivered to or received by the Company or any of their agents officers or servants by or from the Postmaster General or any of his officers or agents.

10. Should it be deemed by the Postmaster General his officers or agents requisite for the public service that any vessel to be employed under this Agreement should at any time or times delay her departure from any port from which the mails are to be conveyed under this Agreement beyond the period appointed for her departure therefrom the Postmaster General his officers and agents shall have power to order such delay (not however exceeding 24 hours) by letter addressed by him or them to the master of any such vessel or person acting as such and which shall be deemed a sufficient authority for such detention.

11. If at any time the Company shall desire to modify the services hereby agreed to be performed by substituting Liverpool for Southampton as one of the ports to and from which mails are to be conveyed under this Agreement they shall be at liberty so to do on giving three calendar months' notice in writing of such their desire and in such case and from and after the time named for that purpose in such notice the services specified under the head route No. 1 in the first Schedule hereunder written shall no longer be performed and in lieu of such services there shall be substituted the services specified in the second Schedule hereunder written and except as herein otherwise expressly provided all the provisions of this Agreement shall thereafter apply to the last-mentioned services in the same manner in all respects as if the services specified in route No. 1 of the said first Schedule had been omitted therefrom and the services specified in the said second Schedule had been inserted in the place thereof Provided always that the amount of the consideration or subsidy to be paid to the Company as hereinafter provided shall not be increased or diminished by reason of the substitution aforesaid.

12. If at any time the Postmaster General shall desire to modify the services hereby agreed to be performed by substituting Brindisi for Marseilles as one of the ports to and from which mails are to be conveyed under this Agreement he shall be at liberty so to do on giving three calendar months' notice in writing of such his desire and in such case and from and after the time named for that purpose in such notice the services specified under the head route No. 2 in the first Schedule hereunder written shall no longer be performed and in lieu of such services there shall be substituted the services specified in the third Schedule hereunder written and except as herein otherwise expressly provided all the provisions of this Agreement shall thereafter apply to the last-mentioned services in the same manner in all respects as if the services specified in route No. 2 of the said first Schedule had been omitted therefrom and the services specified in the said third Schedule had been inserted in the place thereof Provided always that the Company shall not by virtue of any such notice as aforesaid be bound to substitute the services between Brindisi and Alexandria for the services between Marseilles and Alexandria as hereinbefore provided until the Mont Cenis Tunnel is completed and the railway through such tunnel is available for the conveyance of Her Majesty's mails Provided also that the amount of the consideration or subsidy to be paid to the Company as hereinafter provided shall not be increased or diminished by reason of the substitution aforesaid Provided also that after such substitution as aforesaid the Company shall convey the said mails between Brindisi and Alexandria in each direction at a speed which on the average of each voyage of each vessel shall be not less than 11 knots per hour.

13. If at any time or times the Postmaster General shall desire to alter the particular days times or hours of departure from and arrival at any of the ports or places to or from which Her Majesty's mails are for the time being to be conveyed under this Agreement he shall be at liberty so to do on giving three calendar months' notice in writing of such his desire to the Company provided such alterations do not necessitate an increase of speed.

14. If at any time or times the Postmaster General shall desire otherwise to modify the services hereby agreed to be performed (as for example to increase or decrease the frequency of the conveyance of mails between any of the ports or places to or from which such mails are to be conveyed under this Agreement or to extend the conveyance of such mails to any other ports or places not specified in this Agreement or to discontinue the conveyance of such mails to or from any port or place specified in this Agreement) he shall be at liberty so to do on giving reasonable notice to the Company and on paying to them for such increased or extended services such further consideration and in the event of the services hereby agreed to be performed being reduced on his paying to them such reduced consideration as may in either of such cases be mutually agreed upon between the Company and the Postmaster General or failing such mutual agreement by arbitration in the manner hereinafter provided.

15. The particular days times and hours of departure from and arrival at any of

Digitized by Google

such ports or places or other services (if any) which may be appointed by any alteration under the two preceding clauses or either of them shall for the time being be deemed to be the days times and hours of departure and arrival of mails and other services under this Agreement and shall be observed and kept by the Company accordingly.

16. If on any voyage in either direction between Brindisi and Alexandria the Company shall fail to deliver Her Majesty's mails at the port of destination (whether the same be Brindisi or Alexandria) for 12 hours or more after the time at which the same ought to be delivered according to the provisions of this Contract which shall for the time being be in force then and in every such case the Company shall forfeit and pay to Her Majesty Her heirs and successors the sum of 50*l.* for every complete period of 12 hours during which the delivery of such mails shall be delayed beyond the time at which the same ought to be delivered as aforesaid Provided always that the payment of any such penalty as aforesaid shall not be enforced against the Company if it be shown by them to the satisfaction of the Postmaster General that the delay has arisen from causes over which they the Company had not and could not have had any control.

17. If in any case not hereinbefore provided for the Company shall fail to deliver Her Majesty's mails at any port at which the same ought to be delivered in pursuance of this Contract for 24 hours or more after the time at which the same ought to be delivered according to the provisions of this Contract which shall for the time being be in force then and in every such case the Company shall forfeit and pay to Her Majesty Her heirs and successors the sum of 50*l.* for every complete period of 24 hours during which the delivery of such mails shall be delayed beyond the time at which the same ought to be delivered as aforesaid Provided always that the payment of any such penalty as aforesaid shall not be enforced against the Company if it be shown by them to the satisfaction of the Postmaster General that the delay has arisen from causes over which they the Company had not and could not have had any control.

18. If the Company shall deliver Her Majesty's mails at any port at which the same ought to be delivered in pursuance of this Contract 24 hours or more before the time at which the Company is bound to deliver the same according to the provisions of this Contract which shall for the time being be in force then and in every such case Her Majesty's Postmaster General shall pay to the Company a premium of 25*l.* for every complete period of 24 hours by which the delivery of such mails shall have been accelerated as aforesaid.

19. Provided always and it is hereby declared that any extra time to be allowed during the seasons of the south-west and north-east monsoons shall be taken into account in all questions relating to penalties but shall not be taken into account in any question relating to premiums.

20. If the Company fail to provide an efficient vessel at any of the several ports or places at which such vessel ought to be provided in accordance with the terms of this Agreement ready to put to sea on and at the appointed day and hour then and so often as the same shall happen the Company shall forfeit and pay unto Her Majesty Her heirs and successors the sum of 500*l.* and also the further sum of 100*l.* for every successive 24 hours which shall elapse until such vessel actually proceeds to sea on her voyage in pursuance of this Agreement provided always that the total amount of the penalties last aforesaid shall not in the aggregate exceed the part of the subsidy of 450,000*l.* hereinafter made payable to the Company which shall be applicable to the voyage in respect of which default shall have been made by a sum greater than the sum of 1,000*l.*

21. The Company shall whenever required by the Postmaster General so to do receive and allow to remain on board of each of the said vessels while employed in the performance of this Agreement on any route east of Suez and also while remaining at Suez or any port or place east of Suez and whether such vessel shall be with or without mails on board an Officer in her Majesty's Navy to be appointed by the Postmaster General to take charge of the said mails and also a servant of such officer (if required) and every such officer shall be recognised and considered by the Company their officers agents and seamen as the agent of the Postmaster General in charge of mails and as having full authority in all cases to require a due and strict performance of this Agreement on the part of the Company their officers servants and agents and to determine (so far as relates to the levying of penalties) every question whenever arising relative to proceeding to sea or putting into harbour or the necessity of stopping to assist any vessel in distress or to save human life and the decision of such officer as aforesaid shall in every such case be final and binding on the Company unless the Postmaster General on appeal by the Company thinks proper to decide otherwise provided however that the words "to determine every question" shall not confer upon such officer the power of control over the commander of the vessel conveying the said mails.

22. If the Postmaster General at any time or times thinks fit so to do he shall be at

Digitized by Google

liberty to substitute for such naval officer a civil officer in the service of the Post Office to have charge of the said mails and thereupon and in every case in which a civil officer shall be appointed to be in charge of mails such last-mentioned officer shall be received and be allowed to remain on board each of the said vessels as hereinbefore provided with respect to any such naval officer but when any civil officer in the service of the Post Office shall be in charge of the said mails his duties shall be confined to the Post Office business.

23. A suitable first-class cabin with appropriate bed bedding and furniture shall at the cost of the Company be provided and appropriated by them for the exclusive use and accommodation of every such naval or civil officer and every of the said officers shall be victualled by the Company as a chief cabin passenger without any charge either for his passage or victualling.

24. The Company shall also receive and allow to remain on board of the said vessels while employed in the performance of this Agreement on any route east of Suez and also while remaining at Suez or any port or place east of Suez and whether such vessels shall be with or without mails on board in addition to the officer in charge of the mails such a number of officers in the service of the Post Office as shall be reasonably required for the purpose of sorting and making up the mails conveyed or to be conveyed by such vessel and shall provide suitable accommodation and victualling for such additional officers either as chief cabin passengers or as fore cabin passengers at the option of the said Postmaster General.

25. The Company shall at their own cost provide on each of the vessels to be employed under this Agreement a separate and convenient room for the convenient and secure deposit of the mails under lock and key and shall also at the like cost (if and when they shall be required so to do by the said Postmaster General) erect and provide on each of such vessels employed under this Agreement on any route east of Suez a separate and convenient room for sorting and making up the said mails and shall provide in such room all such furniture lamps fittings and other conveniences as shall be necessary or convenient for the purpose of sorting and making up the said mails and all such furniture lamps fittings and other conveniences shall be from time to time cleansed and kept in repair and the oil for the lamps supplied by the servants and at the cost of the Company and the services of the crew of every such vessel shall from time to time be given in the conveyance of the mails between the mail room and the sorting room.

26. At each port or place where the said mails are to be delivered and received the officer having charge of mails shall whenever and as often as by him shall be deemed necessary for the public service and either with or without his assistant or servant be conveyed on shore and also from the shore to the vessel employed for the time being in the performance of this Agreement together with or (if such officer shall consider it necessary for the purposes of this Agreement so to do) without mails in a suitable and seaworthy boat of not less than four oars to be furnished with effectual covering for the mails and properly provided manned and equipped by the Company.

27. The master or commander of each of the said vessels employed in the performance of this Agreement on any route west of Suez and in all cases where the officer or other person appointed to have charge of the mails shall be absent the master or commander of each of the said vessels employed in the performance of this Agreement on any route east of Suez shall without any remuneration (other than the sum herein provided to be paid to the Company) take due care of and the Company shall be responsible for the receipt and delivery of the said mails and each of such masters or commanders shall make the usual declaration or declarations required or which may hereafter be required by the Postmaster General in such and similar cases and furnish such journals returns and information to and perform such services as the Postmaster General or his agents may require and every such master or commander or officer duly authorised by him having the charge of mails shall himself immediately on the arrival at any of the said ports or places of any such vessels deliver all mails for such port or place into the hands of the Postmaster or other person at such port or place whom the Postmaster General shall authorise to receive the same receiving in like manner all the return or other mails to be forwarded in due course.

28. The Company shall not nor shall any of the masters of any of the vessels employed or to be employed under this Agreement receive or permit to be received on board any of the vessels employed under this Agreement any letters for conveyance other than those duly in charge of the said naval officer or other person authorised to have charge of the said mails or which are or may be privileged by law nor any mails for conveyance on behalf of any colony or foreign country without the consent of the Postmaster General and in case of any such default respectively the Company shall be liable to be proceeded against for breach of this Agreement.

29. The Company and all commanding and other officers of the vessels employed in the performance of this Agreement and all agents seamen and servants of the Company shall at all times punctually attend to the orders and directions of the Postmaster General his officers or agents as to the mode time and place of landing delivering and receiving mails.

Digitized by Google

30. The Company shall and will when and as often as in writing they or the masters of their respective vessels shall be required so to do by the said Postmaster General or by any naval or other officers or agents acting under his authority (such writing to specify the rank or description of the person or persons to be conveyed and the accommodation to be provided for him or them) receive provide for victual and convey to and from and between any of the places to which any of the said vessels are to proceed in the performance of this Contract (in addition to the naval officer authorised to have charge of the said mails and to officers of the Post Office employed in connection with the mails conveyed by such vessel) any number of naval military and civil officers in the service of Her Majesty not exceeding eight in any one ship with or without their wives and children as chief cabin or first-class passengers and any number of non-commissioned and warrant officers not exceeding four in any one ship with or without their wives and children as fore cabin or second-class passengers together with servants of both chief and fore cabin passengers and any number of seamen marines soldiers or artificers in Her Majesty's service not exceeding 10 in any one ship with or without their wives and children as deck or third-class passengers to be always provided with effectual protection from rain sun and bad weather and not exposed on deck without such competent shelter and to have hammocks or bunks (subject to the approval of the Lords Commissioners of the Admiralty) placed between decks.

31. The passengers who shall be conveyed in pursuance of the last preceding clause (who are hereinafter designated Government passengers) with their families shall be treated in no respect whether as regards food cabin or other accommodation or aught else in a way inferior to that of ordinary passengers of the same class or that required by the Regulations of Her Majesty's Transport Service. The messing of the first and second class Government passengers shall include in each day an imperial pint of good sound bottled or draught ale or beer and that of the first class in addition an imperial pint of good foreign wine either port or white. The several classes of passengers shall mess in separate places and medical attendance medicine and medical comforts mess utensils and fittings cooking utensils articles for table use and mess places fuel lights requisite articles of bedding and all other necessaries shall be provided for them in like manner as for ordinary passengers of the like classes respectively.

32. The passage money for Government passengers and their families respectively shall be the same as that charged by the Company for ordinary passengers of a similar kind and shall include all the particulars mentioned in the last preceding clause and whenever any alterations of rates for ordinary passengers may be made the Postmaster General and the Lords Commissioners of the Admiralty shall be immediately apprised of such alterations.

33. Returns of the embarkation and disembarkation of all Government passengers shall be furnished to the Director of Transport Services immediately after the departure and arrival of each vessel.

34. Payments for passage money for government passengers shall be applied for by invoices according to a form to be obtained from the office of the Director of Transport Services and shall be made upon the production to such Director of the orders for the passages together with a certificate under the hand of the commanding officer specifying the number of the third-class passengers (men women and children) conveyed with the ages and sexes of the latter and stating the periods during which they have been respectively regularly supplied while on board with provisions and also of a certificate under the hand of each first and second class passenger of his or her having been landed at the place of destination and of having been properly accommodated and messed during the voyage and specifying the dates from and to which they were so messed computed from the first to the last dinner meal.

35. The Company shall convey for every Government passenger free of charge the same quantity of baggage (whether such quantity shall be estimated or ascertained by bulk or weight) which according to the regulations of the Company for the time being they convey free of charge for an ordinary passenger of the same class and freight shall be payable for any extra baggage of a Government passenger after the same rate as the freight payable according to the same regulations for extra baggage of an ordinary passenger of the same class.

36. The passage money for the wives and families of commissioned and civil officers when not ordered to be conveyed at the public expense shall be paid to the Company by the officers themselves.

37. In all cases where an officer in the civil naval or military service of Her Majesty who may not be entitled to a passage at the public expense shall require a passage on board any of the vessels employed in the performance of this Contract the Company shall be bound when they have room to provide a passage for such officer in preference to private passengers and shall charge no higher rate for such passage than is chargeable for an ordinary passenger.

38. The Company shall receive on board each of the vessels employed in the performance of this Contract and shall convey on behalf of the Lords Commissioners of the Admiralty any small packages which may be ordered for conveyance and also (on receiving from the Postmaster General or his officers or agents or from the British naval

Digitized by Google

officer in command of the station two days' previous notice) shall receive on board any naval or other stores not exceeding 10 tons weight or 15 tons of 40 cubic feet each in measurement at any one time in any one vessel (packages and stores of a dangerous or damaging nature excepted in accordance with the general regulations of the Company) and shall convey and deliver such small packages and stores at the lowest rate of freight charged by the Company for private goods of a similar character or description and the Company shall give immediate notice to the Postmaster General and the Lords Commissioners of the Admiralty of any alteration in such rate of freight and shall in all cases be responsible for the custody and safe and speedy delivery of such packages and stores.

THE AMOUNT OF SUBSIDY.

39. And in consideration of the due and faithful performance by the Company of all the services hereby contracted to be by them performed the Postmaster General doth hereby covenant that there shall be paid to the Company (out of such aids or supplies as may from time to time be provided and appropriated by Parliament for that purpose) so long as they perform the whole of such services in manner and with such vessels as hereinbefore respectively provided the sum of 450,000 *l.* per annum by equal quarterly payments on the 1st day of January the 1st day of April the 1st day of July and the 1st day of October in every year and so in proportion for any less period than a quarter.

40. On or as soon as conveniently may be after the 1st day of April and the 1st day of October in every year during the continuance of this Agreement an account shall be made out of the amount payable to the Company or to the Postmaster General on account of premiums earned or penalties incurred by the Company and if it shall appear by such account that any further sum is due from the Postmaster General to the Company the same shall be paid forthwith to the Company by the Postmaster General out of such aids or supplies as aforesaid and on the other hand if it shall appear that any sum is due from the Company to the Postmaster General the same shall be forthwith paid by the Company the Postmaster General or at his option may be deducted from the next quarterly payment due to the Company.

41. Except where otherwise expressly provided none of the services performed or to be performed by the Company under this Contract shall entitle them to any remuneration beyond the said subsidy of 450,000 *l.* per annum and such other sum or sums of money (if any) as are hereinbefore expressly made payable.

And it is hereby further agreed and declared between and by the parties hereto as follows: (that is to say)

42. It shall be lawful for the Postmaster General at any time and from time to time to delegate any of the powers vested in him by virtue of these presents to such person or persons as he shall think fit.

43. The Company shall undertake for themselves all arrangements relative to quarantine as connected with the due and regular performance of the conditions of this Contract.

44. The Lords Commissioners of the Admiralty shall at any time during the continuance of this Contract if they shall consider it necessary for the public interest have power and be at liberty to purchase all or any of the said vessels at a valuation or to charter the same exclusively for Her Majesty's service at a rate of hire to be mutually fixed and agreed on by them and the said Company but if any difference should at any time or times arise as to the amount of valuation or hire so to be paid such difference shall be settled by arbitration in manner hereinafter provided and the said Commissioners in the case of hiring any such vessel shall return the same to the said Company in the same state and condition as she was in at the time of any such hiring reasonable wear and tear excepted and if any difference should arise upon that point the same shall be settled in the same manner as the amount for the hiring is to be settled in case of difference And it is further agreed that in case of such purchase or hire the service hereby contracted to be performed shall be performed by other vessels of the Company of a similar description to the vessel or vessels purchased or hired if they can in due and proper time furnish them and in the event of the said Company being allowed by the Postmaster General to continue to perform only a portion of the service there shall be paid to the said Company such annual sum of money as shall be agreed upon by the Postmaster General and the said Company and in case of their differing as to the amount the difference to be settled by two arbitrators or an umpire to be chosen respectively as aforesaid.

45. This Contract shall commence on or as from the 1st day of April 1869 and shall continue in force until the 1st day of February 1880 and shall then determine if the Postmaster General shall by writing under his hand or under the hand of the Secretary or one of the Assistant Secretaries for the time being of the Post Office have given to the Company or if the Company shall have given to the Postmaster General 24 calendar months' notice that this Contract shall so determine but if neither the Postmaster General nor the Company shall give any such notice this Contract shall continue in force even after the said 1st day of February 1880 until the expiration of a 24 calendar months' notice in writing as aforesaid which may be given by either of the parties here-

Digitized by Google

to to the other of them and which last-mentioned notice may be given at any time after the 1st day of February 1878.

46. The Contract dated the 19th day of November 1867 and made between the Postmaster General of the one part and the Company of the other part shall be deemed and considered to have remained in force until the said 1st day of April 1869 and no longer and as from the last-mentioned date the same is hereby terminated and annulled all claims of the Company in respect of the subsidy therein mentioned having been fully satisfied and discharged up to the said 1st day of April 1869 by the payment up to that date of a subsidy after the rate of 500,000*l.* per annum as the Company do hereby acknowledge.

47. If on the determination of this Agreement any vessel or vessels shall have started or shall start with the mails in conformity with this Agreement such voyage or voyages shall be continued and performed and the mails be delivered and received during the same as if this Agreement had remained in force with regard to any such vessels and services. And with respect to such vessels and services as last aforesaid this Agreement shall be considered as having terminated when such vessels shall have reached their port or place of destination and such services shall have been performed but the said Company shall not be entitled to receive any payment or compensation for the same.

48. All and every the sums of money hereby stipulated to be paid by the Company unto Her Majesty Her heirs and successors shall be considered as stipulated or ascertained damages whether any damage or loss has or has not been sustained and shall and may be retained by the Postmaster General out of any moneys payable or which may thereafter become payable to the Company or the payment may be enforced as a debt due to Her Majesty with full cost of suit at the discretion of the Postmaster General Provided however that the payment by the Company of any sums of money (by way of penalties) shall not in any manner prejudice the right of the Postmaster General to treat the failure (if any) on the part of the Company to provide a proper vessel or to perform any voyage at or within the time for the time being appointed for the performance thereof as a breach of this Agreement.

49. All notices or directions which the Postmaster General his officers agents or others are hereby authorised to give to the Company their officers servants or agents other than any notice of termination of this Contract may at the option of the Postmaster General his officers agents or others either be delivered to the master of any of the said vessels or other officer or agent of the Company in the charge or management of any vessel employed in the performance of this Agreement or left for the Company at their office or house of business in London or any other place and any notices or directions so given or left shall be binding on the Company Provided always that any notice of termination of this Contract shall be served on the Company their officers servants or agents at their office or last known office in London.

50. The Company shall not assign underlet or dispose of this Agreement or any part thereof without the consent of the Postmaster General signified in writing under his hand or under the hand of the Secretary or one of the Assistant Secretaries of the Post Office and in case of the same or any part thereof being assigned underlet or otherwise disposed of or of any great or habitual breach of this Agreement or any covenant matter or thing herein contained on the part of the Company their officers agents or servants and whether there be or be not any penalty or sum of money payable by the Company for any breach it shall be lawful for the Postmaster General if he shall think fit (and notwithstanding there may or may not have been any former breach of this Contract) by writing under his hand or under the hand of the Secretary or one of the Assistant Secretaries of the Post Office to determine this Agreement without any previous notice to the Company or their agents nor shall the Company be entitled to any compensation in respect of such determination and such determination shall not deprive the Postmaster General of any right or remedy to which he would otherwise be entitled by reason of such breach or any prior breach of this Contract.

51. If at any time during the continuance of this Agreement or after the determination thereof any dispute shall arise between the parties hereto or their successors respectively concerning any breach or alleged breach by or on the part of the Company of this Agreement or the sufficiency of any such breach to justify the Postmaster General in putting an end to the same or concerning the amount of consideration to be paid to or allowed by the Company as the case may be for such altered services as hereinbefore in that behalf mentioned or concerning any of the covenants matters or things herein contained or in anywise relating thereto and notwithstanding the power herein contained to determine this Agreement and any execution or attempted execution of such power such dispute shall be referred to two arbitrators one to be chosen from time to time by the Postmaster General and the other by the Company and if such arbitrators should at any time or times not agree in the matter or question referred to them then such question in difference shall be referred by them to an umpire to be chosen by such arbitrators before they proceed with the reference to them and the joint and concurrent award of the said arbitrators or the separate award of the

Digitized by Google

said umpire when the said arbitrators cannot agree shall be binding and conclusive upon both parties.

52. Any submission to arbitration in pursuance to this Agreement may be made a rule of any of Her Majesty's courts of record pursuant to the statute in that case made and provided on the application of either party.

53. In pursuance of the provisions contained in the Act of Parliament passed in the 22nd year of the reign of King George the Third intituled "An Act for restraining any "Person concerned in any Contract Commission or Agreement made for the Public "Service from being elected or sitting and voting as a Member of the House of "Commons" no Member of the House of Commons shall be admitted to any share or part of this Agreement or to any benefit to arise therefrom contrary to the true intent and meaning of the said Act.

54. This agreement shall not be binding until it has lain upon the Table of the House of Commons for one month without disapproval unless it be previously approved by a resolution of the said House of Commons.

55. And lastly for the due and faithful performance of all and singular the covenants conditions provisoes clauses articles and agreements hereinbefore contained which on the part and behalf of the said Company are or ought to be observed performed fulfilled and kept the said Company do hereby bind themselves and their successors unto our Sovereign Lady the Queen in the sum of 45,000*l.* of lawful money of the United Kingdom to be paid to our said Lady the Queen Her heirs and successors by way of stipulated or ascertained damages hereby agreed upon between the Postmaster General and the Company in case of the failure on the part of the Company in the due execution of this Contract or any part thereof.

In witness whereof the said Spencer Compton Cavendish Marquis of Hartington Her Majesty's Postmaster General hath hereunto set his hand and seal and the said Peninsular and Oriental Steam Navigation Company have caused their common seal to be hereunto affixed the day and year first above written.

---

## The Dividend Clause.

*Report of the Postmaster General.*

General Post Office, 20 *July* 1870.

My Lords: By the terms of the contract concluded with the Peninsular and Oriental Steam Navigation Company on the 19th of November 1867, for the East India, China, and Japan Mail Service, of which a copy is enclosed, the subsidy to be paid to the Company is set down at 400,000*l.* a year, with a stipulation, on the one hand, that whenever the annual income of the Company from all sources does not admit of the payment of a dividend of 8 per cent. on the capital employed, the subsidy shall be increased by so much, subject, however, to a limit of 100,000*l.*, as is required to make up such a dividend; and, on the other, that whenever the income is sufficient to allow a dividend exceeding 8 per cent. to be declared, the Company shall pay to the Postmaster General one-fourth of the excess.

Any hope of benefiting by this last proviso has, I regret to say, been necessarily abandoned, and, more than this, it has for some time appeared that the Department would probably be called upon to pay a sum more nearly approaching the maximum than the minimum amount of subsidy.

In fact, for the fourteen months ended the 31st of March 1869, payment at the full rate of 500,000*l.* a year, is admittedly due to the Company, even if certain claims which the Department has set up, are decided in its favour.

Owing to stagnation of trade, and to severe competition on the part of the French Mail Packet Company, the financial position of the Peninsular and Oriental Company, since the contract was entered into, has not been so flourishing as was anticipated, and the opening of the Suez Canal, the success of which was by no means considered certain in 1867, has still further disturbed their prospects by the encouragement it has given to British and other ship owners to compete with the Company for the conveyance of cargo.

It is true that the contract has several years to run, and that a Company so well managed and so prudent as the Peninsular and Oriental Steam Navigation Company are not likely to let any opportunity of recovering their position escape. Still, taking the most favourable view of their prospects, I think it would be over sanguine to expect that the hopes which were entertained when the present contract was concluded are likely to be realised.

To enable the Department to ascertain what payment should be made, it was necessary, as stipulated by the contract, that its officers should inspect the books of the Company, and this inspection has given rise to complicated questions with respect to profits derived from insurance; to the mode in which the amounts set apart for depreciation are to be applied; and to the right of the Company to increase their general reserve fund, which are described somewhat at length in the enclosed corre-

Digitized by Google

spondence, and the settlement of which, by arbitration, the mode appointed by the contract, would involve serious delay.

Under these circumstances I took advantage of an interview which I had recently with a deputation of directors of the Company to intimate to the chairman that if he was desirous of making a contract on a fixed basis, and could see his way to propose one, the adoption of which I should be justified in recommending, I would consider it.

This suggestion having been acted upon, negotiations have taken place, which have resulted in the enclosed Memorandum proposing a basis for a new contract, which will not only settle the conflicting views of the two parties on the several questions raised, but will determine another point of great importance to this Department, and one which must at a very early date have been brought forward, viz., the price to be paid for substituting a mail service between Alexandria and Brindisi for the present service between Alexandria and Marseilles.

The Company are willing, provided they are allowed, on giving sufficient notice, to embark and disembark the heavy portion of the Indian, &c., mails at Liverpool instead of at Southampton, to accept from the 1st of April 1869 a commuted payment of 450,000*l.* a year; such payment to include a weekly line to and from Brindisi, as soon as the tunnel through Mont Cenis is completed, and arrangements can be made for sending the mails by that route.

This will probably be before the end of next year.

The sum of 450,000*l.* will also include calling at Penang, for which service an additional payment of 4,000*l.* a year is now made to the Company.

Looking at all the circumstances of the case, at the difficulty of estimating the probable future receipts of the Company for the conveyance of passengers and cargo, and at the uncertainty which must attend a reference to arbitration on points in dispute, I have come to the conclusion, after personal communication with the Receiver and Accountant General, by whom the books of the Company have been examined, and with the Post Office counsel, who happens to have a great facility in dealing with figures, that the offer is one which is favourable to the Department, and that its acceptance will relieve both the Department and the Company from much embarrassment.

I do not hesitate, therefore, to recommend your Lordships to sanction such acceptance, and to authorise me to enter into a new Contract accordingly.

I have, &c.

(Signed) HARTINGTON.

The LORDS COMMISSIONERS OF THE TREASURY, *&c. &c. &c.*

## WEST INDIA AND BRAZIL MAILS.

*Return to an Order of the Honourable The House of Commons, dated 29 June* 1868, *for Copies "of a Contract, dated the 26th day of June* 1868, *entered into between the Postmaster General and the Royal Mail Steam Packet Company, extending their Contracts for the Conveyance of the West India and Brazil Mails for a further Period:" "And, of Correspondence relating thereto."*

TREASURY CHAMBERS, 29 JUNE 1868. G. SCLATER-BOOTH.

(An extra allowance besides dividend.)

Ordered, by The House of Commons, to be printed, 29 June 1868.

[Commence at page 1. See report of Commissioners appointed by Parliament to examine the Company's books, and with the subsidies could not pay a dividend. The report recommended a guarantee of a dividend to the Company by the Government or the line could not go on.]

### I.

*Copy of Contract, dated 26th June* 1868, *entered into between the Postmaster General and the Royal Mail Steam Packet Company, extending their Contracts for the conveyance of the West India and Brazil Mails for a further Period; with the Treasury Minute thereon.*

No. 1.

COPY OF CONTRACT.

WEST INDIA AND BRAZIL MAILS.

ARTICLES OF AGREEMENT made this 26th day of June in the year 1868 between the Most Noble James Duke of Montrose Her Majesty's Postmaster General of the one part and the Royal Mail Steam Packet Company (hereinafter called the Company) of the other part:—

Whereas by Articles of Agreement under Seal dated the 13th day of July 1863 a Contract was entered into between the Postmaster General and the Company (herein-

Digitized by Google

after referred to as the Brazil Contract) for the conveyance by the Company of Her Majesty's Mails between Southampton and Rio de Janeiro and Buenos Ayres and for the performance of other services upon the terms therein mentioned and it was by the articles now in recital provided that the said Contract should commence on the 1st day of January 1864 and should continue in force for seven years and then determine if the Postmaster General should by writing under his hand or under the hand of the Secretary or one of the Assistant Secretaries of the Post Office for the time being have given to the Company or if the Company should have given to the Postmaster General 24 calendar months' previous notice in writing that such Contract should so determine but if neither party should give any such notice that such Contract should continue in force even after the said term of seven years until the expiration of a 24 calendar months' notice in writing as aforesaid given at any time by either of the parties thereto to the other of them: And whereas by articles of agreement under seal dated the 22nd day of July 1863 a Contract was entered into between the said Postmaster General and the Company (hereinafter referred to as the West India Contract) for the conveyance by the Company of Her Majesty's Mails between Southampton and the Island of St. Thomas and divers other places in the West Indies and for the performance of other services upon the terms therein mentioned and it was by the articles now in recital provided that the said Contract should commence on the 1st day of January 1864 and should continue in force for six years and then determine if the Postmaster General should by writing under his hand or under the hand of the Secretary or one of the Assistant Secretaries of the Post Office for the time being have given to the Company or if the Company should have given to the Postmaster General 24 calendar months' previous notice in writing that such Contract should so determine but if neither the Postmaster General nor the Company should have given any such notice that such Contract should continue in force even after the said term of six years until the expiration of a 24 calendar months' notice in writing as aforesaid given at any time after the expiration of the first five years from the 31st day of December 1863 by either of the parties thereto to the other of them: And whereas the principal and central packet station and establishment of the Company in the West Indies in connection with the last-mentioned Contract is at present at the Island and Port of St. Thomas and it is apprehended that by reason of the unhealthiness of the said island or of the port thereof it may become desirable to remove the said central station and establishment to some other island and port: And whereas it has been agreed between the parties hereto that the said Contracts shall be modified in manner hereinafter appearing: Now these presents witness: And it is hereby agreed and declared between and by the parties hereto as follows (that is to say):—

1. With respect to each of the hereinbefore mentioned Contracts it is hereby agreed and declared that the same shall continue in force until the 31st day of December 1874 inclusive and shall then determine if the Postmaster General shall by writing under his hands or under the hand of the secretary or one of the assistant secretaries for the time being of the Post Office have given to the Company or if the Company shall have given to the Postmaster General 24 calendar months' notice in writing that such Contract shall so determine but if neither party shall have given any such notice such Contract shall continue in force after the 31st day of December 1874 until the expiration of a 24 calendar months' notice in writing as aforesaid given at any time by either of the parties hereto to the other of them.

2. If in any year during the continuance of the hereinbefore-mentioned Contracts or either of them the entire fund arising from the subsidies or subsidy payable thereunder to the Company and from traffic receipts earned by the Company in connection directly or indirectly with voyages made or ships' depôts or establishments used in the performance of such Contracts or Contract and from interest on any reserved fund which shall accrue after the date of these presents and from any balance that may have been left available for future dividends after the last declaration of a dividend shall after deducting working expenses incurred during such year including the usual allowance for depreciation and repairs and renewal exceed the sum necessary for the payment of a dividend of 8 per cent. on the capital employed by the Company in the performance of the said Contracts or Contract then and in every such case the Company shall pay to the Postmaster General a sum equal to one-half of such excess.

3. For the purposes of the last preceding clause the capital employed by the Company in the performance of the hereinbefore mentioned Contracts shall be taken to be the sum of 900,000 *l.*

4. The Company shall be at liberty to include in their working expenses any sum not exceeding the yearly sum of 45,000 *l.* (whether the sum shall be actually paid or merely set apart as an insurance fund) in respect of the insurance of ships employed under the hereinbefore mentioned Contracts and the Postmaster General shall not be entitled in any case to participate in any profits accruing from any insurance fund set apart in conformity with the provisions of this clause.

5. During the continuance of the said Contracts or either of them the Company shall keep their accounts and books of account and statements of capital revenue and ex-

Digitized by Google

penditure in the manner in which the said books accounts and statements are kept at the date of these presents.

6. The Postmaster General and his officers and agents shall at all reasonable times have access to the books of account and accounts of the Company in the same manner and to the same extent as if he and they were directors of the Company and if at any time any questions shall arise between the Postmaster General or his officers and agents and the Company as to the amount (if any) to be paid to the Postmaster General under the preceding clauses of this contract such question shall be referred to arbitration in manner provided by the 27th clause of the West India Contract.

7. On or as soon as conveniently may be after the 1st day of April in every year during the continuance of the said contracts or either of them an account shall be made out of the amount (if any) payable to the Postmaster General under this Contract and such amount (if any) shall be deducted from the next quarterly payment due to the Company.

8. The Company shall upon the requisition of the Postmaster General at any time during the continuance of the West India Contract remove their principal and central packet station and establishment from the island and port of St. Thomas aforesaid to such other island and port as the Postmaster General shall direct and shall effect and complete such removal within a reasonable time after the Postmaster General shall have given them notice in writing requiring them so to do, and any such notice may be under the hand either of the Postmaster General or of the secretary or one of the assistant secretaries of the time being of the Post Office.

9. In the event of such removal it shall be lawful for the Postmaster General to make such reasonable modifications of the services agreed to be performed by the West India Contract as he shall consider necessary or expedient by such removal and the Company shall not be entitled to any increased subsidy or remuneration in respect of any such modification. Provided always that the Postmaster General shall by notice signed as aforesaid give at least three calendar months' notice to the Company of any such intended modification as aforesaid. Provided also that if the Company and the Postmaster General shall differ as to the reasonableness of any such proposed modification such difference shall be settled by arbitration in manner provided by the 27th clause of the said Contract.

10. If any such removal shall take place during the continuance of the said Contract and if by reason thereof the said Company shall incur any additional outlay of capital the Postmaster General shall after such removal shall have taken place grant to the Company such further extension of the term of the the said Contract as shall afford them a fair compensation for such outlay and in case of difference the term of such extended Contract shall be settled by arbitration in the manner provided by the 27th clause of the said Contract.

In witness whereof the said Postmaster General hath hereunto set his hand and seal and the said Royal Mail Steam Packet Company have caused their common seal to be hereunto affixed the day and year first above written.

MONTROSE. [POSTMASTER GENERAL'S SEAL.]

Signed sealed and delivered by the within-named James Duke of Montrose Her Majesty's Postmaster General in the presence of—

J. L. DU PLAT TAYLOR,
*Private Secretary, General Post Office.*

The common seal of the within-named Royal Mail Steam Packet Company was hereunto affixed in the presence of—

J. M. LLOYD, *Secretary,* [COMPANY'S SEAL.]
Z. BROOKE, *Solicitor's Department, General Post Office, London.*

II.

COPY OF CORRESPONDENCE RELATIVE TO THE EXTENDING OF THE CONTRACTS OF THE ROYAL MAIL STEAM PACKET COMPANY FOR THE CONVEYANCE OF THE WEST INDIA AND BRAZIL MAILS, FOR A FURTHER PERIOD.

No. 1.

*The Secretary to the Royal Mail Steam Packet Company to the Secretary to the Treasury.*

ROYAL MAIL STEAM PACKET COMPANY, 55, MOORGATE-STREET,
*London, E. C. 20 November* 1867.

SIR: Her Majesty's Government have, without doubt, become aware of the serious disaster and consequent heavy loss which has befallen this Company through the results of the recent hurricane at and near St. Thomas.

Full particulars of this event have not yet reached the Directors of this Company, but they know that four ships, which originally cost 181,926 *l.*, have been wrecked, and that two others have been dismasted, and a large amount of stores, buildings, and other property in the harbour and on shore destroyed.

To replace properly these vessels and property, an expenditure of not much less than 250,000 *l.* will be requisite.

The Court of Directors have had under their most anxious consideration the course which, under these circumstances, they ought, both in the interest of the public service and of their proprietary, to take; and it will be manifest to Her Majesty's Government that, with Contracts only having two (and, to a smaller extent, three) years to run, it would be unwise in the Court to incur a large capital expenditure, especially in the way of construction of new ships. Such new vessels could not be placed on the station for at least a year to come, and thus might only be employed for a little more than 12 months.

The only course, therefore, available for the Directors, in view of the termination of the present Contract, would be the expensive and unsatisfactory one of chartering vessels for the service.

Under these circumstances, and feeling that the severe blow which has fallen on a Company distinguished for the punctuality of its service, and its readiness to meet the wishes of Her Majesty's Government at all times, will give it a valid claim for consideration, the Court of Directors have resolved to ask Her Majesty's Government to grant the Company a five year's extension of its present Contract, *i. e.*, to the end of 1872 certain, and thenceforward to be at two years' notice. For a portion of the service this would be only four years' extension, but the Directors conceive that it would be more convenient to the Government and to the Company that the contract for the whole service should become terminable simultaneously.

I am desired to add that the Court of Directors have felt some hesitation in making this proposal in view of the present state of the Company's income. Although, during the American War, and before the competition of the highly subsidized French Company, this Company earned sufficient to yield a satisfactory dividend for its shareholders, the case has been very different during the last two years. In 1866, the aggregate profit after writing off the customary per centages for depreciation and insurance, was only 79,689 *l.* 7 *s.* 3 *d.*, and the dividend was, with the cognizance of the shareholders, increased by bringing to its aid part of a fund created to provide against loss on the sale of old ships. In the first half of the current year the profits were only 1,244 *l.* 5 *s.* 5 *d.*, and a similar operation was effected in aid of dividend, a reduction also being made in the amount written off for depreciation. The income of the subsequent quarter, viz., May to September last, shows a still further reduction of receipts. But the directors trust that such a general improvement in commercial affairs will succeed to the present to depression, as will, if a five years' extension be secured to the Company, afford to the proprietary the prospect of a moderate rate of profit.

In order that their statement of the present position of the Company may be verified, the Directors will be most happy to submit the books to the Government on the understanding that the investigation is made in view of an extension of the contracts.

I have, &c.,
(Signed) J. M. LLOYD,
*Secretary.*

G. W. HUNT, Esq., M. P.,
*Secretary, Her Majesty's Treasury, Whitehall.*

## VIEWS OF DEXTER A. HAWKINS.

The CHAIRMAN presented the following communication from Col. Dexter A. Hawkins, which was read and ordered to be printed with the testimony:

111 BROADWAY, NEW YORK,
*September* 10, 1883.

*To the honorable Senate Committee on Education and Labor:*

In compliance with your invitation I submit the following facts and views:

Every person who performs a reasonable amount of daily labor during the period that he is competent to work is entitled, as the fruits of that labor, to a reasonable support for life for himself and for those who cannot labor that are dependent upon him. Those who can labor but won't are not entitled to any support at all out of the fruits of the labor of their fellows.

Whenever the natural conditions in a country are such that it will not produce this support when intelligently worked that fact may safely be taken as a hint from Providence to emigrate. But whenever the laws or social organism in a country is such that their legitimate effect is to prevent any portion of society from obtaining such support from such labor it is clear proof that the laws or social organism should be modified. In the end they are modified always in such cases, either peaceably and wisely, through such investigations as your committee is making, or blindly and by violence.

The face of the earth is not a dead level; rivers are not of equal size; trees are not of a uniform height or bigness, and men are no exception to this universal law of nature; they differ in capacity, physical and intellectual. Under any just and equal laws some must become and will become rich and others poor, but the poorest, to the extent that they are willing to work, are entitled to food, clothing, shelter, and education—a livelihood; and the wealthiest, so far as they comply with the laws, are entitled to the full and complete protection and enjoyment of all their possessions.

The function of human laws in this regard is fully performed when they enable the individual, if he makes the best use of his faculties, to acquire and enjoy the same proportion of the goods of this world, in relation to his fellows, that his faculties and the use he makes of them bear to those of his fellows. All beyond this is outside of the function of human laws. This necessarily gives the fullest and widest scope for the legitimate exercise of individual powers of acquisition, possession, enjoyment, and disposition.

Thirty years ago I made a careful study of the condition of labor in the various countries of Europe and of the British Kingdom. Food there was no cheaper than at that time in this country. Clothing was about thirty per cent. cheaper. Shelter was about twenty-five per cent. cheaper. But wages were not more than one-half what they were here, and the education of the laborers was far below that of those in our then free States. (Our slave labor was far more ignorant than their labor.)

But a social organism existed there, the offspring of the feudal system, that imposed heavy burdens upon labor, and made it abnormally difficult for labor to improve its condition; hence "labor organizations" or "unions" and a social war between these organizations on the one side and capital and the ruling classes on the other.

Digitized by Google

The condition of free labor in this country then was, on the whole, nearly twice as good as there. The great emigration from Europe in the last thirty years, and the addition in that period of some thirty per cent. from the mines to the stock of silver and gold money in the world, has raised the rate of wages all over Europe. But the price of food, of clothing and of shelter has risen there almost equally as much, so that the condition of the laborer there is not much improved in those three items. But in the education of the laborer there it has greatly advanced. England, Scotland, Ireland, Wales, France and Italy then did not recognize the duty of the property in the State, whoever owned the property, to provide for the education of all children in the state, no matter to whom the children belonged. Those countries do now each recognize this duty, and have provided by law for its performance; and in the interest of society they require every child to be educated at least in the elementary branches of both knowledge and industry. This has improved and is fast improving and elevating the character and condition of labor in those countries.

The vast immigration to this country of the last thirty years would have tended to reduce wages and lower the condition of labor here, had not the addition of 90,000 miles to our railways in that time opened up, as it were, a new continent to labor, nearly as large as the whole of Europe; and had not the stimulus of a protective tariff in the last twenty years, by giving our own market to our own people instead of to Europeans, doubled the product of our manufacturers.

These two things have in this country as a whole made the demand for labor keep pace with the supply, though increased from abroad now at the rate of three-quarters of a million emigrants per year. The distribution by means of the railroads of this increase from without of two thousand a day speedily draws off any temporary excess of laborers in any locality. Aided by the above favorable conditions, the price of labor in this country instead of declining for the last thirty years has, as a whole, steadily advanced; while the price of nearly every thing that the laborer needs to consume or to use has, owing to the development of machinery and home manufactures, steadily declined. Scarcely anything except rum and tobacco has increased in price; and the laborer is on the whole better off without these than with them. Food products are cheaper in this country than in Great Britain, France and Germany, for of our surplus we export to them nearly five hundred million dollars' worth per year. Shoes and hats are cheaper, and also clothing of all kinds, except the finer and higher grades, which are not necessaries, but luxuries. Shelter is dearer, because we require new houses for at least two millions of people per year, and nineteen-twentieths of the cost of a house is in some form labor; and the price of labor is still on the average about double what it is in Great Britian, France, Germany, and Italy. The investigations made this year by Mr. Porter and reported from week to week in the Tribune demonstrate this.

It follows from the above facts that the relations of labor to capital are more favorable to labor in this country on the whole than in any other.

In many countries a laborer, discharged without a recommendation or certificate, cannot get employment from any other capitalist. Where such is the rule there would seem to be a propriety in allowing labor unions to dictate to some extent who should be discharged and who employed. But when, as in this country, capital does not possess, or exercise any such prerogative, such dictations are injurious to labor. In some countries no one can exercise a trade till he has served an apprenticeship and obtained his certificate as journeyman or master-workman.

Digitized by Google

In those countries there would seem to be some reason in allowing trades unions to dictate the number of apprentices, so as not to have the trades overcrowded; but in this country as a rule no such apprenticeship or certificate is required. The only effect, then, here of trades unions dictating the number of apprentices a mechanic may take and instruct is to lower the grade and number of our skilled workmen and reduce the ability of labor to compete with capital and to gain a livelihood.

The trades unions were very proper and necessary in Europe under a state of society very different from ours. But in this country they are introducing and enforcing foreign and despotic rules and regulations not in harmony with the condition of affairs here, and that amount often to a positive tyranny over labor; and, besides, they deprive the laborer of a percentage of his earnings.

I will state an instance: The Cumberland coal miners a few years ago were induced to join one of these organizations, and each one paid a portion of his wages into its treasury. The managers, who were not themselves laborers, selecting a time when the companies had entered into large contracts to deliver coal, ordered the miners to strike unless an increase of 30 per cent. on their wages was granted. To save a greater loss from breach of contracts the companies yielded to this extortion; but as soon as their contracts were filled they explained to these managers that the price must go back to the former rate on a certain day or the mines would be closed, for every ton mined at the extortionate rate brought a loss. When the day arrived these managers ordered the whole three thousand miners to strike, and for nearly five months they did not mine a ton of coal, and they and their families were reduced to the greatest straits for their daily bread. Then the managers allowed them to go to work at the old rate all the time offered by the companies. Here was a positive immediate loss to the laborers of nearly a million dollars of wages, a large loss to the capitalists, and a driving away of business to other coal regions, which will decrease labor for many years in that region, thus bringing a large future loss upon these laborers.

This is but one of many similar cases that I could name. Labor unions frequently demand that the length of a day's work and the price of it should both be regulated by statute. This is the same thing in principle as fixing by law the price the laborer should pay for everything he consumes or uses, and the quantity he should consume or use each day, without any regard to his ability or needs. Such things are outside of and beyond the sphere and province of statute law. They are, and, from the very inherent nature of things, must be, regulated by supply and demand, and not by statute. To regulate both the length and price or quantity and price of a day's work by statute is as absurd as to enact that water should of its own accord run up hill. One laborer may be able to do twice as much work in a day as another. To restrict all to the same amount (which is necessarily that of the least efficient), as some of these organizations do, is as absurd as to give only the same amount of food for a meal and cloth for a suit to a giant as is required for a pigmy. It is attempting to be wiser than the Creator. Labor organizations in harmony with our free institutions and social conditions may do much good; but those thus far imported from Europe are quite as much out of place here as would be European governments and methods of administration. They mean well, but lack knowledge of American affairs and free institutions. The chief cause of strikes is ignorance on the part of laborers of the mutual exigencies of capital

Digitized by Google

and labor. Capital requires safety and a reasonable increase; labor requires constant employment at reasonable wages and sure payment. It is for the interest of the laborer that his employer, whether an individual or a corporation, should have ample capital and that this capital should increase from year to year from the proceeds of the business. This secures sure pay and steady employment and a prospect of a rise of wages. If the capital is not ample the payment is uncertain; and if the business does not increase the capital, wages cannot rise; in fact they will fall or the capital will seek other and more profitable investment. The strikers sometimes, as at Pittsburgh a few years ago, destroy capital; this is killing the goose that otherwise could lay the golden egg for them, and results from ignorance of the mutual interest and relations of capital and labor. Educated labor would never, to raise wages, resort to the destruction of capital, any more than a hungry crowd would destroy food in order to increase their supply of it.

The better provision made by law in Europe for the universal education of labor there is steadily but surely putting labor here at a disadvantage. If we do not soon bestir ourselves, the superior training they are now giving their people will leave ours in the competitive race with them handicapped with a backload of ignorance. Intelligence in the laborer is to-day essential to a high productive capacity. Formerly, where little or no machinery or scientific processes were used, it was not. We must enable our labor to keep abreast of the progress of the world, or our country will fall to the rear. Ignorance begets ignorance, and it is a long, slow, and painful struggle to rise from it when kept down by competition with foreign intelligence. The labor unions and friends of labor throughout this country see this; and they are making a wise and just demand upon the Government for laws that shall secure to every child in this country a good elementary education. Careful experiment and examination and comparison of results has demonstrated that a good elementary education, such as should be given to every youth in the free common school, adds 50 per cent. on the average, to his capacity as a mere productive machine over what it would be if he remained illiterate. Pauperism and crime add heavy burdens to labor, as the paupers must be supported, and crime detected and punished, and society protected against criminals; all at the expense of labor or the fruits of labor. The illiterates in this country produce nine times as many criminals and thirty times as many paupers, according to their number, as do the literates.

In the United States there were, according to the census of 1880, 4,404,362 illiterate adults. The minimum *annual* loss to the country on the labor of these by reason of their illiteracy is not less than $50 each, or $210,219,100; or more than twice as much as the *annual* cost of our whole system of public education in the entire country.

If special provision is not made by law to secure general education, this gigantic army of ignorance will by 1890 be increased to five millions of human beings; enough not only to prostrate industry in this country, but to destroy in fact, if not in name, all free government. Free government and ignorant citizens are no more compatible than fire and water. One or the other must cease to be. If free government takes hold of illiteracy in season it can extinguish it; but if it delays too long it will itself be tumbled into the grave.

Labor is in favor of free government and prosperity; hence it demands universal education. All intelligent capital joins in this demand. The National Treasury is overflowing; the National Government is responsible for precipitating upon the country four millions of illiterate citizens.

Digitized by Google

Self-preservation is the first law of governments as well as of nature. There cannot be a reasonable doubt of the power of the Government to appropriate the money from the National Treasury sufficient to eliminate this illiteracy and to supervise its proper expenditure.

Labor thus made intelligent will harmonize itself with capital, and will in any event be amply able, wisely and peacefully, to assert and maintain its just rights.

It is my deliberate judgment that your honorable committee could not do a wiser thing than to give your influence to secure from the National Government the demand of labor for universal education in the elementary branches of knowledge and industry. After the nation has done what is asked, then the States will be able to preserve, support, and enforce universal education.

Very respectfully,

DEXTER A. HAWKINS.

---

## VIEWS OF A TRAMP.

The CHAIRMAN. I also present a communication from an unknown person who signs himself "A Tramp."

The communication was read as follows:

*To the Congressional Committee:*

GENTLEMEN: Your task of finding out why laborers are discontented with the prevailing condition of affairs will not be completed until you have heard from the despised and outlawed individual—the *tramp*—and as one of that class, and a genuine native, whose ancestors for three generations first beheld the sunshine in this country, I volunteer my service as a witness upon this important subject, well knowing that your lofty highnesses will not lower your dignity as statesmen by calling upon any of my class unless they have become millionaire shipbuilders or otherwise disguised themselves.

Now, as one of the undisguised *tramps*, I will proceed to inform you what, in my humble opinion, is the secret you have set out to find—why those who produce everything have nothing, and those who produce nothing have everything. This is the condition of affairs now staring you in the face, and it is no use to beg the question in your investigation or in your report. We are constantly told by the press that there is no remedy for the present condition, which is the source of the discontent you are asking the workingman to explain to you; that these great contrasts of condition among men are caused from the difference in men's mental capacities. On the day that Mr. Gould made his trial trip from Crump's shipyard down the historic Delaware on his $500,000 steam-yacht, I bought a 15-cent excursion ticket from Philadelphia to Wilmington, Del., after which outlay my total capital, "*watered stock*" *and all*, was just 32 cents! As I sat out upon that steamboat deck and cast my eyes from shore to shore, nothing did I see presenting such a contrast as Mr. Gould's $100,000,000 and my 32 cents, and, naturally, I thought of that oft-repeated brain theory and the Earl of Dudley. The pious hypocrite does not go so much on the brain theory, but maintains that these inequalities are due to Providence, who distributes his favors to those most worthy, and that it's highly blasphemous to point to the gigantic defaulters, who also believed this Prov-

Digitized by Google

idence theory, and built a church or run a Sunday school. But, gentlemen, these theories won't do; and the rising intelligence of mankind condemns them, and these advocates are but mental dwarfs, I care not how they stand before the community, whether they make the laws, run the railroads, or preach the sermons.

The most intelligent writers upon social questions do not attribute the causes that produce the discontent which you claim to be investigating to either of the above theories, but state most positively that it is the system of doing business which is at fault.

Now, a system that produces such a condition of affairs as we behold in Great Britain, where less than 30,000 own the land, the source of existence, and less than 300,000 are the possessors of the vast wealth there amassed, has thrown our Republic into the difficulties now confronting the "tramp" and the "statesman."

It is estimated that had the amount, $16, which old William Penn paid the Indians for Pennsylvania in whisky, beads, and blankets, been put out at interest, and allowed to remain, it would to-day equal the wealth of the entire United States. This system is still at work, and yields fabulous results to such men as Vanderbilt and the bondholders, the Astors, and the landlords in Ireland. In fact, it is the fulcrum which Mr. Gould so glibly refers to as *his power of increase.* I am no enemy to Mr. Gould; on the contrary, I very much admire his abilities; but it's his *power of increase* I am after.

Now, gentlemen of the committee, with all respect for your wisdom, I wish to suggest that when you are sufficiently amused at the confusion among the trade unionists about these matters, you go back to Washington and introduce a bill to put that *power of increase* on *labor*, and *not* on the *results of labor*, this system has it; and it is my belief that the statesman who accomplishes this will ere long be pointed to as the emancipator of the human race from a system more vile than human slavery, and will wipe out the absurd condition of affairs which will one day produce its terrible and devastating results, just so sure as the sun shines, unless attended to before it is too late. I might point out the particulars covered, but it is unnecessary to do so, as you understand the field covered by the *power of increase.*

A TRAMP.

P. S.—In order that you may not condemn me as some drunken outcast, I will say that I have a trade, and am tolerably industrious, and strictly sober. My case does not stand alone; witness the telegraph operators who, in three weeks' time, were paupers, or tramps, if they had the courage to change their location, and the other trades are about the same with their average intelligence to back them up. And when 97 per cent. of the wealth is in the hands of 3 per. cent of the population, what else can we expect? An inquiry into what's the matter with the statesmen of the times would prove highly interesting to the average American about now. He has wandered out among the people to be enlightened, and if he gets his information, will go back and vote and act just as before. History will have to repeat itself before the lawmakers will think worth while to listen to the cranks. The ship-building tramp should have informed you that since his walk across Illinois the whole aspect of business has changed, as it was prior to the age of corporations, when there was something like equal opportunities; but this is not the case to-day. The time that men engaged in business with a few dollars is gone, for a syndicate will immediately wipe him out; and I believe there is a corner on the peanuts and gum for boys already. Everything must be cornered now.

Digitized by Google

The CHAIRMAN. I can only say that if any man of the kind wants to be heard as a witness he has only to apply to the committee to be allowed to present his ideas.

The committee adjourned until to-morrow at 10 o'clock a. m.

---

NEW YORK, *Thursday, September* 13, 1883.

The committee met at 10 o'clock a. m.

## LABOR IN THE SOUTHWEST.

JOHN CALDWELL CALHOUN sworn and examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. In Chicot County, Arkansas.

Q. State to the committee, if you please, where you were born, of what family connection you are, and what have been your opportunities for becoming acquainted with the past and the present condition of agricultural labor in the Southern States.—A. I was born in Marengo County, Alabama. My father was a planter there before the war.

Q. He was a son of John C. Calhoun, the statesman?—A. He was a son of Mr. John C. Calhoun, of South Carolina.

Q. You are his grandson, then?—A. Yes, sir; I am his grandson. My father was Col. Andrew P. Calhoun. I was reared in South Carolina. In 1854 my father removed his residence from his plantations in Alabama to Fort Hill, South Carolina, near Pendleton, where I was raised. I have been identified with the agricultural interest of the South from my earliest recollections, and have been a practical cotton planter myself since the war, giving my own personal attention to my interests since 1869.

Q. When did you remove from South Carolina?—A. I removed from South Carolina to Chicot County, Arkansas, in 1869.

Q. Until 1869 you had been a resident of South Carolina?—A. Yes, sir.

Q. And of course very familiar with the condition of things on the Atlantic coast. Since that time you have been in the Mississippi Valley?—A. Yes, sir; my experience as a cotton planter and with the laborers of the South is confined, I may say, almost entirely to the Mississippi Valley, for I left South Carolina so soon after the war that things had hardly shaped themselves there so that I could form an accurate estimate of the labor or the condition of affairs in South Carolina or on the Atlantic coast.

The CHAIRMAN. Not having had a personal acquaintance with Mr. Calhoun, and learning of his rare opportunities to give valuable information to the committee, and of his presence in the city, I addressed him a letter, calling attention to the subject-matter upon which we should like information, and which I had reason to think he could give us better than almost any one else, indicating certain questions which I would like to have him prepared to answer, and receiving a courteous reply, expressing a willingness to oblige the committee, I have called him before the committee, and will now read the questions:

1st. What is the condition of the laborers in your section?

2d. Under what system are the laborers in your section employed?

Digitized by Google

3d. When hired for wages what is paid?

4th. What division is made between labor and capital of their joint production when you work on shares?

5th. When you rent what division is made?

6th. How many hours do the laborers work?

7th. Under what system do you work?

8th. What is the relation existing between the planters and their employés?

9th. What danger is there of strikes?

10th. How can the interest of the laborers of your section be best subserved?

If you have prepared answers to these questions, and can give your answers consecutively, I would like you to do so.

The WITNESS. I have prepared replies in order that I might save the committee time as well as condense my ideas.

Q. 1. What is the condition of the laborers in your section?—A. The laborers in the Mississippi Valley are agricultural. But few whites are employed; they soon become land-owners or tenants. Your question, therefore, reduces itself to, What is the condition of the negroes? I should say good, as compared with a few years ago, and improving. You must recollect that it has only been 18 years since the negroes emerged from slavery without a dollar and with no education, and that for generations they had been taught to rely entirely upon others for guidance and support. They became, therefore, at once the easy prey of unscrupulous men, who used them for their personal aggrandizement, were subjected to every evil influence, and did not discover for years the impositions practiced upon them. They were indolent and extravagant, and eager to buy on a credit everything the planter or merchant would sell them. The planter had nothing except the land, which, with the crop to be grown, was mortgaged generally for advances. If he refused to indulge his laborers in extravagant habits during the year, by crediting them for articles not absolutely necessary, his action was regarded as good grounds for them to quit work, and there were those present who were always ready to use this as an argument to array the negroes against the proprietors. This, of course, demoralized the country to a very great extent, and it has only been in the past few years the negro laborers have realized their true condition and gone to work with a view of making a support for themselves and families. There is yet much room for improvement, but they will improve just as they gain experience and become self-reliant.

Considering their condition after emancipation and the evil influences to which they have been subjected, even the small advancement they have made seems surprising.

Q. 2. Under what systems are the laborers in your section employed?—A. There are three methods: we hire for wages for a part of the crop, or we rent.

Q. 3. When hired for wages what is paid?—A. When hired by the month we pay unskilled field-hands from $10 to $20 per month and board. When hired by the day, for unskilled laborers, from 75 cents to $1. Teamsters, $1 a day and board. Artisans, from $2 to $5. In addition to their wages and board, the laborers are furnished, free of cost, a house, fuel, and a garden spot varying from ½ to 1 acre; also the use of wagon and team with which to haul their fuel and supplies, and pasturage, where they have cattle and hogs, which they are encouraged to raise.

Q. 4. What division is made between labor and capital of their joint

Digitized by Google

production when you work on shares?—A. I doubt if there is greater liberality shown to laborers in any portion of the world than is done under this system. The proprietor furnishes the land and houses, including dwelling, stables, and out-houses, pays the taxes, makes all necessary improvements, keeps up repairs and insurance, gives free of cost a garden spot, fuel, pasturage for the stock owned by the laborers, and allows the use of his teams for hauling fuel and family supplies, provides mules or horses, wagons, gears, implements, feed for teams, the necessary machinery for ginning, or, in short, every expense of making the crop and preparing it for market, and then divides equally the whole gross proceeds with the laborers. In addition to all this, the proprietor frequently mortgages his real estate to obtain means to advance to the laborers supplies on their portion of the crop yet to be grown, thus mortgaging what he actually possesses, and taking a security not yet in existence, and which depends not only upon the vicissitudes of the seasons, but the faithfulness of the laborers themselves. Under this system thrifty, industrious laborers ought soon to become land-owners. But, owing to indolence, the negroes, except where they are very judiciously managed and encouraged, fail to take advantage of the opportunities offered them to raise the necessaries of life. They idle away all the time not actually necessary to make and gather their corn and cotton, and improvidently spend what balance may remain after paying for the advances made to them.

Q. 5. When you rent, what division is made?—A. Where the laborer owns his own teams, gears, and implements necessary for making a crop, he gets two-thirds or three-fourths of the crop, according to the quality and location of the land.

Under the rental system proper, where a laborer is responsible and owns his team, &c., first-class land is rented to him for $8 or $10 per acre. With the land go certain privileges, such as those heretofore enumerated.

Q. 6. How many hours do the laborers work?—A. This is an extremely difficult question to answer. Under the wages system, from sunrise to sunset, with a rest for dinner of from one and one-half to three hours, according to the season of the year.

Under the share or rental system there is much time lost; for instance, they seldom work on Saturday at all, and as the land is fertile, and a living can be made on a much smaller acreage than a hand can cultivate, they generally choose one-third less than they should, and it is safe to say that one-third of the time which could and would be utilized by an industrious laborer is wasted in fishing, hunting, and idleness.

Q. 7. Under what system do you work?—A. We are forced to adopt all of the systems heretofore stated. We prefer, however, the tenant system. We wish to make small farmers of our laborers, and bring them up as nearly as possible to the standard of the small white farmers. But this can only be done gradually, because the larger portion of the negroes are without any personal property. We could not afford to sell mules, implements, &c., where a laborer has nothing. Therefore the first year we contract to work with him on the half-share system, and require him to plant a portion of the land he cultivates in corn, hay, potatoes, &c. For this portion we charge him a reasonable rent, to be paid out of his part of the cotton raised on the remainder. In this way all of the supplies raised belong to him, and at the end of the first year he will, if industrious, find himself possessed of enough supplies to support and feed a mule. We then sell him a mule and implements, preserving, of course, liens until paid. At the end of the second

Digitized by Google

year, if he should be unfortunate, and not quite pay out, we carry the balance over to the next year, and in this way we gradually make a tenant of him. We encourage him in every way in our power to be economical, industrious, and prudent, to surround his home with comforts, to plant an orchard and garden, and to raise his own meat, and to keep his own cows, for which he has free pasturage. Our object is to attach him as much as possible to his home. Under whatever system we work, we require the laborer to plant a part of his land in food crops and the balance in cotton with which to pay his rent and give him ready money. We consider this system as best calculated to advance him. Recognizing him as a citizen, we think we should do all in our power to fit him for the duties of citizenship. We think there is no better method of doing this than by interesting him in the production of the soil, surrounding him with home comforts, and imposing upon him the responsibilities of his business. Who will make the best citizen or laborer, he who goes to a home with a week's rations, wages spent, wife and children hired out, or he who returns to a home surrounded with the ordinary comforts, and wife and children helping him to enjoy the products of their joint labor? We recognize that no country can be prosperous unless the farmers are prosperous. Under our system, we seek to have our property cultivated by a reliable set of tenants, who will be able to always pay their rent and have a surplus left.

Again, a large portion of the cotton crop of the country is made by small white farmers. These to a great extent are raising their own supplies, and making cotton a surplus crop. The number who do this will increase year by year. It must be apparent that the large planters cannot afford to hire labor and compete with those whose cotton costs nothing except the expenditure of their own muscle and energy. The natural consequence resulting from this condition of things is that the negro, if he is to prosper, must gradually become a small farmer, either as a tenant or the owner of the soil, and look himself upon cotton as a surplus crop.

Q. 8. What is the relation existing between the planters and their employés?—A. Friendly and harmonious. The planter feels an interest in the welfare of his laborers, and the latter in turn look to him for advice and assistance.

Q. 9. What danger is there of strikes?—A. Very little. As a rule the laborers are interested in the production of the soil, and a strike would be as disastrous to them as it would be to the proprietors. There is really very little conflict between labor and capital. The conflict in my section, if any should come in the future, will not assume the form of labor against capital, but of race against race.

Q. 10. How can the interest of the laborers of your section be best subserved?—A. By the establishment by the States of industrial schools, by the total elimination from Federal politics of the so-called negro question, and by leaving its solution to time, and a reduction of taxation, both indirect and incidental. It is a noteworthy fact that the improvement of my section has kept pace, *pari passu*, with the cessation of the agitation of race issues. The laborers share equally with the land owners the advantages of the improvement, and there is every reason to expect increasing and permanent prosperity if all questions between the land-owners and their laborers in our section are left to the natural adjustment of the demand for labor. For many years the negroes regarded themselves as the wards of the Federal Government, and it were well for them to understand that they have nothing more to expect from the Federal Government than the white man, and that, like him, their

Digitized by Google

future depends upon their own energy, industry, and economy. This can work no hardship. The constant demand for their labor affords them the amplest protection. Nothing, probably, would contribute so immediately to their prosperity as the reduction of the tariff. They are the producers of no protected articles. The onerous burdens of the tariff naturally fall heaviest upon those who are large consumers of protected articles and produce only the great staples, grain and cotton, which form the basis of our export trade, and which can, from their very nature in this country, receive no protection from a tariff.

Q. In your own State, Arkansas, what proportion of the land cultivated and what proportion of the acreage of the land cultivated is in the form of large plantations?—A. That lying along the Mississippi and Arkansas Rivers. It would be hard for me to estimate the proportions. I do not know that I have ever considered it, but the portions which are cultivated in large plantations lie directly on the Mississippi River in the front of the State of Arkansas and on the Arkansas River. The rest of the State is cultivated very much by small white farmers.

Q. And are the productions of the small holdings and large holdings similar; I inquire as to cotton particularly?—A. No, sir. In the interior of the State cotton is made a surplus crop entirely.

Q. What are the principal crops there?—A. Our people are raising their own supplies, fruits and vegetables. For instance, it was stated by the land agent of the Iron Mountain Railroad at a public meeting in Little Rock some weeks ago that that road had carried out from the State of Arkansas in one week 800,000 pounds of green peas and strawberries.

Q. To what market?—A. To Saint Louis, going to different markets. The section of the State lying between Little Rock and Fort Smith is peculiarly adapted for growing fruit, and there is a very large fruit trade.

Q. What kinds of fruit?—A. I might say almost all kinds, but particularly apples; that section of country is noted for its apples.

Q. Are peaches raised there also?—A. Very fine, indeed.

Q. Plums?—A. Yes, sir.

Q. Are oranges raised there?—A. No, sir; we do not raise any of the tropical fruits, such as oranges, bananas, and lemons.

Q. How in regard to oats, rye, corn, wheat, potatoes, and crops of that description?—A. If our exhibit, which is now being made at the Louisville Exposition, can be seen, it will compare favorably with that of any other portion of the United States.

Q. Even with the Northwest?—A. Even with the Northwest.

Q. Would you judge that one-half the cultivated surface of Arkansas is made up of the larger plantations?—A. No, sir; I should not say more than a third, as a rough estimate.

Q. Upon these plantations is there any crop raised for consumption anywhere but upon the plantations, save the cotton?—A. Only in a very limited way. We raise Irish potatoes for the northern markets, and it is an extremely profitable and productive crop with us.

Q. What is the home market price?—A. We do not sell these potatoes at home at all. We get them to Saint Louis, Chicago, and Cincinnati before the ground is really thawed out up there. We get from $5 to $10 a barrel for them.

Q. A barrel of about 3 bushels?—A. A barrel of about 3 bushels. That of course is a fancy price, and only lasts until the product comes in from other sources.

Q. That is an advantage no farmer has elsewhere in the United States

Digitized by Google

than in Arkansas?—A. In Arkansas and Louisiana, on the Mississippi River.

Q. Are potatoes raised largely in Louisiana?—A. Yes, sir; in parts. The cultivation of the alluvial lands in Louisiana is very similar to what I am speaking of in Arkansas.

Q. Is the potato of good quality raised on those rich lands?—A. Of very fine quality.

Q. Can you give the average crop of potatoes per acre?—A. I cannot, as I have never raised any myself for market. We leave it almost entirely to our small farmers to do that sort of thing.

Q. About 300 bushels per acre, Senator Pugh says. This is the Irish potato you speak of, not the sweet?—A. The Irish potato. We raise also the sweet potato there. I have raised sweet potatoes that weighed five pounds.

Q. And of good quality?—A. Of fine quality.

Q. The size does not depreciate the quality, then?—A. Not at all.

Q. They, I suppose, are raised for exportation from the State?—A. No, sir; they are raised almost entirely for home consumption by our farmers.

Q. Do your people at home prefer the sweet to the Irish potato for their own use?—A. I cannot say they do. I think they raise both in equal proportions.

Q. Which, on the whole, is the most profitable crop to raise of potatoes?—A. The Irish potatoes, because we export and sell them. The sweet potato does not mature until the fall of the year.

Q. Upon your plantations you encourage the raising the variety of crops you have spoken of for consumption by the laborers, and for the use of the planter, I suppose, but not for exportation and sale?—A. Not for sale. We merely raise them for home consumption in case of a disaster to our cotton crops. The cotton crop is subjected to very many vicissitudes, and we want to have all our supplies at home, so that in case of a failure of the cotton crop we have our living made at least.

Q. Are the planters and those who labor upon the plantations substantially independent of the small farmers surrounding them, or do they constitute consumers for the smaller farmers in the interior?—A. We have our own gardens, and generally raise our own supplies, but every planter interests himself to find a market for all the products of his laborers. For instance, we encourage them to raise poultry to a great extent. If they have a surplus of potatoes, or eggs, or chickens, we will buy it and create a market for it, and ship the articles off in order that if they have any surplus they may realize on it. On the Mississippi River we have nearly all the markets. Boats are passing there every day going directly by the banks of the river. We have the markets of New Orleans, Vicksburg, Memphis, Saint Louis, Chicago, and we have, you may say, the whole country open before us where we can create a market. We make the best market we can for the products of our small farmers.

Q Do you know something of the prices in the North for the various crops you have mentioned, and, if so, how do they compare with the prices realized by your laborers at home?—A. Our laborers realize the prices of the Northwest. We ship the articles for them. For instance, a negro has several barrels of potatoes; I consign them to my merchants in Saint Louis, and have them sold for his account.

Q. There are no middlemen, really; you transact this business for them?—A. I transact this business for them direct.

Q. Charging them simply the cost of transportation?—A. You are

Digitized by Google

asking me the relationship between the proprietor and the negro. There are a great many stores on the Mississippi River, and negroes sometimes go and trade directly. There are a great many properties in the Mississippi Valley owned by non-residents. There are some plantations rented out to negroes that there is not a white man on at all. The proprietor comes and collects his rent at the end of the year when the crop is made; or it may be his negro tenant consigns the cotton to a factor in New Orleans.

Q. Where is the proprietor himself usually resident?—A. In different States. We have people who are proprietors of real estate who live out in Orange, New Jersey; some live in South Carolina; some live in Georgia, in the various States, but they own property with us, and this property is rented directly to the negroes. Generally, though, there is a responsible manager in charge of this property, but there are instances where there is not even a white man on the place at all.

Q. In those instances, how do matters work? Do the negroes conduct affairs with reasonable prudence, and consult the interest of the owners?—A. No, sir; in these instances the property generally goes to decay gradually; the negro will not make an improvement on real estate at all.

Q. In these cases do the negroes work together and carry on the plantation as a whole, or is the plantation cut up into small holdings and rented out to negroes?—A. It is cut into small portions and rented according to the size of the family. Some men work two mules; some four. It is regulated better by the number of animals he works. For instance, a mule can cultivate in that country with ease about fifteen acres. A man with two mules would work thirty acres; a man with four, sixty, and so on. I know some negroes who work eight and ten mules that they have paid for; but I will say this right here, and it shows the necessity of the education of the negro and of fitting him for the condition of being able to take care of himself and make his own contracts and sign his own name to a contract: I have known of numerous instances where negroes, working under the management of a proprietor of a plantation, have made enough money to buy a home; such a one will go back out in the hills, that section of country lying back of the alluvial lands, and buy a home. In three or four years he will move back to the river again, having lost all his property, mortgaged it to some storekeeper, become extravagant, and that storekeeper in a short time—three or four years probably—will have absorbed all he had earned under the management of a planter.

Q. About that store system; how extensive is it, and how great an evil does it constitute?—A. It constitutes a very considerable evil, but you cannot blame the storekeeper for it, for this reason, or he can only be blamed partially: Capital in that country is very limited, and capital in New Orleans is very limited. When you consider the fact that New Orleans, which handles the cotton crop of that country, has a smaller banking capital than any one of your little towns in Massachusetts or New Hampshire, it shows at once that there is not enough capital to be advanced to the country people at reasonable enough rates of interest for those people to conduct a strictly legitimate business. I have known capital to cost in New Orleans, counting the commissions, 15 or 20 per cent. for money loaned. The storekeeper who borrows that money to conduct his business with has to buy his goods from some merchant at some point who must make his profit. He cannot go directly to the producer, because he has got to have somebody to help him out if his capital falls short. Therefore, before the goods get down to him, they

Digitized by Google

have cost him perhaps 30, 40, or 50 per cent. more than the first price. Therefore, he has to tack on an enormous profit to bring himself out whole and pay his expenses in order to meet his obligations with the factor in New Orleans. There is, however, among a certain class, as there would be in all sections of the country, as exists right here in New York, or anywhere else, a set of people who will always prey upon ignorance. The best protection that can be afforded to the laborer of that country is education; fit him for his condition of life, that he may protect himself.

Q. Do you mean to be understood that these traders do business upon borrowed capital?—A. Almost entirely.

Q. Their capital is hired in New Orleans?—A. Or any points they may go for it; I merely mention New Orleans as one point. A number of our people borrow money in Memphis, and some borrow money in Vicksburg.

Q. Do you know whether those people to any extent borrow capital of Northern capitalists in New York and other portions of the North?—A. That class of people do not. In the last few years—I might say almost within the last two years—Northern capital has begun to seek investment in our section of the country, but only upon mortgages on real estate. The class of storekeepers I allude to generally have no real estate at all; they only have their stores.

Q. Your system by which the planter makes a market for the surplus productions of the laborers upon his plantation dispenses with a middleman, and enables the laborer to make a saving, whereas if he goes to the hills he makes a loss?—A. Yes, sir. I will put it more definitely: As long as he is under the guidance and care of the proprietor of the plantation he prospers, the planter, as we express it in that country, "loaning him our aid"; we make it very expressive to the negro, we loan him our aid, that is, he must follow our advice, and he has learned to do that, and by doing that he accumulates; but when thrown upon his own resources—there are individual exceptions, of course, where a good many negroes prosper themselves when thrown upon their own resources in Arkansas—but as a general fact, where he leaves the guidance and care of the proprietor of a plantation and subjects himself just as any one else does to the common trading with storekeepers, in a very few years he loses what he has accumulated.

Q. Under these favorable circumstances which surround the laborer on the plantation one would think he ought to accumulate; but I understand you that as a rule he is rather improvident and fails to accumulate. To what do you attribute that improvidence on the part of the negro laborer?—A. It is simply from the want of a proper appreciation of the opportunities of advancement from his condition. The negroes are just beginning, as I expressed it, to realize the responsibilities of life, and just as they begin to realize the responsibilities of life here they begin to prosper. The prosperity of the South has only begun in the last few years, and it has begun to increase just as the race issue has ceased. I will demonstrate that to you by a little paragraph I cut out of the *New York Herald* last night, taken from the New Orleans *Times-Democrat*. If you take the assessed valuation of real estate in Alabama, in 1879 it was assessed at $117,486,581; in 1883 it is assessed at $152,920,115. There has been that increase in four years from $117,000,000 to $152,000,000. Now let us take the State of Arkansas: in 1879 our real estate was valued at $86,892,541; in 1883 it is valued at $136,000,000. It goes on just in that same proportion. For instance, this shows that in eight of the Southern and Southwestern States there has been an

Digitized by Google

increase of nearly half a billion dollars—that is, $494,836,686—in value of taxable property during the short period of four years.

I happened to pick up this book last night. If I had an opportunity I could have gotten some statistics to show you the increased production in these different States, and how completely it has taken place, as the laborer has begun to rely on himself and been thrown on his resources.

Q. Have you observed the origin of these statistics?—A. They come from the New Orleans *Times-Democrat*. I will read this in order that they may be known. This is from the *Herald* of yesterday:

SOUTHERN PROGRESS.

The New Orleans *Times-Democrat* has gathered from trustworthy sources and given to the public valuable statistics showing the industrial progress made in the Southern States during the past four years. This covers the period since 1879, the year to which the figures of the latest national census apply. The census returns show a marvelous material growth in the South during the preceding ten years. But, according to the reports published by our New Orleans contemporary, the progress of the past four years is greater and more wonderful than that achieved during the decade between the census years.

Taking the important item of assessed value of property, a comparison between the years 1879 and 1883 gives the following remarkable results:

| States. | Assessment, 1883. | Tax rate. | Assessment, 1879. | Tax rate. |
|---|---|---|---|---|
| Alabama | $152, 920, 115 | 6½ | $117, 486, 581 | 7 |
| Arkansas | 136, 000, 000 | 7 | 86, 892, 541 | 6½ |
| Florida | 56, 000, 000 | 5 | 29, 471, 648 | 7 |
| Georgia | 300, 000, 000 | 2½ | 135, 659, 530 | 5 |
| Louisiana | 200, 000, 000 | 6 | 209, 361, 402 | 6 |
| Mississippi | 116, 288, 810 | 2½ | 129, 308, 345 | 3½ |
| Tennessee | 252, 289, 873 | 2 | 223, 211, 345 | 1 |
| Texas | 500, 000, 000 | 3 | 304, 470, 736 | 5 |
| Total | 1, 710, 498, 798 | 4½ | 1, 215, 662, 128 | 5 |

This shows that in eight Southern and Southwestern States there has been an increase of nearly half a billion dollars—$494,836,668—in the value of taxable property during the short period of four years, while the rate of taxation has been actually reduced. At the same time liberal appropriations have been made for schools, public improvements, and other useful purposes. "Nor is this marvelous advance in valuation," says the *Times-Democrat*, "the result of any inflation in value, but the natural sequence of grand crops, new industries developed, new manufactures, mines, and lumber mills established."

The extension of railroads has been hardly less astonishing. In the eight States above enumerated there were in 1879 11,604 miles of railroad. There are now 17,891 miles, showing an increase in four years of 6,287 miles. The agricultural progress made is shown by the fact that the value of raw products raised in these States, including all crops, lumber, cattle, and wool, has advanced from $398,000,000 in 1879 to $567,000,000 in 1883, or an increase of $169,000,000. During this period the mineral output of Alabama alone has increased from $4,000,000 to $19,000,000, and the lumber product of Arkansas from $1,790,000 to $8,000,000.

The trade of New Orleans is a barometer of Southern industry and commerce. The value of domestic produce in that city in 1881-'82 was $159,000,000; in 1882-'83 it was $.00,000,000. The value of exports of domestic produce to foreign countries in the former year amounted to $68,000,000; in the latter it reached $95,000,000.

These figures tell a remarkable story of recent progress in the Southern States. Always rich in natural resources, the South has long been poor through lack of development. It has at last entered upon a new era of industrial activity, and is now making rapid strides toward a stage of material prosperity commensurate with its great natural wealth.—*New York Herald*, September 12, 1883.

Now, here is quite a remarkable fact to which I wish to call your attention, to show you the opportunities for labor existing in the South and what is the condition of certain counties in the South. I hold in my hand a book that is compiled for the benefit of the Georgia Pacific

Digitized by Google

Railroad, but I happened to find it in my room and thought these matters would be interesting.

Q. The data you consider reliable?—A. What I read I think comes from the census report; I think this is reliable:

In this connection let us glance at Montgomery County, Alabama, which, although not in the belt we are studying, is on the same prairie formation crossed by the Georgia Pacific Railway, on the edge of Mississippi. Compare it with Butler County, Ohio, which "shows the best record of any county in the West." In live stock Montgomery has $1,748,273; Butler, $1,333,592.

That is the largest producing county in Ohio as compared with Montgomery County, Alabama, before the war.

Montgomery had 63,134 hogs; Butler, 51,640. Animals slaughtered: Montgomery, $336,915; Butler, $318,274. In grain Butler was considerably ahead, but in roots Montgomery led. Montgomery doubled Butler in the production of wool, and had its cotton crop to show besides. The total value of the crops of Montgomery County was $3,264,170; those of Butler only $1,671,132.

There is Montgomery County, Alabama, compared with the leading producing county in Ohio.

Q. Do you know as to the relative size of the two counties?—A. I think it was given here:

A handsome triumph for the Alabama county! And yet Montgomery is not up to the average of the prairie counties of Alabama.

I do not know the relative size. Here is a fact to which I wish to call particular attention:

We have examined the mortality tables of the United States census for 1880, and find that as regards health Georgia, Alabama, and Mississippi make a better showing than some of the oldest and most densely populated Northern States.

There is generally an idea prevailing that the Southern States are very unhealthy. It is a point that bears directly on our labor question, and for that reason I wish to call special attention to this table, which is taken directly from the census:

*Annual death rate for each thousand of population.*

| | |
|---|---|
| New York | 17.38 |
| Pennsylvania | 14.92 |
| Virginia | 16.32 |
| Massachusetts | 18.59 |
| Kentucky | 14.39 |
| Georgia | 13.97 |
| Alabama | 14.20 |
| Mississippi | 12 89 |

Mississippi has the smallest average of death rate of any of that number of States which I have enumerated.

Q. I suppose the circumstance that the average death rate is larger in cities ought to be taken into account, the Southern population being mostly rural, is it not?—A. The Southern population is to a very great extent rural. Still there are cities in Georgia which I suppose in proportion to our rural population would not make the latter in excess of what it is here. If you take your rural population here and in New Jersey, where you are densely populated, we are no more densely populated in the proportion of our city population to the country than you are here, I think.

Q. Of the population, which is, as a rule, the more healthy in the South, the colored or the white population?

By Mr. PUGH:

Q. There must be some qualification of that difference between the death rate between such States as Massachusetts, for instance, and

Digitized by Google

Georgia, on account of the fact—which I suppose must be conceded—that in these new States population is younger and more vigorous than in the older States. The emigration to these States has been of the younger and more vigorous population, not so liable to die as those who remain behind and are older.—A. There has been but very little emigration into these States up to this census.

Mr. PUGH. That is the fact to some extent, I suppose, anyway.

The CHAIRMAN. In that same connection, I suppose, should be borne in mind the fact that the population of these Eastern States is largely reenforced by immigration from Europe, and that is of the younger and more vigorous European population, and I do not know but what the people in Massachusetts will insist upon it that they are as young and as vigorous as anybody.

Mr. PUGH. I have no doubt. I saw a great many very old people there.

The WITNESS. I merely mentioned this because I wanted to do away with the impression which generally exists that the Southern States are very unhealthy.

Mr. PUGH. I have no doubt that what you state is true as a general fact.

The WITNESS. Now, to bear out the assertion which I made that the prosperity of the negroes began to increase with the cessation of race issues in the South, which has been so apparent to me that I can almost mark the time that it began, look at the cotton crop that is being made to a great extent by small farmers; look at the increase of the cotton crop in the different States in the last few years. For instance, take Georgia: in 1870 she made 473,934 bales of cotton; in 1880 she made 814,441, an increase of 75 per cent. Alabama in 1870 produced 429,482 bales; in 1880 she produced 699,654, an increase of 62 per cent. Mississippi in 1870 produced 564,938 bales; in 1880 she produced 955,808 bales, an increase of 69 per cent.

Here is a very significant fact also with regard to the condition of our laborers in the South, and it shows one of the disadvantages we have had to labor under. During the war and from the results of the war nearly all of our live stock was destroyed, a great portion of it was destroyed, which left us after the war without the means of raising our own meat and such supplies at home, and took away from the South a great portion of our wealth, for we know that cattle, hogs &c., increase in arithmetical progress. If you have a hog, this year she bears so many pigs, and in a couple of years those pigs bear so many, and so on. But we were left without live stock. I have here a table which shows, even under those difficulties, the increase in that respect in the Southern States of live stock. These are very significant figures. It is entirely an accident that I happened to get hold of them last night. The live stock of New York in 1870 was 5,286,421; in 1880, 5,422,238, an increase of 2 per cent. In Pennsylvania it was 4,484,748 in 1870; in 1880, 5,255,204, an increase of 17 per cent. In Georgia, in 1870, it was 2,275,137; in 1880, 3,139,101, an increase of 38 per cent. In Alabama it was 1,606,299 in 1870, and in 1880, 2,586,221, an increase of 61 per cent., and in Mississsippi, in 1870, it was 1,724,295, and in 1880, 2,398,334, an increase of 38 per cent. This shows that with all the disadvantages the South had to contend with of their stock cattle being destroyed, the natural advantages of climate and pasturage, to which I attribute it, existing in the South have enabled them to increase more rapidly their live stock than any other of the States of the Union. That shows clearly the advantages which that country offers for immigration and labor. This is

Digitized by Google

an advantage to labor. As I stated in my written reply to your submitted questions, we work but few white laborers in my section of the country. Why? Because they soon become land-owners with the opportunities which present themselves to them. The white man will not be there more than two or three years before he has bought and paid for his land in almost every instance.

By the CHAIRMAN:

Q. And he becomes an employer himself.—A. He becomes an employer himself.

Q. Does he usually locate upon the plantation lands along the rivers?—A. No, sir; he cannot buy this land, because the planter would not divide a large plantation into tracts; he would not sell off a portion of his land without selling the whole.

Q. In how large tracts are the plantations held? Just mention the acreage of some of them that you are acquainted with.—A. I would say variously from 500 to 2,500 acres in cultivation.

Q. How valuable are these plantations per acre?—A. That is a question which cannot be answered definitely except in this way: where a planter owns the land, and he is out of debt, the land is not for sale, because he cannot invest his money in anything that is so profitable; but where a planter's property is mortgaged, and the mortgagee wants to foreclose and will foreclose, and there is not in that country the money which the planter can borrow to relieve himself of his indebtedness, he will probably sell his land at a small excess of his debt in order to save something. You see there is a want of capital in that country, and if a planter is involved, as many planters are and have been ever since the war, he must do the best he can. There are many planters in that country who are nothing but agents of the factors, from the fact that the interest and commissions they pay upon the debt amount to more than the rent for the property, and they hold on to it as a home. Therefore, a planter in that condition will sell at a nominal price, whereas a plantation owned and paid for is not for sale.

By Mr. PUGH:

Q. There is really no established market price?—A. None at all, owing to the necessity of the one to sell and the desire of another to buy.

By the CHAIRMAN:

Q. At what rates per acre have you known the title to change in some instances?—A. I have known lands to be bought there, including woodlands and cleared lands, at from $20 to $25 an acre, which would be, say, $40 or $50 an acre for the cleared land, and I have known other planters to refuse $80 an acre, cash.

Q. Do you think that $80 or $100 per acre would be a reasonable price for these plantation lands?—A. They sold before the war for $120 an acre.

By Mr. CALL:

Q. You are speaking now of the alluvial lands?—A. I am speaking of the alluvial lands on the Mississippi River, cleared, ready for cultivation, with the improvements existing upon them.

By the CHAIRMAN:

Q. Improved plantations?—A. Yes, sir.

Q. Upon what price per acre do you think those lands would pay, one year with another, an interest of 6 per cent.?—A. I will best answer that

Digitized by Google

question by the figures of rents which I have given. The rent, without any responsibility attached to the proprietor at all, is from $8 to $10 an acre.

Q. In money?—A. In money. I will say further that I have been living in that country since 1869, and I have never yet known a year when there has not been a sufficient crop made to pay the rent, without a single exception.

By Mr. CALL:

Q. What is left to the tenant after he pays this $10 an acre?—A. That land produces on an average 400 pounds of lint cotton to the acre, which at 10 cents a pound is $40.

By the CHAIRMAN:

Q. To what extent is Northern capital availing itself of opportunity to invest in these plantations?—A. I might say it is limited.

Q. From what fact does that arise?—A. From the fact that the safety of investments there is just becoming apparent to capitalists. Capitalists up to this time have been afraid to go to the South, owing to the disturbed condition of affairs politically and this very race-issue question. A man does not want to carry his money down there and put it into a country that might be involved in riots or disturbances. Those questions are now just beginning to settle themseves, and capital is beginning to find its way.

Q. Do you anticipate in the near or remote future any further difficulty from the race question?—A. Not at all, and if we are left to ourselves things will very soon equalize themselves.

Q. You are left to yourselves now, are you not?—A. We are now.

Q. All you ask is to continue to be let alone?—A. Just to be let alone. The South, with her natural resources and advantages of climate and soil, feels that she is perfectly able to take care of herself and her affairs, and all she wants is that the legislation of the country, both Federal and State, should be that which will mete out justice to all her citizens, colored as well as white.

Q. Does the South feel as though all she had got to do was to take care of herself, or does she feel a little responsibility for the other section of the country?—A. She feels more immediately now responsibility for that section, for this reason, that the negro population of the South compared with the white population of the South might be a dangerous element, but the negro population compared with the whole white population of the United States as an integral body sinks into insignificance. Therefore, the forces which are at work in the South to-day make us strongly Union. They are directly contrary to what were existing before the war, and there are no people in this Government to-day who have the same interest in the Federal Union that the people of the Southern States have, and they appreciate it.

Q. You feel that it is to your advantage that the negro population should be dealt with by the forty or fifty millions of whites, that the races should be balanced in that proportion rather than in the proportion that exists between them and the white population of the South alone?—A. Yes, sir.

Q. The central idea of the South is a national idea, then?—A. The central idea of the South is more a national idea now than it has been in this respect.

Q. I would use the word "leading" rather than "central" there—the leading idea?—A. We, of course, claim that we want to manage the

Digitized by Google

internal affairs of our States just as much as New York, or New Hampshire, or Massachusetts would want to manage theirs, but that it is necessary for us to have the guidance and protection of the Government: we want it just as much as either of those States.

Q. Have you traveled considerably through the North?—A. I have.

Q. What portions of the North have you visited within the last few years?—A. I have visited Philadelphia, New York, Boston, Hartford, and I might say a number of other points in the States of which they are the chief cities.

Q. While we are speaking of this matter of reciprocal feeling between the sections of country, as you have mentioned the attitude of the South, I should like to know from you, from your personal observation and knowledge, what you find to be that of the North toward the South?—A. I think it is of the kindliest character. I have never in my life been treated with more consideration than I have been by gentlemen in the East who were most opposed to the South during the war.

Q. I do not refer simply to cases of personal courtesy, but I mean the expression of feeling as between the sections, the general tendency and drift of Northern feeling towards the Southern portion of the country, to the people of the South.—A. I think, so far as I have been able to observe, that the feeling in the East towards the South is a general anxiety for her prosperty. I would go so far as to speak of it as anxiety for her prosperty.

Q. You think the war of sections is pretty much over?—A. I think it is obliterated, and for that reason I go back to this point, that our prosperity in the South has begun.

Q. You have described with some minuteness the condition of things among the planters and those who work upon the plantations. I should like to ask this question further, whether any of the negroes along the alluvial bottoms are obtaining ownership of lands in fee simple?—A. In very few instances in the alluvial lands. When they make enough money to buy a home they generally go to the hill country, where land can be bought at a much more reasonable price.

Q. With what amount of accumulation will a negro get up and go to the hills?—A. There are negroes right in my section of the country who have an accumulation clear of all expenses of from a thousand to $3,500 a year.

Q. Do they remain or do they go and buy homesteads for themselves?—A. They probaby remain until they accumulate a few thousand dollars, and then go and buy a home. We encourage it, from the fact that we want the others behind to be stimulated to do the same thing. I will say in that connection that the future of the negro of the South is the alluvial lands.

Q. These plantations?—A. Not only these plantations particularly. What I mean by alluvial lands are the alluvial lands on the coast and the alluvial lands of the Mississippi Valley, the rich lands where the negro relies on his own energy and exertion rather than on his brains. There is an immigration coming into the older States now.

Q. The older Southern States?—A. The older Southern States. As they come in the negroes gradually give way and go to the richer lands. For instance, one railroad last year brought into the Mississippi Valley over 10,000 negro immigrants.

Q. From what States?—A. From the Atlantic and Gulf States.

Q. What became of them?—A. They were scattered along the alluvial lands of the Mississippi Valley. As the negroes of the Mississippi Valley either emigrate from that valley and go in different directions

Digitized by Google

and buy land, the planters of the Mississippi Valley send out to the older States and replace them with labor from those States. A negro in the older States, probably, to make his support would have to cultivate 15 or 20 acres of land, whereas a negro in the Mississippi Valley can make his support on 8 or 10 acres of land.

Q. Will this result in the ownership of the alluvial lands being transferred to the negro?—A. No, sir; because as he makes money he goes off.

Q. He is a Chinese immigrant?—A. I mean by "goes off" he does not go out of the State, but he goes to the hills.

Q. And to smaller ownerships?—A. To smaller ownerships.

Q. And the aim of the Southern planter is to accommodate this tendency of things to smaller rentings?—A. Yes, sir.

Q. Do you think a plantation is more productive where, under a general supervision by the planter or the owner, it is let out in small sections to the negroes to cultivate, or is it better to cultivate the plantation as a whole?—A. It is better to let it out, as I stated in my written answers. The cotton crop of this country is being raised to such an extent by small white farmers that the large planter can no longer afford to hire and compete with that class of labor who only expend their own energy; consequently the tendency is to make farmers of the negroes.

Q. What chance is there of the planter securing white labor to carry on these plantations?—A. There is such a small proportion of white labor in the South that it would be difficult for him to find them, and the tide of foreign immigration is just beginning to be turned in that direction. There has been a prejudice against white emigrants going to the South, on account of going among the negroes.

Q. Do you think that is diminishing?—A. Diminishing yearly.

Q. You mean that immigration from Europe is being employed on the plantations?—A. Not exactly upon the large cotton plantations, but the smaller plantations are now being converted into farms. For instance, there has been a large immigration of European emigrants into that section of the country between Little Rock and Fort Smith.

Q. Do they, upon these farms or small plantations being converted into farms, work in companionship with the negro laborer?—A. No; they generally buy the land and work it themselves; they may hire a negro and work with him; they are laborers themselves.

Q. Is there any tendency among the white and colored laborers of any class to work in companionship, or to fraternize at all in labor?—A. I cannot say that there is. A white man would not take a negro in as a partner to work with him in the field.

Q. And will a white man find any difficulty in hiring another white man and a negro to work together side by side in the field?—A. No, sir; I have them myself working side by side.

Q. There is no prejudice of that kind?—A. None at all.

Q. No white man inquires whether he can work by himself or is to work in company with a negro? Do they exhibit any reluctance to work in company with the negro?—A. The class of white people that work in our country for wages comes from Ohio, and Missouri, and Indiana, and that section of country, and I find there is some prejudice among that class of people sometimes, but still there are instances—as I say, I have men from Indiana now myself hired working right in a gang with negroes.

Q. There is no strong tendency in that way, I suppose?—A. No strong tendency in that way. There are no white laborers from the South

Digitized by Google

proper; at least the number we can hire for wages is so small that it is not sufficient to call it a class.

Q. In the Southern States proper about two-thirds of the population is white, is it not?—A. I do not recollect. According to the census returns I think there are about seven millions of negroes. The census would give the exact statement.

Q. Not far from two-thirds of the population, I think, is white. In the Gulf States proper at least one-half the population must be white. In what way is the white laboring population of the South employed?—A. They are employed as small farmers nearly almost entirely.

Q. Not to as great extent as mechanics and artisans?—A. I suppose there is a liberal proportion of them to the population; we have to have our artisans and mechanics; but as a rule the white population of the South are small farmers, either owners of the land themselves or tenants.

Q. How as to their material prosperity and thrift and saving?—A. It varies very much. For instance, take the State of Georgia—and I believe it is admitted that Georgia is one of the most thrifty and prosperous of all the Southern States—I think the small farmers are generally self-sustaining; they raise their own supplies.

Q. Do these small white farmers employ negro help to any extent?—A. To a certain extent. If a man has more land than his family can work he will hire a negro laborer. There is no prejudice against his doing so either on the part of the farmer hiring him or the negro hired.

Q. He may hire some white and other colored laborers, I suppose?—A. Yes, sir.

Q. Do they work together?—A. Yes, sir.

Q. How in regard to the value of the hill-lands you have spoken of in the State of Arkansas; as compared with the alluvial, what is the difference in value?—A. It is very great. There are farms in Arkansas that can be bought, partially cleared up, with some improvements upon them, for from $5 to $20 an acre, less than the rent of fair lands on the river. There is no finer section of country in the world—I say that unhesitatingly—for a foreign immigrant, or the immigrant from the East, or from anywhere, than is afforded to-day in Arkansas and Texas.

Q. And political disturbances you think are at an end?—A. We apprehend nothing at all; there is no reason why we should.

Q. You were speaking of the necessity of the education of the labor of the South, the negro especially. Will you not describe to us the actual condition of the masses of the colored people in the matter of education, to what extent it has progressed, and what facilities and opportunities exist, and what additional are required?—A. It varies in different sections. For instance, Georgia and Tennessee are probably ahead of any of the Southern States in point of educating the colored people; they have more facilities; they have negro primary schools and colleges where a man is educated. The education that I was speaking of, more particularly for the negro, is a plain English education, sufficient to enable him to read and write.

Q. What we call up North a common-school education?—A. A common-school education. I will illustrate that. Suppose a negro comes to me to make a contract that I have written for him, and he cannot read or write. I offer that contract to him, and I read it to him. He touches a pen and signs his mark to it; there is no obligation attached at all. He says at once, "That man is an educated man; he has the advantage of me; he shows me that contract; I do not know what is in it; I cannot even read it." Therefore a contract made with a negro in

Digitized by Google

that way is almost a nullity; but if he could read that contract himself and sign his own name to it, it would be a very different thing. I never allow a negro to sign a written contract with me before he has taken it home with him and had some friend to read it over and consult with him about it, because I want some obligation attached to my contracts.

Q. It is necessary for you as well as the negro?—A. Necessary for my protection as well as his.

Q. How many of the negroes on the plantations can comprehend a written contract by reading it, because a man may be somewhat educated and not be able decipher a contract?—A. I cannot give you an exact proportion, for it varies to a great extent. I can only say that that number is increasing rapidly.

Q. From what circumstance comes this increase?—A. From their desire to gain knowledge.

Q. Do you find that desire strong among the colored people?—A. Very strong indeed; and there are two ideas which a negro possesses that give me great hopes for his future. If I did not believe the negro was capable of sufficient development to make him a responsible small farmer, I should not want to remain in the business that I am any longer, because I believe that the development of my business is necessarily based upon the development of the negro and the cultivation of my lands. The negro possesses two remarkable qualifications: one is that he is imitative, and the other is that he has got pride; he wants to dress well; he wants to do as well as anybody else does when you get him aroused, and with these two qualifications I have very great hopes for him in the future.

Q. What do you think of his intellectual and moral qualities and his capacity for development?—A. There are individual instances I know of where negroes have received and taken a good education. As a class, it would probably be several generations, at any rate, before they would be able to compete with the Caucasian. I believe that the negro is capable of receiving an ordinary English education, and there are instances where they enter professions and become good lawyers. For instance, I know in the town of Greenville, Miss., right across the river from me, a negro attorney, who is a very intelligent man, and I heard one of the leading attorneys in Greenville say he would almost have anybody on the opposite side of a case rather than he would that negro. The sheriff of my county is from Ohio, and a negro, and he is a man whom we all support in his office, because he is capable of administering his office. We are anxious that the negroes should have a fair representation. For instance, you ask for the feeling existing between the proprietor and the negroes. The probate judge of my county is a negro and one of my tenants, and I am here now in New York attending to important business for my county as an appointee of that man. He has upon him the responsibilities of all estates in the county; he is probate judge.

Q. Is he a capable man?—A. A very capable man, and an excellent, good man, and a very just one.

Q. Do you see any reason why, with fair opportunities assured to himself and to his children, he may not become a useful and competent American citizen?—A. We already consider him so.

Q. The question is settled?—A. I thought you were speaking personally of the man I referred to.

Q. No; I was speaking of the negro generally—the negro race.—A. Let me understand your question exactly.

Q. Do you see any reason why the negroes, as a component part of

Digitized by Google

the American population, may not, with a fair chance, come to be useful, industrious, and competent to the discharge of the duties of citizenship?—A. I think they may as a class, but it will take probably generations for them to arrive at that standard.

Q. It has taken us generations to arrive at the standard, has it not?—A. Yes, sir.

Q. There is some talk about our ancestors having been pirates, I believe. Now, will you state to us what the existing facilities for education are among the negroes?—A. I can only speak as regards Arkansas. Of course I do not know much of the other States. In Arkansas we have in each county a school board. These boards examine and employ teachers. We are taxed for a school fund, from which these teachers are paid.

Q. What proportion of the colored children attend school, do you think?—A. On my own property there are five schools, and I think the larger portion, I might say nearly all that are capable of going to school, do go to school.

Q. How many children are there on your own property?—A. I could scarcely form an idea.

Q. There are five schools?—A. There are five schools, and I should suppose from 300 to 500 children.

Q. Those are educated in public schools?—A. Yes, sir.

Q. I understood you to say that nearly all of them attend?—A. Yes, sir.

Q. For how long a time each year is school kept open?—A. The schools extend all the year except vacation, I think, which is about three months; but a number of the negroes will withdraw their children from school during cotton-picking season, to help them pick the crop.

Q. Between what ages do they actually attend school?—A. From 6 to 19. I know a great many of them who are going to school who are 17, 18, and 19, who can just begin to read and write a little.

Q. Do you find any inclination among the older negroes who are past school age to endeavor to read and write?—A. Not very much, but they are anxious their children should, and appeal to them. In almost every instance where a man has a child who can read and write, he will bring him along with him when he makes a contract. They are very proud of their children being able to read and write.

Q. Are they satisfied, as a rule, with their simply becoming able to read and write, or do they like to have them make a little further progress in mathematics, geography, &c.?—A. As a class they look to them simply to read and write. They think when they have got that far they know everything; but then there are certain ones who have ambition, just as it is with our own race. There are some men who have tastes for literature, and receive a better education than others do, but it is not the same proportion of the negro race of course that it is with our own. There are instances where negroes are also anxious to obtain a collegiate education, and become school teachers.

Q. I do not know that you are able to state to what extent they actually attend school in the hill districts?—A. I am not.

Q. You speak both of your own plantations and of other plantations as well as your own in that regard?—A. I am speaking of the alluvial lands along the Mississippi River.

Q. In Arkansas?—A. Not only in Arkansas, but in Louisiana and Mississippi; I will say the alluvial lands on the Mississippi River between Memphis and Vicksburg.

Q. Are the negroes on those lands generally having the same oppor-

Digitized by Google

tunities for education that they do on your plantation?—A. Oh, yes, sir; there is a common school system.

Q. And it is as prevalent in Louisiana and Mississippi as in Arkansas?—A. I think it is.

Q. What is the nativity of those teachers, as a rule?—A. They are generally colored people from either the East or the Northwest. There are some few white teachers, but very few.

Q. Are any of the white teachers Southern in birth?—A. There is not a white teacher on my own property; they are all colored teachers on my own property. The proportion of white teachers is very small.

Q. How much do these colored teachers themselves know?—A. Some of them are remarkably well educated.

Q. And generally earnestly devoted to their work?—A. Perfectly so.

Q. Or is it simply to get their money?—A. No; I think some of them really have a desire to see their scholars advance.

Q. Some pride in their race, to have them get on, I suppose?—A. I think there is a certain pride in that respect; and, again, they want to gain reputation as teachers.

Q What compensation does a teacher get?—A. I think about from $50 to $100 a month.

Q. Do they pay their own expenses, board and shelter?—A. Yes, sir; but board is very cheap, merely nominal.

Q. About what amount?—A. I should say these teachers can get board for $10 a month.

Q. Is the cost of clothing in your part of the country about the same as here?—A. This is our market.

Q. You buy the ready-made clothing largely for the population in general, I suppose?—A. We buy both ready-made clothing and cloth to make up.

Q. I suppose the colored population hardly buy custom goods?—A. A great many of them buy the cloth, and some of their women are as good tailoresses as you would find anywhere. They buy the cloth and make it up themselves.

Q. That must bring a suit of clothes pretty cheap in a colored family; they really expend nothing but buy the cloth themselves?—A. They sell very good jeans cloth there at 35 or 40 cents a yard; they generally wear jeans.

Q. All seasons of the year?—A. Generally in all seasons of the year. In the summer time a laboring man hardly ever wears a coat at all.

Q. What do you think an average colored Southern laborer expends per annum for his clothing, say the head of the family, the man—what does it cost him for clothing a year?—A. I cannot give you a definite answer. I will only say that we who are the producers of cotton are very glad to see them get in a prosperous condition in order that there may be more consumption, and when a man is prosperous he will buy two suits of clothes, where if he is not prosperous he will make one do.

Q. We have had a good deal of testimony as to what it actually costs a Northern laborer a year for clothing. I have no desire to show that any laborers dress cheaply or poorly; I merely want to get an idea of the relative cost of the laboring man living North or South, in the item of clothing?—A. I can sell and do sell a man a pair of jeans pants and a coat from $7 to $12 per suit.

Q. How many suits will he want in a year?—A. That will depend on his condition and his ability to pay me. If he is a prosperous man and beginning to accumulate he will make one do him. Wherever a negro begins to accumulate he goes to extremes; he does not want to buy any-

Digitized by Google

thing; he wants to accumulate rapidly. Where a man is not doing so well, and there is little doubt of his ability to pay, he would probably want several suits; but I would confine him to one or two.

Q. The same is true, I suppose, of his wife and children?—A. Yes, sir.

Q. But you look on the matter of clothing as a much less expensive item in the laborer's account in your country than here in the North where the climate is colder, I suppose?—A. Yes, sir. What absorbs the profits of the laborers with us is their want of providence; that is, if they get surplus money they throw it away for useless articles.

It has been suggested that a postal savings bank might be a good thing as a place of deposit of the small savings of the colored population of the South; they might feel some confidence in an institution of that kind, and that it would be a beneficial thing to them. What is your own judgment?—A. I advocate it and approve it, and indeed propose to start a savings bank in our own neighborhood. In this connection I will mention another important feature. In the Mississippi Valley—and when I speak of the Mississippi Valley I mean both sides of the river, Arkansas and Louisiana on one side and Mississippi on the other—there are numbers of negroes who have considerable accumulations and use their surplus to advance to other negroes. For instance, there are negroes right on our property who have accumulated enough to help out certain others, as they express it, and they use their money as an investment in that way. For instance one negro who has got something will advance it to another negro and take a mortgage on his crop. Consequently there are numbers of them who are getting advances from their co-laborers, and I always give them that opportunity when they want it. My idea of the adjustment in the Mississippi Valley, seeing what I can make from the mercantile portion of my business, is that it is simply my revenue that I get from the rent of my land as an investment on my capital; and whenever a negro can get his own merchant in New Orleans—a number of them have very good factors in New Orleans and ship their cotton direct—I encourage it. When one negro wants to help out another, I give him the privilege of doing it and encourage it. There are several negroes, a great many, not a few in Chicot County to-day who have their own factors in New Orleans, ship their own goods, and receive their own accounts of sales.

Q. They are not owners of alluvial lands?—A. They are not owners at all; they are tenants.

Q. I suppose some time they will be liable to make some accumulations, and they will now and then own a plantation?—A. I do know of one instance on the river below Vicksburg where the old property of Mr. Davis was bought by a former slave of his.

Q. Is that the only instance?—A. The only instance I know of.

Q. One question we have been accustomed to put is as to the actual personal feeling that exists between the laborers and capitalists of different parts of the country. What is the feeling between the laborers, colored and white, and the owners of the land and of capital at the South?—A. I confine my replies to my own section, because I am not familiar with the others. I have answered that question in the written answers. The feeling is harmonious and good, as I have expressed it there. The negro naturally looks to the planter for advice and for assistance, and the planter looks to his laborers for the development of his property. Consequently their interests are identical and their feelings good.

Q. You have alluded once or twice to the pressure of outside, and I

Digitized by Google

suppose Northern, opinion; I assume that you mean political opinion in the past and the desirability that it should cease. What is the fact as to a progressive disintegration of the solid Republican or solid negro vote of the South? What are the chances of its dividing, and of the white vote dividing? We hear now of a "solid South," colored on the one side and white on the other. What prospect is there of a division in that regard; to what extent does it exist, or is it going on?—A. The negroes of the South are already divided in their votes. There are a great many who vote with the proprietors of the properties. There are instances where they vote with what they call their Republican friends. A few years ago in the South any man who was an escaped convict from one of your penitentiaries here who would come down to that country and tell the negroes that he was one of General Grant's soldiers, and fought to free him, would vote the last one out; but any of those negroes would come to me at that very time with his money and get me to save it for him, and take care of it for him. He would put all his confidence in me so far as his money was concerned, but when it came to politics he would vote with this man, who probably did not own the coat he had on his back. Those kind of interferences were what did do us in the South very material damage. Let me illustrate that by a riot in my own county. In Chicot County, in 1872, there was a proposition to impose upon the county a railroad tax of $250,000 for the purpose of building a railroad.

Q. What proportion of the taxable property of the county would that have been?—A. Our whole assessed valuation was about $1,500,000 at that time. This was brought out by a promise that if the appropriation was made the levees on our river should be built and this road would run on the levees. At that time the whole of the local government in Chicot County was in the hands of men who did not own any property in the county, and had just come down there and been elected by the negroes, who have a very large majority in that county. This tax was a very great imposition upon us. At that time there was a negro attorney at Lake Village, who was one of the prime movers in this thing. The planters knew that this was only intended as a speculation upon the county, for the vote was afterwards taken, the appropriation was made, and not one foot of levee was put up, and not one foot of that railroad was built in Chicot County. Still we are mandamused now for the interest on that debt that was put on us by that kind of influence. One of our planters was remonstrating with this negro attorney about this debt and told him it was an imposition on the property owners, and that the thing ought not to be done, when the man became violent and insolent, and it resulted in a difficulty between this planter and the negro. The planter had a little pen-knife in his pocket, the blade not longer than my little finger; he struck the negro with it and it happened accidentally to hit him on a vital point and killed him. The sheriff of the county was a negro. The planter, with two innocent parties in whose house this occurrence took place at the county-seat, in Lake Village, was arrested and lodged in jail. A few days afterwards—probably not more than two or three—nearly every negro in that county was summoned to Lake Village, and they rose like so many locusts, coming in from every direction, took those three men out of jail shot them to pieces, murdered them. It was such an outrage that the people from Memphis and Vicksburg and from the hill countries commenced to come in there with companies, started down with companies. On investigation we found out that the sheriff of the county had exercised his authority to send out to the ignorant negroes of the county and

Digitized by Google

summon them to the village, and these fellows went because they were afraid not to obey the mandate of the sheriff. At that time feeling was running very high, and these people were anxious to come in and quell this riot, but a few of us who were more prudent, a few of the leading planters of the county, got together, sent these different companies word not to come there, that we did not want them in the county; some of the companies were already on their way to Chicot County, thinking the people there were going to be massacred. A great many of our people had to run away from their homes for several days; but we took the ground that we would let the thing take its natural course. As soon as things quieted down, which they did do partially in three or four days, some of our gentlemen who had gone off with their families returned, and it resulted in our arresting a few of the ringleaders in the county. The courts and the administration were all at that time in the hands of persons not identified with the interests of the county, and it was impossible for us to get justice meted out. We saved a massacre of the negroes of the county, but we never could bring those men to any kind of punishment before the courts, and finally we came to a compromise with them, that if they would leave the county we would withdraw the suit against them, and that was the way the thing was ended. Now, I do not believe you could get up a riot in Chicot County because I think there are many intelligent negroes there who would not permit it. Those are the kind of race issues that I referred to. Relieve us of that sort of thing, and leave our government to ourselves and our people, and give to the negro the same protection the white man has, but do not give him any more. Do not let him feel that he has the United States Government standing behind him, and that he is the child of the United States Government to be taken care of, but that he must rely on his own resources and energy for his living, and time will solve the question, and the demand for his labor will protect him.

Q. Do you find that the feeling among the negroes which resulted in the exodus of a few years ago has been allayed and perhaps has disappeared?—A. I will tell you something that is rather amusing about that. The first that I heard of a negro exodus in my section of the country—it was to Kansas—was my manager coming into my room one morning and saying that the negroes were going out to the river to go to Kansas. I said, "It is several miles to the river; how are they going?" Said he, "They are toting their things out on their heads." Said I, "Go right at once there and offer them the wagons on the plantation to haul the things. What is the matter?" Said he, "I don't know; I went out this morning and summoned the hands to the field, but they say they are all going to Kansas." I got on my horse and rode out and met a negro who had been my engineer. I said to him, "What is the matter; where are you all going?" He stopped right on the road and said, "Mr. Calhoun, you never have deceived me, and I am going to tell you what is the matter. There were two men came through here last week, one night, and said 'You see this picture?' There is a picture of a farm in Kansas for me that General Grant has bought out there for me. That is so because my name is on the back of it, and here is my ticket; that carries me to Kansas." Said I, "Let me see it." He showed me a piece of pasteboard that had printed on it "Good for one trip to Kansas." Said I, "What did you pay him for this?" He said, "We paid him $2 apiece." "How many of you are in this thing?" "Over eighty of us are in this thing." Said I, "That man then swindled you out of $160; he was an impostor; there is no farm bought for

Digitized by Google

you in Kansas." I saw that the time for me to remonstrate with them was not then; they were on their way to the Mississippi River, and I let them all go. After they got out there I went and expostulated with them; told them of the difference in climate, soil, and everything else that they were accustomed to, and that if they went there many of them would lose their families and children. They would not listen to me. They went on to the river bank, and those negroes who went out there owed me over $10,000.

Q. How many of them were there? Eighty I think you said?—A. There were 80, I think. Once, I suppose, there were 150 negroes, perhaps more, on the bank of the river. They were not at a regular landing. They went out to the intermediate points where a boat would not be compelled to land. We notified all the boats coming up the river not to land at this point. I did not want these negroes to go off, being satisfied that they were going to their ruin if they did; that they were leaving comfortable homes; many of them had sold their mules or given them away at a mere sacrifice. One negro sold a mule worth $150 for $15 to get off. They opened their potato-houses, they opened their corn-cribs and scattered the corn, giving it away to everybody that would offer them five cents a bushel. I had given two of these people a piece of land, the productions of all of which they were to have for bringing it into cultivation and improving it. Knowing the negro nature as I do, and knowing that he would not want anybody to derive the benefit of something that he thought he was entitled to, I got two white men in the country to come and offer me to take this piece of land and cultivate it on shares with me, giving me one-half its product, whereas with them I was entitled to nothing. As soon as those two fellows found out that I had made a good bargain for their land they went back home from the river bank, and as soon as they went back all the rest followed. Then I called the whole plantation up and told them to appoint two representatives and that I would send them to Kansas at my own expense to examine into this matter and report to them. These two men went to Kansas, came back, and reported the true condition of affairs; and now if what they call in that country "a poor white man"—the negro's expression—goes through the country and says "Kansas," they almost want to mob him. That was the result of the Kansas movement.

Q. What has become of those who went to Kansas?—A. Many of them have returned and many have died; numbers of them have died. Quite a large number went from Washington County, Mississippi, just opposite to me.

Q. From time to time, at Washington, efforts are being made to secure public lands in the Territories, the Indian Territory and elsewhere, for the purpose of colonizing such tracts with negroes. Do you think there is any sort of occasion for that?—A. None in the world. If the alluvial lands on the Mississippi River were protected from overflow and brought into a condition where they could be cultivated they would afford all the homes, and of the best character, that the negroes could possibly want in the South, and the natural tendency is to come to just such lands.

Q. And the negroes prefer to be there to anywhere else?—A. Those that come, I notice, never go back.

Q. You suggested the improvement of the levees. What is the necessity, and in what degree is it difficult for those residing along the river banks to protect themselves?—A. I am the president of the levee board of Chicot County. The plan which has been suggested by the Mississippi River Commission and Mr. Eads, as their chief engineer, is unques-

Digitized by Google

tionably the correct one for the improvement of the Mississippi River. We know this not only from theory, but from long experience with the river, those of us who have lived there. The Mississippi River being, as it is generally termed, the "Father of Waters," and passing through several States, it is almost a national system, and it would be impossible for any system to be adopted by the States which would be local. Consequently it is imperatively the duty of the Government of the United States to take care of the improvement of the Mississippi River. There are certain sections of the Mississippi River that are naturally above overflow, made so by cut-offs. The fall of the Mississippi River is about four inches to the mile. Consequently, when there is one of those large bends, where the river runs around where the cut-off is, no increase of water is needed. The fall being four inches to the mile, the lands just above the cut-off are made higher and above overflow, whereas just below the lands are overflowed or become liable to overflow. The improvement of the Mississippi River itself for commercial purposes, as well as the protection of the lands, is dependent upon the building of the levees, for the levees of course confine the water within its banks, and give not only a greater volume of water, but greater velocity for scouring purposes, which scours out the sand bars that are formed continually on the river. Captain Eads's plan of forming jetties where the banks cave saves this deposit as it were in the water, which makes the sand bars. A mattress is put against the caving banks which prevents the alluvial land caving into the river which forms the sand bars below. Then the increased volume and increased velocity of the water wash out the channel and improve it for commercial purposes, answering the object of protecting the land, and at the same time opening that immense channel for commerce.

Again, there are very important lines of railroad that are being built up and down either bank of the Mississippi River, and it is necessary they should be protected for commercial purposes, as well as that the Mississippi River should be improved for commercial purposes, and they can only be protected by the building of levees. We who have been on the river, and who feel that we are familiar with it, have closely watched the course of the Commission, and I can only say as an expression of the opinion of the people that we indorse what the Commission are doing.

Q. And desire still more of it?—A. Yes, sir; it is absolutely necessary. What has been already expended by the Government would be absolutely useless unless additional appropriations are made to complete the work. I would like to call your attention to this point. The Atchafalaya, in Louisiana, is a stream which runs from just about the mouth of Red River into the Gulf of Mexico. The fall from the mouth of the Atchafalaya and Red River to the Gulf of Mexico is very much greater than the fall from the mouth of Red River to the Gulf by the way of New Orleans down the Mississippi River. A few years ago the Atchafalaya was a stream which could be waded across, but owing to the current gradually going through it, it commenced to wash out until now it has got to be a stream 100 feet deep.

Q. Is there or not any perceptible increase or diminution of the volume of the Mississippi itself as compared with 25, or 50, or 100 years ago?—A. We think that our waters are higher now than they have ever been before.

Q. Greater extremes, or is there a uniform flow?—A. A larger uniform flow, and it is attributed to the destruction of the forests, though that is mere theory. One of the arguments at any rate is that it is owing to

Digitized by Google

the destruction of the forests in the Northwest, which causes more rain storms and gives a larger rainfall.

Q. I have heard the idea advanced that the destruction of the woods and timber about the headwaters would, in case of rain, lead to its more rapid deposit in the stream, it would not be held back by the swampy nature of the soil, and so you might have more sudden rises and falls in the river than formerly without the volume of water or the uniform flow being increased or lessened?—A. I think—at least I have heard it so expressed by men experienced on the river—that the flow of the Mississippi River is greater now than it was formerly.

Q. That one year with another more water runs down the channel?—A. We can see a slight increase of the water of the Mississippi River. I do not know how it may increase in the future, or if it will at all, but that is the opinion of people there now. The point I want to call your attention to specifically is the necessity for the prevention of the water of the Red River going down through the Atchafalaya, for if the Atchafalaya washes out it leaves New Orleans a large commercial city upon, as it were, an inland sea. The waters which overflow from the banks of the Mississippi River on the front of Arkansas go over into the Red River and never come back into the Mississippi River any more until they come out at the mouth of Red River. Just at the mouth of Red River, and before Red River reaches the Mississippi, is the Atchafalaya. So that all of this overflow water that could be kept in the Mississippi River by building the levees on the front of Arkansas, now goes into Red River and helps to wash out the Atchafalaya, which will ruin the city of New Orleans if that is not prevented. It is a very strong commercial point, for the commerce of New Orleans is a matter to be considered in our affairs.

Q. I suppose there is no doubt that the Atchafalaya furnishes an outlet, which relieves your plantations very much?—A. No, sir; it does not affect where I live at all.

Q. Below the Red River, in Louisiana, is it not a relief in case of an overflow?—A. A partial relief; but in Louisiana, when you get down that far, they pretty much have their system of levees built, which protect the sugar district; there are only probably a few gaps; and the Mississippi River, when it gets that far down, does not rise in the same proportion that it does where I live, 500 miles above. The mouth of the Atchafalaya is 500 miles below where I am.

Q. Has this increased drainage from the Atchafalaya resulted in any injury to the navigation of the river as far north?—A. Not as yet; but if it is not stopped—the commission realize the fact I am now telling you—if it is not checked, the whole Mississippi River will naturally turn through the Atchafalaya, because the fall is so much greater.

Q. How do they propose to check it?—A. That is a matter the commission and scientific engineers would have to decide.

Q. Can they block it at the outlet of the Red River?—A. They propose to check it principally by stopping the water from the Mississippi River that goes into the Red River. There would in that way be an enormous quantity of water kept out of Red River. That would be one method. What the engineers would consider sufficient or necessary to be done, of course I would not venture to express an opinion upon.

Q. What danger is there to the large mass of capital invested in these alluvial lands, unless something is done to prevent the overflows of which you speak?—A. The lands that are now liable to overflow are almost entirely abandoned.

Digitized by Google

Q. To how large an extent are they now abandoned?—A. Taking in the whole of the Mississippi Valley proper from Memphis down.

Q. Has there been any computation or reasonable estimate that you know of the value of those lands affected by the overflow?—A. I have never heard of it; but I will say that those lands which are liable to overflow now, if brought into cultivation, are just as valuable as any we are cultivating; probably more so, because they have the alluvial deposits upon them. There is a deposit there from 3 to 4 inches.

Q. You have no idea of the extent of those lands?—A. I cannot give you the proportion. I will simply say it is a very large proportion.

Q. A third, or a half, or a quarter?—A. More than a half. I saw it estimated some time ago, at least I will give it as a statement published in the *Planters' Journal*, published in Vicksburg, that there are thirteen counties on the Mississippi River which, if all cleared up and put into cultivation, are capable of producing the entire cotton crop of the United States, and I have heard the question discussed.

Q. What prevents their being cleared up and put into cultivation?—A. Simply the overflow.

Q. Have they ever been cleared as yet?—A. A great portion of them; and now destroyed because the levee system is not complete. On these lands all the negro labor which is not found profitable on the poorer lands in the older States could be made extremely profitable, not only to the proprietors of the lands, but to the laborers themselves.

Q. Do you think it would be within limit to say that one-half of the alluvial plantation lands such as you have described in Arkansas, Mississippi, and Louisiana is now practically destroyed by reason of this overflow occasioned by the destruction of the levee system?—A. Yes, sir.

Q. At least one-half?—A. At least one-half of that which has been in cultivation, and which can be brought into cultivation.

Q. Of that which is thus useless now, what portion has been formerly under cultivation?—A. It would be impossible for any one to form an estimate, because it is so varied.

Q. The amount of land that has been improved and which is now destroyed by reason of the overflow, you cannot state?—A. I cannot state it accurately; I will state it approximately; I should say at least one-third.

Q. One-third of the entire amount that has been improved is now destroyed by reason of the overflow resulting from imperfections in the levee system?—A. Yes, sir; that is what I mean to say.

Q. And of that which has not been improved but might be improved, how much?—A. At least a half.

Q. Do you think it possible to present these annual overflows by the levee system?—A. I do; I think it is the only system for protecting that land and for the improvement of the channel of the river.

Q. You are not frightened very much by the idea that the bottom of the stream will gradually be raised, and that by and by we shall have the river in the air?—A. Not at all. However, the Mississippi River is very different from the Nile in that respect. The Nile is a very sluggish stream. The Mississippi has a very strong under-current, so strong that it is one of the most difficult streams to swim in.

Q. The under-current is more rapid than the surface?—A. Yes, sir; there is a very strong under-current. It takes a very expert swimmer to swim in the Mississippi.

Q. He is apt to be drawn under?—A. Yes, sir.

Q. And in some portions of the stream the under-current is much

Digitized by Google

more rapid than in others?—A. Yes, sir; owing to the bends in the river and other things.

The committee took a recess of one hour, and reassembled at 2 o'clock p. m.

JOHN CALDWELL CALHOUN'S examination resumed.

EFFECT OF TARIFF LEGISLATION.

By the CHAIRMAN:

Q. State, if you are able to, what proportion of the cotton crop is marketed in this country, and what is sold abroad.—A. As those are matters of public record, I would prefer to refer to the statistics on cotton. I do not know that I could state accurately.

Q. Is it your impression that more than half is sold in this country?—A. I think more than half in this country.

Q. You would consider the prosperity of the manufacturing interest of the United States, wherever it may be located, as of very great business importance to the South, of course?—A. Certainly.

Q. You made some allusion to free trade or protection. In so far as laws of that description are protective of the business interests of that section of the country which affords a market for the productions of the South, they probably would be beneficial, would they not, to the South?—A. I would say this, that the people of the South have learned to be very conservative, and while we would prefer that there should be no tariff except that needed for revenue, we would of course want to claim a l of the privileges which other manufacturing industries in this country are entitled to.

Q. Would you care to see at the present time a course of legislation adopted which would diminish the capacity of the North to afford a market for the productions of the South?—A. I should not like to see anything inaugurated in the way of legislation or otherwise that would in the slightest degree retard the prosperity of this country, or bring about a convulsion.

Q. Either North or South?—A. Either North or South.

Q. So that, whatever remarks you may have made touching upon the tariff in your testimony this forenoon, you desire to have considered in connection with this general criticism?—A. And as only one of the general benefits to be derived by our labor.

Q. At the present time what do you receive from Europe in consideration or in payment for the cotton which you export to the countries of that continent?—A. I will confine myself to my section of the country and to the business with which I am particularly acquainted. We sell all our cotton in this country. It would be a rare exception if a single planter in the Mississippi Valley shipped his cotton to Europe. That is all sold in this country. If it is shipped abroad, it is by the buyers.

Q. Then take the Mississippi Valley; what things do you receive in return for your cotton? In the first place, is there much paid you in money, or is it mainly in productions of the North?—A. We are paid money for our cotton, but we pay out that money for a large quantity of produce such as we consume and do not raise.

Q. What kind of produce?—A. Such articles as would be used by ordinary farmers. If I were to designate them they would run into all branches of trade.

Q. Do you receive wheat?—A. No, sir; what I mean is such articles as we import to our country for consumption, meats, flour, corn, where

Digitized by Google

there is not a sufficiency raised in our country. Then our clothing comes to us. We import some machinery from Europe. There are certain gin-stands we cannot buy in this country. Those come from Europe to us. It would be very difficult in an examination like this to say exactly what articles we consume. We consume whatever may be needed to advance the interests of the farmer.

Q. The only object I had was to ascertain as nearly as I could what things necessary to the farmer are produced at home, and what things you receive from other portions of the country which you pay for by your staple crop. You have mentioned very largely what you receive?—A. Our machinery particularly, which I did not mention.

Q. Most of that comes from the North?—A. From the North and West.

Q. You say that some forms of machinery you import from Europe because they cannot be obtained in this country?—A. Certain kinds of gin-stands; machinery for ginning cotton.

Q. Is there a large expenditure for that kind of machinery?—A. Not very large, for we generally patronize home industries, and buy most of our machinery of that kind in this country.

Q. Agricultural implements of various kinds are mainly bought in this country, I suppose?—A. Yes, sir.

Q. If the power to manufacture these various utensils and things of Northern production, aside from grain and the like, depends upon the existence of a tariff, you would look upon tariff legislation on the whole as beneficial to the country, would you not?—A. No, sir. Our people, I think, regard the tariff as a burden on the masses, who are the laboring class, and would not be in favor of a tariff beyond a tariff for revenue.

Q. Would they be in favor of a revenue to the extent that the business of the Government required?—A. I think they would.

Q. And for such an adjustment of the tariff as would protect those industries most needing protection, if any?—A. As I have never embarked in political life, I confine my answers to those points that come more immediately under my own knowledge. I should not like to enter into a discussion of the tariff question.

Q. I am not asking for that, but simply for the fact as to the disposition of your people. Knowing that a tariff is to be imposed for purposes of revenue, and so to what extent that revenue is required—that you say is the inclination of your people—I am asking as a matter of fact, not whether it is right or wrong, is it a fact still further that they would be generally inclined to see that tariff so adjusted as to protect, as far as might be, such industries in this country as most needed protection against foreign productions?—A. I will answer that question in this way: Our people would be in favor of a tariff simply for revenue, and want the same protection that is afforded to other manufacturing industries in this country. We feel that the natural advantages we have in the South, being at the home of the articles produced, are sufficient to to enable us to compete with any other part of the world without a tariff.

Q. In the establishment of manufactures?—A. In the establishment of manufactures; but, mark you, if there is any protection to manufactures anywhere else in this country our people would claim it.

Q. With these superior advantages which I understand are possessed through the South for manufacturing as well as for the raising of cotton, what is the reason, in your judgment as a business man, that manufacturing as a business interest has not more largely developed? I suppose it is developing, is it not?—A. It is developing rapidly, and it has

Digitized by Google

not more largely developed up to this time from the fact that capital has been timid about seeking investment in the South.

Q. You refer to the period since the war?—A. Since the war. Before the war our industries were such that there were very few institutions of that kind started in the South.

Q. Do you think that the laboring population in Arkansas and that portion of the country will take readily to the education which a manufacturing population needs in the handling and use of machinery?—A. I think they would with a certain amount of culture; they would have to be cultivated up to it.

Q. I suppose your white population there would be more likely to take to manufacturing than the colored population, would they not?—A. I have been surprised at the remarkable manner in which our colored laborers have adapted themselves to improved machinery.

Q. What forms of machinery?—A. For instance the improved plows for the preparation of land, all kinds of improved implements, such as are used in the Northwest for the cultivation of corn and wheat. We are introducing all that kind of machinery into our country now. I find that the more intelligent class of our colored laborers are adapting themselves to it admirably.

Q. With as much apparent readiness and facility as the white laborers perhaps?—A. I could hardly compare the two, because, as I said, we have but very few white laborers in our country.

Q. Is this labor-saving agricultural machinery also being introduced among the small farmers?—A. I think so in a limited way.

Q. Is there any cotton and woolen manufacturing being introduced into Arkansas?

ARKANSAS TIMBER INTEREST.

A. Only to a very small extent.

Q. How of the iron and other ore resources of your State?—A. I think they will compare favorably with any other portion of the South, especially our timber interest. During the period from 1879 to 1882 the mineral out-put of Alabama alone has increased from four million to nineteen, and the lumber products of Arkansas from $1,790,000 to $8,000,000.

Q. Where is the market for that lumber?—A. It goes down. There is a vast demand for it in Texas. For instance I heard it stated in a speech at a public meeting in Little Rock, to which I alluded this morning, by a gentleman of intelligence, a resident of Little Rock and a business man, that the shingle trade alone of Little Rock going down into Texas was worth $1,000 a day net profit to the city of Little Rock.

Q. By what route does it get there?—A. By the Iron Mountain road and the various branches that go out from Little Rock. In going from Memphis to Little Rock, on the Memphis and Little Rock Railroad, you will see acres covered with cypress shingles ready for transportation, and the cypress is a very valuable lumber, which is not so liable to rot and decay as other woods. It exists in vast quantities in Arkansas.

Q. It is used for building purposes mainly in your own State?—A. For building purposes not only in our State, but there is now a demand for it springing up in Chicago. People from Chicago and that northwestern country, where the timber interest is becoming exhausted to a certain extent, are rapidly seeking investments in the timber lands of Arkansas.

Q. Is this wood to some extent a substitute for the white pine of the North?—A. Very much like the pines of the North, only a more solid wood.

Digitized by Google

Q. And really you have a remarkably valuable wood for building houses?—A. It is so considered.

Q. How as to the existence of cypress forests in other Southern States?—A. There are vast quantities scattered throughout the south. Mississippi has large cypress brakes, as they are termed; Florida has, and I suppose you will find cypress in almost all the States, particularly those bordering on the Gulf and the coast.

Q. Have these cypress forests been encroached upon for business uses to any great extent as yet?—A. They are almost in a virgin state.

Q. How large does the cypress tree grow?—A. There are cypress trees in my immediate section that will measure 5 feet in diameter at the butt and 100 feet at the first limb.

Q. Is that anything unusual?—A. That is considered a good quality of cypress—would be considered in most sections rather above the average.

Q. What other timber is there which is available for capital as an investment?—A. One timber that we have in vast quantities, which is coming into use, is the gum, which is a substitute for walnut. It can be utilized for manufacturing furniture. We have all the varieties of oak; we have the sassafras; we have the pecan. We have large pecan groves in my section, very much like the hickory. The pecans in my section are a portion of our business and trade. They grow naturally, and they are gathered up by the negroes and brought in to us. We buy them from them, and they afford a considerable revenue to the negroes in my section.

Q. You have large coal and iron deposits, I think you have stated?—A. In my State there are large coal and iron deposits. I think the specimens of both our mineral resources and wood that we have on exhibition now at Louisville would compare favorably with those of any other portion of the country.

## RELATIONS OF THE RACES.

Q. Speaking of the personal feelings between the white and colored races in different parts of the South, how have those feelings been in the State of Arkansas as compared with the same in other States, now and hitherto?—A. I do not know that I could draw any distinction. I do not think it is particularly different in Arkansas from what it is in any of the other Southern States.

Q. In the testimony before the Exodus Committee, of which I was a member, many of the witnesses testified to a better condition of things, so far as they were concerned, at that time (it was in 1879, I think,) in Arkansas than in some other Southern States.—A. I think the same rule that applies to almost all the walks of life governs there, which is that it is a matter of interest; and I do not see why there should be any difference of feeling in any other State from what there is in Arkansas. The interest of the laborer and the interest of the white man are identical; they must take care of each other.

Q. Do you think the feelings between the planter and the colored laborer, as a rule, are more amicable and friendly than on the part of the small white farmers toward the negro population; how is it in that regard?—A. I think that the white farmer is not so dependent upon the negroes as the large planter is for his labor, and he is not brought so much in contact with the negro laborer as the large proprietor. Probably he has not the same experience with him; but if a small white farmer became a planter and would have to employ laborers I do not

Digitized by Google

know that there would be any difference in his treatment from that of an ordinary planter.

Q. Mutual relations depend very largely on mutual interests there as everywhere else, of course?—A. Yes.

Q. What is the moral condition of the negro population now as compared with what it was before the abolition of slavery?—A. I think from the end of the war—from emancipation on, probably—the negroes became demoralized; they naturally would. A great many of them went off to cities and towns who had been in the country before and were not subjected to evil influences; were not led off by temptations and all kinds of extravagance. I think, therefore, the demoralization was very much greater in their morals. Their morals are not as good as they were before the war; but I think that as the negro begins to accumulate some little property, and feels the responsibilities of citizenship resting upon him, and begins to acquire information, his morals improve along as he becomes able really to take care of himself and to think for himself.

Q. Taking the colored population as a whole, so far as you know them, are they in a material and mental and moral condition getting better or getting worse?—A. Decidedly getting better.

Q. In every respect?—A. Yes, sir.

Q. Your account of them is mainly of a very hopeful character?—A. It is. I do not wish to be construed, however, as comparing the future prosperity of the negro if left to his own resources as he is to that of an industrious white man, because he has not got the same qualifications. I think that the negro, with his surroundings, his character, and his habits, will make strides toward improvement; but that he will improve to the same degree that a white population would, placed under similar circumstances, I do not think.

Q. In other words, you think there is some natural difference in the qualities of the two races?—A. I do.

MONEY FOR EDUCATION.

Q. Speaking of the matter of education, and remembering that we are sent as a committee for the National Government to make such inquiries and recommendations as occur to us, are there any suggestions you can make to us in reference to the matter of the education of the colored people or of the uneducated people of any or all parts of the country?—A. If there was a surplus in the Treasury of the United States I think it should be distributed back to the States *pro rata* according to their population for the benefit of the States, and it could not be applied to a better purpose than that of education; and I think further that so far as a negro is ignorant in the South, who was emancipated and placed upon his own resources, it is eminently proper he should derive all the benefits of an education, and to facilitate the States it would be eminently proper that the $70,000,000 which has been paid into the Treasury by the tax on cotton after the war, which was certainly unconstitutional, should be given back to the States for educational purposes. I do not believe that tax, if refunded, would ever reach the people from whom it was derived originally, and I do not think it would be any more than justice to the Southern States that that money should be paid back, and it could not be applied to a better purpose than to the education of the citizens.

Q. Re-enforcing the common school systems of the various States?—A. Yes, sir.

Q. Do any other suggestions occur to you to make to the committee?—A. None at all, except to repeat what I have said, that we want no legisla-

Digitized by Google

tion in the South for our affairs further than that which can be given to us by our States and the natural protection which the General Government should afford to the States, and to leave to time the solution of this question and to the demand for the labor which exists in the South as the best protection that can be afforded.

By Mr. CALL:

Q. What is your business?—A. I am a cotton planter.

Q. Have you ever held office or been a candidate for office?—A. Never in my life. I have confined myself exclusively to my business affairs.

Q. You speak entirely then from your observation as a business man?—A. Yes, sir.

## THE PATENT LAWS.

HENRY PALMIERI affirmed and examined.

By Mr. CALL:

Question. I understand that you have some facts to present in regard to the interest of patents and the relations of capital and labor to matters connected with them.—Answer. Yes, sir.

Q. Make your statement.—A. My statement refers to section 8 of article 1 of the Constitution, in which is written that "Congress shall have power to promote"——

Q. Are you connected with patents in any way?—A. I have been interested in patents since 1872.

Q. How? As an inventor?—A. As an inventor and solicitor of patents—

> Congress shall have power * * * to promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.

I have written a statement with regard especially to inventors, also touching upon the labor question generally.

Q. Is your statement one of facts or opinion?—A. Facts.

Q. Give it to us.—A. Mr. Chairman, in this great bloodless war between labor and capital, and on the labor side of the question, we find the inventor, the creator of all improvements in the arts and sciences, the father of progress, and for all that a martyr to a heartless and avaricious community. There are a few inventors who succeed in obtaining payment for their services; there are thousands who spend their substance mentally and physically *pro bono publico* and get starvation for their pains. Some days ago Mr. Swinton, who posed as a labor reformer before your committee, stated that all patents should be free, *i. e.* that although the laborer was worthy of his hire the inventor was not. I will not dwell at length upon the inconsistency of this man's views; they are unjust, and unworthy of notice. History has taught us that tyranny imposes its outrages upon the people gradually and systematically, its shackles being welded link by link. So gradual is the imposition that it often remains unnoticed until the burden becomes extremely oppressive. To-day the people are gasping for breath under the atrocious weight of monopoly. Every man who works for his daily bread bears his share of this imperial burden.

Mr. Chairman, the question is not, "Are we wisely governed?" but logically and effectively, "Do we enjoy personal freedom and the fruit of our labor?" Of course the last question must be answered in the negative. Those who enjoy most are those who create least of the world's goods. How then do we benefit by the leadership of those

Digitized by Google

great lights upon social science, political economy and reform? How do we benefit by our elaborate and expensive legislation and our Government machines that drain from the consumer $250,000,000 a year? What do our extensive libraries, with their brilliant studies upon mankind amount to? The facts are glaring, they stare reform out of countenance.

Mr. Chairman, the science of accumulation has defeated all attempts in the direction of justice; practically the masses are mere tools, beasts of burden; they work, crawl along, suffer, or strike madly at their oppressors in their desperation. This is history and it is ours to-day. The monopolist says: "We are well enough. Why not let well enough alone;" or else they say: "Well, what are you going to do about it?"

Mr. Chairman, I call your attention to the relation existing between our Declaration of Independence of 1776 and the present issues between labor and capital. Strange indeed is the fatality which compels us, after a period of one hundred years, to borrow from the protests of our forefathers against a foreign despot words and sentiments with which to characterize and denounce a class of our fellow-citizens who have built up against us (by special legislation and treachery) a despotism greater than that which caused the rupture between England and this country.

By the CHAIRMAN:

Q. Do you mean that we are worse off than our fathers were at the outbreak of the Revolutionary war?—A. Precisely; we are worse off. But you may say how can individuals hold the people in bondage. My answer is that they do effectively, and the Government of these United States is behind the monopolist, the capitalist. The demands of the lobby are respected, while the protests and petitions of our oppressed people are despised, ignored, and pigeonholed. The press, the pulpit, the bench, preach patience to the people. Our reverend friends show us how, bread and water is a possible diet, and in point of fact it is a popular one. Patience may be a virtue but men cease to be patient when they begin to starve. When after a hard week's work with bended back they reach their miserable home with money enough to pay their landlord and a little balance with which to practice semi-starvation on the coming week, how can men be patient? This is a true picture. I tell you, Mr. Chairman, that this talk about the workman getting a house of his own is bosh, and it is a theory peculiar to certain men whom fortune has favored. It won't wash for a cent, if I may adopt a slang but expressive saying.

Q. Why is it bosh?—A. Because there is not one man in ten thousand who can reach that point; for if he has not enough to pay for his rent and his necessaries he cannot lay by anything, and if he cannot lay by anything he cannot buy a house.

Q. Are you a laboring man?—A. Yes, sir; I am essentially a laboring man.

Q. You are an inventor?—A. Not only an inventor, but I am a man who works my inventions, works them into shape and brings them to perfection; not an inventor who lies on his side and merely tells people I have done so and so, go ahead and complete it; but I have perfected my inventions and worked them out.

By Mr. CALL:

Q. What is your invention?—A. I am coming to it presently, if you will permit me.

Digitized by Google

By the CHAIRMAN:

Q. I would like to ask a question before you go on; I am not controverting your position. You say that the assertion that a workingman can get a house after awhile, that he can buy a house from his savings, is all bosh?—A. I say as a rule it is bosh, under the present *régime*.

Q. Your circumstances, your knowledge of your surroundings and the condition of other workingmen is the basis upon which you found that proposition?—A. Precisely.

Q. Now state what that knowledge is, a little in detail.—A. Will you allow me to proceed two pages further and then I will come to that?

Q. Very well. I do not wish to interfere with the continuity of your statement, but I should like you to explain that, because that is a fact we want to know about if it is so.—A. Yes, sir; I will proceed: People say the inventor is "*such a bad manager, you know*," that he always makes mistakes in business, *always fails*. Who, I ask, would not be a bad manager with a monopolist as a partner Mr. Gould, for instance, if you will allow me to mention names here——

The CHAIRMAN. We are not squeamish about that.

The WITNESS. Mr. Gould, for instance; who can save his interests from the cunning grasp of such men, especially when that partner owns two-thirds interest, &c. The inventor may be a bad or good manager, but never can have any voice or power under such conditions.

By Mr. CALL:

Q. Tell me why Mr. Gould would not be a good partner?—A. He would not be a good partner because he would swallow up everything.

Q. How does that happen?—A. It happens because he put in all the money and would have all the say.

Q. Is it not a good thing to have money in business?—A. It is a very good thing, but it simply effects this: that the man who puts in his brains against money is out—frozen out.

Q. I do not see how that happens. It seems to me it would be a first-rate thing to have a partner who had money in the business.—A. That is invariably the case.

Q. Would you prefer to have a partner having no money?—A. Oh, no; I am not fighting monopoly; I do not propose to fight monopoly. All inventors who put up their brains against money will be fleeced.

Q. I thought that was what an inventor always did, put his brains up?—A. Then they are always fleeced. There are some exceptions, but they are so rare that they are hardly worth talking of.

Q. Is not that what the provision in the Constitution is, that a man shall have the exclusive right to his invention for the purpose of promoting the progress of the useful arts?—A. Precisely; but Congress has lost sight of the fact that progress and the regular course of trade and the law of accumulation will defeat that, and Congress should protect the inventor more than it does, and it is for that purpose that I am at present addressing you.

Q. Go on.—A. Monopolists will tell you that the people are satisfied, but that it is the infernal agitators who do all the talking and all the mischief. I can tell you that there are not enough agitators upon this question, and the reason is that the world is too selfish and too conservative. There are a great many men who are so conservative that they object to appear and make a statement of this kind; they do not want to be laughed at; they do not want to be hooted as "communists," &c. I am not a communist; I do not approve of communism; at the same time I want to speak of facts as they appear to me. As soon as an agitator ap-

Digitized by Google

pears who displays some ability, monopoly immediately tries to buy him; if they cannot buy him then they will use him up if possible; that is they will get him out of the way. It is very easily done. I will give you an instance where the imposition comes, where I have had some experience of it. The horse-car companies enforce a rule compelling their men to remain standing all day; when a driver reaches home he is greatly exhausted. Many of these men are lamed for life. Some years ago I tried to introduce a seat for them. Our philanthropist, Mr. Bergh, came to my assistance, but I had to give it up, the bosses refused to grant this humane request; why? Because they care more for the loss of a horse than for that of a man; a man costs nothing, at least not as much as a horse. When a horse dies it is a practical loss; when a man dies there is another man to take his place, and so it goes.

Q. Was that an invention—a patent seat?—A. No, sir. I did not claim any invention for it. I have not finished my statement, but I am at your disposal.

The CHAIRMAN. Perhaps you had better go right through with your statement.

The WITNESS. Very well; I will proceed. You talk about your civil rights. Why, at an election a year or so ago the men of a railroad company in this city were marched to the polls like cattle and compelled to vote one ticket; and this was done under the *nose* of your district attorney, who could not see anything beyond it upon this special occasion. Liberty exists among the workmen here, if in liberty you imply the right to close by suicide a miserable existence. When a man is well fixed he imagines that all around him are happy because he is. Inebriates feel that way too.

Mr. Chairman, I am not a reformer; I am what is known as a growler. I growl because I have been hurt. I would bite, but that would only make matters worse. When I walk along our thoroughfares and see the extent of *my* work, and when I consider that *my patent is free to the public* (as Mr. Swinton desires all patents to be), and when I realize what a splendid thing it is to be a public benefactor, especially, Mr. Chairman, when we are benefiting a wealthy and prosperous branch of trade, a sensation of pleasure crawls down one's back, and a tinge of pride lights up even the countenance of a hungry inventor. Mr. Chairman, I calculate that since the Chicago fire (when I first brought to practical existence my system of iron hose for high buildings) the owners of our warehouses in this country owe me at least $1,000,000. Mr. Gould thinks that with perseverance and grit a man is bound to succeed. Well, if Mr. Gould had met the obstacles that have presented themselves to me I can tell him that he might yet be peddling rat-traps to this day, or milking cows upon the old farm.

Q. Do you think that it is either wise or courteous to select some one man when there are hundreds in the country that you might select to personify all the evils of monopoly that you are suffering from and against which you would complain?—A. No, sir; I simply mention Mr. Gould because he is the last man I heard here, and I have read his statements and recognize their inaccuracy. At the same time, I suggested to you that I should not mention any names unless as you please about that.

The CHAIRMAN. I do not object to the mention of names, but I do not want the records of the committee to be simply a vehicle for the conveyance of what would be improper intercourse between gentlemen.

The WITNESS. Nor do I. This is more of a political and general statement than a personal one.

Digitized by Google

The CHAIRMAN. Go on.

The WITNESS. Mr. Chairman, I desire to correct a prevailing misapprehension on the part of the world in general regarding monopolists. It is supposed that these men are wiser, shrewder, and more industrious than their impecunious neighbors; Mr. Gould's World says so, and Mr. Tilden's Sun affirms the same theory. Mr. Bennett's Herald believes it, and Mr. Villard's Post chants it politically, while Mr. Mill's Tribune chimes in its "ay! ay!" You see there is no especial person mentioned there. I might mention Mr. John Kelly's Star, but that is immaterial.

The CHAIRMAN. You have it very equitably distributed now, you think?

The WITNESS. I think now I have got it spread out generally. Mr. Chairman, disclaiming any intention to depreciate the virtues of any of the above-mentioned money kings, I think that they will not compare favorably in business tact and knowledge with many of our merchants. I think that, intellectually speaking, they cannot hold a candle to our average statesmen. One of these gentlemen of the guilded sphere, factiously replied to your inquiries regarding the working classes by stating that the people had a fair chance to make a fortune, when he does not pay living wages to his employés, and to cap the climax of absurdity he advises the people to "go get educated." Mr. Chairman, the practices by which our capitalists have fallen into wealth, I think, had better remain a part of their private and unseen life, for certainly morality cannot benefit by their examples. There is nothing as successful as success, and it is the opportunity that makes the thief, as it is the opportunity that makes the bloated monopolist. If you will consult the statistics you will observe that a very small proportion of our merchants acquire large fortunes; you will also notice that our shrewdest, most industrious and best business men are continually failing, which goes to prove that there is more good luck than good management in this millionaire business. Of course industry and perseverance are necessary qualifications for successful business, but the kind of business done by the monopolists referred to is not included in the category of general business. A business which permits a man to accumulate $200,000,000 in a score of years is a business in which the Government should take a hand. Congress within the last few years has lavished public favors upon these monopolists, thereby greatly increasing the centralization of individual power. This mistake on the part of our legislators amounts to high treason against the people. I predict that if a remedy to the existing evil is not forthcoming there will arise a cyclone of vengeance and retribution that will level things pretty generally, including Congress and its wealthy wards. You will please observe, Mr. Chairman, that I am not reproaching our monopolists for the state of affairs in which we find ourselves. Monopolists are human and selfish; all men work in the direction of monopoly, from the scavenger to the highest mortal; all are struggling to obtain more goods, more pleasures, but few can succeed. My reproaches are unequivocally addressed to our legislatures, general and local, and I, as a unit in the great national tribunal, lift up my voice for 8,000,000 voters to impeach this Government for criminal negligence of its trusts, for its usurpations of power, and its confiscation of national property.

To obtain a patent nowadays is equivalent to walking out at night among a pack of wolves wrapped in a sheet soaked in gore. The impositions practiced upon the inventor begin in the Patent Office. There is entirely too much red tape about the Patent Office—a great

Digitized by Google

deal of unnecessary quibbling and superfluous correspondence. The examiners are very particular on some occasions, and extraordinarily careless upon others. They grant patents that infringe upon others, and refuse claims that are novel. When an inventor applies for a patent he has to pay his attorney $20 to make drawing and specifications; his model may cost from $5 to $100; he then sends a money order for $15 (first Government fee) to the Commissioner of Patents. Usually his application is rejected, and he is referred by the examiner to some patent supposed to anticipate his. It often happens that the reference relates to an invention entirely different. After amending the application to conform with the whims of the examiner (whose infallibility must not be questioned) the petitioner returns it to the Patent Office, with some unimportant alterations. The petition is then granted; but accompanying the grant is a notice, calling the inventor's attention to an interference on the part of a contemporary petitioner; this involves a cost of about $200, unless the parties have the matter settled by referee. It frequently happens that the two applications for patent refer to inventions which do not conflict. Thus unnecessary time, labor, and money is wasted.

In case the application goes through smoothly the Government asks $20 more, and our proud inventor begins to look around for capital to place his improvement on the market. If the invention is valuable, the inventor will easily find a capitalist, who will make the following peculiar arrangement with him: They form a stock company of 20,000 shares, out of which the inventor receives 5,000 shares, representing half a million dollars at par, all neatly engraved, and legally drawn, indorsed, certified and red-taped.

There is a paid-in working capital of $50,000 for manufacturing use, to pay for building, machinery, material, and labor. Then they agree to buy a few shares of the inventor's stock to help him along and reimburse him for his long years of labor in perfecting the improvement. They very liberally agree to take of him 500 shares at $10, which about pays the inventor for the time, labor, and money he has expended in developing the improvement. This is all the cash he may expect. During several years the company remains at a standstill; nothing is done excepting paying out sinecure salaries. The inventor becomes despondent; thinks he had better sell out; does so for a song, and that closes his interest in the invention over which he spent so many sleepless nights and upon which he devoted so many laborious days, sweating his blood away and stinting his stomach to succeed in his task. Did ever one of our Wall street nabobs do such work? Oh, no; that is not his business. He waits patiently while the inventor is unraveling the scientific threads which are soon to be woven into golden and imperial garments for monopoly to wear. When the capitalist has secured the inventor's stock and rid himself of that erratic individual (who everlastingly wants to borrow money before any money is made out of the confounded invention), then the capitalist changes his tactics. He immediately sets his machinery to work and doubles his investment over and over again. In the mean time our poor inventor is pulling the devil by the tail and scratching his head in devising new schemes, in which he is doomed to be swindled every time.

This trick played upon inventors by men of means is so well understood, so frequently witnessed, that its victims cease to inspire a sympathy. The people look upon an inventor's misfortune as a foregone conclusion. It happens so often that it no longer interests any one.

Digitized by Google

The workman's case is precisely the same, and loses notice through its monotony.

Mr. Chairman, I respectfully submit to your committee a plan, or rather a sketch thereof, by which both the inventor and consumer would be benefited:

The National Patent Agency, headquarters, Washington; sub-offices at the post-office of each State capital in the United States.

To take out letters-patent for inventors at a cost of not over $5 to the inventor, to advertise the same with description thereof each month for one year. To offer for sale manufacturers' licenses at a moderate royalty (same rate for all purchasers). To accomplish such sales by selling suitable stamps or trade-marks to the manufacturer as he may require them. We give the invention to the public in that way and allow any manufacturer to manufacture on paying us 5 per cent., or one or two cents on each article he manufactures, having stamps for that purpose.

To impose a heavy fine for counterfeiting or using any patent without said stamp, and to offer a large reward for the detection of any violation of the law.

To stop infringers with preliminary injunction, regardless of bonds, and prosecute all infringements to a final issue, patent agency and inventor dividing royalties.

Mr. Chairman, there are few inventors, if any, who would not gladly avail themselves of such services as this agency would afford. It would be a source of large revenue to the Government. And very few infringers would take a stand before such a power.

Goods manufactured under its patents would reach the consumer at a reasonable advance upon unpatented goods.

Any manufacturer could handle the inventions because the same tax would be paid by all. The increased manufacture would realize to the inventor a larger revenue than he could obtain from an exclusive manufacture of his invention.

I think that these desiderata are worthy the consideration of Congress.

Concluding my statement, Mr. Chairman, and thanking your committee for its polite attention to the same, I would express the hope that the people of this country will succeed in obtaining legislative relief. There are laws upon our statutes that give the lie to our Constitutional prerogatives as citizens; there are others which are special, exclusive, and incompatible with democratic principles. The people must take a broader view of their affairs. There is too much individual politics nowadays. Men should disappear behind principles. What is man, after all—a very fallible and perishable thing at best. Principles will stand engraved on the rock of ages, while generation after generation passes into oblivion.

Q. I should like to get your idea of a national patent agency. Explain it a little fuller verbally?—A. I think that ought to be drawn up very carefully. I have simply given a sketch.

Q. Is the idea that this be a national institution?—A. Yes, sir.

Q. Established by law?—A. Established by law.

Q. We have the Patent Office now. Would you abolish that?—A. By no means. I think that gradually the Patent Office would go out of existence. I think this would supersede it, but that would be done gradually.

Q. How would you establish this agency?—A. The idea is simply to afford to the inventor protection against the impositions practiced upon him now by agents and men of means, also to protect the consumer

Digitized by Google

against exorbitant advances. For instance, certain patented articles sell at very exorbitant profits. If the thing was given to the public for a small royalty, say 2 or 3 per cent., or 2 or 3 cents on each article that was generally manufactured, you can see that the revenue would be much larger, especially if the invention was valuable, while a great many inventions would not be taken up at all.

Q. The procurement of the patent itself is to be through the operation of this agency? You have struck upon one of the most serious grievances of the time. This is a very important matter, and I do not know what your suggestion may be worth; but the men who do the thinking and the inventing very seldom get a proper reward for what they have done; for the service they have rendered the country?—A. Very seldom.

Q. How would you have this national agency operate? It is to be an institution to which the inventor may apply for practical assistance in the way of securing the necessary advances and helping him to prosecute his claim for a patent before the Patent Office itself?—A. Yes, sir. If I get up a certain invention, instead of applying to the Patent Office or taking out a *caveat* for it, I would apply directly to the national patent agency, and they would make a search in the Patent Office and ascertain whether that patent had been anticipated or not. If not they would be bound then to take out a patent at their expense. Therefore we would want a fund to start on. I should think a very small fund would suffice; probably $25,000 or $30,000 would do to start on. Then they would take out this patent in the name of the applicant, the papers would be made out in the usual way, only going through the patent agency. Instead of being issued to the inventor it would be issued to the patent agency in the name of the inventor, and this agency would become half partner with the inventor in that invention. Then there would be a publication monthly of this patent agency giving a description of the various inventions patented to date, and offering the same for sale, and specifying what royalty would be charged. This would be sent throughout the country, and in fact manufacturers throughout the country would be very glad to examine this report and see whether there was anything in their branch of trade that would be useful to them, in which case they would make an application to the patent agency for a manufacturer's license, which would be granted under certain conditions. I suggest the stamp business, which I think would be a good plan, to sell them by the thousand, or by the hundred, without discount; there must be one price, so that there will be no preference for one manufacturer or another.

By Mr. CALL:

Q. Cannot you do all that now under the law as it is?—A. No, sir.

Q. You can get up as many patent agencies as you please?—A. So you can, and so they told me here when I had to go to the different papers to publish a letter "Why don't you start a paper of your own; then you will get your views ventilated and circulated." It is precisely an analogous case.

Q. You mean you want the Government to do it?—A. Yes, sir.

Q. Then you want to change the Constitution?—A. No; I want to say to the Government, "Here is an opportunity for you to make money enough to pay the national debt."

Q. Read the Constitution and see what it says?—A. I know, but then we are not bound to sit on the Constitution and remain there forever. We go on progressing; we want legislation.

Q. The Constitution can be changed undoubtedly.—A. We require

Digitized by Google

further legislation. I do not propose to confine myself to old laws. New issues require new laws, and we have had plenty of laws lately, special laws.

Q. The people have only given to Congress power to pass laws securing the exclusive right to the inventor?—A. The first and elementary fundamental principle of the Constitution is: "We, the people of the United States, in order to * * * establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, * * * do ordain, &c." Now to "promote the general welfare," Congress has a right to legislate. Nobody denies that.

Q. I never heard that before.—A. What is the use of a Congress? By Congress and two-thirds of the States you can change the Constitution, can you not?

Q. Oh, yes, you can amend the Constitution.—A. I simply make the suggestion to you gentlemen. Of course I am not a Congressman. I submit the thing to you as a citizen. I think it would be to the benefit of the Government and of the people to organize something of this kind.

The CHAIRMAN. Such an agency could be incorporated undoubtedly, and could go into business, and do business like any other corporate institution, and I do not know why the provision in the Constitution for securing the exclusive right to inventors of what they may invent is in any way in collision with their right to relinquish any claim of a mere royalty upon the article that may be manufactured. You could undoubtedly do that under the Constitution as it is. I do not know but what your idea might be practicable without any change in the Constitution, the inventor relinquishing a right to anything but a royalty upon the patented article.

The WITNESS. That is all he would practically have.

The CHAIRMAN. That is all he would have under your plan. I do not see why any change in the Constitution is necessary to do that.

Mr. CALL. Because the law is imperative and mandatory, and if the law says that if a man chooses to do so and so he may, it is no law at all. The Constitution says that Congress may pass laws securing the exclusive right of property to every inventor, but it does not say that Congress may pass laws securing the right of property to anybody but the inventor.

The CHAIRMAN. The greater always includes the less.

Mr. CALL. If the inventor wants to give it away, or sell it, he can do so now without any change of the Constitution.

The CHAIRMAN. That is precisely what I was saying. The right to secure the greater certainty includes the right to secure the less, and that right by way of royalty is no greater and may be less than a right to the exclusive use of the invention.

The WITNESS. The inventor could assign the entire right to the United States and receive from the United States therefor a certain royalty.

By Mr. CALL:

Q. Do you know any provision of our Government by which the United States may receive any such assignment as that and go into the patent business?—A. I do not see why we may not legislate to that effect.

Q. Then we might go into the grain-selling business, or any other kind of business.

By the CHAIRMAN:

Q. Why do you need really any organization connected with the United States? Why could not an organization be incorporated having capital

Digitized by Google

to do business and take its share of the profits that might result from the usual development of the inventions?—A. It would not be half as popular in the first place. It would be looked upon as a great monopoly. It would become more powerful than the Government after awhile, and that is the reason I object to it. I think such an organization is as important as our railroad interests, and I think that there is only one power that should handle it, and that is the United States Government. It would be immensely valuable. You can see for yourself our great inventions, and see the fortunes, the millions that are being made from them. Take the telegraph, our different improvements on railroads and on the sewing-machine, and so on.

Q. Your plan is to effect a distribution of that wealth among the people at large. Then there is no reason why the organization should become unduly wealthy; the profits would go to the people.—A. If this thing was in the hands of a private corporation the royalty would necessarily increase; they would find it to their interest; no law would bind them to make it lower. If it was under the Government they could afford to do so.

Q. I was only desirous of developing your idea so as to be sure to comprehend it. Have you any other suggestion to make?—A. Nothing at all, excepting these two.

## BUREAU OF LABOR STATISTICS.

ELISHA WINTER sworn and examined.

By the CHAIRMAN:

Question. What are your business connections?—Answer. I am employed in the Delaware and Hudson Canal Company, in the auditor's office. I am assistant auditor, and interested in a subject which is before this committee for investigation.

Q. State the particular matter that you have in mind.—A. I wish to add my feeble testimony in favor of the idea, which I think has already been brought before this investigating committee, of a national bureau of labor statistics and protection to foreign immigration. I want to add my indorsement to much that has been said, and also possibly add something that may be of value to that idea. My personal experience here in the city in helping people in charity-need and people looking for work has got me interested in the idea of the labor class being assisted, and as everybody nowadays seems to think the Government ought take care of everything, down to cooking a man's victuals, I suppose I have naturally fallen into the idea that it must be done by the Government. I do not see myself, honestly, any other way of getting at this information that we need than as a nation. The indifference of States to each other and the natural spirit of jealousy between cities and States is such that they will not give impartial information even about themselves, much less about each other, and I have come to plead in behalf of the National Government taking up the idea of furnishing to the world through a national bureau, if you please, all the information that is needed by people who come here to settle in this country. People come here from Europe in a very degraded state of mind, often knowing nothing of our resources, and they are often the victims of land agents, railroad speculators, or anybody into whose hands they happen to fall. We have a bureau at Castle Garden that attempts to protect them after they get here, but only to a partial extent. It is very fortunate that most immigration has its destination fixed before it comes

Digitized by Google

here, but the information on which they base their decision often comes through the influence of land speculators and people who are interested in a certain locality. I argue in favor of the National Government furnishing impartially through a publication that shall be recognized all over the world as coming with the stamp of this Government information of every State, county, and town that may be asked for, and giving it thoroughly and accurately.

Q. I see that the idea which you are advocating here is the same as that in which the British Government has so largely interested itself and brought to the attention of our State Department, and which has been indorsed by the State Department, and is really an idea of very great importance.—A. Yes, sir; even the island of New Zealand and Canada both do this. We are behind the whole world in furnishing this information, and yet there is more important information wanted from this country than the rest of the world put together, and they can get less of it from the Government of the United States.

Q. What is the name of that English gentleman largely connected with the Government and so prominent in the discussion of economic questions?—A. George Jacob Holyoke, as I recall it. He was here last year visiting this country on that express mission. I saw that our President and Secretary of State gave him great encouragement, saying that our Government, as far as they could assist it, would be in favor ultimately of doing something in this line. While we have the proud distinction now of coming up at the foot of all the nations of the world, it is "better late than never," and it is high time, I think, that the subject should receive the important attention which it deserves. I was first interested in the subject by seeing how ignorant people in these cities are, hundreds and thousands of them, as to what is best for their own condition. I found the foreign population dumped into this city like a congested mass of rotting ignorance, with lack of self-protection, with nothing to give it excuse for being here excepting that they had to live and they had to work, and ignorant of the fact that within 100 miles of the city of New York seven out of ten of them could establish independence and comfort in ten years, and they do not know it, and often when you tell it to them they do not believe you. They think you are interested in some land speculation, or have some lots to sell, and they do not care to listen to you; but I think, coming from the Government, with the stamp of authority of Uncle Sam on it, it would pass circulation, and would receive that credit which it now does not get. The great lack of success I found in helping people in this city and the great success in helping those who would get out of the city on to land was what gave me first an interest in this subject. I could give most amusing and most sorrowful examples of this, but have not time, and I do not think you have to listen to it. Our education lacks nature, and our labor is too fond of city life. That is the first point I would like to bring up. Money spent here in the city in charity, in my opinion, I am sorry to say, only manufactures pauperism.

Q. What has been your connection with charitable work in this city and vicinity?—A. I am sorry to say it has been more unsuccessful than successful. I was chairman of the missionary committee of the Brooklyn Sunday School Union for a couple of years, and I had a good deal to do in inducing Mr. Seth Low to assist in organizing a Brooklyn bureau of charities. At one of those meetings I introduced a resolution that since went through the State legislature, and went through Congress last year, for the appointment of a national commission of immigration, but I think it went through in such a hurry that it was not

Digitized by Google

properly digested, and I hope this winter Congress will bring the thing up and combine it with a bureau of labor statistics and assisting immigration.

Money spent in assisting to country homes is not "bosh," as our friend who has just preceded me said. My personal experience is right to the contrary of his testimony. Not only out West, but within 100 miles of New York City is to be found the very best charitable expenditure that can be made, in my opinion, especially getting children there when they are old enough to work. If you get children there when young they are pretty apt to stay, and often through the children you can get the parents. I have taken great interest in the Tribune fresh-air fund. I have sent out parties this week; one is going out next Saturday, and it is delightful to see the influence it has in some few cases—few, I am sorry to say, but good, I think, will come as the thing grows—from the influence the children coming back into the city have to get their parents into the country, and in a few years, I have no doubt in ten years, men who would live and die here and never have enough money to bury them can go into the country, and in ten years own better homes than they now rent, and the money they now pay in rent will buy the house. If I had time I could give the figures to prove it. All this is not known. You would think it was known, but it is not. Men are as ignorant as horses outside of the smoke of their own chimney and the circle in which they live. They will not read a paper that does not give them the ideas they have already through education or prejudice, and it is almost impossible to get men to look at the other side of anything that they have accidentally fallen into by inclination, prejudice, or early education. My opinion is that people look to nothing but the Government for impartial information. They consider the Government is not a party, is not a boss, and is not a monopolist. Almost everybody else nowadays is accused of being something, either a monopolist or a communist, or being some powerful influence for evil in the country, and what they do receives no kind attention; but what comes from the Government does or can receive the attention of the whole civilized and a good part of the uncivilized world. I magnify perhaps the importance of the idea, but I must say I firmly believe that if this Government takes up the cause of assisting the foreign immigrant here, protecting him after he gets here from himself and from each other, they will add to the nineteenth century one of the grandest things this country has yet done for dignifying labor. I have a very great deal of faith in the idea, I assure you.

One great advantage, I think, that would come from this is that it would disarm local geographical prejudice. It is sorrowful and yet laughable to see how one little town will hate another little town three or four miles off. You might suppose that a whole State would naturally have a great feeling of pride in every part of itself; but why a little bit of town, and sometimes a ward in a city, should be jealous of its neighbors is strange. Take the eastern district of Brooklyn. If anything is started in the western district, and if the people of the eastern district have not their full share, they are as mad as red hens. If they have an idea of anything going to hurt the western district, you will see the Brooklyn Eagle and other papers go for it and kill it, because it does not help them. This local geographical prejudice is a bug-bear, a stumbling-block in the way of national progress.

The Government protects the population that is here now from that which hereafter is coming by means of National Commissioners of Emi-

Digitized by Google

gration, and that is perfectly right. It should also protect the population that is here now from each other, and often from themselves.

Genuine protection to home industry demands the extermination of sectional geographical prejudice, and the National Government alone can do this.

These are the points I wish to enlarge on to the extent of your patience and my time. My personal experience I have given. The bill that went through Congress last year carried out partially the idea I agitated in the Brooklyn Times last fall. I took it down to a meeting of the bureau of charities and I got there pretty late. Just as it adjourned I gave it to Hon. Ripley Ropes. He was very much pleased with the idea and jumped up and introduced it, but they had adjourned, and he said, "Send it up to the State board of charities at Albany with my indorsement, and ask them to put it through the legislature." They did put it through. It seemed they had the idea up already at Boston, at the congress of charities. It went through the State legislature flying. In fact, it went through too quick. It did not get in the proper shape that it ought to have been. Hon. J. Hyatt Smith, before he was elected to Congress, promised me warmly that he would indorse it, and he did. Representative S. S. Cox also did. Senator Warner Miller introduced it into the Senate, and it went through the House with about the same speed it went through our State legislature, and, I think, in the same week.

Q. Did the bill pass the House of Representatives at Washington, did you say?—A. Yes, sir; appointing commissioners of immigration. But I complain that it was only *ex parte* in its influence, and I hope this Congress will combine that with Mr. George Jacob Holyoke's idea of a bureau of labor statistics and protection.

Rural life is declining here among Americans. Farms in New England and the Middle States are falling into the hands of ignorant foreigners. Stagnation of property around New York, within a radius of fifty miles, beats all imagination and belief. Years ago people invested in rural property. If they had any idea of it to-day they would not put a dollar in it as an investment. In Yonkers, almost within the corporation of this city, where Mr. Jay Gould's secretary lives, property is the same in value to-day that it was ten years ago, because the rural spirit seems to be so declining and people are getting into cities, and city people are more ignorant geographically than any class in the country because their prejudices are so narrow they take interest only in what prejudice calls for, and they have less public spirit, I believe, than many backwoods farmers that do not see a paper once a year. My experience is that those latter people know more about the country geographically than the people I meet here in the city. The lack of information and of figures and statistics I think is deplorable, for the reason that if they see anything in the paper they will not believe it. I know but three editors in New York and Brooklyn that are free from suspicion. Silly, stupid people say, "this editor has a collar on him," or is the man's dog; "nobody gives him credit" for truth. Information in the press does not carry weight for the reason that people seem to think a paper that has a great history or national reputation is small enough to get down and be a mat for some millionaire to wipe his feet on. I have no faith in the power of the papers here arousing any interest in the subject, and I turn to the Government because public spirit in the cities is dead, and I know of no other resource.

Q. What could people do for a living on the places to which you have referred, or within a radius of fifty miles of the city?—A. Up as far as

Digitized by Google

Maine, if you read last Sunday's Tribune, you will find where a man representing a big firm on Broadway put up one hundred or two hundred suits in a box, sent it to Maine, and those backwoods farmers' wives there sew at night and can beat the people who work here in tenement houses. They have less rent to pay, and all the expense is the freight, which would not be 25 cents on a suit of clothes. I saw that confirmed by one member of the committee who has been down east and came back and reported that the people who lived in the country, those who were laborers and mechanics, were in his opinion better off than people living right here in the city. This could be applied to the suburbs of New York.

Q. What is the reason that these available lands are not appropriated as the homes of mechanics and laborers?—A. Ignorance and stupidity, prejudice and laziness, I am sorry to say, to a large extent. Americans do not seem to want to work a farm. They talk about the dignity of human labor, and they seem to think that to work where you see the most beautiful handiwork of nature is degrading; but working in a dirty city, where there is nothing but artificial life and where the comforts of home are nothing equal to what they are in the country, that is dignity and that is the perfection of human existence. I say that comes from ignorance, and people will not listen to the clergy or to the press, and I am in hopes the Government can pound information into them.

Home life in cities does not turn out great men. Our great editors, ministers, and financiers come from the backwoods; even Jay Gould came from Delaware County. New York City raises nothing but gin-mill statesmen, dudes, and other criminals. I believe in a love of nature. The British and Germans, cultivating a love of nature among us, are our principal resource. I would rather let foreigners have our land, if Americans will not take it. For two hundred years the German Government has taken up the cultivation of its forests. We do not know how many or how much area of trees we have. There is not one man in a thousand who can tell one tree from another, whereas in Germany the love of nature is so respected that they would not destroy a tree any more than they would destroy your house. The people there have had ingrained into them a love of nature. I am a good stiff Dutch Reformed deacon, but I believe the love of nature is the best religion we can have in this country for the greatest number. I believe it ought never to be separated from the church, and our education ought to have nature in it as its very foundation teaching. It is being taken up, I am glad to say, by the kindergarten, and should have all the importance it deserves.

The native American imitates foreign life at London and Paris, but not the country life of Europe, which is the only part worth imitating.

Assisted immigration by State and National Government it will be important to undertake, not only on account of disarming prejudice, but I am sanguine that we are as a nation to be the great international factor in bringing about international republicanism and the coming federation of man and parliament of the world; and if our President Garfield had lived I believe that idea would have had an impetus that would by this time have been acknowledged and recognized by the country at large. I am afraid we lost in his death years of development of that idea.

The Government should form a national bureau of immigration and labor statistics, giving impartial statistics of every State, county, and town when asked for, to be worked out by making continued reports. Now, some of the States make reports to themselves. The Government, I suppose, could establish an interstate agency. I have no doubt the postmasters have not enough to do sometimes to keep them awake.

Digitized by Google

They could take full charge and very likely furnish all the information at no expense to the country at large except for postage stamps and white paper. Canada and even New Zealand, as I have said, have gone ahead of us in this idea; but the coming of George Jacob Holyoke to this country, backed up with $500 from Mr. Gladstone, the expression of our President and State Department, the many evidences we have had before this committee show that the idea is in people's minds, and it will be made attractive I hope at the next session of Congress.

Q. Perhaps you are aware that Mrs. Elizabeth Thompson has taken considerable interest in the way of the promotion of this same object of securing statistics by national indorsement, to be distributed throughout this country and Europe also.—A. She has done grandly.

Q. I have the impression, however, that you may have been the originator of the idea.—A. Perhaps I may be made out a liar on that, but until I am I am going to claim that I am the inventor of the idea. Genuine protection to home industry demands the extermination of sectional geographical prejudice, and the National Government alone can do this; not only that, but systematically cultivate a national love of the whole of mankind.

Q. Have you elaborated in your own mind the method in which this information should be collected and distributed?—A. No, sir; I have not given it that attention yet. I am gathering information now continually. I have little time from my business. I do not allow my family to suffer, and therefore this thing goes on very slowly. I have had to tinker at it as I get an opportunity, but I hope to get it in shape to lay before our people in the country. I am interested now in getting them to start little rural improvement ideas. The State of Connecticut has had it going for years. I want people to be aroused to the importance of dignifying country life and making it what it ought to be, the grandest instead of as now the most ignorant part of American interest. People are leaving the country and coming into the cities, where they are not wanted, and land is lying idle that could support a population of a thousand where there are now only a hundred, or even ten. They growl because there is not enough to do here, where they are not wanted, when there is enough to make them rich if they would go where they are wanted. If the Government cannot kindle this public interest I do not see what in the world there is for us to do, but to allow those big "monopolies" we talk about to take all the land, because ten years ago there was not one farm of a thousand acres where there are now, I suppose, a dozen or a hundred. There are farms of thousands of acres within a hundred miles of New York. Mr. John Roach has a big farm; Mr. Borden, in Ulster County, has a big farm of a thousand acres. Men buy large farms because they foreclose; there is nobody to work them and they sometimes have to take them; they cannot unload.

By Mr. CALL:

Q. What is your employment?—A. Coal. We have had the same trouble among our miners. We cannot get one Irishman in a dozen to pay for a house after he buys it; he will work on it twelve, twenty years because they do not seem to care to own a little place that they can farm. They would rather pay some man rents, so that he can get on their back, and the corner grocer and everybody they meet can get on their back and ride them and get two prices for everything they sell them. The men thus throw away money not only in unnecessary pleasures but unnecessary expenses, which would, if saved, give every man of them a home in a few years.

ANTHRACITE COAL PRODUCTION.

By the CHAIRMAN:

Q. You are connected with the coal business to some extent?—A. I am in the auditor's department of the Delaware and Hudson Canal Company.

Q. How large a business do they do in the coal mining?—A. They sell 3,000,000 tons a year.

Q. Where is it sold principally?—A. All over the country, from Maine to Saint Louis.

Q. What coal companies are there that do a very large business in the line of supplying fuel?—A. There are about seven or eight of them that probably control the anthracite business. The Philadelphia and Reading controls 53 per cent. of all the anthracite business.

Q. What proportion does your company control?—A. We mine 3,000,000 out of 30,000,000, about one-tenth.

Q. What other companies have large interests?—A. There is the Delaware, Lackawanna and Western.

Q. How much does it control?—A. About the same as ours; a little ahead of us, not much.

Q. What are the others, and what is the percentage of the entire amount that each one has or controls?—A. I can only approximate the figures. They are published every week in the trade journals. The Pennsylvania Coal Company is a smaller company, that is the "Pittston coal," as it is called. The largest, as I said, is the Philadelphia and Reading. Next come the Lehigh companies; then comes our company and the Delaware, Lackawanna and Western, and the Pittston Company, then small operators.

Q. Where is the chief point of distribution? This city, or does it go direct from the mines to those portions of the country where it is used?—A. It scatters now to all points.

Q. Scatters from the mines themselves?—A. Yes, sir; in all directions, north, south, east, and west.

Q. Do you say you send it as far west as Saint Louis?—A. Yes, sir; farther.

Q. How far?—A. I think we have sent a lot to the Northern Pacific.

Q. Is this coal all mined in Pennsylvania?—A. Yes, sir.

CONDITION OF COAL MINES.

Q. You must know, then, very much in regard to the actual condition of the coal mining population.—A. I think I do. I audit every bill the company pays. I know what the men get, but that, of course is private business, and I do not suppose the company would be obliged to me if I gave it.

Q. The rates of wages paid to miners is not private business. That is the immediate matter we are investigating.—A. I should hesitate to give anything connected with the working of the company without their consent, except in general terms, as it is now known in print.

Q. I do not ask for any secret working of the company, but I want to know what prices are generally paid to the miners for the working of coal mines.—A. That is public information. The men average from 70 cents up to $1.25 mining coal. That is what the miner gets.

By Mr. CALL:

Q. Is that per day?—A. No, per ton. One miner generally hires two men under him; one boss and two assistants.

Digitized by Google

Q. How many tons can he mine in a day?—A. I suppose some of them mine two tons a day per man, good handy workingmen. It depends on the coal; it depends on the veins and the situation for its preparation. Some veins are worked under great difficulty, and to others they can apply machinery that cannot be applied in other places.

By the CHAIRMAN:

Q. Do you know the number of miners employed in working the anthracite coal mines of Pennsylvania?—A. I do not. Our company must employ, I suppose, two or three thousand, and as we mine one-tenth of the coal, I suppose at a rough guess there must be thirty or forty thousand men.

Q. Have you visited the mines yourself?—A. Yes, sir.

Q. What is the actual physical condition of the men who work in them? How well are they clothed, and how well are they fed, and how well are they sheltered, how many hours do they work, and so on? Give us some idea of their real state.—A. It depends on the race. The Welsh miners, I think, are universally prosperous; in fact I think they own houses. In tracing the real estate records I find they generally pay for their houses; they are not foreclosed and taken back; but among some of the other classes, especially among the Irish, they are not so fortunate in possessing their houses, and the houses that are taken back I notice generally are in Irish names, though I do not think we have any trouble with our Irish workingmen. I think they are good, steady men, and I think we have as good a class of workingmen as there are in the country; but I notice from the records that the Irish are not as thrifty in owning houses as other races. I find it by the names on the record.

Q. I understood you to say you had been on the ground among them personally?—A. Yes, sir.

Q. How about the schooling of their children?—A. The children all go to school; a number of them work in the mines, but not under twelve or fourteen years of age, I think. A great many of these men employ their children there picking coal and preparing it for market; but I think, as a rule, they all go to school now.

Q. You do not know to what extent?—A. No, sir.

Q. And you do not know how well they are actually educated?—A. I do not. I know they are very intelligent, good sober citizens. I speak of our miners.

Q. I speak of the chance the children are getting in the way of education.—A. I only know they go to school.

Q. Do small children work in the mines to any large extent?—A. They work outside the mines in preparing coal. They do not do any manual work in mining coal.

Q. You said that a miner has one or two working under him?—A. We pay them that way. We pay one man and he divides with two, who work under him.

Q. Does he divide equally with them?—A. I suppose so.

Q. But you have no means of knowing?—A. No. I know it is the same way with our Weehawken shovelers. I pay all the men there. The shovelers are paid in gangs of three. I have seen them go to lager-beer saloons and divide the money.

Q. To what extent is there a disposition or is it a matter of fact that their earnings are expended in the way you speak of, smoking and drinking?—A. I do not think to any large extent. I do not know what they do spend their money for, but the idea that so much money is spent in whisky I think is a mistaken idea.

Digitized by Google

Q. You said you saw them go to the lager-beer saloons and divide equally. I did not know but that you meant to imply something.—A. They pay five cents for a glass of beer, I suppose, but they are sober men.

Q. You do not mean to convey the impression that there is any general waste of their wages by what you have said?—A. Not to any abnormal extent, because I know our people would not hire them unless they were industrious, temperate men. They go there more for convenience. The money is paid in large amounts and they go to the beer saloon because the beer saloon proprietor will change it for them, and they will get a glass of beer when it is divided.

Q. How continuously during the year do the miners work? I suppose you make some regulation in regard to the output from year to year.—A. It is practically controlled by an imaginary board of control, and we are working pretty regularly in our mines. I do not know what time is lost, but I do not believe the miners lose any more time than carpenters or laborers generally.

Q. Each company understands the amount it is to mine and put on the market each year?—A. Yes, sir.

Q. It is determined on beforehand by this board of control and apportioned among them?—A. Yes, sir; it is not a fixed, iron-clad thing, but it is understood and agreed.

Q. Understood in an honorary way?—A. Yes, sir; there is no penalty and no attempt to bind.

Q. What is the object of that limitation upon the output? Why is it?—A. To prevent overproduction. Coal is a thing that cannot be exported very well. If the market is overstocked there is nothing to do but to break the market or limit production.

Q. Do you mean that there is danger of a larger output than can be consumed?—A. Yes, sir; great danger.

Q. Then there is no difficulty in operating the mines to the extent of getting out a very much larger amount of coal than the country can burn?—A. Undoubtedly they could increase their output; mines are being opened all the time.

Q. If that was done, would the result be that coal would be more generally distributed and burnt than it is now, do you think?—A. I do not see why it should be. We have sold more coal this year at higher prices. People have to have coal; they have to burn about so much. If the tariff shuts up manufacturers you might give them coal for nothing and they would not take it. Cheap coal would make more manufacturing to some extent, but I do not imagine the expense of coal is such a large item in manufacturing except in iron. There undoubtedly would be a difference, but I guess people must have about so much coal.

Q. If the price was reduced do you think it would be distributed over a larger extent of territory?—A. Yes; further west somewhat.

Q. And north and east?—A. Undoubtedly.

Q. Are the mines of Pennsylvania controlled by these companies that you speak of—those which have not as yet been developed as well as those which have been?—A. Not entirely; a great many of them are leased from individual owners. Companies lease them and pay them royalty or buy them right out.

Q. So that whatever mining can be done is really controlled by these companies, or most of it?—A. No. There are individual operators who mine their own coal and pay their freight and sell it in the market. In Trinity Building, 111 Broadway, you will find lots of them, men who are not under any obligation to any company.

Digitized by Google

Q. Who own coal mines and work them themselves?—A. Yes, sir; but it is not a large part of the tonnage.

Q. Is there any relation between the coal companies and the railroads in regard to the matter of transportation?—A. I suppose there is.

Q. The coal companies are somewhat under the control of the transportation companies, I suppose?—A. I do not know whether it is that way or the reverse, whether the coal companies control the transportation or transportation controls the coal companies. I rather think the coal companies are the masters of the situation and control transportation.

Q. How is that?—A. Because they have railroads of their own. We own 700 miles of road.

Q. Have any of these companies a line reaching to New York City, for instance?—A. Yes, sir; the Reading has. Our company has its canal to Rondout and its railroad to Albany; then it has its freight contracts with other railroads.

Q. Owning the mines and owning the highways that lead to them, of course what you said in the first place is apparent—that they must control the coal market both in output and transportation.—A. The coal market could be broken in thirty days, however, by any party of capitalists who wanted to do it. You could no more stop it than you could stop the sun from rising to-morrow morning.

Q. Explain how that can be done by any capitalist who chooses to do it.—A. Mr. Jay Gould could do it in thirty days. He could wreck the coal market, bear the stocks, and sacrifice millions of dollars, if he felt like doing it.

Q. How could he do it?—A. He could shove the coal right into market by the million tons.

Q. Does he own coal?—A. No; but if he chose to go into the coal business he could do it.

Q. If he was disposed to go into the coal business in opposition to the existing companies?—A. Yes; or anybody else.

Q. How could he get the coal?—A. He could buy out the stock of the companies and open all the mines he could find.

Q. There probably would not be much inclination to do it on the part of any capitalist, for in destroying others he would destroy himself, would he not?—A. Oh, they are burnt always in these fights. It is a kind of insanity for railroads to be fighting each other. I never could understand myself why they do it. It is, nevertheless, true that they seem to make money on Wall street if they do not make it out of the companies; there are "ways that are dark and tricks that are vain" there.

Q. In Wall street?—A. Yes, sir; the coal companies have to stand it as much as other people.

Q. The true theory is to keep out of it, is it not?—A. Undoubtedly.

By Mr. PUGH:

Q. You say the miners are paid from 60 cents to $1.25 a ton?—A. In our company from 70 cents to $1.25. No; it is more than that, because they are paid also for preparing the coal and extras in opening up headways and extra work. I should judge the average would be very nearly a dollar a ton. I should roughly say that is what the miner gets himself.

Q. What proportion of the miners turn out two tons a day?—A. I do not know.

Q. What is your best estimate?—A. From the way they are paid by

Digitized by Google

the month, I should think most of them did; that would be $60 a month, working full time.

Q. Most of them turn out two tons a day?—A. I should think so; that would give them $60 a month on full time. Some of them make much more; some of them make a $100 a month, but they are smart men, and the coal is very favorably placed.

Q. What is the market value per ton of anthracite coal where it is mined at this time?—A. I do not know; I should not feel at liberty to go into that, as my information might not be very reliable.

Q. What is your best information as to the present market value per ton of anthracite coal where it is mined?—A. I should think from $2 to $2.50 a ton. The transportation brings it up to about $3.50 or $4 at tide water. When freights are lower it costs less. As the price of coal rises the cost scales up. Coal costs less at one time than at another.

Q. What other items of cost are there in a ton of coal made ready for market except the labor?—A. It has to be prepared and separated out.

Q. You say it is worth from $2 to $2.50 a ton where it is mined. Now, what other items of cost enter into a ton of coal where it is mined besides the labor?—A. There is the item of cleaning it, picking out the Slate.

Q. That is part of the labor, is it not? You say they get a dollar a ton for all that work on an average?—A. Yes, sir; for *mining* it, but not for preparing it.

Q. Now, outside of the labor item, the dollar a ton?—A. The transportation.

Q. Without regard to transportation, what other items of cost in a ton of coal where it is mined are there, leaving out the cost of labor?—A. There is royalty where they lease the mines upon a royalty of sometimes half a dollar a ton.

Q. As much as half a dollar a ton?—A. Sometimes.

Q. The market value of that coal where it is mined you say is from $2 to $2.50, and they pay half a dollar a ton royalty?—A. I do not know that my information is reliable, but my impression is that $2.50 would cover the expense of getting a ton of coal on the car.

Q. It is worth that at the depot where it is shipped?—A. Yes, sir; I should think $2.50. At the farthest $3 would cover it, royalty and everything.

Q. What proportion of that $2.50 a ton is clear profit to the man who sells and owns the coal; what amount of profit per ton, in your best judgment?—A. Possibly 25 per cent.

The committee adjourned until 10 o'clock a. m. to-morrow.

---

NEW YORK, *Friday, September* 14, 1883.

The committee met at 10 o'clock a. m.

## PROPERTY IN LITERARY PRODUCTIONS.

MAURICE KRAUSKOPF sworn and examined.

By the CHAIRMAN:

Question. Are you the author of the memorial which you now present to the committee?—Answer. Yes, sir.

Q. Where do you reside?—A. At 41 Cheever Place, Brooklyn.

Digitized by Google

Q. What has been your pursuit in life?—A. During the day-time I am selling goods to earn my living, and I am making dramatic compositions and other kinds of literary work in addition.

Q. When did you leave Germany?—A. I left Germany in 1852.

Q. Had you opportunities for study and education in that country?—A. None at all.

Q. You submit this memorial to the committee. Will you state in a few words what your idea is?—A. My idea is principally that every person has a common-property right in every literary production that is original, and that the act of the House of Lords declaring that there is no common-law property right in a literary work is an annulment of the fundament upon which the society of the people of the United States rests.

Q. You desire legislation which will better protect the original ideas and the expression of those ideas by literary men?—A. Precisely.

Q. And in this memorial have you fully set out your ideas?—A. Yes, sir.

Q. The committee will receive it and give careful attention to it.

The memorial is as follows:

41 CHEEVER PLACE, BROOKLYN, N. Y.,
*September* 10, 1883.

*To the United States Senate Committee on Labor and Education:*

The undersigned, a citizen of the United States, most respectfully petitions you to take into consideration, as being in connection with education and the rights of labor, and to recommend to the Congress of the United States concerning the rights of literary productors and the necessity of insuring honesty in literature.

First. Whereas the society of the people of the United States as yet rests upon common-law property exclusively, to wit, upon the principle that every person has the right of acquiring, by means valid under it, the exclusive right of utilizing, commercially, or in any manner otherwise, the properties of anything, or of any utility arising out of, and being in any manner connected with anything or things, and also the right of holding such right for himself, heirs, or assigns unlimited in time as long as the thing or the utility so controlled continues to be existent, and also the right of acquiring such rights in as many things and utilities as he can acquire by means valid at common law; and whereas there cannot be under the common law anything or any utility that is commercially, to wit, money-earningly, utilizable and not be, by some title or other, the property of some person or other, real or artificial; and whereas, whenever a thing or a utility is the product of any kind of human labor, corporeal or mental, lawfully performed, such thing or such utility is self-evidently by the most valid of all titles, to wit, that of labor, the property of its lawful productor; and whereas, there not being as yet any other than common-law property as the fundament of society, such labor product is necessarily the common-law property of the productor; and whereas that principle of common-law property is, as emphasized by Blackstone, held as being so fundamental in society that even public necessity cannot annul it, but can, at most, by special legislative act compel the proprietor of a thing or of a utility unavoidably necessary for the public weal to sell it to the State or community; and whereas a literary work is a product of human labor, and is a commercial utility, and therefore, until abandoned by its productor, is in all

Digitized by Google

that is in it lawfully original by him. his common-law property; and whereas the enactment by a British House of Lords of the last century declaring that there is no common-law property in a literary work, not having been accompanied by an announcement of a higher property, fundament under the principles of which whatsoever is lawfully original in a literary product could have been held as originally the property with certain limitations, of its author, placed literary labor products outside of the fundament of society, and established a precedent that, if sequentially applied to all species of labor products and utilities, would surrender society to the anarchy of a vile communism; and whereas that precedent has been followed concerning literary works in the jurisprudence of the United States, and apparently even in the Constitution of the United States, it is therefore necessary to provide that said precedent be of no effect in the United States; that the Constitution of the United States, if its clause relating to literary works is not construable as not resting upon that precedent, be in that amended; that all acts of Congress relating to literary works resting, as those acts do rest, upon that precedent, be repealed; that it be declared that any person who originally and lawfully, to wit, without violating the common-law property of any other person in a prior literary work, conceives and makes a literary work, whether in extent a line, or a volume, or a series of volumes, shall have, until otherwise ordained by the supercession of ethical-property law, within the jurisdiction of the United States, and as far as the power of the United States by treaty or otherwise reaches, a common-law property in whatsoever is in his work lawfully original by him, and is not coincidentally identical with or markedly similar to any prior work or part of any prior work by any other person; and that such common-law property be held in jurisprudence as an incorporeal hereditament arising, by labor title, out of the person of its author as the thing corporate and attached to him, and consisting of the right of exclusively controlling unlimited in time and location for himself, heirs, or assigns, the utilization of all the commercial and other properties of whatsoever is in his literary labor product lawfully original by him.

Secondly. Whereas it is, on the one side, self-evident that a person who, by the lawful exercise of his personal mind properties, conceives and makes a literary work be materially and ideally rewarded for his labor, it is, on the other side, also self-evident that common-law property in literary works, when carried out to the full, is, since literary labor is for the most variatively reproductive, an enormous hindrance to the free exercise of the literary labor properties of the public; and whereas it is also self-evident that it is utterly impracticable to remove that hindrance by the common-law right by which the State can, when the public weal demands, coerce a person to sell his private property to the public; and whereas, while on the one side the principles of common-law property, being, as they are, the formulated efforts of human society to build itself, live, move, and have its being upon the basis of what it conceives to be right and just, and being, such as they are, the best which society could attain in its primitive and later degrees of ethical knowledge and social architecture, have in themselves a warrantee of being a fundament *de jure*, as well as by *de facto*, circumstance, they are, on the other side, from the highest ethical stand-points attained by, comparatively speaking, a few persons, and especially from that of the Master who is crowned as the Christ of the globe, only relatively *de jure*, or, in other words, of a low degree of ethicality; and whereas, while, therefore, the common-law property of society is, in the divine order of cosmos, only a transient one awaiting the divine approach of the higher,

Digitized by Google

it is also self-evident that neither in ethicality nor in social science is the human race, or any numerically notable portion of it, advanced to that degree that that common-law property fundament can, with safety to society, be annulled, except in a few certain species of things and utilities; and whereas, the literary species of utilities is one of these few; and whereas, not only the material interests of society but also the highest ethical verities demand that on the annullment of any portion of the common-law property fundament ethical-property law must take the place of the annulled portion; and whereas it is the highest ethical or ideal property of the human race, gained by the labors of its past, that its ethical progressions be made in the majesty of law, and with a due recognition of what is the righteousness of its past, it is therefore necessary, after such recognition has been rendered to the past by repudiating the aforesaid enactment of the British House of Lords, to provide that on and after a certain date common-law property in literary works shall cease by cause of ethical expiration, and that ethical-property law shall be, concerning literary labor products, in force, to a certain degree in the United States, to wit, that all the rights of common-law property shall be possessed by a person in whatsoever is his lawful literary product only during fifty years, beginning from the time of his initiatory labor thereon, and that after the lapse of such fifty years, if not previous by any act of its proprietor granting or forfeiting it to the public, it shall be public property, provided that in any utilization thereof by any person the *ideal property* of the original author, to wit, the ideal distinction as the author thereof, be formally recognized during all ages into which it may be carried by the course of human events.

Thirdly. Whether under the common law or under any system of principles of property, it is absolutely necessary that special legislation be effected for the protection of the literary productor as well as for the honor and dignity of the nation. If the dignity of the State is violated by the theft of a thing that is consumed on being utilized, and thereby ceases to exist—if to receive such stolen corporeal property is a felony, it is as much more a violation of the dignity of the state when a person steals directly or indirectly from an author's mental product, or mentally consumes such stolen product, knowing, or having reasons to believe it to have been stolen, or commercially or in any other manner utilizes it, it is not only a violation of private property but also a burdening of what is the abiding ideal wealth of the nation with an heirloom of theft. The race has in its masses not yet reached that ethical degree that, on being reached, makes the question of the authorship of certain works known as "Shakespeare's" a foremost one in intellectual life, and wherever it is reached there is no cause to be grateful to former times for having bequeathed to posterity a legacy of doubt and an heirloom of discomfort in uncertainty as to the authorship thereof. At present there is no more provision on that than there has been formerly. Whether there are or will not be any more authors of the height of him, whosever he has been, out of whom came these works or the highest parts thereof, is not in question. Assuming that no more there will be, authors of any degree of lawful originality have ethical rights to what is their own, and the communal conscience has a right to its easement on questions of authorship of works of any degree of originality. Yet who can deny to Nature power to even excel those works, or that there is less lawlessness now than formerly? Nature, when she acts her potencies phenomenally original or in any degree of originality, does not first steal herself invisibly through the ranks of the vast regiments of professionals to find some mental pauper into whose cranium to breathe the spirit of the Creator.

Digitized by Google

She is invariably first an amateur. Indeed, she remains true to her highest only as long as she remains amateur, and is in her lowest when she acts under the professional's trade-animus. And governmental protection, as far as it can possibly be given, is necessary not only as between professionals, but also, *and mostly so*, for the protection of the amateur against the professional, so called, for, as to lawlessness in the literary sphere of labor, it may be said that in these times, when literary originalities have such an enormous money value, cupidity is more than formerly a factor in causing unknown original authors to be plundered, maltreated, and extinguished.

In legislation thereon, it is, above all, necessary to provide that any person, on conceiving or on having made a literary originality, may deposit with the Government a synopsis of the originality or a full copy of the work, and that he must depose, *under oath*, that what he claims as being original with him, is in fact and lawfully original with him, and whence whatsoever is in his work not original with him has been taken, and that it has been lawfully taken and utilized, to wit, that it is either public property, or, when not public property, the consent of the lawful proprietor has been formally obtained for the utilization, and that the utilization itself is not a copy of the original undistinguished in any manner as being a copy, but is an original variation thereof. A further necessity thereon is a formal declaration of any violation of an author's rights a felony against the State. Other necessities there are, and your petitioner begs to refer to a bill thereon, made by him, and introduced into the House of Representatives of the United States by Mr. Wm. E. Robinson, and referred by the House to its Committee on Patents, with orders to have it printed.

Without such provisions there is no protection on that where it is most needed. For, while in the literary profession, and in the various branches of commerce arising out of and connected with it, many persons there are to whose moral responsibility an unknown author may leave his originalities, it is also a fact that they contain numbers that are thieves and tools of outlawism. When an unknown author gives his manuscript out of his hands—as he must give it before he can reach the public arena of literature—its contents, if not always directly reached by literary thieves, can be readily communicated to them and its originalities utilized, and held on grounds like those of the burglar, who, after having broken into an iron safe and plundered it, claimed rights of labor, and, consequently, of personal property in the plunder because the conception of the act was original by him, and the act itself a feat of mechanical art. Not only does the honest author know himself to be plundered, and his work, even if he gets before the public, deteriorated in value, because no more possessing that newness that is such a great factor in establishing a work in the soil of literature, and giving it commercial value, but he is, when poor, unable to carry on legal proceedings against the thieves, and is likely to be clandestinely operated against in any effort to bring his works before the public lest the similarities between his own original work and the originally stolen work may brand the author of the latter as a thief. And when to those persons are added newspaper Geslers, capriciously arrogant, and newspaper thugs, maliciously mischievous, and newspaper Hessians, venially servile, pouncing on the poor, struggling worker—and pouncing the more the more genius or talent or honest aspiration he evidences—and when, also, fanatics of caste and creed and tyranny add themselves to the clandestinely conducted operations against him, it needs, indeed, the strongest arm of the majesty of the nation, in law and government constituted, to

Digitized by Google

lift itself in defense of violated personal and national rights, and of material and ideal property.

Your petitioner has, since over twelve years, with a few brief intermissions only, after employing himself, in order to earn his living, in a legitimate branch of common law commerce, devoted the hours usually given to recreation after the day's toil to the arduous task of literary labor. He has discovered vast truths, has gained great conceptions, and has made a number of dramatic compositions of great originalities. And yet his experience is only of there being such a lawlessness operative against him that he dare not submit any new literary originality, or aught else new in the world of thought, lest he be plundered thereof, and the plunder scattered even as far as Europe. Without here entering into details of that experience, he simply insists that if what is his experience even be held as improbable, the necessity for legislation on the subject of authors' rights of labor is imperatively self-evident. The fundamental principle in the government of society is to the effect that the protection of rights of persons and property be not given over to the arbitrarily active agency of any factor or person in society, but, even if such factorship be ethically moved, to formulated laws and officers of government, statutorily invested with power of law. It is expected that all factors in society, active under the protection of statutory law, ethically aid, to the fullest of their power, the administration of law, but no factor, under our system of government, outside of statutorily established office, has arbitrary power in any function of government. This refers especially to newspaperdom as a foremost factor in society. Your committee is already aware of the low *morale* thereof in this city and in New York. There is not one of them that does not know where protection for unknown, or, as far as concerns that, any originally productive person, is most needed; yet not one of them, to the knowledge of your petitioner, has called public attention to the fact. On the occasion of the introduction of the bill on literature, above mentioned, one of them, in malmotive against your petitioner, made a disgraceful onslaught on the Hon. William E. Robinson, and the others, like corner-boys on a fence, enjoyed that exhibition of the chivalry of New York newstraderdom. To criticise men and measures is, in democracy, an absolute right; but there is a point were criticism ceases and maluse of the right of criticism begins. When that point is reached it becomes treason against the press, against what is, in democracy, the counter-government to what may prove itself as being in republican forms of government vestiges of dynastyism in the abuse of powers of government by temporary incumbents of its offices. It is then dynastyism in the press itself, tainted with all the caprices, vices, abuses, and personal malmotives of that of former times.

Your petitioner is prepared to submit, if desired, demonstrations briefly made on the two necessities named at the beginning of this petition, and also any further statements that may be desired on the last named. And he will ever pray.

M. KRAUSKOPF.

### PROTECTIVE TARIFF POLICY.

The CHAIRMAN. I have a memorial from William Lawrence, First Comptroller of the Treasury, with resolutions adopted by the Association of American, Economists of Washington, an association made up of a large number of prominent public men in Washington and other parts of the country, which he desires to lay before the committee, the resolutions and memorial bearing particularly on the subject of the tariff. The paper will be received and filed.

The document is as follows:

## ASSOCIATION OF AMERICAN ECONOMISTS.

[President, William Lawrence, Washington, D. C.; First Vice-President, John C. New, Washington, D. C.; Treasurer, J. R. Dodge, Washington, D. C.; Corresponding Secretary, L. Sanial, New York City; Recording Secretary, Edward Young, 1431 Q street, Washington, D. C.; Vice-Presidents: For Massachusetts, George Basil Dixwill, Boston; for Rhode Island, H. B. Metcalf, Pawtucket; for Vermont, Redfield Proctor, Rutland; for Maine, Frederick Robie, Augusta; for Pennsylvania, Joseph D. Weeks, Pittsburgh; for Ohio, Columbus Delano, Mt. Vernon; for Illinois, David H. Mason, Chicago.]

WASHINGTON, D. C., *September* 10, 1883.

DEAR SIR: We take pleasure in informing you that in addition to the other work of the association, tariff clubs have recently been organized in various cities of Ohio, chiefly by the corresponding secretary. It is believed that these clubs—some of which already consist of 300 members—and others soon to be organized, will exert a powerful influence in that State during the ensuing year.

You are respectfully invited to attend a Tariff Convention at Columbus, Tuesday, September 18th, at which delegates from the various tariff clubs, and other friends of protection to American industry will be present. There will be a Republican mass meeting in the evening of the same day, at which will also be present *hundreds of miners*, and of workmen from manufacturing establishments in different parts of the State. General Raum, late Commissioner of Internal Revenue, ex-Senator Bruce, and other eminent speakers from other States, as well as from Ohio, have consented to address one or the other of these assemblages; Governor Porter, of Indiana, is also expected. Should you be unable to attend it is hoped that you will in a letter to the President, to be read at the convention, strongly indorse the work of the association, stating that a protective tariff is now the issue overshadowing all others, etc.

A preliminary draft of a platform to be submitted for adoption is appended hereto, and you are respectfully asked to give it your earnest consideration, and to suggest such amendments, additions, etc., as may seem to you desirable. To secure a Congress favorable to protection *next year*, it is important that Ohio be carried *this year*.

Address either of the undersigned, previous to the 18th instant, at the Neil House, Columbus, Ohio.

Very respectfully yours,

WM. LAWRENCE,
*President.*
EDWARD YOUNG,
*Recording Secretary.*

### DRAFT OF RESOLUTION.

Whereas, on the 8th of April, 1789, James Madison, "the father of the Constitution," declared that before its adoption the States "had the power to protect and cherish" manufactures, and "that manufactures have been reared up by the fostering care of State legislatures," and that "by adopting the Constitution they have thrown the exercise of this power into" the Congress, "with an expectation that those interests would not be neglected here;"

And whereas this power to enact a protective tariff law is found in the authority given to Congress "to lay and collect taxes, duties [and] imposts," and "to regulate commerce with foreign nations and among the several States" (Art. 1, Sec. 8), in pursuance of which the second act passed by the first Congress, on a day which made it a second Declaration of Independence—July 4, 1789—was "An act for laying duties on goods, wares, and merchandise imported into the United States," the preamble to which declares that "it is necessary for the encouragement and protection of manu-

Digitized by Google

factures" (1 Stat., 24); and the power to levy protective duties has since been sustained by the Supreme Court (Gibbons *vs.* Ogden, 9 Wheaton, 196; United States *vs.* Marigold, 9 Howard, 566);

And whereas a protective tariff is essential to secure prosperity and happiness to all the people and to maintain national revenues, independence, and power for the following, among other reasons:

(1.) It exacts from foreign producers a payment for the privilege of selling their commodities here, and thus gives to American producers, exempt from such payment, an advantage which secures employment to capital here, diversifies our industries, builds up manufactures, enlarges commerce, builds up cities, adds to the value of farms, gives employment to our people protected against competition with the cheap pauper wages of Europe, and thereby secures an honest day's wages for an honest day's work, and recognizes the rights of labor and the dignity of laborers;

(2.) It protects from foreign competition the products of American farms and secures for them a HOME MARKET which is permanent, unfailing, and adequate, and thus places the agricultural, mechanical, manufacturing, and mining industries in close proximity, and thereby, in a large measure, saves to all the cost of ocean and other transportation, and especially gives to the farmer and gardener a market for products which could not be exported;

(3.) It brings to our shores the skilled mechanics, manufacturers, and artisans, and the honest toilers of other lands, thus taking from European nations *their elements of strength and power*, and planting them on American soil, to become and mingle with American citizens, to secure for themselves independence, competence, wealth, and happiness, and for the Republic the fruits of their enterprise and industry, in a land where they are welcome—where employment and the just rewards of labor await them;

(4.) It brings prosperity to our industries, the means of comfort, plenty, and a competence to every citizen able and willing to labor, with every avenue to wealth equally open to the enterprise of all, and a common-school education for all the children of the land, with no injustice to or discrimination against any one on account of nationality, class, creed, color, or condition;

(5.) It secures to American consumers a supply for their wants at such rates as does equal and exact justice to all. Under it the prices of all commodities bear a just relation to each other which does no wrong to any. Under protection properly sustained, the cost of every article to clothe the body and generally to supply all human wants has been rendered cheaper. Free trade or a low tariff would destroy our manufactures, and then European manufacturers, having the only great work-shops of the world thus relieved of American competition, would advance the price of their products in selling to American citizens, and reduce the price they would otherwise pay for American agricultural products;

(6.) It secures the production of all articles at home which are essential to the comfort, happiness, and well-being of our people and requisite for their support in peace and for national defense in war, thus giving to the Republic a perfect independence of all other nations, and the means by which it may endure through all time;

(7.) It has secured in every period of our history prosperity for all our industries, a sound currency, abundant national revenues, high public credit, and rapid growth in wealth. Every period in our history under free trade or a low tariff has been attended with hard times, embarrassed industries, disordered currency, deficient revenues, depreciated public credit, and has been without material progress in wealth;

And whereas the Cobden Club, a free-trade association in England, and British manufacturers are annually sending to the United States free-trade documents for distribution among the people, and money to aid in their objects to secure a "tariff for revenue only," thereby to build up a European monopoly of manufactures and to destroy American industries, in which work they are aided by the American Free Trade League of New York and similar associations elsewhere; Therefore,

*Resolved*, That it is the duty, as it is the interest, of every American citizen to aid in counteracting these alien influences, alike hostile and ruinous to the success and prosperity of American industries.

*Resolved*, That we demand of Congress that it shall perfect and adhere to that form of legislation which will foster, protect, and encourage the labor of the mechanic, the manufacturer, the artisan, and of labor in all forms, and secure for it just rewards; and, in order to accomplish this, it is indispensably necessary to protect agriculture, manufactures, mining, shipping, navigation, and all the industries of our people.

*Resolved*, That as education elevates, improves, and dignifies the condition of men, and is essential to make labor effective in all forms, we demand that an unsectarian common-school system shall be maintained in every State and Territory adequate to give the advantages of education to every youth of the land of proper school age, with no discrimination against or on account of race, creed, color, or condition. And we favor aid and encouragement to schools for instruction in such industrial arts as

Digitized by Google

may be necessary to secure the highest development of the capacity of our people and the resources of the country.

*Resolved*, That we favor such legislation in the States and by Congress as will advance the interests, secure the rights of and justice to all who are engaged in industrial pursuits.

*Resolved*, That while we welcome to our shores the enterprising and industrious people of Europe who voluntarily choose to become American citizens, we protest against enforced pauper emigration from other lands to this, and we especially oppose the immigration from Asiatic countries of those whose presence would introduce cheap labor by a class of people having no sentiment in common with American institutions or of the dignity of and respect due to those whose toil is the chief source of wealth.

*Resolved*, That we are in favor of abolishing the prison contract labor system, and we oppose every system of prison labor that will tend to reduce the wages or just rewards of labor, or impair its dignity.

*Resolved*, That we are opposed to "a tariff for revenue only," because it will destroy American industries, deprive our people of employment, reduce the wages of labor, introduce all the evils of Chinese immigration, deprive the nation of adequate revenues, impair the public credit, endanger the payment of the pensions of soldiers and sailors, and reduce multitudes of our people to the condition of the starving population of Europe.

*Resolved*, That we demand the restoration of the wool tariff of 1867.

## IS A PROTECTIVE TARIFF CONSTITUTIONAL?

### OPINION OF JUDGE LAWRENCE, FIRST COMPTROLLER OF THE TREASURY, ON THE CONSTITUTIONALITY OF A PROTECTIVE TARIFF.

OFFICE OF THE ASSOCIATION OF AMERICAN ECONOMISTS,
*Washington, D. C., August* 1, 1883.

One of the ablest and one of the best men of the country, whose patriotism is not doubted and whose integrity is unquestionable—Senator Bayard—in a letter dated May 23, 1883, has called in question the constitutionality of a protective tariff. As he is a prominent, if not the most prominent, Eastern Democratic candidate for the Presidential nomination his utterances on all subjects are entitled to profound respect and attention. Indeed they are so without reference to the latter fact. His views are doubtless those of the great body of the Democratic party. In his letter he says:

The more important the question the greater the necessity in dealing with it gravely and worthily, and anything like finesse or the appearance of finesse or trick in dealing with such an issue as a tariff for revenue or a tariff for the protection of certain classes of our citizens will greatly weaken the party resorting to it.

Quite independent of the economy to the Treasury and incidental benefit to American producers and manufacturers which is to be effected by a higher or lower rate of tariff taxation is the more profound question of political right and power to lay any public burden upon the entire people for the benefit or "protection" of private individuals.

If this claim be admitted as one of right, then privileged classes do exist in this country, and although *titles* may not be allowed by the Constitution, yet all the advantages and privileges of rank will be obtained without the *name*.

I know of no position more impregnable, and upon which it is more important for the Democratic party to form its lines than that *public property cannot be taken for private use under any pretext*.

The Constitution of the United States—and of every one of the States so united—provides for the taking of private property for public use *only* upon the rendition of "just compensation" to the owner, but nowhere in this country and nowhere where free institutions have recognition can the sovereign power take public property for private use or the private property of A to be bestowed upon B *with* or *without* compensation.

The only ground upon which any individual can be deprived of his property is to benefit the community, and whenever such an exigency arises he must (under our guarantees) be justly compensated.

The *form* of the exaction is immaterial—as much so as the place—and a tax collected in the interior, or at a man's residence, or at the seaport of entry and under a tariff law—an excise or a direct tax law—it is all the same, and to be *justified* must be *in the name and for the use* of the Government of the United States.

Digitized by Google

With this principle once laid down the *rate* of taxation will be easily measured by the public exigencies, and such a spectacle as was witnessed at the last session of Congress—of a handful of men representing private interests and controlling and molding public laws of taxation to suit those interests—will never again be tolerated by honest public sentiment.

In this statement one objection is urged to a protective tariff without saying that it goes to its constitutionality, to wit, that if the "political right and power to lay any public burden upon the *entire people* for the benefit, profit, or 'protection' of private individuals * * * be admitted as one of right, then privileged classes *do* exist in this country." And the letter says that under such a system "all the advantages and privileges of rank will be obtained without the *name*."

In this the two prominent but both erroneous declarations are (1), that a protective tariff imposes a "public burden upon the entire people for the benefit * * * of private individuals," and (2) that the "private individuals" thus benefited or protected constitute "privileged classes."

Let us examine these declarations.

I. By "private individuals" must be understood classes or portions of the entire population, especially those private individuals engaged in manufacturing.

Now a protective tariff has never been urged *exclusively* or *chiefly* for the benefit of manufacturers or for the sole benefit of any particular private individuals. *Revenue* is generally an object of a protective tariff, and this is expended for the benefit of all the people. But so far as a protective tariff law has an object *additional* to revenue it has always been urged and justified on the ground that it would be "for the benefit or protection of [*all* the] private individuals of the whole country. And such has been the effect. This assertion, of course, involves the question, how has protection operated? which is in a large measure a question *of fact* determinable by the condition of the people.

If it be necessary to show this by *evidence* and by *argument*, the discussion must be reserved for another time. But the point which is now more particularly affirmed is, that the *legislative purpose* of enacting a protective tariff law has always been to benefit not "classes" of "private individuals" but the whole public. The point affirmed in the letter under discussion is in effect that to admit the constitutional power to enact a protective tariff law is to say that the *legislative purpose* of such law is to benefit, profit, or protect *some* private individuals rather than the whole public. An allegation of this character requires more than *assertion;* it requires proof. The *onus* of proving it is on the party who asserts it. No such proof is offered. It may be safely asserted that it is a mere assumption, an error, which cannot be proved.

II. It is equally erroneous to assert that under protective tariff legislation "privileged classes *do* exist in this country."

What is a *privileged class?* It is a portion of the people for whom the law provides some privilege, right, benefit, or immunity, which the *law* denies to all others. When the law gives all an equal chance there is *equality before the law*. Now no protective tariff law has provided a privilege for any man, or class of men, which it denied to any other man or class of men. Every citizen of the United States has always had, and now has, a right to avail himself of the benefit of every protective law. All who choose can, on equal terms, embark in any business affected by tariff legislation. It is not at all correct to say, then, that under a protective tariff law there is any privileged class or classes.

Digitized by Google

If it be said that only those engaged in manufacturing are benefited by protective tariff legislation, and that these constitute a class, the answer is plain. All the people are benefited by such legislation. But if only manufacturers are benefited this is no objection to such legislation, when no other class is injured by it. And, in any event, nearly all legislation benefits some class. The laws which gave farmers a right to own lands and exclude every one else from the possession and use of them, except by consent of the owners, is, in one sense, class legislation. I am a farmer, more deeply interested in the ownership, cultivation, and use of land than in all other objects combined. We have legislation in our favor. All the land-owners of the United States are a class of people, and as to their lands they enjoy an exclusive privilege. We can manufacture if we wish, but manufacturers cannot farm our lands if they wish. Yet would any man repeal all laws for the protection of land titles and the possession of lands?

The school laws benefit classes of people and give privileges which all cannot enjoy; but would any statesman for this reason abolish schools? The object of all legislation is to benefit somebody. It seems like a strange objection to a law that it will benefit people.

III. The letter under consideration gravely arraigns protective tariff legislation as unconstitutional because it takes *public property for private use.* This is not the exact form of expression used, but it is the effect of what is said, else what is the significance of the words "*that public property cannot be taken for private use under any pretext.*"

Again it may be said that he who asserts a controverted proposition should offer some proof of it. Certainly it is not shown how a protective tariff law has ever taken or ever can take public property for private use. In the absence of any evidence in support of such complaint it may be assumed that it is unfounded.

There are laws and wise laws which do take public property for private use, because they result in public benefit. Public money is appropriated for the private use and benefit of the children in the public schools. Will any one object to this? Public money is appropriated to build up the levees of the Mississippi River to save from ruin private property and preserve a navigable river for the public. Is this objectionable because it benefits classes or takes public money for private use? What legislation exists that does not benefit some class? And shall all such be repealed? A railroad charter gives to a class an extensive privilege. Shall the public do without railways because they are built by classes? Such charter gives *public property* for a private use—for the franchise is property, and it is given by public authority. Yet shall all such franchises be denied because they give public property for private use?

## IV. A Protective Tariff Law is Constitutional.

The letter under consideration assigns no reason in support of the objection it makes, beyond what has been considered. It is not now intended to present a full argument in support of the proposition stated above. Only a few points will be briefly presented.

The Constitution provides that "the Congress shall have power to *regulate commerce* with foreign nations, and among the several States, and with the Indian tribes." (Art. I, sec. 8.) This gives to Congress the power to enact a protective tariff law.

1. The Supreme Court has so declared. Thus in Gibbons *vs.* Ogden

Digitized by Google

(9 Wheaton, 196) the court, referring to the clause of the Constitution above quoted, say:

What is this power? It is the power to regulate; that is, to prescribe the rule by which commerce is to be governed. This power, like all others vested in Congress, is *complete in itself, may be exercised to its utmost extent,* and acknowledges *no limitations* other than are prescribed in the Constitution. * * * If, as has always been understood, *the sovereignty of Congress,* though limited to specified objects, *is plenary as to those objects,* the power over commerce with foreign nations and among the several States is vested in Congress as absolutely as it would be in a single government, having in its constitution the same restrictions on the exercise of the power as are found in the Constitution of the United States—the wisdom and the *discretion of Congress,* their identity with the people, and the influence which their constituents possess at elections, are, in *this,* as in many other instances—as that, for example, of declaring war—*the sole restraints* on which they have relied to secure them from abuse.

Here the Supreme Court declares in effect that the kind of a tariff law which Congress may enact, whether "for *revenue only,* or for revenue and *protection,* is solely in the discretion of Congress."

In the case of the United States *vs.* Marigold (9 Howard, 566). the Supreme Court said:

Congress are, by the Constitution, vested with the power to regulate commerce with foreign nations; and, however, at periods of excitement an application of the terms "regulate commerce," such as would embrace *absolute prohibition,* may have been questioned, yet, since the passage of the *embargo* and *non-intercourse laws, and the repeated judicial sanctions those statutes have received,* it can scarcely, at this day, be open to doubt that every subject falling within the legitimate sphere of commercial regulation *may be partially or wholly excluded* which either measure shall be demanded by the safety or *by the important* interests of the entire nation. Such exclusion cannot be limited to *particular classes,* or descriptions of commercial subjects; it may embrace *manufactures,* bullion, coin, or any other thing. The power once conceded, it may operate on any and every subject of commerce to which *the legislative discretion* may apply it.

There are many other cases which may be cited, all supporting the opinion that Congress has power to enact a protective tariff. When the Supreme Court has so decided, that should be the end of controversy.

2. The power of Congress to enact a protective tariff law exists, because its power to regulate commerce is given *in unlimited terms.* It is not a power to regulate commerce limited to levying *duties for revenue.* It is a universal rule, supported by many authorities, that a power given in general terms may be exercised in the discretion of the legislature.

3. The Constitution is to be read in the light of history. Before its adoption the British Parliament passed laws to protect and encourage manufactures in England, and to discourage manufactures in the colonies. It is unreasonable to suppose that the people of the States, when making a Constitution, did not intend that Congress should have as much power as Parliament to build up and protect manufactures. Any other condition would leave Parliament armed with power to ruin our industries, and Congress with no power to retaliate.

4. Those who favor a tariff for revenue only concede that it may be so framed as to afford *incidental protection.* Yet it seems to follow: If the power exists to afford incidental protection it may be provided for *directly.*

5. A tariff for revenue and protection is the usual form in which all nations have through centuries levied duties. The framers of our Constitution knew this, and gave Congress power to do what all other nations did on this subject.

It is to be remembered that the power to pass a protective tariff law includes the power to protect the producer of wool and all agricultural products.

Digitized by Google

The second act passed by the first Congress under the Constitution was a protective tariff act, approved by Washington July 4, 1789 (1 Stat., 24). Its preamble recites that it is "necessary for the support of Government, for the discharge of the debts of the United States, *and the encouragement* and PROTECTION OF MANUFACTURES, that duties be laid on goods, wares, and merchandise imported."

Mr. Madison introduced the bill, and discussing it April 8, 1789, said:

In pursuing this measure I know that two points occur for our consideration. *The first* respects the general *regulation of commerce*, which, in my opinion, ought to be as free as the policy of nations will admit. The *second* relates to revenue alone, and this is the point I mean more particularly to bring into the view of the committee. * * * The States that are most advanced in population and ripe for manufactures *ought to have their particular interests attended to* in some degree. While these States retained the power of regulations of trade they had the power to protect and cherish such institutions; by adopting the present Constitution they have thrown the exercise of this power into other hands; they must have done this with an expectation that those interests would not be neglected here. * * *

Mr. Madison moved to lay an impost of eight cents on all beer imported. He did not think that this sum would give a monopoly, but hoped it would be such an encouragement as to induce the manufacture to take deep root in every Stete in the Union.

During the discussion of the question of duties on tonnage May 7, 1789, he said:

Gentlemen who are opposed to giving sufficient encouragement to ship-building ought to recollect an argumen', that was considered of weight in the case of encouraging manufactures. It is certain that manufactures have been reared up by the fostering care of State legislatures, displayed in the shape of *protecting duties;* but the people, by the adoption of this Constitution have put it out of their power to continue them. * * * Those States not being able to continue their encouragement expect that we will attend to their policy, and protect their citizens in the property they were led to acquire under the State regulations. If we disappoint them they will suffer more than is consistent with good policy.

These are only some among the many reasons which show the power of Congress to enact a protective tariff law.

WILLIAM LAWRENCE.

## EIGHT HOURS A DAY'S WORK.

The CHAIRMAN. I have also received from William J. Noble, of this city, a pamphlet entitled "Eight Hours as the Standard Day's Work. An Appeal in Behaif of the Same to the Workingmen of America," accompanied by a letter in which he desires to file it as a statement before the committee. It is a pamphlet which has been circulated to a considerable extent throughout the country, and appears to be a strong argument in favor of the eight-hour law.

The pamphlet is as follows:

### *EIGHT HOURS AS THE STANDARD DAY'S WORK.—AN APPEAL IN BEHALF OF THE SAME, TO THE WORKINGMEN OF AMERICA.*

[The following concise and plain appeal in favor of the eight-hour system of labor is respectfully submitted to the workingmen of America by one of their fellow-laborers in their cause. If, after they have read it, they should consider it worthy of patronage and circulation, the writer cordially invites them to have copies of it printed and distributed. It should be remembered that the present favorable condition of the iron trade is owing to the long suspensions and light productions in that line for the last four years. See his name and address on the last page.]

Digitized by Google

Believing that the "depression of trade," and also the "eight-hour movement," are the two important issues of the day, I claim that the enforcement of the latter is the only direct relief for the former, inasmuch as the markets are glutted with all kinds of goods. And still manufacturers and corporations, in their blind cupidity, speed their machinery to its utmost capacity ten hours per day, exciting competition, cheapening goods, and reducing prices until the manufacturing of staple goods affords no profit, from which condition they invariably seek relief by a further reduction of wages, which is generally followed by strikes and the shutting down of mills. Yet as consumption continues during these suspensions of production, demand naturally gains a stride toward an equilibrium with supply; but soon necessity compels labor to resume work at reduced wages, and again on goes overproduction, with the advantage to capital of a more firm market and cheaper labor. In this regard strikes generally terminate to the advantage of capital and detrimental to labor. But as a natural consequence, when supply is in excess of demand, the markets are soon again glutted, many merchants necessitated to disgorge at ruinous prices, and trade and labor are depressed by the many evils that naturally follow such a state of affairs.

All these, I claim, are the natural consequences of our overproduction, which has emanated from the introduction of improved machinery and other labor-saving and fast-producing facilities, of which the capacity for production have reached a stage when it is evident we can no longer (in keeping with the law of supply and demand) provide ten hours per day remunerative employment to all who depend upon employed labor for their living. And if capital and labor are to hold an equality of dignity we must necessarily make a further retrenchment of labor to, say, eight hours per day; for so long as capital lays claim to control labor so long is it but just for labor to claim that capitalists should be wise and generous enough to study the laborers' interest as well as their own.

Although all wealth emanates from labor yet labor should not be unreasonable in its demands on capital; for as there can be no mutually satisfactory arrangement instituted that is not mutually beneficial to both capital and labor, it is essential that capital and labor should alike understand how a retrenchment of labor to eight hours per day would affect respective interests.

First. Contemplating the effects the proposed retrenchment of labor would naturally have on capital, we would be relieved from overproduction and the constant fluctuations of prices which are caused by alternate overproduction and suspensions. We would have a more regular and better demand for our productions, firmer and steadier markets, confidence in commercial interests would be restored, and prices would advance until they attained a standard 20 per cent. higher than present prices. This would be the natural consequence of the retrenchment of labor to eight hours per day, consequently labor would likewise advance 20 per cent. above its present standard. As the value of supply is estimated by demand, the retrenchment of labor and production from ten to eight hours would enhance the value of the same as 10 is to 8, and as it would afford capital steady business it would also afford labor steady employment, and thus be a mutual benefit to capital and labor.

In contemplating labor as it would be affected by the proposed retrenchment, we encounter an obstacle at the outset, inasmuch as it is necessary in order to insure the general adoption of eight hours as the

Digitized by Google

standard day's work, a sacrifice must be made, either by capital or labor or both; but, knowing the nature of man, the perversity of those who govern, and that the dominant spirit of avarice, cupidity, and self is strongest in wealth and capital, hence I despair of the success of an appeal to capital to make the sacrifice. Nor is it best or just that capital should make the sacrifice, for under the present state of affairs capital cannot remuneratively pay for eight hours' labor the same wages for which they are now receiving ten hours' labor; consequently, if labor would enjoy the benefits that must naturally follow the retrenchment, some labor must lead in the movement and institute eight hours as the standard day's work, by submitting to a reduction of 20 per cent. in wages. This reduction of wages will at the outset have a tendency to discourage many low-wage operatives and laborers from joining in the eight-hour movement; but all such should remember that it would be only for a short time that they would be required to accept the reduced wages, for as soon as the present stock of goods in the market that were produced under the ten-hour system were turned into the hands of consumers (which would require but a few months) then would prices and consequent wages advance, as I have stated, to 20 per cent. more than you now get for ten hours.

As this is a rule that is best understood by experience, we will refer to the time when fourteen hours constituted a day's work, and the wages that were then paid to skilled and unskilled labor throughout America and Europe. Note the improvement in trade and the advance of wages that followed the change from fourteen to twelve hours as a day's work. And again, the happy result of the change from twelve to ten hours as the standard day's work, when wages within a short time advanced 25 per cent., and now that the improved facilities employed in the manufacture of all kinds of goods have so increased our productions that we now find it necessary to make a further retrenchment of labor to eight hours per day, and when once started will soon become general throughout the country in all manufacturing business.

One of the grounds of objection taken by capitalists against the eight-hour movement is that it would kill our export trade. This, however, is too sweeping a claim, since it could only materially affect our export trade in cotton goods; and when we consider the small portion of these goods that we export and the strenuous effort it requires of capital and labor to compete for this, I doubt if it is a benefit to us, when we know that an advance of cotton goods of two cents per yard would not affect the poorest woman in buying a calico dress, and would be a benefit to the capital and labor employed in that industry, as seven is to five, and while we could no more expect the agriculturist and many other vocations to observe the eight-hour standard than they now observe the ten-hour standard day's work; consequently, the retrenchment could have no effect on our export trade in beef, cheese, butter, hops, wheat, and cotton. Even England did continue to work ten hours per day, but we have reason to know that England would gladly follow us in the eight-hour movement, and in fact is now leading us, as we are informed by a London correspondent in the New York Daily Herald of August 8, that the gloom which has for months darkened the iron and cotton trade in England grows deeper and deeper, and that it is now passing through the most severe commercial crisis in English history. The general idea seems to be that the cause is overproduction; the short-time movement is spreading throughout the Lancashire cotton districts. The condition in the Oldham district is summed up by the Herald correspondent thus: Ten millions of dollars of capital, representing two-thirds of the limited com-

Digitized by Google

panies, unproductive for three years; $600,000 in debt; wages reduced until it is admitted that trade is not to be remedied by obliging operatives to make further sacrifices; many mills are closed; numerous failures, and house property decreased 50 per cent. in value.

As this statement will give the reader some idea of the depression of trade in England, it will also enable us to form an opinion as to whether England instead of us would be willing to follow or join in the general adoption of eight hours as the standard day's work. Some claim that if the working classes worked only eight hours per day there would be more drunkenness and crime. This is a wrong idea and an unjust assertion; for while it is not the working classes who are criminals, want of employment has probably driven some to commit crimes. We know that the retrenchment of labor would afford employment for those who are idle, inasmuch as two hours taken from each of the labor of four men would afford eight hours' labor to a fifth man.

As to the prophecy of drunkenness, we know the reverse. Statistics and experience prove that constant work for long hours, or over-exertion, causes exhaustion, and creates a desire for strong artificial stimulants (such as alcoholic liquors), produce mental incapacity, general insensibility, grossness of feeling and perception, with disease and shortened life. That the intelligence of the working classes would improve with the advantage of more leisure time we have every reason to believe, and that political tricksters and shameless demagogues could no longer turn their ignorance to the advantage of political party power. They would better understand the causes of their evils and the remedies they ought to apply, and instead of considering machinery a detriment to labor, they would realize it as the greatest benefit to them, exactly as the elements of fire and water can be beneficial or injurious to us just as we put ourselves in right or wrong relations to them.

It has been computed, says Dr. Franklin, that if every man and woman would work four hours each day on something useful, that labor would be sufficient to procure all the necessaries and comforts of life, want and misery would be banished out of the world, and the rest of the twenty-four hours might be leisure and pleasure; but as Dr. Franklin computed one hundred years ago, with our present facilities, were it possible for all to perform their share of useful work, two hours would suffice.

## ELEMENTS OF NATIONAL PROSPERITY.

The CHAIRMAN. We have also received this morning a treatise upon "The Elements of National Prosperity," by Edward Atkinson, of Boston, a pamphlet of about 30 pages, prepared evidently with his usual care and ability.

The document is as follows:

ADDRESS DELIVERED BY EDWARD ATKINSON AT THE OPENING OF THE SECOND ANNUAL FAIR OF THE NEW ENGLAND MANUFACTURERS' AND MECHANICS' INSTITUTE, IN BOSTON, WEDNESDAY, SEPTEMBER 6, 1882.

Mr. PRESIDENT, GENTLEMEN OF THE NEW ENGLAND MANUFACTURERS' AND MECHANICS' INSTITUTE, LADIES AND GENTLEMEN: I have been asked to open this fair with an address which shall indicate the purposes and methods of its work, as they are defined in the minds of those who founded this association; I will come directly to the subject without taking up your time with any further introduction. I shall speak without much regard to the danger of being dry or abstruse, but

Digitized by Google

will endeavor, as far as in me lies, to present thoughts which will be, at least in some degree, commensurate with the importance of the occasion. I shall not hesitate to reiterate some statements to which I have previously called attention, but which can hardly be too often presented. I shall spare you statistics as much as possible; they will be found in the notes if this address is published.

The purpose of this fair is instruction in the application of science to the useful arts. In what manner and to what extent this purpose may yet be developed depends upon the way in which it is sustained by exhibitors and by the public. Its method is to bring annually into public notice all the recent improvements in machinery, tools, and appliances to which the inventors, promoters, or owners desire to call attention, with a view to their general introduction. Its medal is a dollar, earned in recompense for a service rendered. It is based upon the simple and fundamental yet little-understood principle, that in all true commerce men serve each other.

It also gives to sections, to States, to railway corporations, and to individuals the opportunity to bring here and spread before the eye examples of the undeveloped resources in which they are severally interested, to exhibit the potentiality of the future, and to show the way to the place where men may supply their wants and attain welfare.

To this end especial attention has this year been given to the great middle section of our Southern land—the land of high and beautiful mountains, the highest east of the Mississippi, heavily timbered to their very tops; divided into ranges by upland valleys of unequaled beauty, salubrity, and fertility; underlain by "all the minerals which animate the arts," and surrounded by broad upland plateaus, where every crop of the temperate and semi-tropical zones finds its true soil and climate.

To this grand tangible prophecy of future national welfare I call your attention, and I may repeat to you what I have said to the people of the South, in the hall of their great exposition at Atlanta, knowing that you will respond as heartily as they responded. With them let us all be thankful that the principle of liberty established by our common ancestors—by Washington and Adams, by Patrick Henry and John Hancock, by Laurens and Hamilton—could not be subdued, but has dominated both them and ourselves. Let us thank God that the Potomac has not become the Rhine, dividing two hostile nations, and rendering the oppression of great standing armies necessary for each, but that this "Union stands, now and forever, one and inseparable," bound by the iron bands over which peaceful commerce finds its unobstructed way, and by the common interests of mutual service which only freemen can render to each other.

We welcome our Southern brethren to this fair, and invite their cooperation in carrying out its purpose and in sustaining its methods. No broader, more national, or more beneficent purpose could be presented; and it being a most righteous purpose, its methods will develop themselves as time goes on. It cannot fail. Why is it necessary? The answer is plain. Prosperity consists mainly in ample production, sustained by quick and ready distribution; not much in what is commonly known as accumulated wealth. It is given to very few members, even of this community, and to a yet smaller portion of the human race, to possess wealth and leisure under such conditions that they may devote themselves to science, art, or knowledge for their own sakes only, and without regard to their application to industry.

It is a matter of necessity, and always will be, that by far the larger part of the community—at least nine out of ten, probably more—shall

Digitized by Google

earn their daily bread by their daily work. The true end to be sought, therefore, is to make that daily work less arduous.

It is not of much consequence that dollars shall be more plenty if each dollar will buy more in this year than it did in the last.

I shall presently prove to you that the measure of comfort which each man, woman, and child can yet enjoy on the average, even in this prosperous land, must come within what half a dollar a day—possibly, not even probably, 60 cents—will buy at present prices.

The computations of the value of annual product will be given further on. Different economists have varied in this computation in such measure that their estimates, applied to our present population, would range from seventy-five hundred to ten thousand million dollars. I have adopted the latter, which gives half a dollar a day to each man, woman, and child.

We now number about 54,000,000, or we shall reach that number very soon. The following table will show how rapidly an addition of products to the value of 5 cents a day *per capita* increases the gross annual product:

| | |
|---|---|
| At 35 cents per day our annual product is | $6,898,500,000 |
| 40 cents per day our annual product is | 7,884,000,000 |
| 45 cents per day our annual product is | 8,869,500,000 |
| 50 cents per day our annual product is | 9,855,000,000 |
| 55 cents per day our annual product is | 10,840,500,000 |
| 60 cents per day our annual product is | 11,826,000,000 |
| 65 cents per day our annual product is | 12,811,500,000 |
| 70 cents per day our annual product is | 13,797,000,000 |

Even the whole waste and cost of war must come from each year's product during the war itself, except such munitions as may be borrowed from other countries. Debt incurred for war merely defers payment.

The first question of wages is a question of quantity—how much is there produced?

The second question is the question of price—what is the product worth?

The third question the question of distribution—what share of the product at its price does the workman receive?

The wages fund is not the quantity of things previously produced, but it is substantially the quantity produced at the time or in the year in which the work is done.

Fifty cents a day is very surely the average measure of the subsistence, savings, and taxes of each person. One dollar a day for each adult, $2 a day for each family group of two adults and two children, is the limit, because there is probably no more to buy. By so much as some of you enjoy more, others must have less, if such is the measure of all there is annually produced. What have each one of you done, what are you doing now, to entitle you to more than what half a dollar a day will pay for in food and fuel, shelter and clothing? Are you rendering service equivalent to your greater gain? Are you engaged in useful work by which the abundance of things is increased and the general struggle for life made easier?

That is the purpose of those who have founded this association. The glowing visions of quick and beneficent results which moved our friend Mr. Mudge—whose presence we miss, and whose absence we mourn so much to-day—may perhaps only be an incentive to us to try to realize them, but what can be done by the zeal and practical energy of your present president and his associates we may be sure will be accomplished.

This measure of subsistence is indeed very limited, but only those can be permanently helped to enlarge it who can help themselves, and few

Digitized by Google

have done more to establish the practical arts upon a scientific basis by which abundance may be increased than the men who remain in charge of this work, and who control and direct the work of this association.

The small minority of the people who can become the possessors of capital in any large measure, even in this great and prosperous nation, must justify the leisure which they or their fathers have earned by the use which they make of the time and means at their disposal.

The great benefit which ensues in the application of modern inventions to useful productions consists not in the accumulation of wealth, but in the general relief brought about by these inventions in the daily work of life. A larger product, and therefore more ample consumption, are assured from less labor, measured either by hours or by effort; dangerous and noxious conditions of work are abated or alleviated; and it can be clearly foreseen that the time is not far distant—if it is not now present—when even a moderate degree of intelligence and of effort will assure a reasonably good subsistence to every man and woman in the community who is not disqualified from work by laziness, vice, or inherent disease. These new inventions and appliances also increase wealth; but, so far from its being proved that such an increase is of necessity complemented by increase of poverty, in this country at least the very reverse is true. If my observations possess any value, they prove to me that material prosperity, measured in terms of wealth or income, is like a pyramid constantly rising as if lifted from above, as well as sustained from beneath; and as the apex of the great fortunes steadily rises, while such fortunes are relatively few in number, they do not burden those who are below, but they lift the base higher and higher, and make room for increasing numbers who, except for this lifting power of capital could have found no place and might have starved; while, on the other hand, those who come in at the base, which grows broader and broader with each year, sustain the fortunes of those who are above, without being oppressed by them. The prosperity of each and all rests upon the basis of certain definite rules for the possession of individual property both in land and things—property in possession and property in use.

Yet these very rules, which have been taking the form of statute laws, which have been gradually evolved in the experience of men, may themselves be abused, and may become instruments which for a time retard progress rather than promote it. This may be especially true in respect to the possession of land.

At the foundation of all property, and underlying all considerations affecting the title to things made by human labor, lies the question of the title to land. Everything which can be applied to human subsistence must come either from the field, the forest, the sea, or the mine. To the multitudinous seas no individual claims title; but to the land many claim it. From whom is their title derived? There are no direct grants from the Almighty; but it has been proved in the course of human experience that land itself is but a tool, the most productive use of which depends upon individual possession. Where mere possession is abused rather than used, and any large portion of the product is diverted from the subsistence of those who do the work—in the form of rent to absentee owners, as in Ireland, or in the form of taxes for the support of great standing armies, as in Germany and France—revolutionary changes, either under the forms of law or in spite of law, may become necessary.

Witness the acts of legislation lately passed by the Parliament of Great Britain, which are in part acts of bankruptcy for the discharge

Digitized by Google

of debts incurred for rent, and in part a recovery by the nation of the control of titles to land which have been abused.

How soon may similar acts become necessary in England and Scotland no man can tell. Perhaps our present great harvest in the United States, meeting a fair harvest in Europe, may so reduce the price of food as to make even the present reduced payments of rent on English land impossible; and then must inevitably come a profound change in the whole system of English land tenure, and yet a greater change in the forms of English society, under which 7,000 people now claim title to four-fifths of her whole soil. Appalling as these questions are, they are simple compared to those which must be solved upon the continent. The standing armies of Europe are as impossible to be sustained many years longer as they are to be disbanded without bringing society almost to a state of anarchy; yet they must be disbanded in the face of our competition for the commerce of the world, when we become conscious of our own strength and claim our full share in the peaceful conquest of nations.

Witness the great migration, partly forced and partly voluntary, from these overburdened lands. To this country—in which the proportion of adults in the total population is already greater than in many other nations—have come nearly a million and a half of immigrants, mostly in the prime of life, in the last two fiscal years, and in the present year a million more may come. We are engaged in a work by which the antagonisms of race and language of the Old World will be overcome. Democracy is the solvent, and the common school is the crystallizing medium. Presently the people of this land will have ingrafted upon the narrow but versatile intellect of the Yankee the courage and endurance of the Englishman, without his pig-headedness; the cleanliness of the Dutchman, without his stolidity; the thrift of the French peasant, without his superstition; the artistic sense of the Italian, without his treachery; the wit of the Irishman, without his incapacity to trust his neighbor; the philosophy of the German, without his skepticism; the acquisitiveness of the Jew, without his selfishness; the manual dexterity of the Chinaman, without his idolatry; and the fun and music of the negro, without his shiftlessness.

Will not such a polyglot race make something of this land more than we can yet conceive? What will its moral and material influence be a century hence?

But what, some one may ask, is the application of this statement to our present purpose? What have we to do with the Irish question? Where is the connection with this fair? It is partly this; that the Irish peasants who are being forced to migrate will, many of them, come here; with them are coming Italians and Germans, also forced to migrate by similar causes, and unless we provide in the right way for the instruction of the children of these adults, who are now, and have long been, almost paupers, we shall have the Irish question forced upon us, only in a new form; and that form will be how to deal with a mass of people who, without fault of their own, have become incapable of availing themselves of the advantages of the modern applications of science, and for whose merely manual labor or brute force there may be less and less demand as time goes on. Long years, ay, centuries of submission to the privilege of class and caste, to bad systems of land tenure, to the intolerance of a priesthood jealous of intelligence, and to prejudice against wealth have prepared many of these new-comers to become the dangerous element in our body politic, the tools of the demagogue and the instruments of the knave; and unless we can reform and regenerate their

Digitized by Google

children, our children may be called upon to face economic questions which nothing but force can settle.

It takes two to make a bargain, that is, to make an exchange, and it often happens that the very things which every one needs can be produced in greatest abundance, but there is no possibility for many to share the abundance, because they have not been so trained as to be able to render a service in exchange; they are only *common* laborers, and at that time and in that place common labor is not wanted.

The material welfare of a people depends, as I have said, not upon one but upon two factors, which are each the necessary complement of the other:

1st. An abundant production.

2d. A quick and equitable distribution.

Bad institutions; the unwarranted interference of statutes with individual rights; the abuse of the power of taxation; the waste of public money; the creation of a class of public spendthrifts who batten upon the labor of a people under the forms of law; ignorance among great masses, and incapacity to adopt the new industrial methods which every day assume new forms, may even in this country, as in all others, interfere with equitable distribution and promote scarcity.

Witness the burden of the standing armies and of the privileges of the few in other countries, to which I shall presently call your attention more directly. True, we are free from these special evils; but let us ask ourselves how long can we bear without moral, mental, and material degradation, the corruption of the civil service, the spoils system in politics, and the abuses of the power of taxation in cities, States, and nation, which are not only a consequence but a most potent cause of civil-service corruption?

But let me return from this digression. The subsistence of each year consists mainly in the distribution of the products of the soil, the forest, and the mine of that special year; perhaps a small part of the product of one, or at most of the two, previous seasons are consumed this year, while a small part of this year's product is saved for the next.

In respect to food, the world as a whole is always within one year of partial starvation. If work ceased, the most prosperous country would be reduced to general starvation in two, or at the utmost three, years.

In respect to clothing and the materials for clothing, the world is always within two or three years of becoming naked.

In respect to shelter, if work should cease, and repairs were not done, the world would be houseless and homeless almost in a single decade.

In respect to the common ways, our roads would soon become impassable if not maintained year by year; our railways would be dangerous and presently useless if the trackmen did not keep up their daily inspection and repair.

In respect even to the great works and factories, it has come to be the conclusion, after long observation, even of the most sagacious, that it is almost useless to plan anything except foundations for a life of more than twenty-five years; and within that term, in almost every department of manufacturing and mechanical work, all the machinery will have been once or twice wholly changed. Hence it follows that each year's life is substantially sustained by each year's work; and this work can never cease, because it is almost wholly spent in sustaining existence; but little can be saved.

It is impossible to prove what portion of each year's product constitutes its cost. I think, from my own observation, fully 90 per cent.

Within the limits of this address I cannot give the data on which this

Digitized by Google

conclusion is based, but I think it will be apparent that at least nine-tenths of the value or substance of our annual product, whatever its amount may be, must be shared among those who constitute the working force, if the following unquestioned facts are considered.

The capital invested in all the departments of manufacture of Massachusetts does not exceed in amount one-half the value of the gross product of manufactured goods; 5 per cent. profit on the goods will therefore yield 10 per cent. per annum on the capital. At this rate all the capital will be supplied and invested which the demand for the goods will warrant.

It therefore follows that wherever an opportunity can be found to pay ninety-five parts in a hundred to workmen and for materials that opportunity will be taken.

The same analysis may be applied to the raw materials used in the factories, and the same rule will serve, except that, as a rule, the proportion of capital necessary for the production of raw materials is less than is needed in the factory; therefore a larger share of the annual product of raw material must be assigned to labor.

In respect to distribution, it may be considered that the range of commissions and of profits in large establishments is from 1 to 5 per cent., and from this small commission all the subsistence of those who do the work is paid.

No great merchant of modern times can save for himself 1 per cent., or one dollar in a hundred, of the value of the goods in which he deals. I therefore think it can be proved that nine parts in every ten of each year's product are divided among those who do the daily work for their daily bread, and that ten parts in a hundred are the utmost that can ever be set aside for the maintenance or increase of capital or of wealth.

Nine-tenths at least of our annual product are therefore spent in its production or in its distribution, and therefore constitute the cost of each year's subsistence.

This estimate is very surely a safe one. If the annual product is greater than I have computed it, then even a larger proportion is consumed and a lesser percentage is saved.

It would be interesting and instructive if census data could be compiled which would give accurately the measure of our annual product in terms of money, and also determine the portion spent for mere subsistence; but it is practically impossible. The difficulties are, first, the home or family consumption of the agricultural population, which never finds a place in our market-reports. Even the ascertained market value of our dairy product is as great or greater than that of the commercial cotton-crop; but who can measure the value of the milk consumed on the farm? Again, cotton, wool, leather, iron, and the like are listed in the census under their own titles, but are duplicated as a part of the value of the manufactured goods.

There is, however, one way of making an approximation to the value of our annual product and its expenditure, and an estimate of our annual savings. We now number about 54,000,000, over one-fourth of whom are adult males of voting age, and it may therefore be assumed that another fourth are adult women. If we assume that the actual subsistence, repairs of dwellings, public expenses, and other annual items of cost, including all the home productions consumed on the farms, would have a value, if all were priced at the market standard of $150 a year *per capita*, or 41 cents a day, then our annual product which is consumed must be priced at $8,100,000,000. This would be $600 a year for each family group of four, aside from savings.

Digitized by Google

I do not think it possible to assume less than 41 cents a day as the cost of subsistence, cost of repairs of dwellings, and proportion of national, State, and municipal taxes, for each member of the nation, men, women, and children included, and also including domestic farm consumption.

If this sum measures in money the actual cost, that is to say, the consumption necessary for each year's work, and if this is 90 per cent. of each year's product, then we have a product of the value of $9,000,000,000, and an annual surplus, used either to maintain or added in part to the wealth and in part to the capital of the country, of $900,000,000.

If the average daily measure of the annual product consumed by each person be a little more, or 45 cents a day, constituting nine-tenths of that day's product, then the total measure of production is 50 cents for each man, woman, and child. This would give 90 cents a day for the value to themselves of the work of the adult men and women who compose one-half the population, and 10 cents over for the maintenance and increase of capital, counting three hundred and sixty-five days to the year. At this rate the annual product of each adult man and woman is measured at $1 a day, or at $365 a year; of which $328.50 is expended for the subsistence, shelter, and taxes of one adult and one child, and $36.50 is set aside for the maintenance and increase of capital. At these rates, our total annual product, if measured in money, would be $9,855,000,000, or, in round figures, $10,000,000,000 worth a year; and the portion set aside for the maintenance and increase of capital 10 per cent., or, in round figures, $1,000,000,000. A large part of this latter measure, more than one-half, must be applied to the maintenance of existing capital; the rest is added to the wealth or to the capital of the country.

In point of fact, the census data, as far as we have them, tend to prove these figures to be substantially correct, especially of the measure of the annual product to be assigned to each one of the working force, the real working force being less than one-half of the population, and the average product somewhat over the measure of $1 a day for the year through, including Sundays, so far as the data are yet published.

It may seem almost appalling to those who are not accustomed to submit to such a narrow measure of comfort to be assured that the total annual subsistence, shelter, and taxes of each man, woman, and child, together with the entire margin for the profit or saving, must come within the measure of what half a dollar a day will buy; yet this must be so, because that is probably the measure in money, at market prices, of all that is produced. We cannot have more than there is, and this is very surely all there is. Even if it be 70 cents a day, would it not then be true that one-tenth part of the people of the world little know how the other nine-tenths live?

The family unit of this country consists practically of four persons, there being one adult male of voting age in each four. At 50 cents *per capita*, as the measure of the total production (including domestic farm consumption), the gross value of each day's average product would be $2; equal to $730 per year for each family. Ten per cent. off for the maintenance and increase of wealth and capital leaves $657 per year net; which would be, under these conditions, the average measure of consumption of each group of four persons, including all taxes, at the retail prices of commodities—that is to say, at the prices which measure the final distribution of all products.

National, State, and municipal taxes divert about 7 per cent. of the computed annual product from the pockets of the producers to those

Digitized by Google

who perform the necessary functions of government; this deduction for taxes leaves a little over $600 a year net to each family of four persons.

This is a large estimate for an average family of four, rather than a small one, and I have erred, if at all, on the liberal side of the estimate, my point being to prove that the average subsistence of each man, woman, and child in this prosperous country must be limited to the measure of what 40 to 50 cents a day will buy.

We must add $1,000,000 worth to the product of each year in order to be able to add only 5 cents' worth per day to the consumption of each person; so close do the footsteps of want press upon the limits of welfare.

Who dares scout the science which, under the name of "*political economy*," treats these vast questions of human welfare, in which a single error or misapplication of the functions of government may cost the very lives of armies of men a century hence?

The abuses of centuries are culminating in Ireland to-day, and the compromise with slavery, to which our ancestors consented, cost the lives of more than half a million men, and imposed upon us the burden of our present debt and our complicated and onerous system of taxation. Slavery was only a form of the organization of labor, a false method of inducing production.

What, then, can we do to make the struggle for life easier? The only answer is, "Give such instruction as will develop brain and hand together, so that the purchasing power of each dollar may be increased. Save the waste of labor and the waste of product. We are the most wasteful nation in the world; and one reason is that even at our present measure of product there is vastly greater abundance here than there is anywhere else.

What margin is there for increase or for saving, do you ask? The answer is plain. Our general methods of agriculture are poor and shiftless; our crops are not one-half what a reasonably good system would bring forth. The potentiality of a single acre of land is still almost an unknown quality. If I were to say to you that, next to the abolition of slavery and the use of the railway and the steamship, the re-discovery of the method of saving green crops—called *ensilage*—was the most important event in its effects on material welfare of the present century, you might suggest that a commission of lunacy should be appointed to examine the condition of my brain. Consider the waste of fencing, because one man cannot trust his neighbor to keep his cattle where they belong. Witness the waste of sheep, because the cur dog is tolerated while the farmer suffers.

Marvelous as the machinery in this great building may be, science has work to do vastly greater than any thing yet accomplished. Almost the only tools yet perfected are the water-wheel and the dynamo-electric machine. Look at that seemingly perfect steam-engine and boiler; it wastes nine-tenths of the fuel with which it is supplied. Examine that costly and clumsy locomotive and heavy train of cars; only one pound in a hundred of the fuel used is actually applied to the movement of the load. Observe that almost self-operating carding-engine, spinning-frame, and loom; are they perfect? Four-fifths of the power is wasted in operating them; and when you have put your cotton fiber into cloth you have lost three-fourths of its original strength by your rough treatment.

Your builders cut up your timber so as to lose or waste one-half its strength; most of your architects plan your buildings so as to assure the most perfect combustion. You make a clumsy effort to distribute your fire loss of nearly a hundred millions a year through insurance

Digitized by Google

companies, and you waste 40 per cent. of your premiums in the mere expense of making the attempt. You cannot even start a horse-car without wasting the knees of your horses by the excessive strain.

I might go on in this line indefinitely, but the greatest waste of all is the waste of food and fuel.

The grain, root, and hay crops of this country weigh over 150,000,000 tons—300,000,000,000 food pounds to be harvested, sorted, distributed, converted into meat, butter, cheese, bread, and the like, in order that each one of us may have our daily ration of about three pounds—a pound each for our breakfast, dinner, and supper.

Seventy million tons of coal are mined and converted. Are we not all aware that half our food is wasted, and perhaps more than half our fuel, especially in cooking?

How shall we save this waste? Must we not save it if each man, woman, and child can earn, on the average, only what 50 cents a day will buy? Try for yourselves what you can get in the little shops on the South Cove or at the North End, where the poor must buy their food, and then you will know why so many suffer want, even in the midst of plenty, for the lack of instruction in the commonest arts of life. Must not our common schools be somewhat common in quality when they qualify their pupils so little in the practical arts of life?

And here let me call your attention to the importance of the smallest fraction saved. In order to do this I must repeat myself. The average charge upon the New York Central and Hudson River Railroad in 1866–'69, inclusive, was 1.9567 cents in gold—say 2 cents per ton per mile. From 1870–'79, inclusive, it was 1.1123 cents. The difference was only .8444, say eighty-five hundredths of a cent per tonp er mile. Yet in the ten years last named this difference saved the consumers of the goods carried over this one line 121,000,000 gold dollars.

The average charge over this line has been again reduced, and was last year only seventy-eight hundredths of a cent per ton per mile.

This line performs one twenty-sixth part only of the railway service in moving merchandise of the United States. If all the other railways have reduced their rates since 1869 only one-half as much as this corporation has reduced theirs—which is far within the fact—the saving on the moving of merchandise in the year 1881, as compared to the rates prevailing from 1866 to 1869, only twelve to fifteen years since, was over $400,000,000. Let us be conservative, and call it only $300,000,000, and then we have a sum more than sufficient to pay the first cost of the 9,400 miles of new railroad which we added to our service in that year.

Eighty-five hundredths of a cent a ton a mile is equal to $8.50 per ton from Chicago to Boston, or less than a dollar on a barrel of flour carried a thousand miles; yet this little fraction, applied only in part to the total traffic of all the railroads of the United States, worked a saving of over $200,000,000 a year for ten years to 1879, inclusive; and at the yet lower rates of 1880 and 1881, as compared to 1866–'69, inclusive, this saving has been, at the very least, $300,000,000 a year, or 33⅓ per cent. of the estimated amount of our possible annual addition to our wealth or capital. It has not been added to capital, however; by far the larger part has gone to the benefit of consumers, and has been saved by them in the work of gaining their subsistence. This is the function of capital in the form of a railroad.

This is a complete example of the thesis which I have presented. These great applications of science save a part of the necessary work, and render the struggle for life far easier.

The figures which prove this proposition are so startling that it is

Digitized by Google

necessary to sustain them by citing the actual facts. In the year 1881 the New York Central and Hudson River Railroad moved 11,591,379 actual tons of merchandise, or 2,646,814,098 tons carried one mile, for which service it received $20,736,750, or seventy-eight hundredths of a cent a ton a mile. The average charge from 1866 to 1869 for the same service (rates reduced to gold) was 1.95 cents per ton per mile (1866 to 1869, inclusive, 10,102,659 tons moved; 1,868,448,179 tons moved one mile; receipts in currency, $50,556,876); difference, 1.17 cents per ton per mile saved on 2,646,814,098 tons, equal to $30,970,000 in the single year 1881.

In the year 1881 the total receipts of the New York Central and Hudson River Railroad for freight constituted 3.76 per cent. of the total freight receipts of all the railroads of the country, or a fraction under one twenty-sixth part of the whole.

If the reduction in the freight charge on other roads, or the saving which has been compassed by the construction of new lines, has been equal to that on this line—1.17 cents per ton per mile—the saving would amount to over $823,000,000 in the single year 1881 upon the traffic of that year.

Mr. H. V. Poor computes the whole traffic of all the railways of the United States, including coal, at not less than 350,000,000 tons, or more than thirty times the quantity carried by the New York Central and Hudson River Railroad.

Let me repeat this proposition: if the construction of new lines and the reduction of charge on old lines has saved consumers one cent and seventeen-hundredths per ton per mile upon the actual traffic of the year 1881, as compared to the charge made for railway service from 1866–'69, inclusive, the difference in the year 1881 amounted to over $80,000,000.

The fortunes which the railway magnates have secured to themselves, and which they are now applying in part to an extension of the railway service by at least 10,000 miles in the year 1882, constitute but a small part of this saving; the greater part has been secured by consumers, and has to that extent reduced the cost of subsistence.

Upon this basis the computation of an actual saving to consumers of $300,000,000, as given in the body of the address, may be considered a very safe and cautious one.

In fact, the effect of the construction and extension of our railway service, and the progress made since the panic of 1873 in the reduction of its cost, almost transcends comprehension; and all computations and forecastings based upon these changes have a visionary aspect even to the most careful student. The gain in this respect more than compensates for the waste of public money and the abuses of the powers of taxation, and thus even retards the progress of economic reform by obscuring the evil effects of excessive taxation.

In this address it is therefore made apparent, on the one hand, that the average measure of comfort which each man, woman, and child can enjoy must come within the substance of what half a dollar a day will buy; while, on the other hand, this analysis of the results of science applied to the construction of railways proves that, after making due allowance for the fluctuations of the seasons and the variation of the crops, the purchasing power of each half dollar has been increased at least 5 per cent., perhaps more, since 1870.

I have computed the present value of the products of the United States, at the place of consumption, at $10,000,000,000, which gives each inhabitant 50 cents' worth a day.

Digitized by Google

The freight earnings of the railroads of the United States in the year 1881 were $551,968,477.

The cost of distribution by rail was, therefore, 5½ per cent. upon the computed value of the product.

At the higher rates of 1866–'69, this charge for railway service might have been $1,350,000,000, which would have been 13½ per cent. upon the computed value of our whole product. If consumers have gained the sum used in the body of this address, $300,000,000, then the purchasing power of each half dollar has been increased 3 per cent. since 1870. If $500,000,000, then 5 per cent. If $825,000,000, then over 8 per cent. Add to this amount saved by railroads the results of the improvement in machinery applied to agriculture, to manufactures, and the mechanic arts; and I think it is safe to repeat what I have elsewhere affirmed, that the aggregate labor of the people of the United States has been made at least one-third more effective by the application of science to the useful arts since the end of our civil war in 1865.

In other words, the purchasing power of each person's daily income of half a dollar has been increased one-third in less than twenty years. How soon will it be doubled? It now costs more to live, because people demand more, spend more, and, on the whole, enjoy more, than they used to, and they also waste more. The wages of factory operatives are double what they were in 1842, and the hours of labor are ten to eleven per day now, as compared to thirteen then. The daughters of New England farmers have found less arduous employment at much higher wages; while the immigrants, who now constitute the great body of the factory operatives, would then have found only the most arduous menial or common labor, could they have then found any place in our body politic.

One of the best definitions of man, as compared to beasts, ever given, is this: "Man is the only animal endowed with progressive desires."

The more there is, the more we spend; the more we have, the more we want. The measure of a sufficient fortune or income is a little more, and thus the world wags on.

And as it is in this matter of the railroad, so is it in all things; the difference between welfare and poverty consists only in knowing how to save a dollar in moving a barrel of flour a thousand miles. It costs to-day only half a dollar to bring a barrel of flour from Chicago to Boston, and a barrel a year is all that each person needs. Now, let me ask you, how much do we lose in not knowing how to make bread—how to use the barrel of flour? How large a factor in the national welfare is in the mere question of household economy?

How much will this fair teach us on that subject? Follow the wheat from the field to the poor man's table, and you will soon prove to yourselves that ignorance of the simplest household arts is a heavier tax than the entire cost of railway service. Is this to the credit of our schools? I will not undervalue in the least the mental instruction of the schools. I would not deny the opportunity for the highest instruction, but if a large portion of the time of the pupils is not spread over a great mass of merely mental rubbish, a great injustice is being done by their critics.

In order that these propositions may be made plain, and the purpose of this address may become more clear, let me ask you to discharge from your minds all idea of money and of price. Money is merely an instrument by which the exchange of services among men is rendered easy. Price, whether applied to things or to services, is but a measure expressed in terms of money. What really happens is this: A small

Digitized by Google

very small, part of the work of each year can be saved in the concrete form called capital; that is to say, in the form of a railway, of a factory, of improvements upon land, or developments of a mine; and when thus saved it is so applied as to increase the production or lessen the work of the next and of ensuing years.

As I have said, I am of opinion that even in this prosperous country not less than nine parts in ten of the total product, on the average, constitute the cost of production, and are consumed in different proportions by those who do the work.

To the workman or workwoman it matters not what the measure in money is by which their wages or earnings are defined. The real question is: How good a house, how large a room, how adequate a supply of food and fuel and clothing can I purchase with that money?

It therefore follows that every application of science to manufacturing industry, to mining, or to agriculture, by which the aggregate of things is increased, while the labor is diminished, tends to increase the quantity of the commodities to be divided among the laborers; and as this increase is progressive year by year the proportion which capital can secure to itself under free contract becomes less, while the proportion which is assigned to labor becomes greater.

The object of this fair is to bring into prominent notice every new application of science by which abundance may be increased, and also to bring to the knowledge of those who seek a new place in which science may be applied the sections of country and the natural resources which are yet undeveloped. It is a great object-lesson in human welfare.

But of what use will this great lesson be if boys and girls and men and women are not qualified to take advantage of the opportunities thus spread before them?

It may happen that, by the application of intelligence and of science on the part of the few, the quantity of things produced has been greatly increased; and yet, in the midst of plenty, sometimes thousands, aye, even hundreds of thousands, of men and women have suffered want. Witness 1873. Why is this? Must it always be so? It may be said, it *ought* not to be—it *need* not be; and yet it probably *will* be so for many years to come.

It may be that those who have lived in foreign lands until they have come to adult years under obstructive laws or systems, and who have not learned how to do any service by which they may gain a part of this abundance except in the commonest of common labor, will be very poor, even here in the midst of plenty.

Hence will follow the continued need, not only of charity which takes the form of giving alms and sustaining life, but of that mental charity also which, even while repressing the outbreaks and disorders which may arise from the presence of those who are not only very poor but very ignorant, will yet palliate and excuse even the evils which it may be necessary to suppress by force.

But if the grand purpose of those who have founded this association can be carried into action—if methods of industrial instruction can be added to the mental training of the schools—if the hand and the head can be developed together—as the children of these immigrants grow up they can be qualified to render such service to their fellow-men that the measure of their earnings or wages shall be ample for their welfare.

It is by such instruction, by such preparation for the need of future

Digitized by Google

generations, that the very causes of want may be almost wholly removed.

Let me illustrate this. Every master manufacturer, every master mechanic, every capitalist who desires to employ others, seeks to hire the man or woman who can make the largest product at the lowest cost. And now I beg to present to you a proposition which is very far-reaching, very subtle, and of very wide application, but which is seldom considered unless attention is almost forced to it. It is this: So long as freedom of contract is not restricted or obstructed by statute-law, so long as laws are enacted only for the enforcement of justice and order, the prevention of crime and punishment of fraud, and the accomplishment of purposes which cannot be worked by individuals, it will be found that high wages or earnings are almost the necessary correlative of low cost of production, and not, as is so commonly assumed, that low cost can only be compassed by way of low wages.

This seems a paradox; yet it is elementary, and it is within the observation of every one of you here present; from your own experience you can prove or disprove this proposition. It simply needs to be borne in mind that the annual profits of capital and the annual wages of labor are both derived alike from the annual product. The more effective the capital in the form of machinery, the less the number of persons required, the higher the wages. The more skill on the part of the persons who operate the machinery, still again the less the number required, and the higher the wages. The more effective the capital, the lesser the proportion which the capitalist will secure in order to make good interest upon his investment. The more adequate the skill, the larger proportion will the laborer attain. The more effective the application both of capital and of labor, the larger both the profit and the share of the laborer. And when this product is converted into terms of money, or what money will buy, the higher the price of wages, and the lower the cost of the production.

It therefore follows that the rate of wages or earnings of the masses of the people who are of necessity engaged in their daily work for their daily bread will be high or low (always assuming an honest specie standard for the money in which the sum of wages is to be expressed):

1st. According to the conditions and resources of the country in which the labor is exerted.

2d. According to the freedom of that country from statues under which the liberty of the individual is restricted.

3d. According to the freedom of that country from the imposition of taxes by which a large portion of the products of labor are diverted from the remuneration either of labor or capital, and are applied to what may be named (for the purposes of this consideration) destructive taxation.

Of the first two conditions I need not speak at length; but I may call your attention to our paramount advantage in respect to the third.

There are two kinds of work to which the proceeds of taxes are, or may be, applied:

1st. Constructive work which the municipality, the State, or the nation can perform better than the individual, such as making of common highways, the maintenance of common schools, the postal service, and some other simple functions distinct from the administration of justice or other administrative functions of government.

In this country even the support of the army may be included in the constructive work of government, because it is our good fortune to need

Digitized by Google

an army only to serve as a border police, and for the protection of settlers engaged in increasing the general product.

But if we compare our condition with that of those states of Europe which are called civilized, we find a marked difference. In such states, for various reasons, a very large proportion of the annual product of labor is taken from the people in the form of taxes, and is applied either to sustain special privileges, or merely to the destructive purposes of war.

I may cite to you the comparison between this country and France and Germany considered together. The long-continued error in regard to the true function of commerce, which has dominated the mental conceptions of those who assume to govern those great states—to wit, "that, in all commerce, what one nation gains another must lose"—has kept those two states apart more than any prejudice of race or difference of religion; but from all these causes combined, namely, industrial prejudice, hatred of race, and the perversion of the religious idea, each of these nations finds it necessary to protect itself against the other and against all the rest, by maintaining standing armies in camp and barracks, which to-day (without consideration of reserves, but including those who are engaged in merely preparing material for war) number over one million men out of a population of eighty millions.

Our proportion to-day, if we were obliged or chose to maintain a standing army, in ratio to our present population of about fifty-four millions, would be seven hundred thousand men; more than one in twenty of all the adult males of voting age within the limits of the country would be withdrawn from their productive work, whereby the quantity of things to be divided between labor and capital, from each year's annual product, would be so much diminished.

Yet more: one more man in every nineteen of those remaining would be forced to labor in order to pay the taxes necessary to sustain the seven hundred thousand idle men gathered together in camp and barracks waiting for the work of destruction.

Let me prove this. This army would be, in its organization and in the persons who compose it, like unto the great industrial army engaged in our greatest works. The officers of the armies of Germany and of France must be men of ability, equal but not superior to those who lead the industrial armies of this country—equal in capacity but how inferior in purpose, to the men who build and control the railroads and the iron works, manage the factories, bring order and system into action, and direct the productive energy of the people!

The soldiers composing the destructive armies of France and Germany are in the prime of life, capable of exerting the maximum force ever developed by them. They would be like unto those who constitute the working force upon our new railroads and in our mines and factories; and seven hundred thousand, which would be our proportion did we emulate those nations in the work of destruction, would outnumber the whole force of adult males who are to-day engaged in building railroads and in all the iron mines, iron works, and all the textile factories of the United States combined.

This minus quantity, this reduction of product, this scarcity which is enforced upon these nations of Europe by their armies, may be measured by the construction of all our new railroads, and by the addition to our annual product of all the product of our iron mines and iron and steel works, and all our textile factories combined, to which the labor of adult men is applied (omitting the product of women and children) in these United States.

Digitized by Google

And yet more: the cost of these great European armies of destruction, levied in the taxes and paid by those who are permitted to remain in the work of production, is more than equal to the sum of all the wages earned in this country by all the iron-miners, all the iron-workers, and all the men, women, and children in our textile factories, put together.

Must not wages or earnings in this land be higher than in any other land thus burdened? Must not the quantity of things to be divided—which constitute the true earnings—be so much greater, and the cost of making so much less?

If you apply these rules to your own experience, each one of you, you will find how true they are. The last man or woman whom you desire to discharge from the works which you control, when the times are hard, is the one earning the most for himself or for herself; the first to be discharged is the unfortunate one whose hand and brain have not been developed together, and who can, in hard times, no longer render you a service, even if paid a sum barely sufficient to support life. Even if the conditions become such, as they did from 1873 to 1879, that skilled mechanics and artisans find no demand for all their work, then they, by their very training, have been made competent to change the method of their work, and in new places, under new conditions, they assure welfare for themselves.

And as it is with persons, so it is with classes, with States, with countries. Where the conditions are best, where the natural resources are the greatest, if no obstruction is interposed by statute law, there will be found the most skillful persons, the best machinery, and the largest product. If, under free conditions, you would seek to find the place in which the very lowest labor cost of any given thing is compassed, you make take as your guide the measure of the highest wages earned by those who do the work.

Where earnings are the greatest—earnings being but a share of a large product ensuing from favorable conditions, ample capital, and superior skill—you will most surely find the lowest cost, always provided that in that place justice and equal rights are assured, that the government is honest and stable, and that the taxes are not diverted from public uses to private ends.

This rule will not apply to hand-work or handicraft. The fine silks of Lyons woven only on a hand-loom, the laces of Brussels, the fine carving of Switzerland, the Tuscan jewelry, the production of tea in China, the spade-labor of Belgium, and the like, can only be conducted on the lowest rates of earnings, barely sufficient to support life; and yet the fabric may be of extremely high cost, because of the amount of labor, or the arduous conditions under which it is conducted.

There are yet many occupations which we cannot afford to carry on in this country so long as we can procure the product in some other way, because the amount of labor is so great, or the necessary conditions are still so bad.

We have a continent yet to subdue, in which we can choose our work.

Glance your eye over this vast collection of the potentiality of our Southern land. Witness the profusion of everything needed to sustain life in comfort. Observe the coal and iron lying close together upon the very surface of the earth—not separated, as they are farther north, by great intervening mountains of sandstone, but the coal, iron, and limestone lying one against the other at the headwaters of great navi-

Digitized by Google

gable rivers, where they can be converted to the use of man with the least expenditure of human labor.

Glance over this great exhibition of timber which has been so wasted, even in our Northern States. Witness the variety of the products of agriculture which can be brought to the service of man amid scenes of utmost beauty; and, so far as a very large section of the Southern country is concerned, under conditions unequaled on this continent for health and salubrity. Why have they not been developed? Because labor was not honored, and he who exerted it could not enjoy the earnings.

Why are they being developed now so rapidly? Because the South to-day is even in advance of the North in the effort which she is making to promote the instruction of the hand and the head together, in order that she may avail herself of her great advantage, and overcome the malignant effects of a century of slavery, and of misgovernment and lack of education of almost every kind.

We welcome her competition. We will emulate her in her progress. Each needs what the other can produce; and in the exchange of service between the States, free and unrestricted as it is and as it must remain under the beneficent provisions of our Constitution, each section will gain under the working of that law which I presented at the beginning of this address—that all true commerce among men, whether between states or nations, is but the exchange of service by which both are made more prosperous, and both are rendered more capable of sustaining their own population in comfort and well-being.

It will be apparent, if this principle be admitted—namely, that where mental capacity and manual dexterity are combined, and are applied under the best conditions to the direction of machinery, there will be found the largest production, the highest wages, and the safest and most adequate remuneration of capital; and, also, if it be admitted that the production of the joint work of labor and capital would be most completely enjoyed where there is the greatest freedom from what I have called destructive taxation, it follows that this country has the advantage over all others—

1st. In the variety and extent of its natural resources, capable of being worked with the least exertion or effort.

2d. In the fact that in some sections of the country, and presently in all, the systems of common education, even if still imperfect, yet on the whole do qualify pupils to apply the greatest versatility and to combine mental and manual capacity at least somewhat more completely than in most other countries.

3d. In our absolute and paramount advantage in being free from destructive taxation.

From all these advantages, it follows that both the wages of labor and the remuneration of capital must be greater in proportion to the effort used than in any other section of the world's surface; and these facts themselves prove that the cost of production—in other words, the labor expended in productive service—is less in ratio to product than it can be anywhere else. Therefore our high wages are but the sign and proof of low cost, and we may command the commerce of the world, if we so elect.

We may exchange the product of a single day's work of machinery, directed by one man, for fifty or one hundred days' product of those who are still obliged to follow pursuits to which either their ignorance, their backwardness in the use of machinery, or want of opportunity, prevents the application of their labor under favorable conditions.

Digitized by Google

We may obtain the product of perhaps fifty days' labor in the coffee plantations of South America or of Java; or one hundred days' labor in the tea-fields or mulberry-groves of China; or twenty days' labor in the sugar plantations of Cuba, or the hemp-fields of Manila; or ten days' labor in the wool-growing sections of South America and Australia, for the work of a single man or woman directing machinery operated by steam or water power. By means of such exchange, we can increase the quantity of things to be divided among our own people, while conferring a benefit even upon those with whom we exchange, who without our demand could perhaps make no disposition even of the surplus of their hand-work; thus both parties are vastly benefited, and commerce becomes the measure of intelligence, of civilization, and of wealth.

Many attempts have been made to compute the actual wealth of a state or nation statistically; but such figures can give only approximate estimates at a given time, since progress is much greater by way of the destruction of what has been wealth, than by its accumulation.

The substitution of simple for complex machinery, by means of which greater production is assured, coupled with the application of capital of less money value, is an instance.

In this address I have assumed a thousand million dollars' worth of product set aside for the maintenance and increase of capital, or 10 per cent. upon an approximately accurate estimate of an annual product of ten thousand million dollars' worth of substance.

If 5 per cent. had been set aside for the maintenance of capital previously accumulated, and 5 per cent. of our annual product had been added each year to the wealth of capital of the country, the effect would have been the same as that of money put at compound interest at 5 per cent. per annum. There is nothing to show for any such accumulation.

Massachusetts possessed in 1875, according to Carroll D. Wright's most admirable and accurate census, confirmed by the tax commissioner's reports, property aside from the value of land amounting to only $600 per head of the population, which sum measures a saving equal to only two or three years' production of the same State in the same year; and there is probably no state in the world in which the annual product per head is larger, being not less than $200, probably about $300 per year *per capita*.

Even if 10 per cent., or $1,000,000,000 worth, can be set aside, above the mere consumption or cost of production of the people of the United States, it is manifest that much more than one-half of this substance must be used merely for maintenance of capital, much less than one-half for additions to wealth or capital.

These considerations may be deemed somewhat theoretic, but they become of the greatest importance when considered with reference to national and municipal taxation. The burden of a tax is to be considered not so much with reference to its ratio to the gross income of each state or person, as it is with reference to the possible savings of each person or to the margin of profit upon any given business.

The writer has not himself compiled the figures of national, State, and municipal taxes, but is assured upon the latest data compiled in the Census Department that the total amount of all such taxes at the present time is $700,000,000 a year.

This sum is important, even if it is only considered in ratio to a probable product of $10,000,000,000, on which it is 7 per cent.; yet more important in its ratio to probable saving of $1,000,000,000, on which it is 70 per cent.; yet more important in its ratio to the probable actual addition to our wealth, even if that amounts to $500,000,000, on which

Digitized by Google

it is 140 per cent.; most important of all in its ratio to the annual average production of each adult man and woman, which I have computed at probably, hardly possibly, over $1 a day, on which the proportion of all taxation is 7 per cent., or 7 cents of every dollar earned.

Well for us that our taxes are not destructively expended; well for us, indeed, that the avails of taxation are on the whole productively expended, and that not over 25 per cent. is, in the long run, wasted in national or municipal jobs.

In view of the fact that all taxes upon commodities are added to the cost, and are paid by consumers in the ratio of their consumption, the abatement of the excess of national revenue becomes a question of paramount interest.

Such taxes take from the many what they may actually need for a bare subsistence; they must fall with greatest hardship on those whose earnings for their families are less then the average dollar a day to each adult man and woman; and where our present excess of national taxation may be equal to only 15 per cent. of the possible savings of the whole people, it may take 100 per cent., even the little all of what the poor might save.

The most profound students of the social order of Europe have come to the conclusion that national debts and chronic war taxes are the prime cause of the pauperism of great masses of the people.

It is true that this surplus revenue is not lost to the country when it is applied to the payment of its debts; but it may be misspent in extravagant expenditures, and then it becomes a loss; and even in the payment of debts it takes a part of this year's product from one, and transfers it to another in payment for service in the long-distant past. It is useless to palter with such problems as this; our public men must either master them, or be mastered by them. They are the great political issues of the future, before which all the dead issues of the past will fade away. The question to be solved at present is not whether $100,000,000 of excessive taxation—one-seventh part of the whole burden—shall be removed, or not; it is only in what way shall the relief be given. The evil of excessive taxation is not simply in the imposition of taxes, but also in the method of removal. They may so alter the direction of industry as to make even their removal work temporary injury to a portion of the people.

Industrial reconstruction (especially in the South), technical education, tax reform, honest administration, a strict limitation of the functoins of government and personal liberty—such are the subjects which the object-lessons in this great fair bring into view.

I have called your attention to this need of combining the instruction of the brain and of the hand together.

At the other end of this broad avenue stand the buildings of the Massachusetts Institute of Technology, where the higher branches of technical education, with manual instruction in the mechanic arts, have been combined and developed to the extent of the means placed at our disposal.

That institution has been founded and sustained in part by the very men who belong to this Manufacturers' and Mechanics' Institute. That institution is yet to be sustained by many of you who are here present, when you have found out its merits, by contributions from your ample capital, which you will make when you have learned that it is the best possible investment.

Each of these institutions is the complement of the other. *Here* you have the visible results of science applied to useful arts, the tangible

Digitized by Google

evidences of the opportunity for yet grander enterprise. *There* you have the opening in which you can aid in the development of this great work of instructing the brain and hand together. Each of these institutions is but the beginning; they may serve as examples which must be followed in New England even if nowhere else.

If we are to maintain our relative position in competition with our sister States, we can only do so by compensating for our lack of natural resources by the perfection of our methods of instruction in the application of science to the useful arts. In sustaining these institutions, you can justify yourselves for the possession of more than 50 cents a day for each member of your families, by the investment which you may make of your surplus wealth.

May we not share in teaching the teachers of the new gospel of peace and plenty, which it is the mission of this country, first among all nations, to preach to the down-trodden of the world? To do unto others as you would be done by, is to help others to help themselves. To give alms may be dangerous, and at best can only palliate the evils and wrongs of society. To relieve want by State charity may only promote pauperism. Yet give alms we must, and sustain charitable institutions we are compelled to, because we are subjected to the incoming of the poor and incapable of other lands. But from our children and our children's children even unto the third and fourth generation, we may remove the doom of the ancient law, and we may assure them the reward of the faithful steward, by developing hand and head together in their application to useful service.

## WHAT FREE TRADE MEANS.

The CHAIRMAN. I have also received a treatise of about 80 pages by Thomas Sargent Fernon, entitled "Free trade means serf pay and famine fare," which he desires to be considered by the committee as a statement of his views upon the subject.

### *FREE TRADE MEANS SERF PAY AND FAMINE FARE.*

AMERICAN CITIZEN WORKMEN, LOOK TO CONGRESS AS YOU LOOK FOR DINNER!

LESSONS.—A protective tariff in the United States of North America is a quarantine agains infection, importable in competitive foreign manufactures. The sole emblem of equality extant in the world, available among men, is the ballot in the American Union, where every citizen is an elector, and every ballot according to the law counts one, whether voted by a poor man or a millionaire. Citizens and subjects are on high and low levels, with obstructions between, like Lakes Erie and Ontario, divided by Niagara Falls and the Whirlpool. Free trade will reduce the wages or give the work of American citizens to subjects of the British crown, and so lock down the citizen to the bottom level of the subject, whilst it cannot lock up the subject to the summit-level of the citizen; because the British Dynasty of princesses and princes, and nobility in seriated ranks, constitute an aristocracy of ruling classes who plead for free trade in British goods in American markets, thereby to give British tenants employment to earn wages to pay rent to proprietors of hereditary estates and titles; but who same time deny free trade in political rights to the mass of British population, on whose industry the monarchy is built.

BY THOMAS SARGENT FERNON,

*Author of "No Dynasty in North America," &c.*

## I.—THE UNITED STATES AND GREAT BRITAIN.

The foremost question in American politics is, Shall the citizen workman of America forego his birthright for the support of the subject laborer in Europe? The answer of the ballot-armed elector is, No; emphatically no. And why?

The advent of the iron man, moved by steam power, and its versatile capacity, shown in transportation, agriculture, manufactures, and the mechanic arts, admonishes the American citizen workman that, if he expects to keep pace with progress, and continue in confraternity with invention and improvement, thus and thereby to realize and enjoy advantage and benefit through shortened hours of labor and additional and prolonged opportunities for intellectual culture and physical rest, he must oppose and combat the heterodox plea which British economists and their agents, attorneys, and imitators nominate free trade, and prescribe for the American Republic, which is in health, as if it were a patient under treatment; although, in truth, Great Britain meantime derives more revenue per head of population from duties of customs on foreign imports than is collected into the Treasury of the United States from its tariff laws, which move the ire of the British politician and incite the amateur publicist to prate of reciprocity in trade.

True, the free list of Great Britain is now long, and its dutiable list is short; but that is because Great Britain throughout the last fifty and odd years has intermittently remodeled its tariff according to its interest at the time and the prospect ahead; not, however, in the light of reciprocity, but of profit, taking care while adding to its free list that the aggregate revenue from "customs" shall not undergo material reduction as an item in the income schedule of the United Kingdom.

For the year ended June 30, 1879, the United States and Great Britain derived from "customs" these sums, respectively, to wit:

*Year ending June* 30, 1879.

| Countries. | Amount. | Population. | Average per head. |
|---|---|---|---|
| The United States | $137, 250, 047 | 48, 000, 000 | $2 $\frac{85}{100}$ |
| Great Britain and Ireland | 100, 080, 000 | 34, 000, 000 | 2 $\frac{94}{100}$ |

| Countries. | Total public revenue. | Population. | Taxation per head. |
|---|---|---|---|
| The United States | $273, 827, 184 | 48, 000, 000 | 5 $\frac{70}{100}$ |
| Great Britain and Ireland | 393, 402, 770 | 34, 000, 000 | 11 $\frac{57}{100}$. |

Digitized by Google

*National debt.*

| Countries. | Principal. | Population. | Average per head. |
|---|---|---|---|
| The United States, January 1, 1880 | $2,195,090,455 | 48,000,000 | 45 78/100 |
| Great Britain and Ireland, September 1, 1879 | 3,890,394,200 | 34,000,000 | 114 44/100 |

The Government of the United States has a domain comprising 1,000,000,000 acres of public land, eight-tenths of it in Territories destined, most of them, soon to become States, and important States too, particularly Dakota and Montana, which, we trust, will not be partitioned, but will both be admitted, when entitled to admission into the Union as States, with their present boundaries, as counterweights to Texas; for it is important to have States conspicuous for size, resources, and inhabitants scattered through the Union.

Great Britain, on the contrary, within boundaries circumscribed by nature, has a redundant population which is oppressed by land laws that tend to a diminution of proprietors and an increase of tenants, and is also forced to endure hardships and hunger to support a political superstructure too big for its base, in a costly dynasty and a proud nobility and gentry.

It is a faulty bridge that requires props to keep it in place on its piers. And a steeple that inclines from the perpendicular, because of inequalities at its foundation, is taken down and rebuilt according to a plan adjusted to the supporting power of its site. England has too many long-bow archers, not enough architecture of the American and French schools; it grows too many Micawber politicians who are ever waiting for "something to turn up" in the United States, wherefrom British manufacturers may gather profit; and its typical free-trade economist, merged in a colporteur, comes over here not to "consider the beam which is in his own eye," but to "behold the mote which is in his brother's eye," through glasses which magnify the American tariff into a cause of obscuration of the golden glow of the American market to spectatorial England; albeit the interposition of the iron-clad rover Alabama, between Washington and London, caused the obscuration of the light of ocean commerce in the United States; but this last-named eclipse was phenomenal, according to the political astronomy of the British Government during the rebellion, and, barring the Geneva arbitration halt, has since been dismissed from consideration, like the last eclipse of the sun caused by the interposition of the moon between the earth and its source of light.

On "two commandments hang all the law and the prophets."

In two words, "British interests," is the Englishman's creed, as if Christianity has no interests which its professors are bound to weigh and watch, and other nations have no rights or longings, save where they do not antagonize "British interests," considered paramount. Such selfishness may be an element in the administration of Satan, the successful tempter of Englishmen who yearn for dominion, but God will smite it, nevertheless. In European Turkey the Briton is as anti-Christian as the modern Islamite, because the Briton contravenes his religious professions in his political practices, whereas the Turk in his adversity is not a propagandist but a stoic, with a fast hold on Mahomet's promise of a pass to Paradise. Moreover, the Briton is eager and lustful for new acquisitions, whilst the Turk, from a defiant aggressor in Europe, is now reduced to a tolerated trespasser occupied

Digitized by Google

with his own defense, and with misgivings of his fate, which the Berlin Congress of June–July, 1878, adjourned, but did not change. And if the coffin of the Turk's prophet was suspended between earth and heaven at Medina, the Turk himself is in suspense in Constantinople, where there are diplomatic headsmen and garroters in ambassadors from capitals south of St. Petersburg, sent to watch the "sick man" as impecunious heirs watch the ebbing life of a landholder whose possessions they expect to get a slice of after his decease. The Russian was the Turk's adversary in war waged for cause, and won in battle what was confirmed by treaty; but the Berlin congress made a gift to Austria of two of the provinces of Turkey, Bosnia and Herzegovina, which it had not a shadow of a right to give away. Hence, in time of peace, after a conflict, Russia and Turkey can affiliate, because both have to be alert, one against the jealousy, the other against the covetousness, of spectator powers.

How wars begun will end is a question not answerable beforehand; for a campaign may have a successful military issue, and grave political consequences ensue, contrary to the expectations and opposite the wishes of both belligerents. The German campaign to Paris in 1870 was a military success, but its political consequences reimbursed France in the destruction of the empire of Napoleon III, and the erection of the third republic on its site. True, France lost territory and paid indemnity to its adversary; but France meantime gained a free Government under which it has since prospered beyond example in Europe, and to the amazement of crowned heads and imperial chancellors. And now France, homogeneous France, the land of trials and of triumphs, is again a power in Europe, mighty in men and means, to play on option a conspicuous republican part in the European drama. And surely this end of the war of 1870–'71 was not foreseen in its beginning, and is not what the vanquished Napoleon III nor the victorious William I anticipated or desired, either for Germany or France. The achieved independence of the United States inspired France with republican ideas; and the achieved independence of France in its government of the people over the last dynasty extinguished, will cause subjects in Great Britain and on the continent to consider the advantages of citizenship and the superiority of a republic over a dynastic Government.

## II.—THE FASHION LINE DRAWN AT TRADE.

In a republic free trade is an infection to be kept out by protection, because, as in engineering, from the datum line of the tide level, which is uniformly distant from the earth's center, all elevations and altitudes are measured, so in the republic of the United States all citizens stand on a common level of equal rights "to life, liberty, and the pursuit of happiness," from which horizontal plane all advancements, promotions, and merits are calculated and credited in the review of a lifetime; and hence in biographical annals there are as many statures and sizes of men as among trees planted apart, whereof two never grow precisely alike.

But in a kingdom or empire where population is divided into nobles and commons there are castes in classes; and law, usage, and fashion combine to exalt the title-wearer who is promiscuous in what he tastes with his palate and devours with his teeth, and fastidious in what he greets with his tongue and touches with his fingers, over the bread-winners in the organized army and navy of trade, which operate the works of the treaty-bound world and supply society with its necessities and comforts.

Digitized by Google

True, etiquette is not an enactment of Parliament, though it might as well be, since a society regulation established at Windsor Castle is formulated thence and made the fashion among the nobility and gentry, and others "in trade" of equal ability and merit with their patrons and preceptors; and so Britons have castes between titles and trades as actual and real as if described in the civil code. To be sure, people everywhere gravitate into groups and circles, and friendships are formed according to attainments, means, opportunity, and taste. But this is a matter between the parties for their own regulation, where there are no patented birthrights, no aristocracy of orders inherited and transmitted in perpetuity in established grades, and where merit, elsewhere an element in evolution, is merely an incident in a link of chain. A citizen must be leavened with intelligence or he cannot rise; a scion of nobility may be born a dunce and die a duke, for the law promotes him, in the wake of death, to fill vacancies and inherit fortune; but the citizen can mount the political ladder to its top, there enjoy the highest honor in his country, thence descend from office again a citizen, and die a benefactor with an exemplary name. How different this from the machine-made fame of a prince born to figure-head a court in a King's crown.

And that Windsor Castle is on the summit of a social fabric of levels and inclined planes, like the abandoned Portage Railway across the Allegheny Mountain in Pennsylvania, is obvious in the exclusiveness arrogated on wedding days in the royal family; as when, for illustration, at the marriage of Prince Arthur, Duke of Connaught, to the Princess Margaret of Prussia, on the 13th of March, 1879, the invitations issued to representatives of foreign Governments at the Court of St. James, London, were so restricted by a general rule that no cause for offense could be alleged on technical grounds, because several ambassadors were counted out in the proceeding. To be sure, an omitted ambassador might have said, "Give me my passport; I will go home;" and that course would have provoked discussion and roused indignation against the trade bar; but in the case mentioned the rule applied limited the invited guests to blood relations, and excluded more than one minister from powers of the first rank.

But when it is considered that there are on the earth 1,400,000,000 inhabitants, under a hundred Governments, of which only sixteen contain ten million or more inhabitants, and ten which contain between five and ten million inhabitants, making but twenty-six Governments with a population ranging from five million upwards, it is not difficult to conceive how an order might be framed for the limitation of invitations to a celebration or special company at Windsor Castle, to exclude a few cases under a general rule.

After royalty shall have passed away off the face of the earth, the dogma that dynastic personages reigned by "divine right" will be deemed an imposition kindred in wickedness to witchcraft—a delusion that, according to Barrington's estimate, caused thirty thousand judicial murders in England in two hundred years, prior to 1736. Judicial murders for witchcraft were also committed in the New England colonies.

If God were to found a household on the earth—and we say this not in irreverence—he surely would not organize it out of the reigning families of Europe, who are in no wise abler nor better than their subjects. The chosen apostles of Christ were not potentates, nor courtiers, nor special pleaders, but humble men of practical wisdom and personal worth, save one among the twelve; so that of par only 8⅓ per cent. were spurious to 91⅔ per cent. genuine.

Digitized by Google

In the United States, the citizen, elevated into Chief Magistrate, serves out his term of office and then returns back again to private life, having devoted himself to his country to the best of his ability (which is the most that mortal can do), and so performed his part in a conspicuous character in the drama of government. He makes the round, as water evaporated out of the sea into the air is borne inland on the wind, and there and thence descends to fructify the ground, in drops of dew or rain, and flows back again down rivulets and rivers to the ocean, to commingle in the movements of the tides.

Great Britain is not unlike a compartment ship that draws too much water to float across the bars and shoals which obstruct channels between great cities and the deep sea, or a tree with a small radius of roots and a large circumference of branches, and which, when a blast from a colony resolved on independence shall bend it, trunk and bough, is sure to break at a crotch and lose a limb; or a tower widened upward from its base, heedless of gravitation, to make room on its top for observations to estimate the specie value of the silver beams borrowed (by Luna the celestial to loan to her terrestrial majesty's subjects) from the bullionist of solar bars, whose rays bring day from a gold disk outside of of Her Majesty's jurisdiction, though not out of sight from Her Majesty's dominions.

In sooth, to make a show of assets in its empire balance-sheet, Great Britain would fain construe romance into a commodity through assessment of a silver value on beams from the moon and a gold value on rays from the sun, and make levy on the things supposititiously gilded with precious metal from the sky, did it not fear that, in such a seizure of candle-power in illuminated air, its—

> Vaulting ambition might o'erleap itself
> And fall on the other side.

### III.—GRADUATED KING-CRAFTINESS—SEA-LEVEL CITIZENSHIP.

Great Britain increases its purchases in foreign countries where, meantime, its sales diminish, because the tendency among nations is to caution in the creation of debt and to home manufacture of indigenous productions, the raw materials of commerce into commodities for domestic use.

This manifest progress in the utilization of native resources with home machinery and labor bodes no good to Great Britain, which is more dependent on foreign trade than any other nation; for it organized its manufactures on a scale adjusted not to the capacity of its own subjects for consumption, but on the supposition that its free-trade juggle would cozen other nations into prolonged content as "hewers of wood and drawers of water;" and that the profits, premiums, and prizes in international trade would continue to enrich British manufacturers, and distribute wealth in rent, royalty, and interest, paid to hereditary and patented nobles who hold the titles to the realty of the kingdom, through the Crown, and monopolize the luxuries and honors.

Great Britain, in truth, has grown into disproportion; its breadth of girth between its shoulders and its hips has made its body too weighty and unwieldy for its knees, which are no stonger than of yore, though the load on them has been made heavier in recent years.

Thus time reverses some things and so changes others that the face of the political world varies in expression like the countenance of an actor in tragedy or farce, for there are many phases of political and military weather in the affairs of cabinet and camp.

Not long ago, in Cincinnati, a lion sprang upon the back of a donkey,

Digitized by Google

when the party attacked put its assailant *hors de combat*, with its teeth and heels, and in the arena proved itself the better four-legged gladiator.

The domestic animal overcame the "king of beasts" with the force latent in its extremities, and the "roar" of the lion was a waste of wind in the combat. The donkey had not heard how Satan in a lion's skin goes prowling around "seeking whom he may devour," nor how the Briton in a lion's skin, or its effigy in scarlet cloth, goes roving around among savages, unused to fire-arms, especially of modern make, seeking whom he may annex.

The lower animal donkey knew that it had been assailed, and that sufficed to rouse the law implanted in its being for self-preservation. And if the higher animal man, where robbed of his birthright as the heir of the Creator resident in heaven to a share equal to any of his sublunary fellows, in the opportunities for advancement incidental to human life, according as the outlook is from a belfry or a basement, would put himself on the law in his reason and the strength in his arm, jointly available for the vindication of his rights, and stand up like the lion rampant on a shield, the lion *couchant* would not effigy his situation in an escutcheon nor on a ship's stern.

The web of royal fiction, woven by diplomatic spiders, was cut with the sword of Cromwell, and afterwards by Napoleon I, who made pedestals of thrones and puppets of kings; and which web, though magnified from a spider's thread into imitation wire ropes, was swept out of the Tuileries September 4, 1870, with a town-meeting resolution broom, when the Republic of France, since confirmed by the ballot, succeeded the Empire of Napoleon III, the last of the crowned Bonapartes.

And as the sword succumbed to the ballot in France, which is now reaping the fruits of the destruction of the Bastile July 14, 1789, so will the sword succumb to the ballot in the British home islands, when the Washington and the Jefferson in the future shall appear to the scribes (the interviewers) and the people, who are already educated and ripe for a Fourth of July of their own, with the modern improvements in political architecture.

God speed the republic in Great Britain and Ireland, and hasten the departure of princes out of Europe, from the longitude of Rome and Berlin, and the capitals west thereof, leaving it to time to leaven the East and bake it into autonomic beads for the republican rosary which the world will wear around its neck, before it can be put in order for the millennium.

The supreme law is a written constitution; the supreme power is "the will of the people," expressed at the polls and in the national Congress and State legislatures.

Between citizens of the United States and subjects of Great Britain, bonded to hereditary rulers, an aristocracy, not of brain but of birth, there is a demarkation which the Atlantic Ocean represents and resembles. And reciprocity in free trade would take from the citizen and give to the subject, and yet not raise up the latter to the cut-down level of the former, for the reason that British institutions are storied one above another in an edifice which has vaults under its pavements and skylights in its roof; a kingdom containing an implexed series of inhabitants in succession, like creditors and stockholders of a debt-burdened corporation; the former secured, some by a first lien, others by a second, third, or still later lien, others again holding bills payable without collaterals, the stockholders coming in last, and only entitled to a dividend if suf-

Digitized by Google

ficient surplus profit remain, after payment of interest on all debts outstanding.

The American citizen stands upon fast land above high-water mark, where his footing is secure, his prospect without a cloud to darken the horizon; the subject stands on low ground, behind a bank made to keep out the water, and where a break or a washover would beset him with discomfort if not danger; for where there was chaos once, "chaos may come again," and remembering how long the "Dark Ages" covered Europe, and how tenacious a dynasty is of power in its grasp—who can foretell the earthquake that shall shake thrones and bury the devices which have so long withheld from the masses, rights normal in human nature?

"Excelsior!" is the word for those at the base who look up the mountain; those at the top who witness the ascent must relinquish their feudalistic prerogatives and greet the vanguard of progress as fellow-members of a common fraternity, or else escape down the other side of the mountain and flee into the desert, for the wrath that will follow them will be lava-like.

## IV.—WHEN THE TITLE OF BARONET WAS CREATED AND HOW IT WAS SOLD.

James I, who, as "King of Great Britain," united the two crowns of England and Scotland, ascended the throne March 24, 1603. To replenish his treasury he created a new hereditary title, that of Baronet (which is below a Baron and above a Knight), in May, 1611; "the price of a baronetcy, including fees, was about £1,200" ($6,000). The King's patent declared that the order was instituted to raise revenue for the plantation of Ulster, whereas Lord Treasurer Salisbury said the object was "to put money in the purse."

Charles I sold baronetcies in Scotland to provide funds for the plantation of Nova Scotia. This royal personage "stipulated that the number of baronetcies should under no circumstances exceed two hundred;" but he himself had created two hundred and fifty-three, when he was beheaded by Parliament, January 30, 1649.

The London *Pall Mall Gazette*, in August, 1877, published an article on "English Baronetage," in which its writer says:

"Excluding Scotch and Irish baronetcies, * * * no fewer than 1,058 baronetcies had been created when George III came to the throne."

This battalion of manufactured gentry was patented in these proportions, to wit:

| | | | |
|---|---|---|---|
| By James I | 205 | By William III | 37 |
| By Charles I | 253 | By Queen Anne | 27 |
| By Charles II | 426 | By George I | 42 |
| By James II | 20 | By George II | 48 |
| Total, as in extract quoted | | | 1,058 |

"By far the greater number of baronets who are not also peers bear titles not older than the reign of George III, who created over 300 of them. Of those created by George IV there are 47; by William IV, 47; and by the Queen [Victoria], 83."

In 1879 there were in the kingdom, 577 peers and 865 baronets.

There was an interregnum in the dynasty, during the Commonwealth, from the beheading of Charles I, January 30, 1649, to the restoration of the monarchy under Charles II, who ascended the throne May 29, 1660.

Digitized by Google

The court of Charles II is described by Thomas Babington Macaulay, in his History of England, in these words:

"Whitehall, when he dwelt there, was the focus of political intrigue and of fashionable gayety. Half the jobbing and half the flirting of the metropolis went on under his roof. Whoever could make himself agreeable to the prince, or could secure the good offices of the mistress, might hope to rise in the world without rendering any service to the Government, without being even known by sight to any minister of state. This courtier got a frigate, and that a company; a third, the pardon of a rich offender; a fourth, a lease of crown land on easy terms. If the King notified his pleasure that a briefless lawyer should be made a judge, or that a libertine baronet should be made a peer, the gravest counselors, after a little murmuring, submitted."

How many hereditary title-wearers there are in the United Kingdom of Great Britain and Ireland to-day, in the five orders of nobility above baronet, and what their income is, derived from rent, much of it from rent of land for which their ancestors paid no consideration, is a question adjourned for a coming deliverance to solve on a platform of citizenship, to which the titled legions will be invited to step down to surrender their patents, and the untitled millions will be asked to step up into possession of their restored rights.

Among the later baronets created in England is Sir Morton Peto, who built a railroad in the Crimea, in 1855, for the allies, from Balaklava to the camp before Sebastopol, and in 1866 negotiated the lease of the Catawissa Railroad for account of the Atlantic and Great Western Railway Company; and Sir Edwin W. Watkin and Sir Henry W. Tyler, both of record in the annals of the Canada Grand Trunk and New York, Lake Erie and Western (formerly Erie) Railway Companies. Thus out of the railway ranks were taken three of Her Majesty's subjects to recruit the gallery of Windsor Castle's auditorium, which has court circles with social barriers between, like tiers in an opera house, with the dukes in the stage boxes, the marquises in the parquette seats, the earls in the parquette circle, the viscounts in the first tier or balcony, and the barons in the second tier or family circle. Hence to rise in rank, gallery baronets have to descend from tier to tier, so going up in promotion as they go down in gravitation; not unlike the Mississippi River, which to reach the sea has to run up hill between New Orleans and the Gulf of Mexico, because as its width of surface increases its depth of channel decreases, and so its bottom towards its mouth is an ascending plane against its current.

All three of the railway baronets have visited the United States and the Dominion of Canada—the last two several times. Sir Morton, however, retired wounded in his balance-sheet, but Sirs Edwin and Henry are in the business of making railway accounts balance with reconstruction weights. On their travels in the American Union and the Canada Dominion, Sir Edwin and Sir Henry both look through glasses of magnifying power and telescopic range, which enable them to see more than there is, in what there is to be. The patients, Canada Grand Trunk, New York, Lake Erie and Western, and Atlantic and Great Western, though never well to these fiscal physicians, are always convalescent per appearance and sure to recover in future time, if nourished with the proceeds of an assessment or a new subscription to a new issue of promises to pay. This consolation Sir Edwin and Sir Henry take with them home to England in narrative which "holds the word of promise to the ear," and thence send over to America new pounds to vivisect the expended pounds sent before. If too sanguine and enthusiastic, their

Digitized by Google

relation is attributed to the aurora borealis and the dazzling shine on its prismatic colors reflected in the Dominion's counterpane of Canada ice; and the British investor is thus indemnified for his past losses, with information of "where his money will do the most good." But whatsoever may have been the merit rewarded in prefixing "Sir" to Edwin and Henry, certain it is that if railway reconstructionists and inflationists, and captains from campaigns against unoffending tribes in Africa and Asia, are in the line of promotion to titles patent, England will have as many baronets as its Jingoes have nightmares, and its aristocracy of nobility and gentry will outnumber its sparrows.

## V.—THE COSTLINESS OF DYNASTIC GOVERNMENT.

How the expenses of administration have increased in Great Britain and Ireland since the Crimean war, which was declared simultaneously by England and France, March 28, 1854, and ended by the treaty of Paris between the four allied powers and Russia, signed March 30, 1856, these figures attest:

| Years. | Total income. | Years. | Total expenditure. |
|---|---|---|---|
| 1853 | £57,726,990 = $288,634,950 | 1853 | £55,309,328 = $276,546,640 |
| 1859 | 65,623,180 = 328,115,900 | 1859 | 64,802,872 = 320,014,360 |
| 1869 | 72,591,992 = 362,959,960 | 1869 | 75,490,909 = 377,454,545 |
| 1879 | 85,115,972 = 425,579,860 | 1879 | 85,407,789 = 427,038,945 |

In 1853 the official year ended January 5. In 1859, and since, the official year ended March 31.

The revenue of the United Kingdom of Great Britain and Ireland and the revenue of the United States, from all sources, in both cases, for the year ended June 30, 1879, was as under, to wit:

UNITED KINGDOM OF GREAT BRITAIN AND IRELAND.

Year ended June 30, 1879.

| From— | |
|---|---|
| Customs | $100,080,000 |
| Excise | 135,375,000 |
| Stamps | 54,620,000 |
| Land tax and house duty | 13,270,000 |
| Property and income tax | 46,705,000 |
| Post-office | 31,280,000 |
| Telegraph service | 6,675,000 |
| Crown lands | 2,035,000 |
| Interest on advances | 5,588,625 |
| Miscellaneous sources | 20,473,010 |
| Total | $416,101,635 |
| Estimated population | 34,000,000 |
| Expenditure for official year ended March 31, 1879 | $427,038,945 |

UNITED STATES OF AMERICA.

Year ended June 30, 1879.

| From— | |
|---|---|
| Customs | $137,250,047 |
| Internal revenue | 113,561,610 |
| Sales of public lands | 924,781 |
| Tax on circulation and deposits of national banks | 6,747,500 |
| Repayment of interest by Pacific railway companies | 2,707,201 |
| Customs' fees, fines, penalties, &c | 1,100,876 |
| Fees consular, letters patent, and lands | 2,136,051 |
| Proceeds of sales of Government property | 181,128 |
| Premiums on sales of coin | 8,104 |
| Premiums on loans | 1,496,943 |
| Profits on coinage, &c | 2,924,938 |
| Revenues of the District of Columbia | 1,741,461 |
| Miscellaneous sources | 3,046,544 |
| Total | $273,827,184 |
| Estimated population (low). | 48,000,000 |
| Expenditure for official year ended June 30, 1879 | $266,947,883 |

Here we have proof that, with 41 per cent. less of population, the United Kingdom—think of a "united" Kingdom with Ireland included with England—had to collect 51 per cent. more of revenue, and was still short.

England has an empire, but its parts are not contiguous nor sympathetic and its colonies and far-away conquests are not profitable investments in a revenue sense. Besides, if a colony develop into strength, physical and educational, it will naturally yearn and plan for political independence. It does not suffice to say to the colonist "peace, be still," and lodge your hopes in the established church, the hereditary House of Lords, and the Dynasty, because a human being is never a man of the maximum measure of human nature till he become a nationalist and has a country to which he exclusively belongs. The colonial situation is an intermediate political purgatory; for a Canadian is a colonist, not a British nor an Irish subject of the United Kingdom, nor an American citizen. And it is preposterous to suppose that the Australian will remain a colonist in his own grand insulated country.

## VI.—WHAT THE HUGUENOTS, LOMBARDS, AND FLEMINGS DID FOR ENGLAND.

The problem with Great Britain is how to subsist its population; for manifest it is that England is overpeopled, and that emigration is the remedy and cure. England has had an extraordinary career, as had other nationalities before it, of record in the Bible and later books; but progress is a power which cannot be stayed on its march, and change of commercial base is the sequence of agricultural expansion and industrial development in new fields, where nature is fresh and prolific and man matures without the shackles of the old world upon his limbs. The citizen is a field oak with a clean bark. The subject is a tree girdled with parasites which cluster where they squeeze and cover cuts with leaves.

What is the American Union but a revelation to the old civilizations of what man in citizenship can compass over his fellow-creature as a subject? The boundary lines on the map of Europe were traced with the sword; the States in the American Union additional to the thirteen colonies were founded by immigrants from the old States into the wilderness, whither also flocked strangers from Europe, to find a rest from oppression and a reward for industry, in manhood aspirations and home joys. And as a State in the Union has a mission as part of a nation, and a course to run like a star in the solar system, States foster cities and towns and develop industries to collect and employ urban population; for States "purely rural" would fall behind in the race of enterprise to the goal of opulence and greatness. Thus States in the American Union, in material matters, are as nations in Europe. And if some of the old States in the Union, like some of the old nations in Europe, are behind others in the development of industries to utililize resources and increase population, the causes will be found in mistaken administration policy and practice.

Handling goods in transitu never built a populous city, as witness Havre, the port of Paris, and New Orleans, the shipping port of the Mississippi Valley. And if Norfolk manipulated into textile fabrics more of the cotton bales it exports to Europe, it would contain a population of cotton operatives many times more numerous that its stevedores.

In the infancy of its manufactures Pennsylvania exported its initial

Digitized by Google

make of pig-iron, whereas now it imports iron ores in coal-boats as return freight from the Hudson River and other New York waters, in steam craft on the lakes, in cars from neighboring States, and in ships from foreign lands, for admixture with its own native ores, and elaborates its home-made pig-iron into the multiform manufactures of that master metal.

Pennsylvania is the youngest of the thirteen original colonies, except Georgia. Virginia was settled by the English at Jamestown in 1607; New York by the Dutch in 1612; Massachusetts by the Pilgrims, 1620; New Hampshire was settled 1623; New Jersey between 1620 and 1630; Maryland, 1632; Connecticut, 1633; Rhode Island founded 1638; Delaware settled 1638; North Carolina settled between 1650 and 1660; South Carolina, 1670; Pennsylvania was founded by William Penn under charter from Charles II, dated March 4, 1681; Georgia was settled 1733.

New York City, settled 1612, is seventy years, equal to two generations, older than Philadelphia, founded 1682.

Coal and iron are the bases of machinery and steam-power; gold and silver are the bases of circulating mediums and commercial transactions; cotton and wool are the bases of textile manufactures; wheat and corn are the bases of bread; and all these and more, including cattle, sheep and swine, fish, poultry and game, rice, sugar and buckwheat, barley and hops, potatoes and oats, and fruits and vegetables, and nuts and acorns, and hemp, jute, and flax, and copper, zinc and lead, and granite and marble, and potters' clay, and woods and furs, are among the productions of American soils, quarries, forests and mines, coasts, bays, lakes, and rivers. To which add orchards and vineyards, fisheries, oil wells, and oyster beds; all in profusion, variety, perfection. Look along the coast's bill of fare from Cape Florida to Cape Cod!

What a picture is America to the mind of man which, where it has zeal, has sight to traverse curves of light as well as straight rays, and so see beyond mountains and across waters, and meantime sympathize with the crusaders of the day in the struggles which distract mankind, where fetters fastened with rivets are yet to be knocked off.

The American citizen, unbiased and independent, will continue to hope on and sigh till the crescent shall have been removed from the minarets of St. Sophia, in Constantinople, to give place to the Greek cross which crowned the spires of St. Sophia four hundred years ago, before it was taken down by the conqueror of the city, who put in its stead the symbol of the false prophet, whose work was war, to make conquest for the Koran.

And now in these days of intelligence in submarine cables, overland wires, steamships, railways and newspapers, how pitiful is the German, English, and Austrian jealousy which retains the Christ-hating Turk in Constantinople, when it is the manifest mission of Christianity to recover the ground it lost through the subversion of the Greek Empire (successor to the Eastern Roman Empire), by the Mohammedan Empire, as it is to cordon the earth with political communities advanced ahead of the heathen, pagan, barbarian and gentile, in Government, morals, institutions and arts.

Adam ate forbidden fruit in the garden of Eden, whereupon God summoned the guilty first-man, and said unto him, Genesis 3: 19, 23:

19. "In the sweat of thy face shalt thou eat bread, till thou return unto the ground; for out of it thou wast taken; for dust thou art, and unto dust shalt thou return. * * *

23. "Therefore the Lord sent him forth from the garden of Eden, to till the ground from whence he was taken."

Digitized by Google

Hence man has no option but to seek subsistence out of the ground by tilling its soil and developing its deposits, both gifts of nature. To earn a livelihood is God's injunction. To foster opportunities to earn a livelihood is the duty of rulers to the ruled. And as the earth is portioned off into nationalities comprised of races with different languages, laws, customs, interests, and ambitions, conflicts of jurisdiction ensue, accompanied with controversy instigated for territorial conquest or commercial gain. The map of Europe is mainly the work of armed men; and now that the western nations of Europe are overpeopled, the trouble is to extract from the ground subsistence for the populations. Without breadstuffs and provisions from America there would be more famine in Europe.

To "till the ground" is to utilize its surface and subterranean productions; to grind wheat into flour, weave wool and cotton into apparel, and manipulate ores of iron into articles of use in the arts of peace and and war. Thus agriculture and manufactures are twin essentials to human development, prosperity, and progress.

In the genealogy of the Patriarchs, in Genesis, the record is:

4: 20. "And Adah bare Jabal; he was the father of such as dwell in tents, and of such as have cattle.

21 "And his brother's name was Jubal; he was the father of such as handle the harp and organ.

22. "And Zillah she also bare Tubal-Cain, an instructor of every artificer in brass and iron."

In the generations of Adam, therefore, there were bread-winners, cattle-raisers, workers in the metals, and musicians. And so God diversified pursuits "when men began to multiply on the face of the earth."

After the flood, Noah and his sons, and his wife and his son's wives with him, went forth out of the ark, with male and female of every living thing preserved, "to keep seed alive upon the face of all the earth."

"And the sons of Noah that went forth of the ark were Shem and Ham and Japhet;" "and of them was the whole earth overspread."

Lands were cultivated and cities built, wherein labor was utilized and arts encouraged; and so nations were founded and civilization was developed; but progress was uncertain as well after as before Christ.

After the disintegration of the Roman Empire of the West (ended in 492), the dark ages covered about six hundred years. The Romans entered Britain fifty-five years before Christ, and left it voluntarily, because of home troubles, four hundred and twenty-seven years after Christ, concluding a stay of nearly five centuries.

The feudal ages were distinguished for field sports; the small portion of land cultivated was near the castles, the feudal possessors (when not in war) taking more pleasure in hunting than in agriculture or literature.

For the first two centuries after the conquest, says Hallam, "commerce was almost confined to the exportation of wool, the great staple commodity of England."

Dew's Digest of the Laws, Customs, Manners, and Institutions of the Ancient and Modern Nations (page 337), says:

"Tools of tradesmen very rude and cheap, *e. g.*, at Colchester in 1296 and 1301 carpenter's stock valued at one shilling and consisted of only five tools. Other tradesmen in proportion, except tanner, whose stock was valued at £9 7*s.* 10*d.* Latter greatest trade of the times, owing to the clothing being made of skins. There was scarcely any commerce,

Digitized by Google

for all the highways were infested with robbers and the water with pirates. Even greatest nobles joined in robbery. * * * For these reasons movable property was but little regarded, and hence cities were small and miserable, for they had no trade or manufactures."

In the fourteenth century the harvest-man received 4*d.* a day; the common laborer under Henry VI, 1422–1461, earned 3*d.* a day. By act of Parliament in 1350 wages of reapers 3*d.* a day, without diet. Yearly wages of a chief hind or shepherd £1 4*s.*; common servant in husbandry 18*s.* 4*d.*, with meat and drink. Though food was cheap in these feudal times, manufactures were dear and comfort a stranger to the serf, called a villein.

Norton's History of London says:

"Whatever commerce may have been carried on in the earlier ages of British history by foreigners visiting the English shores, it may safely be pronounced that the *natives* engaged no further in it than by supplying raw materials to their customers. * * * The system of feudal tenure established at the conquest was peculiarly unfavorable to mercantile pursuits. The whole community, with the exception of a few towns, may be said under that polity to have consisted of landed proprietors and their slaves or villeins.

"The time, however, had now arrived in which the many incorporated companies of foreigners which had from time to time established themselves in London, with all their various and distinguishing privileges, were obliged to yield to the universal animosity expressed against them. They had, in the progress of some centuries, dispensed the most important benefits throughout the nation, by the communication of the arts and comforts of civilization; by the introduction of manufactures of every kind; by their commercial example and instruction; and by their promotion of naval enterprise."

Accordingly, in the reign of Edward VI (1547–1553), all the privileges of the company of the Hanseatic league and the society of the merchants of the steelyard were declared void and their franchises forfeited.

"Besides these two bodies of foreign merchants, who were regularly assaciated as incorporated companies, many others, chiefly Lombards, were settled in different parts of England, and carried on a very considerable trade, both external and internal. The English, more particularly the Londoners, instead of profiting by the instruction to be derived from these strangers, in the arts of manufacture and of commerce, and endeavoring to compete with them, cherished feelings of the most rancorous jealousy and hatred against them."

Fifteen thousand Flemings were obliged to leave London at one time by order of council. (Le Grand, vol. iii, p. 232.)

May 1, 1517, in a furious riot against them, many foreigners were killed and their houses plundered.

In the reign of Henry VIII (1509–1547), says Norton, "although the clothing manufacture flourished in a considerable degree, the export of raw wool still continued enormous; sixty vessels laden with that staple sailed in one year from Southampton for the Netherlands. * * *

"In the reign of James I, the exportation of wool, which had been denied to foreigners by Elizabeth, was, in direct contrast to the policy of our early ancestors, forbidden altogether."

The navigation act passed by the Parliament of the Commonwealth, October, 1651, provided that "all goods exported from any foreign country, except those of the growth of such country, shall only be imported into Great Britain in British bottoms."

This restrictive navigation act of Cromwell caused a rapid diminution

Digitized by Google

of the carrying trade of Holland and contributed to increase the carrying trade of England, thus realizing the two objects of its enactment.

From the expulsion by Edward VI of the foreign associated companies which had introduced manufactures in England, to the end of the reign of Charles II, the commerce of England advanced with a rapidity which had no precedent. Having profited from the instructions of the numerous weavers and artificers among the invited foreigners from the Continent, who located in England in the fourteenth century and communicated their skill in the arts wherein Englishmen were ignorant, the Government of England, in pursuance of the "sharp practice" since adhered to in cases enough for a chronological table, forfeited the franchises granted to invited and refugee foreigners, and so gave to the pupil what it had vested in his preceptor. It is repudiation by foreigners, not confiscation by Englishmen, that horrifies the moral sense of London, abbreviated into *loot*.

"The people of England," says Norton, "did not, until the reign of Edward I (1272–1307), cultivate any manufactures for the purpose of wholesale trade. Most of the manufactured articles, even the woolen (which was the earliest they were engaged in), were imported."

"It was not till the reign of Edward III (1327–1377) that the woolen manufactures of England arrived at such perfection as to produce cloths in any considerable quantity for exportation. * * * This improvement and increase of our manufactures must be entirely attributed to the great encouragement given by Edward III to foreign weavers and artificers, great numbers of whom settled in many parts of England, and particularly in London, Norwich, and Worsted—a place in Norfolk of which not a vestige now remains, but which gave the name to the manufacture of worsted."

In 1331 Edward III took advantage of discontent among the manufacturers of Flanders to invite them into his realm. Of the inducements held out to the Flemings, Fuller's Church History, quoted in a foot-note in Hallam's Middle Ages, gives this picture:

"Here they should feed on fat beef and mutton till nothing but fullness should stint their stomachs; their beds should be good and their bed-fellows better, seeing the richest yeomen in England would not disdain to marry their daughters unto them, and such the English beauties that the most envious foreigners could not but commend them."

Henry VII, 1485–1509, imported great numbers of Flemish woolen manufacturers, who, says Norton, "were superior to our own, and settled them at Leeds, Wakefield, and Halifax."

In the reign of the illustrious Elizabeth, 1558–1603, the massacre and persecution of the Huguenots in France, and the execution and persecution of the Flemings by the Duke of Alva, caused thousands of refugees from the Continent to seek asylum in England, where the strangers, comprising the most skillful and industrious artisans in Europe, by their superior ingenuity in the arts, won a welcome which mollified if it did not allay the jealousy against foreigners prevailing in England.

## VII.—POPULATION OF THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND.

In the reign of Henry VIII, who ascended the throne April 22, 1509, the population of London was computed at 135,000.

At the accession of James I, 1603, London was estimated to contain, of inhabitants, about 150,000.

London was founded by the Celtic Britons, and was occupied by the Romans. In 827 Egbert, on the union of the Saxon states under his sole dominion, fixed upon London as the seat of his residence and the

Digitized by Google

capital of his kingdom. The Danes captured London in 839, but were expelled by Alfred, who "strengthened" London 884.

In 1066 William, the Norman, killed Harold, the Saxon King, at Hastings, and was crowned at London.

Still, London, notwithstanding its antiquity, is substantially the growth of the present century, as the figures below show, to wit:

POPULATION OF LONDON.

| | |
|---|---|
| 1801 | 864,845 |
| 1811 | 1,009,546 |
| 1821 | 1,225,694 |
| 1831 | 1,474,069 |
| 1841 | 1,870,727 |
| 1851 | 2,362,236 |
| 1861 | 2,803,921 |
| 1871 | 3,251,804 |

Wales was annexed to England in 1283.

Population of England and Wales from the fourteenth to the eighteenth century, both inclusive:

| | |
|---|---|
| 1377 | 2,092,978 |
| 1483 | 4,689,000 |
| 1696 | 5,250,000 |
| 1750 | 6,467,000 |
| 1770 | 7,428,000 |
| 1780 | 7,953,000 |
| 1790 | 8,675,000 |

In the three hundred and seven years from 1483 to 1790, England and Wales increased only 3,986,000, or 85 per cent. in population. Or in other words, from the discovery of America by Columbus (1492) to the commencement of the French revolution by the destruction of the Bastile in 1789. The discovery of the Cape of Good Hope as an ocean route to India was made in 1497.

In 1652, in the time of Oliver Cromwell and the Commonwealth, the population of Ireland was 850,000. In 1870 the population of the State of New Jersey was 906,096. The population of England and Wales was six to one of the population in Ireland at the time Charles I was beheaded, and the King was proved not more "divine," not less mortal than the subject. And so the proof will continue to accumulate till the last scion of a pretender to "divinity" titleship to a throne (since the veritable Son of God was crucified, and whose kingdom is not of this world) shall have been driven into exile or made to earn his bread like any other creature of the sole Creator.

No wonder that an intellectual prince or noble, of which there is still one here and there, after a visit to and over the United States, returns sore-headed to Europe, because he *saw too much on his travels*, albeit he may have been entertained at the tables of plenty in banquet halls where stewards of fortune smile in reciprocity of mutual admiration, like one die-cut face to another on the coin of commerce, and see sky angels with wings in mint eagles stamped in gold.

But the dollar, though mighty to move fashion's tongue and the flatterer's pen, is not "almighty" to buy brain or build a fame to last longer than the stomach can digest its dinner; for a name to be illustrious in human annals, must have scintillating rays like a sunbeam admitted into a dark place where the motes floating in air are visible in the streak of light sent down from the genius of day.

The detective machine of intellectual society is illustrated in a coal-breaker in the anthracite region of Pennsylvania, where *slate* found in coal on its way to the screen for assortment into sizes is picked out and cast away.

A straddler who plants one foot in England, the other in America, and puts one palm on the Washington Capitol and the other palm on the London Parliament House, cannot withdraw either leg to stand straight in either country, as such attempt to abate his dilemma would cause him to fall into the sea and the oblivion which awaits all who miscalculate their mental base, or who think they can escalade the gravitation law as easy as they can stride a curbstone in crossing a street.

Scotland was united to England and Wales in 1707, which three countries comprise Great Britain. In 1800 the Parliamentary union of Ireland with Great Britain was effected, to date from January 1, 1801, when the realm was named "The United Kingdom of Great Britain and Ireland."

| Furnaces in blast | 499 |
| Tons of pig-iron made | 6,381,051 |
| 1788: | |
| Furnaces in blast | 77 |
| Tons of pig-iron made | 61,900 |

In 1873 there were in blast 683 furnaces, which produced 6,566,451 tons.

COTTON GOODS EXPORTED FROM GREAT BRITAIN.

| | |
|---|---|
| 1878. Cotton manufactures and cotton yarn | $320,317,000 |
| 1790. Cotton manufactures and cotton yarn | 8,311,845 |

The fact that, in 1780, Great Britain and Ireland, comprising England, Wales, Scotland, and Ireland, contained less than 12,000,000 of inhabitants, or about the same population (or less) as the three contiguous States, New York, Pennsylvania, and Ohio contain at this time, proves that at the date mentioned agriculture was the principal employment of British subjects, notwithstanding that three hundred years had elapsed since Edward III had encouraged foreign weavers and artificers to settle in England, to school-master the natives in the manufacturing arts and industries. England encouraged foreign immigration till it no longer needed tutors from the continent to teach primary schools of art, and then it forfeited the charters granted to the strangers invited or welcomed by it, and clamored against foreigners as dangerous sojourners.

## VII.—CUSTOMS DUTIES OF GREAT BRITAIN.

The expulsion of the foreign associated companies by Edward VI and the navigation act passed by the Parliament of the Commonwealth, gave England a maritime policy and stimulated domestic manufactures in a way that caused English ships to multiply and Dutch ships to decrease, and also begot a selfish desire for the destruction of the organized industries of other nations, even to the engrossment of the markets of the world.

In pursuance of this object England imposed duties on imports for the protection of the products of its agriculture and its manufactures.

A custom-house on a large scale was erected in London in 1304. The customs were "farmed" for the last time by Charles II, in 1666. In 1671 commissioners were appointed. In 1787 the customs were consolidated by Pitt. From time to time, however, since 1846, the number of articles subject to customs duties has been reduced, but nevertheless the customs duties collected in the calendar year 1840, when England's tariff list comprised 1,042 articles, and its policy of protection was paramount, was less in gross amount than in the calendar year 1878, under England's practice of qualified free trade; for where there is free trade "pure and simple" there can be no customs duties.

United Kingdom of Great Britain and Ireland:

| | |
|---|---|
| Revenue from customs duties, 1878 | $100,825,000 |
| Revenue from customs duties, 1840 | 99,576,480 |
| Increase | 1,278,520 |

Sir Robert Peel's so-called free-trade measures were enacted into law in June, 1846, whereby the tariff list was reduced to fewer articles. Therefore it should follow that the customs duties collected in 1850, four years subsequent to the inauguration of free trade, would exhibit a decrease, compared with the customs duties on imports collected in

Digitized by Google

1845, the last year of England's confessedly protective tariff, but the contrary is the truth, as see:

| | |
|---|---|
| Revenue from customs duties, 1850 | $102,210,850 |
| Revenue from customs duties, 1845 | 100,984,280 |
| Increase | 1,226,570 |

In 1857 customs duties were collected on 439 articles in Great Britain. In 1860 the list was reduced, and is now restricted to but few articles on which the customs duties are heavy, made so to yield revenue. The duty on wheat imported was continued down to 1869, inclusive.

The British tariff of 1868 (twenty-two years after Sir Robert Peel's inauguration of what has since been called "free trade") imposed these rates of duty among others, to wit:

| | | £ | s. | d. | U. S. money.* |
|---|---|---|---|---|---|
| Beer and ale, all kinds of | per barrel | 1 | 0 | 0 | $5 00 |
| Coffee | per pound | | | 3 | 6 |
| Corn and grain of all kinds | per cwt | | | 3 | 6 |
| Meal and flour of all kinds | do | | | 4½ | 9 |
| Malt | per quarter | 1 | 5 | 0 | 6 25 |
| Plate, gold | per ounce troy | | 17 | 0 | 4 25 |
| Plate, silver, gilt or ungilt | do | | 1 | 6 | 37 |
| Brandy | per proof gallon | | 10 | 5 | 2 60 |
| Rum | per gallon | | 10 | 5 | 2 60 |
| Perfumed spirits for perfumery | do | | 14 | 0 | 3 50 |
| Sugar, refined, or equal thereto | per cwt | | 12 | 10 | 3 20 |
| Sugar not equal to brown muscovado | do | | 8 | 2 | 2 04 |
| Molasses | do | | 3 | 6 | 87 |
| Tea | per pound | | | 6 | 12 |
| Tobacco: | | | | | |
| Manufactured, cigars | do | | 5 | 0 | 1 25 |
| Cavendish or negrohead | do | | 4 | 6 | 1 12 |
| Snuff | do | | 3 | 9 | 93 |
| Varnish | per gallon | | 12 | 0 | 3 00 |
| Vinegar | do | | | 3 | 6 |
| Wine, under 26° proof spirit | do | | 1 | 0 | 25 |
| Wine, under 42° and in bottles | do | | 2 | 6 | 62 |

Having established its woolen, cotton, and iron manufactures, and trained its labor into imitation of the skill of foreigners from the continent, settled in England on invitation for instruction, or for refuge from persecution, England adjusted its policy to its condition and curtailed its tariff list, in proportion as it felt strong to defy competition at home and wage competition abroad.

Duties on wool exported were levied in England in 1275.

The exportation of wool was prohibited in 1337.

"Staples" (marts) of wool established in Ireland 1343.

Seventy families of cloth-workers from the Netherlands settled in England in 1331.

Exportation of wool from Ireland prohibited in 1521.

In the reign of Queen Elizabeth, 1558–1603 (the massacre of Saint Bartholomew occurred 24th August, 1572, under Charles IX), thousands of refugee Huguenots, the most skillful and industrious artisans in Europe, settled in England, particularly in London, where they became useful and profitable members of the national household.

The Lombards, also, settled in different parts of England, imparted instruction to the natives in the arts, and carried on a considerable internal and foreign trade.

* Pound sterling computed at $5.

## IX.—HOW ENGLAND MADE IRELAND POOR AND TOOK ITS PLACE IN MARKET.

Under William III, 1686–1702, restrictions were imposed on Irish wool and woolens, whereby exportation from Ireland was prohibited, except to particular ports in England.

James Anthony Froude, a living English historian, in the third lecture in his course on Irish History, delivered in Philadelphia in 1872, took for his theme "The Penal Laws and their Consequences."

After the abdication of James II, William III, Prince of Orange, ascended the throne in 1689, and reigned until 1702. Of the condition of Ireland under William III, Mr. Froude says:

"Two struggling manufactures had been already established, and were already thriving there. The linen manufacture in the north was Protestant, and the woolen manufacture was spread over the country, and in this the Catholics shared. Every cabin had its spinning-wheel, and every village in the country its sprinkling of hand-loom weavers. * * * Industry had taken root; it needed only fair play to develop Ireland into the rival of England; it needed only justice and political equality to have made an end of Irish misery. * * * Woolen weaving in Ireland was so prosperous that the English manufacturers trembled for their supremacy. * * * The manufacturers petitioned Parliament to lay such restrictions upon Ireland and Irish trade as should destroy that trade forever. The English Parliament regarded Ireland as hopeless, and conceived, in a sort of desperation, that the only chance was to keep her poor and helpless; and laws were passed which at once overwhelmed the woolen trade, and cut off, at a single blow, the support of one-half of these poor people. * * * One more touch still had to be added to the picture. * * * The English cloth-manufacturers proposed at this time a monopoly of the woolen manufacture, the Irish weaving industry being at an end, but their cupidity was still unsatisfied. The advantage of England over the world lay in the quality of her wool. But the Irish wool was as good, or even better; so that the French, with one bag of Irish wool, with three of their own, could successfully compete with England. The Irish wool must therefore be secured to the English manufacturer, and on easy terms.

"The English Parliament passed an act that not a fleece of Irish wool should be exported to any other country except England. All must come to England, and at a fixed price fit to be paid for it—only sixpence a pound—while the French at the same time were willing to give three shillings a pound." * * *

"Ireland, as she stood at the accession of George I," of the house of Hanover, which succeeded the house of Stuart in 1714, "so remained," says Froude, "until her chains were broken by the revolt of the American Colonies," in the reign of George III.

## X.—ENGLAND'S OPPOSITION TO MANUFACTURES IN THE AMERICAN COLONIES.

To the development of manufactures in the American colonies, which declared themselves independent States in 1776, the Government of England was particularly hostile, and it moreover restricted their direct maritime trade with foreign nations.

The King of England having imposed heavy duties on Virginia tobacco, the Virginia Company in 1621 sent all its tobacco to Holland. To prevent loss of revenue and diminution of trade, the King and

Digitized by Google

council, who then and long afterwards regulated the affairs of the plantations, issued an order enjoining:

"That no tobacco or other production of the colonies should thenceforth be carried into any foreign ports, until they were first landed in England and the customs paid."

This was the beginning of a series of restrictive acts enforced against the colonies.

The navigation act of 1651, passed during the Cromwell Commonwealth, and adopted in its purposes by the English Parliament in 1660, soon after the restoration in the accession of Charles II to the throne, with a view to the confinement of the colonial export trade to the stepmother country, enjoined that:

"Sugars, tobacco, cotton, wool, indigo, ginger, fustic, and other dyewoods should only be carried to England, Ireland, or the Principality of Wales, or to other British plantations."

Having thus limited the *export* trade of the colonies, Parliament in 1663 also limited the *import* trade in corresponding selfishness, declaring that:

"No commodity of the growth or manufacture of Europe shall be imported into any of the King's plantations in Asia, Africa, or America, but what shall have been shipped in England, Wales, or the town of Berwick [southeast corner of Scotland], and in English-built shipping, &c., whereof the master and three-fourths of the mariners are English, and carried directly thence to the said plantations."

It was permitted, however, to take salt from Europe for the fisheries of New England and Newfoundland, wines from certain places named, and provisions from Scotland for the plantations.

England sought to make its colonies feel their dependence, meantime that it supplied them with English woolens and other manufactures and commodities. And colonial trade meant trade with England, no matter how circuitous the route through England.

Next, free trade between the colonies was interdicted; for in 1672 certain colonial products transported from one to another of the colonies were subjected to duties, including sugars, tobacco, and cotton-wool.

These trade and navigation laws elicited opposition and fomented discontent to such extreme that their disregard was not uncommon.

Taxation on internal commerce between the colonies and prohibition from intertrade with the nations of Europe, except England, were factors in spreading colonial dissatisfation, because the policy of England was to monopolize the trade of the colonies for its own profit, not considering the discomfort of its distant subjects.

The English merchants coveted the products of the colonies for maritime traffic, and the English manufacturers regarded the colonies as markets for the consumption of commodities, to be first handled or manipulated in England.

England same time contemplated with satisfaction the growth of colonial agriculture, because such growth was considered evidence of capability to buy and dispose of, in domestic ways, additional quantities of articles enhanced by British labor. But the colonists were not content to forego opportunity and restrict industry to the subjugation of wilderness and forest for the cultivation of raw materials, to the neglect of surrounding advantages in abounding facilities for diversified manufactures, to satisfy domestic demand and supply new valuables for intertrade.

This departure from the packhorse path marked out for the colonies

Digitized by Google

to travel, by the London Government, was obnoxious and disappointing to Parliament, which body had assumed to tell the colonies what to do and how and when and where to do it; for obedience to the commandments of Parliament was expected from the colonies of the crown, as if the colonies were subject to orders and destitute of option of choice in the premises.

The preamble to the act of Parliament of 1663, already mentioned, set forth that:

"Whereas His Majesty's plantations beyond the seas are inhabited and peopled by his subjects of this his kingdom of England"—mark the import of these words—therefore, "for the maintaining a greater correspondence and kindness between them and keeping them in a firmer dependence upon it, and rendering them [the colonies] more beneficial and advantageous unto it [the kingdom] in the further employment and increase of English shipping and seamen, vent of English woolens and other manufactures and commodities, rendering the navigation to and from the same more safe and cheap, and making this kingdom a staple not only of the commodities of these plantations but also of other countries and places for supplying them."

The governors of the colonies were required to enforce this act or be liable to removal from office, rendered incapable of the government of any colony, and forfeit £1,000.

In the maintenance of the policy declared in the act of 1663, Charles II, Parliament in 1669, William III, provided that "no wool, yarn, or woolen manufactures of their American plantations should be shipped or even laden, in order to be transported from thence, to any place whatever."

In 1719, George I, Parliament declared that "the erecting of manufactories in the colonies tended to lessen their dependence upon Great Britain."

In 1731, George II, in consequence of complaints made to Parliament that the colonies were carrying on trade and encouraging manufactures, the House of Commons ordered the Board of Trade to inquire and report "with respect to laws made, manufactures set up, or trade carried on detrimental to the trade, navigation, or manufactures of Great Britain."

In pursuance of this order it was reported that certain trades and manufactures were carried on in the colonies, to the injury and detriment of the navigation, trade, and manufactures of the parent country.

In 1732, in consequence of the complaint of a London company of hatters, Parliament restricted the manufacture of hats in the colonies, and prevented the exportation of hats from the colonies to foreign countries.

"In the year 1750 [see Pitkin's History of the United States], Parliament permitted pig and bar iron to be imported from the colonies into London, duty free, but prohibited the erection or continuance of any mill or other engine for slitting or rolling iron or any plating forge to work with a tilt hammer or any furnace for making steel in the colonies, under the penalty of £200.

"More effectually to carry this act into execution, every mill, engine, plating forge, and furnace was declared a common nuisance, and the governors of the colonies, on the information of two witnesses on oath, were directed to cause the same to be abated within thirty days or to forfeit the sum of £500."

The production of finished iron England reserved to itself; and as it is the labor put upon iron that enhances its cost, a ton of pig-iron manipulated into hardware, cutlery, &c., is many times magnified in commercial value.

## XI.—HOW LABOR UTILIZES THE EARTH'S CRUST.

Labor quarries the marble in its bed and sculptures the statue for the monument; blasts the rock which resists the flood and dresses it for walls and archways; hews the tree with the ax and saws the log into lumber for the carpenter and carver; removes the stump where the forest stood, for the plough which furrows the field in seed-time; molds and burns clay into brick, pottery, and porcelain; excavates mines and pits for minerals and fuels and the precious ores and metals.

For what is a city but a street-fissured mass of brick and stone, mortared and cemented, and wood and iron and glass, paint, and putty, all utilized in the erection of habitations and warehouses, industrial hives and school-houses, hotels and hospitals, churches and law courts, studios and libraries, infirmaries, prisons, and asylums?

In brief, is not a city a host made up of regiments in built-up blocks between streets, with commanding brigadiers and drill-sergeants in chimney tops, whence there is a view of the multitude going to and fro on the pavements below, even though the heavens be obscured by smoke and cloud, as in the woods there are spaces for the denizens to roam between the trunks of the oaks, the chestnuts, and the pines, whose branches weave a curtain over the spectator, which shuts out the sky? Nor is a city unlike a forest in other respects. For is not a city a solitude where the faces are strange, like a forest where the trees are mute?

The more elaborate is the work of human hands the greater the skill required and the heavier the expenditure incurred. A city, therefore, is invested capital materialized by labor, under roofs and within walls; and thus labor and capital are helpmates mutually dependent on cooperation, as two legs in locomotion of the body.

In the vicissitudes of fortune in a republic like the American Union, where the "battle of life" is a "free fight" for subsistence, wealth or preferment, relative positions are not infrequently reversed, owing to opportunities, efforts, and circumstances, which advance the workingman to the front and retire the capitalist to the rear, whereby the poor man is lifted up and the rich man is bowed down.

In the United States the prizes are drawn from a revolving wheel of passing events or reached from a ladder rested against a fruit-bearing tree. To these wheels and these ladders the ways are all open. To be sure, there are some frauds where there are so many successes, but that is because man is not infallible, and justice blindfolded is hung in a picture-frame against the wall; whereas the goddess who holds the balance in her hand ought to be personated in marble and placed opposite the bench, with the face of the judge for a focus to magnifying lenses held level with her eyes.

The pyramids of Egypt are monuments commemorative of labor, and of nothing else authentically demonstrated, for their builder and his purpose are unwritten and unknown, and history and hypothesis are at fault concerning them, except that they are heroes of a war with time, which has secrets buried in the past, as nature has secrets reserved for the future; and herein are two providences to reward discovery, when knowledge shall have ended mystery and translated romance into a schoolmistress, learned on ruins and wise on rocks.

When Adam was banished from Eden, the earth was made a place for labor. What else it might have been had Adam been proof against temptation it is not worth while to inquire, where Adam and Eve are extant in their posterity, a fact showing that the sexes are still cast in the original mold, in the foundry of wedlock.

Digitized by Google

The costliest edifice on the earth is all labor, save the sum paid for leave to take the materials used, where found imbedded in the earth or growing on its surface; for labor comprises all exertion and effort, bodily and mental. Work done is labor performed, whatsoever its kind, for the versatile hand of man is expert with implement of industry, pencil in art, and pen in authorship and book accounts. Finger-power in brain and spindle-power in steam are the two great motors in manual and made machinery.

The distinguishing characteristic of the American republic is that its citizens are born free and equal in the law, with rights common to all under the law, to traverse any one of all the roads open to occupation and opportunity for advancement within the law, which applies to all alike, save to the insane so pronounced, and who are thereafter cared for.

The subject, on the contrary, is born into the world where many of its possessions and most of its honors are already vested in a class and the posterity of that class, and thereby withheld from the people so deprived of their birthright by confiscation for the benefit of kings, princes, dukes, marquises, earls, viscounts, barons and baronets, and their brothers and their uncles and their kin, who fill the steps between the royal stairhead and the untitled floor; and among whom are distributed commissions in the army and navy and sinecures and other places in the public service, where they hold the offices and enjoy the fees and salaries and honors; leaving the mass not on the pay-roll to re-enforce the ranks and recruit the crews in a crisis, without prospect of promotion, except now and then in an exceptional case too conspicuous in merit to be overlooked or neglected, lest outcry should be raised and a storm of indignation let loose against party leaders in power. And as the majority "inns" are on the defensive, the aggressive minority "outs" are not slow to season a cry with a grievance.

The theory of a civil service may be admirable and its practice seem impartial; but government patronage is a booty which politicians in and out of Parliament, as in and out of Congress, take care to divide, in very large part among relations and friends.

Do not sly law judges distribute among favorites court patronage in the auditing of estates? Do not unfit corporation directors and pay-roll principals practice nepotism in appointments and intrigue for their friends and their friends' friends? Does not a chief officer in any service, if himself morally obtuse, pack the subordinate places with his tools?

And as for examinations to test qualification: Do not law students unfitted for the legal profession gain admission to the bar by the score? Are not medical students graduated by the hundred, by a process less perfect than that which grain undergoes in a windmill, which winnows the chaff from the wheat?

No doubt the British civil-service machine, like other manuary machines, has been improved; but so long as the British aristocracy has legal and official existence it will make the Government support it, and the people will only get public patronage in crumbs. The City of Glasgow Bank failure and its appalling consequences is a sufficient testimony that the boasted perfection of British civil law is a sham in the United Kingdom, whereas British practice in Africa and Asia is a reproach on civilization and a scandal to Christendom. Sodom and Gomorrah were consumed by fire from heaven. Babylon under Nebuchadnezzar was the capital of the world, and originated idolatry and spread it broadcast; but Babylon is among the cities of the past, as London will be in its time and turn.

Digitized by Google

And, indeed, even where promotion is won in the British army ranks the untitled merit-winner is seldom welcomed in his new position, for there he finds castes, which, if not envious of a brevet, can be unpleasant to a new-comer, even though advanced for heroic service.

Man ought to be more than an automaton in a government made with a military sword and a diplomatic pen, because man is made in the image of God, with a heart for a motor to move his members, a mind to engineer his actions, a conscience to sit in judgment on his motives, and a soul to illuminate his life.

That British subjects in the American colonies would rest satisfied under invidious restrictions not imposed on subjects of the crown in feudal England, and submit to taxation without representation, was contrary to human nature, inasmuch as colonial life tended to make man self-reliant and conscious of his rights in his dealings with men, independent of the fictions of rank.

Hence the stamp act, passed in 1765, irritated him into opposition; nor did its repeal, in 1766, dissipate his exasperation. And when, in 1767, duties were levied on foreign importations, of which tea was one, the embers of wrath which had smoldered in sparks, in ashes of patience consumed, finally burst into flame.

To forbid the colonist to do what his manhood commanded him to do was to fire him with indignation and hurry him to vindication, first by petition for redress, next by resistance for independence.

The single battle of Hastings, fought October 14, 1066, where William of Normandy defeated the English and killed their King, Harold II, enabled William the Conqueror to seize and wear the crown of England, and reward his favorites with valuable parts of his conquest, divided into baronies.

But no single battle ever determined a result in America, for feudalism and its hereditaments could not be transplanted across the ocean to a wilderness, where the ground had to be reclaimed from nature, society organized, and industries established. And the interference of the London Parliament, to prevent the development of manufactures in the American colonies, together with the determination exhibited to make the colonies a source of revenue by taxation without representation, provoked remonstrance and aggravated controversy, which logically led on, by successive steps, to resistance and revolution.

The transportation of convicts from England to Virginia and Maryland, whereby subjects deserving incarceration in the realm were turned loose in the colonies, is also a count full of aggravation in the indictment found by the colonies against the crown.

"It was calculated," says Pitkin "that, about the year 1750, not less than from three to four hundred felons were annually brought into the province of Maryland."

As there had been brigands among the barons of England, possibly Parliament conceived that convicts discharged from English prisons into the colonies might there establish a nobility by nomination of themselves to the crown for confirmation; but American colonists were political economists, not serfs, and the convict element, instead of rising to the political surface, like a fish after a fly, disappeared to the bottom, like coloring matter in a subsiding pool.

### XII.—GREAT BRITAIN'S PROTECTIVE TARIFF ON IRON AND DISCRIMINATION AGAINST FOREIGN VESSELS.

The manufacture of iron was an early art in England, first practiced by the Romans who invaded Britain under Julius Cæsar, fifty-five years

How Great Britain fostered its iron trade and protected home production and home labor by duties on iron imported from foreign countries, is succinctly set forth in the following extract of an article in the London *Colliery Guardian* of September 22, 1876, headed:

"ENGLISH TARIFF ON IRON TILL TRADE WAS DEVELOPED.

"It is remarkable with how firm a grip this country held imported iron as a source of revenue. For many years that grip went on tightening. From 1782 till 1795, the duty on foreign bars was £2 16*s.* 2*d.* per ton. It rose to £3 4*s.* 7*d.* in 1797; from 1798 to 1802, it was £3 15*s.* 5*d.*; in two years it had got to £4 17*s.* 1*d.*; from 1806 to 1808 it stood at £5 7*s.* 5¾*d.*; in the three years between 1809 and 1812, it was £5 9*s.* 10*d.*; and in the five years ending with 1818, it had been £6 9*s.* 10*d.* At this date a distinction was made in the interest of British shipping; for while thenceforward, till the close of 1825, the duty on foreign bars was £6 10*s.* ($32.50), if imported in British ships, it was £7 18*s.* 6*d.* ($39.62), if imported in foreign. Nor was this all; iron slit, or hammered into rods, and iron drawn down, or hammered, less than three-quarters of an inch square, was made to pay a duty at the rate of £20 per ton ($100.00); wrought iron, not otherwise enumerated, was taxed with a payment of £50 for every £100 worth imported; and steel, or manufactures of steel, were similarly loaded with a *fifty per cent. duty.* * * *

"Our manufacturing industry was getting so conspicuous that at a time when the duties imposed were the highest *the necessities of consumers were greatest.* The railway age had begun, and foreigners in the Old, and our relations in the New World, were demanding of us goods made of iron and steel, which we could not supply with our own metals; and under the encouragement of the *duties on the raw materials which we enforced*, our would-be customers were beginning themselves to manufacture—had in truth entered upon that competitive course which has gone on developing up to the present day, and is now more felt than ever. * * * We were not, however, as a nation, sufficiently advanced in our new commercial policy to be prepared to give without taking. There must be reciprocity. The change from the high to the low duty must be effected

Digitized by Google

with caution, and should not be made with respect to all countries at once. Besides, we had a dual object in proposing to remove these prohibitory duties; to remove an impediment out of the way of manufacturers at home, and to encourage prohibitory nations to enter upon the same course which we had determined to pursue."

By a general customs act, which took effect January 5, 1826, the import duty on certain descriptions of iron and steel was reduced, and thus and then Great Britain began to trim and modify its tariff legislation, not on principle, but on calculation, with "British interests" always in view, front, flanks, and rear.

Great Britain could not fill, with "its own metals," all orders received for "goods made of iron and steel"; for, though Great Britain contains large deposits of ores, there are varieties of ores of iron essential in the manufacture of particular qualities of metal, which it does not contain, but which it continues to import. Moreover, other nations were intent on the development of manufactures; and what Great Britain wanted at that time, and since at all times, was increase of customers. And having adhered to ultra protective duties till it had in operation a manufacturing plant of large capacity and easy duplication, it occupied the advanced position, at a propitious time; for the first *public* iron road was a pronounced success, and the extension of the iron road, it needed no prophet to foretell, would open a market for iron rails, locomotive and shop machinery and cars. Protection had stocked the British Island with workshops, its industries were organized, its labor trained by continental tuition was potential, and so the kingdom was ready for the great occasion. But the affair was exclusively a matter of *trade*, in the English sense of that word, and principle had no part in it. And notwithstanding that Great Britain, since 1826, has passed numerous customs acts, and therein reconstructed its tariff, notably so in June 1846, when Sir Robert Peel carried his limited free-trade measures, Great Britain still has a tariff, and continues to derive income from duties on importations.

| | £. | s. | d. | |
|---|---|---|---|---|
| Thus from 1782 to 1795 the duty per ton on foreign bars was.... | 2 | 16 | 2 | $14 12 |
| In 1797 | 3 | 4 | 7 | 16 14 |
| From 1798 to 1802 | 3 | 15 | 5 | 18 85 |
| From 1806 to 1808 | 5 | 7 | 5¼ | 26 87 |
| From 1809 to 1812 | 5 | 9 | 10 | 27 45 |
| From 1813 to 1818 | 6 | 9 | 10 | 32 45 |

There was also a discrimination against foreign ships:

| | £. | s. | d. | |
|---|---|---|---|---|
| From 1818 to 1825, duty on foreign bars, if imported in British vessels | 6 | 10 | 0 | 32 50 |
| From 1818 to 1825, if imported in foreign vessels | 7 | 18 | 6 | 39 62 |
| Iron slit or hammered into rods, &c | 20 | 0 | 0 | 100 00 |

Wrought iron not otherwise enumerated, 50 per cent. of value.
Steel and manufactures of steel, 50 per cent. of value.

No wonder that the customers of Great Britain, which imposed the highest duties when "the necessities of consumers were greatest," embarked in the manufacture of articles of iron—first for themselves, next for competitive account.

We are taught that "self-preservation is the first law of nature"; and this supreme law, applicable to individuals, is likewise applicable to nationalities and races of men. Wherefore, as Great Britain plotted to increase its profits according as certain of its customers appeared helpless in its eyes to resist its impositions, others of its customers were meantime devising plans for emancipation from commercial thraldom.

Digitized by Google

And the fact that nowadays there are industries everywhere throughout the nations is proof conclusive that where there is intelligent administration of public affairs, whatever the political system may be, the aim is to employ home labor in the manipulation of home staples; and this tends to narrow down the principal items in international intertrade to commerce in surplus productions of cereal, fibrous and mineral kind, for reciprocity is intersale of what is left over estimated domestic requirements, for interpurchase (out of the proceeds) of necessaries and luxuries not produced at home.

## XIII.—RAILROADS AND RAILS.

The first railroad opened to the public for passenger and freight traffic was the Darlington and Stockton Railroad, in England, inaugurated September 27, 1825.

Pioneership in railway construction and consequent improvement in overland transportation is a proud distinction which belongs to England; and good roads are not merely a modern but are a recent achievement. Macaulay, in his History of England, says:

"In the seventeenth century, the inhabitants of London were, for almost every practicable purpose, further from Reading (38 miles) than they are now from Edinburgh (339 miles), and further from Edinburgh than they are now from Vienna."

Artificial roads of broken stone were devised by McAdam about 1818, and for his invention of the macadamized road he received from Parliament £10,000. In 1827 he was made surveyor-general of the metropolitan roads.

*Railroad statistics of the United Kingdom of Great Britain and Ireland..*

| Year ended December 31— | Miles in operation. | England and Wales. | Scotland. | Ireland. | Capital paid up. |
|---|---|---|---|---|---|
| 1825 | 40 | | | | $510,000 |
| 1840 | 1,435 | | | | 206,958,170 |
| 1845 | 2,441 | | | | 442,406,880 |
| 1850 | 6,621 | | | | 1,201,353,730 |
| 1855 | 8,335 | $1,249,026,530 | $162,855,540 | $76,041,475 | 1,487,923,545 |
| 1860 | 10,433 | 1,443,458,055 | 194,193,705 | 102,998,875 | 1,740,650,635 |
| 1865 | 13,289 | 1,898,024,135 | 251,030,160 | 128,336,420 | 2,277,390,715 |
| 1870 | 15,537 | 2,200,847,275 | 312,561,485 | 136,134,605 | 2,649,543,365 |
| 1875 | 16,658 | 2,635,453,335 | 364,433,260 | 151,230,875 | 3,151,117,470 |
| 1878 | 17,333 | 2,896,938,156 | 435,945,340 | 159,842,280 | 3,492,725,770 |
| Total | | | | | |

In 1878, the aggregate miles in operation were: England and Wales, 12,229; Scotland, 2,845; Ireland, 2,259.

According to the *Railroad Gazette* of January 16, 1880, there were in the United States December 31, 1870, railroads of the aggregate length of 86,263 miles. This railway mileage in the American Union surpasses the entire railway mileage in Europe, exclusive of Russia, which is of larger area in Asia than in Europe.

Prior to 1850 but a small quantity of rails had been made in the United States; consequently from the laying down of the first iron railway at Mauch Chunk in 1827, to the end of 1874, there were imported into the United States, from England and Wales, large quantities of railway iron.

| | Tons. |
|---|---|
| To 1860, inclusive, the quantity imported was | 2,625,403 |
| From 1861 to 1874, both inclusive, fourteen years | 2,239,149 |
| Total to end of 1874 | 4,864,552 |

Digitized by Google

As rails of different weights were used, from under 50 pounds per yard to over 60 pounds, it is safe to say that the 4,864,552 tons of foreign rails imported into the United States prior to 1875 were sufficient for 50,000 miles of railroad, single track.

The average price of American iron rails at Philadelphia, from 1848 to 1878, both years inclusive, was $60.86 per ton; and as very few rails were made in the United States before 1848, it may be said that the British had the American market to themselves, as, indeed, they also had it almost to themselves for years subsequent to 1848. Hence the average price of American rails for thirty-one years will serve to estimate approximately the cost of foreign rails imported into the United States to 1874, inclusive, since which date there is a marked decrease. Here is the sum:

| | |
|---|---|
| 4,864,552 tons, at average of $60.86 per ton | $296,056,634 |
| Add for difference between cost of steel rails over iron rails, from Bessemer's discovery to 1874, inclusive | 30,000,000 |
| Probable cost of iron and steel imported to 1874, inclusive | 326,056,634 |

The foreign market is the goose that laid England's golden eggs.

In 1875 there were imported 18,258 tons of foreign iron and steel rails; in 1876 only 287 tons of iron rails, none of steel; in 1877 the small quantity of 35 tons of steel rails, none of iron; in 1878 the minimum of 10 tons of steel rails, none of iron. In 1879, notwithstanding the extraordinary demand which commenced in September, when many furnaces were out of blast and mills were closed, the quantity of iron and steel rails imported into the United States rose to only 44,210 tons (19,153 iron, 25,057 steel), against 1,000,000 tons of iron and steel rails made at home.

Value of iron and steel rails imported into the United States from 1873 to 1879, both inclusive. For official year ended June 30:

| | |
|---|---|
| 1873 | $19,740,702 |
| 1874 | 10,758,435 |
| 1875 | 2,932,310 |
| 1876 | 321,020 |
| 1877 | 1,464 |
| 1878 | 530 |
| 1879 | 78,257 |

This is a decrease in the right direction, for the principal cost of rails is for labor in ore pits and coal mines, furnaces and rolling-mills; and where the rails are foreign, the labor paid for of course is foreign, whereas if the rails be American, the money paid for labor is disbursed among citizen workmen and put into circulation at home. American iron works create capital in the community; imported rails create debts payable in a foreign country. Consider this vital difference, Messieurs Congressmen!

*Progress of iron rail making in the United States.*

H. Bessemer's discovery of a new process for making steel by blowing hot air through molten pig-iron, was announced at the meeting of the British Association held in Cheltenham in 1856. In 1860 steel rails made by the Bessemer process were laid down in the track of the London and Northwestern Railway. The Bessemer-steel rail on trial at once inspired confidence, and its substitution for iron followed on roads of large traffic, owned by companies of undoubted credit.

The Pennsylvania Railroad Company and the Philadelphia, Wilmington and Baltimore Railroad Company laid down English steel rails on their roads in 1864, in which year the price was $150 gold, per ton.

If no Bessemer-steel works had been erected in the United States, American railroad companies to this day would have been charged an ultra high price for the foreign article. Doctrinaires may asseverate and protest and promise to the contrary, but truth, like a bell, rings a convincing sound through the "porches of the ear" into the understanding.

Miles of railroads in operation in the United States at dates given, copied from the Railroad Manual, except for 1879, derived from the Railroad Gazette:

| | Miles. | | Miles. |
|---|---|---|---|
| 1830 | 23 | 1865 | 35,085 |
| 1835 | 1,098 | 1870 | 52,914 |
| 1840 | 2,818 | 1875 | 74,096 |
| 1845 | 4,633 | 1876 | 76,808 |
| 1850 | 9,021 | 1877 | 79,147 |
| 1855 | 18,374 | 1878 | 81,841 |
| 1860 | 30,635 | 1879 | 86,263 |

Investment in railroads in the United States, December 31, 1879, represented by stock and debt on 78,960 miles of roads reported on (leaving 2,881 miles not reported on), $4,589,948,793.

The iron road, the iron ship, the iron bridge, the iron house, the locomotive, and the marine engine are all inventions and improvements of recent date; and in these developments of science and art utilized, progress is materialized to the senses, and its footprints are in the rocks and on the waters. The effect of the evolution of iron—an evolution of reality, not controversy—has been to speed its production in electrical ratio.

## XIV.—COMPARISON BETWEEN THE BRITISH KINGDOM AND THREE UNION STATES.

New York and Pennsylvania are larger in area and superior in natural resources to England, Wales, and Scotland, which jointly comprise the island of Great Britain; and Ohio is larger in area and superior in resources to Ireland. Thus three contiguous States of average size considerably less than the *average* size of the thirty-eight States in the

Digitized by Google

Union, surpass the United Kingdom of Great Britain and Ireland in territorial acres and mineral deposits, and are at least equal in fertility of soils for surface crops.

| | Square miles. | Census. | Population. | | Square miles. | Census. | Population. |
|---|---|---|---|---|---|---|---|
| England | 50,922 | 1871 | 21,495,131 | New York | 47,000 | 1870 | 4,382,759 |
| Wales | 7,397 | 1871 | 1,217,135 | Pennsylvania | 46,000 | 1870 | 3,521,951 |
| Scotland | 31,324 | 1871 | 3,360,018 | | 93,000 | ..... | 7,904,710 |
| Total, Great Britain | 89,643 | | 26,072,284 | Ohio | 39,964 | ..... | 2,665,260 |
| Ireland | 32,481 | 1871 | 5,411,416 | | | | |
| Isle of Man and Channel Islands | 304 | 1871 | 144,038 | | | | |
| Army, navy, merchant seamen | ..... | 1871 | 229.000 | | | | |
| Great Britain and Ireland | 122,518 | ..... | 31,857,338 | Total | 132,964 | 1870 | 10,569,970 |

Population per square mile in England ..... 422
Population per square mile in New York ..... 93

As England has London on its east side and Liverpool on its west side, so has New York State New York City on its east side and Buffalo on its west side; and so has Pennsylvania Philadelphia at its east end and Pittsburgh at its west end, the first on the Atlantic-Delaware, the latter on the Mississippi-Ohio; and so, too, the State of Ohio has Cincinnati on its south, or Ohio River side, and Cleveland on its north or Lake Erie side.

California is three times as large as England; Texas is more than twice the size of the United Kingdom of Great Britain and Ireland, and Dakota and Montana are each larger than the United Kingdom of Great Britain and Ireland. Massachusetts in territory surpasses Wales; Ohio, as already mentioned, in territory surpasses Ireland; Indiana in territory surpasses Scotland, and Illinois in territory surpasses England.

In 1870, in Massachusetts, the densest peopled *State*, there were 187 of population per square mile.

In England, in 1871, there were 422 of population per square mile.

If New York were populated as densely as England was in 1871, it would contain 19,834,000 inhabitants; Illinois would contain 23,383,020 inhabitants; Missouri would contain 27,577,700 inhabitants, and California would contain 79,749,982 inhabitants.

How Ireland has declined since 1841 these figures attest:

Population of Ireland: 1841, 8,175,124; 1851, 6,515,794; 1861, 5,764,543; 1871, 5,411,416.

If Ireland had a redundant population in 1841, surely England has a redundant population at the present time, when even an average harvest yields only about half sufficient breadstuffs for the subsistence of its population, and its importations of both cotton and wool in bales for manipulation into textile manufactures exhibit a falling off, the first in bulk and weight, the latter in quantity and value.

And this proves that the Christian nations, which comprise the principal intertrading peoples, are intent on the utilization of their home staples for the employment and profit of home labor, herein demonstrating that the tendency of foreign intertrade is towards restriction to interchange of articles produced in surplus quantity out of agriculture and mines, and the surplus manufactures of domestic staples.

This is "the handwriting on the wall" for England to read and London shrink from, because London cannot enlarge forever, and when it shall cease to grow it will begin to decay, and so succumb to the inevitable, like cities of the olden time and modern cities in Italy and the

Digitized by Google

Netherlands, each of which in turn expanded and grew strong as the gravitating center of international intertrade moved towards it, and contracted and decayed as the center of commercial gravity moved from it to another port, provided with a new dial and magnetic needle, pointing not to the pole of geography, but to the pole of commerce in a new market, or to a new way to an old competing place.

What is London but the Babylon of the Euphrates reproduced on the Thames? What is London but a magnified Venice of the Adriatic, or Antwerp of the Scheldt, which, not omitting Genoa and Bruges, at different dates commanded a trade justly considered grand for the riches it concentrated and the greatness it conferred, in the world then open to intercourse, mainly carried on with vessels and camels, the vehicles and carriers then in use for transportation and travel?

The vastness of London is due to a number of causes, stimulating in immediate effect and fruitful in after consequences.

Thus London profited during the period of maritime commerce with sailing vessels, succeeding the discovery of America and the Cape of Good Hope, in which epoch or era the insulated position of the British isle, anchored in the ocean, made it the outpost of the near by continent of Europe in its rear.

Another cause of London's growth was Cromwell's navigation act, passed when Holland was paramount in the ocean carrying trade. Another cause was the arrival there of immigrants skilled in the useful arts (of which the British then knew next to nothing), including many driven by persecution from France and the Netherlands. Another, and the one which overshadows all the others, was the growth and spread throughout the island of British manufactures under a protective tariff policy, wherein the duties were made high, according as "British interests" required, and afterwards modified and made lower, and finally abolished altogether in particular cases, according as "British interests" dictated; but nevertheless there was a duty retained on wheat to 1869 inclusive, by which time the urban population of Great Britain had so outgrown its rural population that foreign-grown food had to be imported to subsist the subjects of the British crown; yes, that is the word, the British crown—a thing of gew-gaws, diamonds, and jewels, held together with hands directed by abler minds than the royal head burdened by its weight, but overpaid and recompensed more than a thousand-fold, through usurped prerogatives and arrogated options.

Moreover, the presence of Parliament was of incalculable benefit to London, because there the law-makers of the realm had ready and steady conference with the master minds in manufactures, finance, and foreign trade. Parliament made London virtually the proxy of England. London in England is Hamlet in the play.

We read of upper classes, middle classes, lower classes, and criminal classes in Europe; but these four classes are divided into two classes in America, where the criminal class is impartially composed of every offender against honesty from a law judge to a road-tramp; and the other class, which constitutes the States and the nation in functional authority, is impartially made up out of every authorized human pursuit, from treaty-negotiating and law-making statesmanship ,to pin-peddling in the public streets.

A "map of the world on the Mercator projection, exhibiting the American continent as its center," with steamship pathways from San Francisco to Japan, China, and Australia, and from Portland, Boston, New York, Philadelphia, Baltimore, Norfolk, and New Orleans to Europe and elsewhere, dwarfs England in the panorama it opens to contemplation.

## XV.—THE TEXTILE INDUSTRIES OF THE KINGDOM AND ITS PRINCIPAL ARTICLES OF IMPORT AND EXPORT.

In the statistical appendix to the official catalogue of the United States International Exhibition of 1876, at Philadelphia, is a paper, doubtless contributed by the commission from Great Britain, in which appears the following table of the textile industries of the United Kingdom in 1874:

| Articles. | Number of factories. | Hands employed. |
|---|---|---|
| Cotton | 2,655 | 479,515 |
| Woolen | 1,800 | 135,606 |
| Worsted | 692 | 142,097 |
| Flax | 449 | 128,459 |
| Silk | 818 | 45,559 |
| Shoddy | 125 | 3,431 |
| Hemp | 61 | 5,211 |
| Jute | 110 | 37,920 |
| Hair | 27 | 1,211 |
| Hosiery and other factories | 557 | 27,667 |
| Total | 7,294 | 1,006,675 |

As this matter of textile fabrics from fibrous staples is important and interesting, we add a later tabulation copied from the London *Economist* of October 25, 1879:

"OUR TEXTILE INDUSTRIES.—There has been issued this week a Parliamentary return of the number of factories authorized to be inspected under the factory and workshops acts, the number of persons engaged in each industry, and the number of spindles, looms, and other machines used. The following table summarizes the main heads of information:

| Industry. | Number of factories. | Number of spinning spindles. | Number of doubling spindles. | Number of power looms. | Persons employed. |
|---|---|---|---|---|---|
| **England and Wales:** | | | | | |
| Cotton factories | 2,579 | 38,489,865 | 4,150,444 | 489,960 | 451,508 |
| Woolen factories | 1,412 | 2,738,381 | 251,199 | 50,249 | 109,702 |
| Worsted factories | 636 | 2,049,374 | 434,605 | 76,149 | 117,866 |
| Flax factories | 101 | 190,808 | 28,4 9 | 4,081 | 14,988 |
| Jute factories | 12 | 23,762 | 1,407 | 1,057 | 4,061 |
| Other factories | 1,449 | 928,325 | 177,805 | 15,519 | 78,678 |
| Total | 6,189 | 44,420,515 | 5,043,899 | 636,015 | 777,703 |
| **Scotland:** | | | | | |
| Cotton factories | 89 | 961,259 | 526,594 | 22,265 | 29,775 |
| Woolen factories | 246 | 559,021 | 62,013 | 6,284 | 22,667 |
| Worsted factories | 55 | 47,158 | 21,375 | 11,244 | 13,012 |
| Flax factories | 155 | 265,263 | 18,495 | 16,756 | 37,476 |
| Jute factories | 99 | 183,056 | 5,855 | 10,009 | 30,401 |
| Other factories | 31 | 13,420 | 11,120 | 211 | 2,882 |
| Total | 675 | 2,029,177 | 645,432 | 66,769 | 136,213 |
| **Ireland:** | | | | | |
| Cotton factories | 6 | 76,796 | 1,732 | 2,686 | 1,626 |
| Woolen factories | 74 | 40,205 | 4,942 | 411 | 1,975 |
| Worsted factories | 2 | 288 | 134 | ..... | 47 |
| Flax factories | 144 | 808,695 | 18,048 | 19,611 | 56,342 |
| Jute factories | 6 | 5,853 | 320 | 222 | 992 |
| Other factories | 9 | 6,538 | 39 | ..... | 654 |
| Total | 241 | 938,380 | 25,125 | 22,930 | 61,636 |
| **Total United Kingdom** | 7,105 | 47,388,072 | 5,714,456 | 725,714 | 975,546 |

Digitized by Google

"Of the total number of persons engaged, 374,199 are males and 601,347 females, these totals comprising 51,186 boys and 51,399 girls making half-time."

The 74 woolen factories in Ireland, it will be perceived, employed only 1,975 persons, equal to 26 for each establishment, an average indicative of a small out-put capacity; whilst the 97 factories remaining after the subtraction of the 144 flax factories employed only 5,288 persons, equal to an average of 54 persons for each factory exclusive of flax; and as the population of Ireland in 1871 was 5,411,416, it follows that the 5,288 persons employed in textile manufactures other than flax comprised only one person out of every 1,023 persons, or less than one-tenth of one per cent. of the population.

Apart from agriculture, which is oppressed with too heavy land rent, Ireland has no distinguishing industry worthy of the name of industry applied to persons employed, except flax raised and woven into linen.

Truly is Ireland an oppressed appendage of the British realm, and most truly are the Irish a subject people, whose lands were confiscated and whose wool industry was destroyed to enrich favorites of the dynasty in authority in London, and so give England a monopoly of woolen manufactures.

The following statement of the value of the ten principal articles of food imported into the United Kingdom of Great Britain and Ireland in the years 1877 and 1878, shows how dependent is that title-burdened, dollar-proud power on the harvests of other climes for provisions wherewith to subsist its redundant population; also for cotton, wool, wood, silk, and wine:

| Articles. | 1877. | 1878. |
|---|---|---|
| Wheat | $164, 365, 000 | $133, 154, 000 |
| Sugar | 131, 886, 000 | 101, 234, 000 |

| Wine | 34, 878, 000 | 29, 179, 000 |
| All other articles | 802, 255, 000 | 761, 152, 000 |
| Total | 1, 916, 880, 000 | 1, 779, 052, 000 |

The importation of wheat and flour for 1879 was 70,100,000 cwts., valued at $199,200,000, exceeding any previous year. The area of land under wheat in 1869 was 3,982,000 acres. In 1879 it was 3,056,000 acres. Diminution in ten years, 926,000 acres.

The principal articles of exportation from the United Kingdom of Great Britain and Ireland, and the value of the same, for the years 1877 and 1878, were as under, to wit:

| Articles. | 1877. | 1878. |
|---|---|---|
| Cotton manufactures | $277,190,000 | $257,108,000 |
| Cotton yarn | 59,259,000 | 63,209,000 |
| Total cotton manufactures | 336,449,000 | 320,317,000 |
| Woolen manufactures | 84,287,000 | 81,274,000 |
| Woolen yarn | 17,540,000 | 19,000,000 |
| Total woolens | 101,827,000 | 100,274,000 |
| Iron and steel, wrought and unwrought | 97,744,000 | 89,095,000 |
| Coals, coke, and cinders | 38,127,000 | 35,580,000 |
| Machinery and mill work | 32,602,000 | 36,406,000 |
| Linen and jute yarns and manufactures | 28,353,000 | 22,959,000 |
| Haberdashery and millinery | 18,507,000 | 19,275,000 |
| Hardware and cutlery | 16,213,000 | 15,990,000 |
| Apparel and "slops" | 13,773,000 | 15,333,000 |
| Total of seven items | 245,219,000 | 234,638,000 |
| All other articles | 283,030,000 | 280,798,000 |
| Cotton manufactures and yarn brought down | 436,449,000 | 320,317,000 |
| Woolen manufactures and yarn brought down | 101,827,000 | 100,270,000 |
| Total domestic exports | 966,625,000 | 926,027,000 |

Foreign imports exported and colonial imports exported are not included in the foregoing, compiled from "Commercial Relations."

The total imports and exports of Great Britain and Ireland for the last two calendar years, as given in a supplement to the London *Economist* of January 17, 1880, were as under, to wit:

| | 1878. | 1879. |
|---|---|---|
| Total imports | $1,843,048,050 | $1,810,638,705 |
| Total exports | 964,244,570 | 957,518,360 |
| Imports over exports | 878,803,480 | 853,120,345 |

Since March 15, 1879, Canada has had a protective tariff, and so, too, has one or more of the Australian colonies a tariff for the protection of domestic manufactures; from which local enactments for industrial independence of London imperialism, of course, success will follow, for a Canadian is not an Englishman, an Australian is not an Englishman, and neither of these twain can be a nationalist, till Canada shall have been made a republic or annexed to the United States, and the Australias shall have been united in an union independent of royalty in Europe.

A Welshman is not an Englishman, but a Briton; a Scotchman is not an Englishman, but a Briton; an American citizen is an American citizen everywhere, owing no allegiance outside of his country; nor will a Canadian, not a monarchist, cockney, or snob, be content till he take rank as an American citizen; whilst, as for the Australian subject, his future is foreshadowed in citizenship in his own to be independent country, owing allegiance to no distant dynasty, bound to obedience to none but home-made laws.

What do you import and pay for, to satisfy the demands of home consumption, and what do you produce at home in excess of domestic

Digitized by Google

consumption and send abroad and get money or credit for, in international intertrade?

These are twin questions in political economy. And the fact that the United Kingdom is debtor in account current with foreign nations, bodes no good to the overpeopled island which has its court in London, 56 miles up the river Thames, from the North Sea, and 3,000 over-water miles from the foreshadowed future center of commerce and finance in America, a "promised land" to Britons, Irishmen, and Germans, to all Celts and all Teutons, as Canaan was to the Israelites in Egypt.

## XVI.—FOREIGN TRADE OF THE UNITED STATES FOR TWENTY YEARS.

It is not alone to the United States of America that the exports from the United Kingdom of Great Britain and Ireland show a reduction, but the same is true of its exports to nineteen other nations, scattered over all the continents.

Thus in a table in the London *Economist* of July 12, 1879, it is shown that the diminution in exports of the products of the Kingdom in 1878, compared with 1872, to the twenty countries named, was ($5 to £1) $349,350,000. The increase in exports of the products of the Kingdom in 1878, compared with 1872, to nine countries named, was $17,000,000. Falling off in exports in six years, $332,350,000.

This totalized decline in exports is in excess of the entire export trade of many, indeed of most foreign countries, including Austria-Hungary, Italy, and China.

[From the annual report of the Chief of the Bureau of Statistics, Hon. Joseph Nimmo, jr., on the Foreign Commerce of the United States, for the fiscal year ended June 30, 1879.]

"The following table exhibits the combined value of *merchandise and specie* imported into and exported from the United States. It affords an expression of the aggregate foreign commerce of the country:"

*Value of merchandise, and of gold and silver coin and bullion, imported into, and exported from, the United States, from* 1860 *to* 1879, *inclusive—specie values.*

| Year ended June 30— | Exports. | | Total exports. | Imports. | Total imports and exports. | Excess of exports over imports. | Excess of imports over exports. |
|---|---|---|---|---|---|---|---|
| | Domestic. | Foreign. | | | | | |
| 1860 | $373, 189, 274 | $26, 933, 022 | $400. 122, 296 | $362, 166, 254 | $762, 288, 550 | $37, 956, 048 | |
| 1861 | 228, 699. 486 | 20, 645, 427 | 249, 344, 913 | 335, 650, 153 | 584, 995, 066 | | $86, 305, 249 |
| 1862 | 210, 688, 675 | 16, 869, 466 | 227, 558, 141 | 205, 771, 729 | 433, 329, 870 | 21, 786, 412 | |
| 1863 | 241, 997, 474 | 26, 123, 584 | 268, 121, 058 | 252, 919, 920 | 521, 040, 978 | 15, 201, 138 | |
| 1864 | 243, 977, 589 | 20, 256, 940 | 264, 234, 529 | 329, 562, 895 | 593, 797, 424 | | 65, 328, 366 |

| 1876 | 575, 620. 938 | 21, 270, 035 | 596 890. 973 | 476, 677, 871 | 1, 073, 568, 844 | 120, 213, 102 | |
| 1877 | 6 2, 804, 962 | 25, 832, 495 | 658, 637. 457 | 492, 097, 540 | 1, 150, 734, 997 | 166, 539, 917 | |
| 1878 | 707, 771, 153 | 20, 834, 738 | 728. 605. 891 | 466, 872. 846 | 1, 195, 478, 737 | 261, 733, 045 | |
| 1879 | 715, 895, 825 | 19, 541, 057 | 735, 436, 882 | 466, 073, 775 | 1, 201, 510, 657 | 269, 363, 107 | |

For the last six consecutive years, to June 30, 1879, the excess of exports over imports was, $926,570,068.

Digitized by Google

This is a prodigious amount, but it will be very much increased by the addition of the excess of exports over imports at the end of the current fiscal year, to wit, June 30, 1880.

The United States is a creditor nation, supreme over every other country in its dealings with nations overpeopled and overburdened with debt, and nations groaning under despotism and standing armies.

## XVII.—FOREIGN TRADE OF THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND.

[From the report of the State Department "upon the Commercial Relations of the United States with Foreign Countries, for the year 1878."]

*Foreign trade of the United Kingdom for fifteen years.*

IMPORTS AND EXPORTS OF MERCHANDISE.

| Year. | Imports. | Exports, domestic and foreign. | Excess of imports. |
|---|---|---|---|
| 1864 | $1,326,267,000 | $1,035,334,000 | $292,933,000 |
| 1865 | 1,317,410,000 | 1,063,524,000 | 253,886,000 |
| 1866 | 1,435,110,000 | 1,194,530,000 | 240,580,000 |
| 1867 | 1,341,290,000 | 1,097,403,000 | 243,887,000 |
| 1868 | 1,432,213,000 | 1,107,002,000 | 325,211,000 |
| 1869 | 1,435,936,000 | 1,151,893,000 | 284,043,000 |
| 1870 | 1,473,850,000 | 1,196,234,000 | 277,616,000 |
| 1871 | 1,607,733,000 | 1,378,175,090 | 229,558,000 |
| 1872 | 1,716,717,000 | 1,520,003,000 | 196,714,000 |
| 1873 | 1,804,454,000 | 1,511,485,000 | 292,969,000 |
| 1874 | 1,798,604,000 | 1,446,579,000 | 352,025,000 |
| 1875 | 1,797,031,000 | 1,368,635,000 | 428,396,000 |
| 1876 | 1,823,254,000 | 1,247,947,000 | 575,317,000 |
| 1877 | 1,916,879,000 | 1,226,400,000 | 690,479,000 |
| 1878 | 1,779,052,000 | 1,180,028,000 | 599,024,000 |
| | 24,005,800,000 | 18,723,162,000 | 5,282,638,000 |
| | 18,723,162,000 | | |
| Total excess of imports in fifteen years | 5,282,638,000 | | 5,282,638,000 |

The progressive increase of commercial intercourse between Great Britain and other nations will be seen in the subjoined skeleton exhibit of the value of imports into Great Britain from all parts of the world, and the value of exports from Great Britain to all parts of the world, compiled from sundry sources:

| Calendar year. | Imports. | Exports. | Excess of imports. | Excess of exports. |
|---|---|---|---|---|
| 1750 | $36,447,910 | $50,654,955 | | $14,207,045 |
| 1775 | 74,079,275 | 81,631,815 | | 7,552,540 |
| 1800 | 152,853,025 | 190,600,600 | | 37,747,575 |
| 1820 | 182,572,820 | 258,665,565 | | 76,092,745 |
| 1830 | 231,226,205 | 333,677,225 | | 102,451,020 |
| 1840 | 310,020,000 | 487,013,630 | | 176,993,630 |
| 1851 | 517,897,910 | 951,989,050 | | 434,091,140 |
| 1861 | 1,087,425,120 | 798,162,490 | $289,262,630 | |
| 1871 | 1,793,099,000 | 1,542,254,000 | 250,845,000 | |
| 1879 | 1,810,638,705 | 957,518,360 | 853,120,345 | |

## XVIII.—WHAT IS SCIENCE AND WHAT IS ART?

It is a common expression to say the "science" of this, the "science" of that, and the "science" of something else, as for instance the "science" of hair-cutting, the "science" of corporation book-keeping, &c.; but a

Digitized by Google

little observation and reflection will serve to demonstrate and realize that not a small proportion of so-called "science" is in truth *art*. Thus the practice of medicine is an art, else doctors would not differ as they do, in diagnosis and prescription; whereas anatomy is a science, because the bones in the human frame-work have a nomenclature which is in uncontroverted acceptation among surgeons; and physiology is a science, because the vital organs in the human body have functions which are understood by physicians to actuate the supreme flesh-clad machine, with motive power supplied by blood from the heart and breath in the lungs.

Astronomy is a science, because if the movements of the heavenly bodies were not describable, eclipses could not be foretold; nor the changes made in the seasons by the sun be anticipated and provided for, as in summer and autumn for winter and spring; nor the time of high tide and low tide, sunrise and sunset, be published in advance, and, moreover, there would be no almanac.

Dynastic government is an art, and kingcraft is necromancy; and as duped believers in witchcraft attributed supernatural powers to astrologers, sorcerers, and seers, so superstition and ignorance served commanders and courtiers to fill thrones with royal pretenders to divine rights, albeit some who were made kings had red hands and bad hearts; but the axe, the guillotine, and the gun, each impartially attests that a crown-wearer brought to trial and to judgment undergoes decapitation and suffers quietus like any other life-lighted tabernacle of clay; whereby the pretension to "divine right" to reign and rule and name a successor is fallacy and usurpation, which may be exposed and punished.

For, after all, what are legitimate kings and hereditary princes more than other mortals cast in the molding-box of the human body in the Adamite pattern of the race, and of which God made the first model in his own image? King and peasant are alike born of woman, nor is wedlock holier in the palace than the tenant-house; and beatitudes and imperfections are found promiscuously in society as beauty and blemishes are discoverable in a foundry where iron and bronze and brass are run hot into molds to crystallize into articles of art.

## XIX.—POLITICAL ECONOMY.

Political economy is an art, whereby governments strive to make income from revenue equal to outgo for expenses in ordinary times, through the operation of laws founded on situation, necessity, and circumstance. And hence the imposition of taxes—a plural of multitude of meanings—is a work of discrimination, for ability and willingness to pay have a limit; and it is the interest alike of a dynasty and every other form of administration to cultivate a diversity of home occupations and develop native resources in domestic manufactures, so to compass two ends, in employment of population and emancipation from dependence on foreign nations, for clothing and food and articles for ornament and use. In a word, to keep down to a minimum imports from foreign countries.

Thus a nation that grows cotton in fields and wool on flocks, and contains deposits of metallic ores and mineral fuel, should naturally endeavor to establish cotton and woolen manufactures at least equal to the consumption of the domestic market; and same time export cotton fiber in bales and wool fiber in bales to foreign countries, for elaboration into textile articles in their own works, if possessive of machinery and fuel, and provided with skilled labor.

And a nation that abounds in metallic ores and in coal, hard and soft,

Digitized by Google

including coal for gas and coal for coke, can make machinery and supply steam-power at minimum cost; such a nation, too, can attract immigration, develop mechanical ingenuity and build up home industries for the utilization of fibrous and mineral productions.

The everlasting union of "indestructible states" jointed like the bones in a living body, exports cotton fiber to Great Britain, France, Germany, Italy, South America, and indeed to most of the nationalities that intertrade.

But why England, greedy, grasping, never-sated, never-satisfied England, that Julius Cæsar annexed to the Roman Empire, and William the Norman conqueror escheated to himself and portioned off among his barons; England, that hungers in Africa and Asia for more possessions and aspires for universal dominion in commerce; England, which has poison in its fangs, and bites and bribes and smiles with deadly selfishness; why should England descend from its belfry built high for outlook downward on Asiatics and Africans, whom it shoots and hangs contrary to established usage in welfare, and rummage its property-room in its show-house, thence to send hither, in character parts, across the Atlantic Ocean three thousand miles wide between the shores of an old continent and a new world, members of Parliament and others, some big as whales and prodigal of sugared words, some small as sparrows but not too little for spy-glasses, to ask Americans not to do as Britons did to establish their own industries, but do as Britons wish for their own sake? This consolidated querry Time (which is older than Adam and never halts on its course that leads on to the end of the circle, thus to complete the period and fulfill the mission of the planet so immense to man though a mote of matter in the universe), will answer as it journeys along, to measured step, bearing its scythe, a symbol understood, and reading the decrees of nature in its looking-glass.

What is the mortal part of man but a morsel for the worm, which however, comes not into possession till after the soul has served out its term in a preparatory school, made up of pupils who graduate to sink or mount, according as they load themselves with sins or provide themselves with pinions?

### XX.—IS TITLE PATENTED, TORPEDO BALLOT-PROOF? TURKEY, THE TRANSVAAL, ZULULAND, AFGHANISTAN.

The sequence of assumption is dissappointment, of arrogance the final effect is humiliation. For the bluster of the British who cares except Africans in fig-leaves and savages without fire-arms? To be sure, the Briton has courage and in measure large as the bravest among mortals; but the dynastic Briton, not the British worker in cotton, wool, and the metals, if not morally obtuse, has ceased to be nice, and will swallow the oyster though it be tainted and the egg even if stale.

His bowels are not moved by compassion, nor does his digestion, wherein he excels the shark, require cathartic stimulation, for his belly is never so full that it will not admit a little more; his lust for dominion is insatiable, and justice is not a law of his ambition, where there is land for loot in Asia, Africa, and the South Sea Islands; his conscience travels on a ticket-of-leave, and the pocket in his trousers is dialed in the palm of his hand.

His chariot is Juggernaut, his Orissa the United Kingdom, his Hindoos the serfs of land barons, the tenantry of manor-lords, and the subjects of the crown, deprived of civil rights that make a man, and which citizens inherit free.

Digitized by Google

Poverty and hunger cloud the hope of the British poor, who need a Moses to lead them out of serfage in feudaldom to a Canaan where land is subdivided among proprietary tillers, and equality prevails in the distribution of elective situations; and where estates are not entailed, titles are not transmitible, and merit is the test of promotion and reward, supreme over inherited rank and primogenitive riches.

Let England level down its landed aristocracy, its titled gentry, and its stags and hounds of fashion, salary-fed in the public service, and level up its worthy millions in its toiling masses to a causeway graded to a datum line for all to travel, on the same condition, like ticket-holders in a railway train, from a depot of departure to a destination.

No monopoly is a wholesome motto. There is no monopoly in ideas, for brain matter is free soil, wherein a head-owner may cultivate his taste for letters and market his intellectual productions. And surely there should be no monopoly in privileges, opportunities, offices and honors, anywhere on the earth.

In America, colossal fortunes, like drift snow banks in a change of weather, melt down after the accumulator's death, into as many streams to society's commingled sea as their are legal heirs, each knowing that in the course of nature his Nile will rise and irrigate his patch of expectation; but where estates are entailed, the glacier, which is the congealment of sundry winters, thaws only on the outside, and trickles in a rut in the road, disturbing nothing over the fields, to satisfy the flocks that hunger for grass and cannot browse on thistles.

Having a commercial mind, the diplomatic Briton hucksters, promiscuously and indiscriminately, goods and statutes, treaties, promises, principles and professions, everything to expediency.

Review British diplomacy and foreign practice since Great Britain refused to sign the Berlin memorandum, dated May, 1876, which the Emperors of Russia, Germany and Austria officially approved, and which was framed to avert, and would have averted the war between Russia and Turkey, declared by Russia on the 24th April, 1877, in championship of the Christian populations in European Turkey. And what does the record show in Asiatic Turkey, the Transvaal, Zululand and Afghanistan?

Is there anything in history surpassing the heartlessness of Great Britain's abandonment of the Christians in European Turkey and its false friendship for the Turks, whom it encouraged to resist the advice and pressure of the three Emperors, and whom it afterwards cheated out of Cyprus, and finally bullied for reforms in Asia Minor?

Is there anything in history more selfish and less honest than the extinction and absorption of the independent and peaceful republic of Transvaal, in South Africa, by Great Britain in 1877, and its subsequent hypocritical treatment of the Boers, to whom in 1879 Sir Bartle Frere "held the word of promise to the ear," when "every British soldier in South Africa was needed to fight Cetywayo," for Sir Garnet Wolseley "to break it to the hope," after Cetywayo had been made a prisoner and the Zulu war was terminated?

After his capture, Cetywayo, King of the Zulus, said the English "shot us to make us Christians." The British Government, as a missionary society to proselyte Africa and Asia, has substituted the shotgun and hanging-rope for the Hebrew Bible and Greek Testament.

The British fought the Chinese in 1840-'41, and compelled China to admit India opium into its ports.

Bishop Colenso, in a letter written home to England in reprobation of the inhumanity and baseness of the British towards the Zulus, de-

Digitized by Google

scribes the process whereby the English general, Lord Gifford, discovered the hiding place of Cetywayo.

"Five Zulus were takened prisoners and questioned severally as to the place where the King was hiding. They persisted in declaring that they did not know where he was. Whereupon they were all flogged, with what right let Englishmen judge. They bore their flogging, and still refused to betray their King's hiding place, and two of them managed to escape. Then the scheme was adopted which had been practiced once before in this war, of taking them blindfolded, each to a separate spot, when two gun-shots were fired, and each of course supposed that the other two were killed. And so the secret was obtained from one or more of them."

The correspondent of the London *Daily News* thus wrote just before the battle of Ulundi:

"Buller is scarcely the man to commit any default in any enterprise which experience proves to be so eminently congenial to his nature. Reaching the bed of the White Umvolosi on the first evening, by daylight on the second morning he engaged in the annexation of cattle. The people in charge of these made a feeble resistance, and were not warriors, but policy demanded that a certain number of them should die for the sake of creating an impression, and about a dozen of them fell under the fire of Buller's men. Some three hundred cattle were captured, also a man and a number of women."

On this extract the London *Capital and Labor* newspaper remarks: "Unarmed peasants in charge of cattle are shot down 'for the sake of creating an impression!' It is usually supposed that soldiers throwing down their arms in acknowledgement of defeat receive quarter, but the war correspondent tells how a noble British officer slew the fugitive Zulus as if he were pig-sticking!"

[Extract of an article on "Martial Law in Cabul," by Frederick Harrison, in the London *Fortnightly Review* of December 1, 1879.]

"In spite of the conspicuous coolness and generosity of our soldiers the fact remains that they never meet their equals or a civilized foe. A generation has passed since Englishmen met in fight white men, and even those were hardly of European civilization. They never fight under the rules and condition of modern war. They hardly ever fight with a foe whom they treat as an honorable foreign enemy. They are forever engaged in battues of black skins, red skins, brown skins, 'niggers,' or savages of some kind. Their enemy are almost always 'rebels,' or 'mutineers,' or 'insurgents,' or 'marauders,' with whom they do not pretend to hold the conventional laws of warfare. Our officers, therefore, are almost always partial executioners and partly criminal police as well as soldiers. They not only use their swords, but they have ever in their train ropes and halters, gibbets and cats, and all the apparatus of a Russian army in Poland. They seldom fight without killing prisoners in cold blood after all resistance has ceased. They blow them from guns by platoons; they hang them from the first tree; they shoot them in squads; they flog them by scores; they burn villages by wholesale; their men knife wounded men (at leaft they boast that they do); they hold drumhead courts-martial on priests and officials; they proclaim martial law at their own free will. * * *

"The British army, of all armies in the world, is the one which is most often hanging, shooting, or punishing prisoners of war."

The censorship of English functionaries over war correspondents is lucidly described by Archibald Forbes, an able pen-painter of battles and campaigns, in *The Nineteenth Century* for January, 1880.

## XXI.—THE BEACONSFIED JINGO-CLAQUER. MORE ALABAMAS.

Having a covetous eye on Afghanistan, it was not difficult for Great Britain to originate and amplify a grievance against the Ameer at Cabul, and follow the charge with a military force, organized for invasion and occupation. How Major Cavagnari, the British envoy, entered Cabul on the 24th of July, 1879, and how he was killed in September, and what has since taken place in dramatic acts, is matter of familiar record to newspaper readers; but what more will be evolved out of this Afghan movement for the extension of the frontier of India towards St. Petersburg and Constantinople, a movement which, by the way, may have the Redan back-step in it, we must wait on diplomacy or war, or both, to uncover, in the coming days; and as diplomacy is of uncertain issue, and boundaries made by war are not fixable beforehand with the pen, curiosity must get behind patience and wait.

When the Berlin memorandum failed, because Great Britain would not co-operate in pressure on Turkey, to make reforms in concessions to its outraged Christian populations, and Russia declared war against Turkey by proclamation dated April 24, 1877, no one knew that history was pregnant with the Bulgaria which was born in the treaty of San Stefano of 19th February, 1878, whereby, in addition, three states wrested from Turkey were made independent powers.

The extraordinary and triumphant manner in which the Russians, despite the rigors of winter and the desperation of the Turks, fought their way through the passes of the Balkan Mountains in the winter of 1878, and the treaty of San Stefano, which electrified three and stupefied two European powers in the spring of 1878, reflect a luster on the arms and a finish on the diplomacy of Russia that the Berlin Congress of the summer of 1878 could not cover up, nor get over nor around; but which it did modify mainly in the interest of Austria, and to the disadvantage of Christians and the shame of Christendom as Christ's community, in the malicious and jealous partition of Bulgaria by the erection of Eastern Roumelia into a Turkish province, which was conceived and born within thirty days, about the period required to incubate a reptile's egg with borrowed artificial heat.

Obviously the theory of the situation framed by Great Britain when it withheld its signature from the Berlin memorandum, was a conception of spurious statesmanship; and if war ensue between Great Britain and Russia, no precaution which Beaconsfield may plan beforehand will save from capture sundry of the English ships employed in maritime commerce around the globe. To pretend otherwise is to deny that man is an imitative creature, and also to ignore the fact that new inventions and improved weapons are incorporated into the tactics of war purposely to destroy combatants and compel the party hurt most to succumb first, to obtain peace. England's "little game" will be played against England, for a large stake against a small hazard.

Yes, yes. The British-built and British-crewed rebel privateers, Alabama, Shenandoah, Georgia, and Florida, have passed into the minutes and the award of the Geneva Board of Arbitration, but not thence into the oblivion of forgetfulness; for Great Britain still profits from its indirect raid on American commerce during the rebellion: and Russia is not blind to where her enemy is vulnerable, and the prospective prizes are British ships and their cargoes, easy of capture between ports wide apart.

It was stated in Parliament by Lord Panmure that the loss of the British army by death in the Crimea from September 19, 1854, to March

Digitized by Google

31, 1856, not including the *naval* arm of the service, was 217 officers, and 19,314 men; incapacitated men discharged, to be added, 2,873. The Crimean war did not rob Russia of much, nor pay England in any aspect of the case. The Crimean war only touched Russia on its edges. In Bessarabia the frontier is again on the Danube. Kars is a Russian fortress, and Batoum is a Russian port.

In the siege of Sebastopol by the allied powers the French gained the Malakoff, and the British failed twice at the Redan, which was not taken. Moreover, only that part of Sebastopol which the Russians evacuated, was occupied by the allies.

And as at Inkerman the Russians in superior force attacked the English camp and were driven back, but not pursued, French aid having arrived as opportunely at Inkerman as Prussian aid arrived on the field of Waterloo, so at New Orleans did General Andrew Jackson with six thousand men, chiefly raw recruits, defeat Sir Edward Pakenham, who had 14,000 men, mostly veteran British troops, in his disastrous assault. The battle, says the highest authority, is not always with the (numerically) strong.

The French have not duplicated the first Napoleon, nor have the English developed a Wellington since Waterloo. But Von Moltke is more than a reproduction of Blucher.

That Lord Beaconsfield had Burmah in his programme for the year 1879 there is testimony extant to justify assertion and secure belief; but matters in the Transvaal country, in Zululand, and in Afghanistan, together with the uncertainty in perturbed European Turkey, appear to have admonished the Beaconsfield ministry that public opinion, too often tampered with, might be aroused, and in its anger cause the tory cabinet loss of office. Therefore Burmah was not set upon for concession, indemnity, or partition; but this forbearance was forced by circumstances, and is not due to repentance.

Lord Beaconsfield's ambition has his imagination for its wings, and his conscience does not weigh as heavy on his fancy when it soars as a news item on tissue paper borne by a carrier-pigeon in its flight; nor does any moral sense move the humanity latent, not normal, in his nature, and inaccessible to sympathy or justice, where he sees a way into a new market for India opium or British goods, or a new acquisition in tribes, or herds, or flocks, or fisheries, or forests, or a new flora for a hot-house or a window-garden, or a new fauna for furred robes or decoration feathers, or a new something else, no matter where, whether under the sun, "limited" to the planetary system as organized, or in the milky way not yet portioned among the powers; no matter what, so that it be not a donkey nor a dog, but an Esquimaux, a cannibal, or a gorilla, available to swell the census and make the Jingo cheer.

The Jingo idol in statesmanship is typified in the gold-beater, who hammers out a guinea into sheets of wondrous *thinness* for gilding picture-frames, sign-boards, baubles, and the backs of books.

The Briton boasts of empire, and apostrophizes or rhapsodizes the sun, because it "never sets on Her Majesty's dominions"; but the Briton, notwithstanding, has only to cross Saint George's Channel to find in Hibernia a member of the United Kingdom anxious for a divorce from the bonds of political fellowship; and in Hindoostan, if British jurisdiction were not enforced by an army of occupation officered and leavened with subjects sent thither, it would not be tolerated a day.

In past time the Roman citizen bore the proudest distinction among men under government. In present time American citizenship is the summit of the political world, not rounded like the physical world

Digitized by Google

(which holds all its indwellers at equal distance from its common center, to which they all gravitate under the same law), but a terraced world of nations populated with high and low conditions and incompatible castes.

## XXII.—ENGLAND'S RUNNING ACCOUNT.

Great Britain is in account with all the continents in books and archives, from which its record cannot be expunged nor abstracted like a fugitive state paper, nor misinterpreted like a treaty; and Great Britain, having retrograded from a progressive civilizing Christian power into imperialism and barbarity in its foreign policy of land piracy and its unchristian treatment of prisoners and non-combatants, lives in the hate of more human beings, shocked at its inhumanity after battle, exasperated at its blustering interferences, or injured through its hypocricy and selfishness, in plot or marplan, than any other nation on the earth. Even where it has consanguinity it has few sympathizers and no allies, because in a struggle it does not take the side of humanity and attempt to close a wound which might be healed, but reconnoiters the situation, ready to smite on a chance to dissever or demolish, in order afterwards to participate in a distribution of results. It is the gamester among the powers, and plays windy bets to win substantial stakes, not caring who may be worsted and weakened, so that it may acquire booty and strength. But the British Empire is on a false basis, for it is founded, not on rock conglomerated of pebbles cemented in a supporting strata, like a bottom rock in a mineral basin, where superincumbent veins and their floors and roofs in alternating layers rest on it, but on sands which separate under pressure and wash away, when beat against by billows. A distant colony is an embryo nation; and in the future as in the past new nations will develop into greatness, and old nations will be retired from rank to rank to the rear, through the grades of mother, mother-in-law, grandmother, to maternal ancestor, with a pedigree traceable to Noah, or to the Celt of Erin who survived the deluge in a boat of his own, independent of the ark.

Contemplate the genealogical tree of Rome, with its branches stretching not out across the oceans of the world, but over all the shores of the principal sea of Europe—a vast area in that era. And as Rome is to London in present time, so will London be to cities in existing colonies, as nations, in future time. England is in the mother-in-law period of her eventful life, but she does not confine her jobbiness to her blood relations; and since the rebellion in the United States the African in the cotton States has ceased to be considered her "colored brother," and the African in Africa is made her victim, without mercy. England, like a mistress, has one principal lover at a time, but many lovers through a lifetime.

The unrest which the Berlin memorandum of 1876 was framed to pacify was local; and the Turk, who was in the wrong, could not have resisted the pressure put upon him, if England had not inflated him with "great expectations," thereby to thwart the plan of the three emperors, for peace. At present time there is unrest—rocking, heaving, volcanic unrest—throughout Europe; and the thunder fulminated in the newspapers, in the interest of dynasties, causes no more alarm among the subject peoples, who are stirred with ideas of revolution for self-emancipation, than stage thunder to an audience of theater goers. The III Ananias, in Calmet, would be a tame liar in London or Berlin, in these latter days.

Digitized by Google

In Europe the republic is actual and in its morning hour, and king-craft is past its prime and in its afternoon; hence the latter is sinking towards the night, the former is rising towards the noon; and when noon is reached, then will come the millennium.

There is no cohesion in the different parts of the hoop-bound British *Empire* akin to that which pervades the States of the American Union, cemented by the Constitution like atoms annealed in iron and pebbles fused in rock.

Even in the States which seceded from the Union and set up in business for their own account and failed, and which are now back again in their old places, there is a native population which leavens public opinion and seeds the political soil over all its acres; but in India the Briton is a trespasser and an oppressor, and the Hindoo native *knows* that the Briton is a foreigner antagonistic to him and at enmity with him in his temporal interests and his aspirations for independence.

The Hindoo is the Briton's bondsman, and consciousness of this fact is a weight on his yearnings, humiliating to him in the light reflected from the back history of his country, aglow with grandeur in his sight and faith, down to almost his own generation.

As for empires, the old world—the ante-Columbus world—which has only a hemisphere or half a sphere, bounded by the islands of Ireland and Japan, was dotted here and there with ruins of cities, which had been capitals of kingdoms or emporiums of intertrade.

Five hundred years before Christ the Persian Empire of Cyrus extended from the Dardanelles to the Indus and from the Black and the Caspian Seas to Egypt and the Persian Gulf.

Three hundred years before Christ the Macedonian Empire of Alexander the Great, in addition to the territory of the Persian Empire destroyed, included Greece and Thrace, and Libya and Egypt.

Next came the Roman Empire, which was distinguished by the birth of the Saviour and the reign of the Cæsars, and by feats of arms and works of art.

After the division of the Roman Empire, A. D. 337, on the death of Constantine, the Western Roman Empire did not long survive, for it was dissolved in 476.

The downfall of the Eastern Roman-Greek Empire, however, did not occur until 1453, when Constantinople was taken by the Turks.

The Greek Empire, at the end of the tenth century, comprised, under the Emperors of Constantinople, Greece, the coasts and islands of the Ægean Sea, part of Naples and Sicily, Croatia, Servia, Thrace, Macedonia, and Asia Minor. In the fifteenth century the Greek Empire was overrun by the Turks.

At the time of the First Crusade, 1095, the Mohammedan Empire extended from Hungary to Hindoostan, and from the Sea of Aral to the Red Sea, and included part of Spain and the whole of the Mediterranean shore of Africa. But Spain expelled the Moors in the fifteenth century; Persia became an independent power in the sixteenth century; Greece was made an independent kingdom in 1829; and the treaty of San Stefano negotiated between Russia and Turkey in 1878, when the Russian army, which had crossed the Balkan Mountains, as before mentioned, was halted at the gates of Constantinople, wrested from the subdued Turk Roumania, Servia, and Montenegro, whose nationality the Berlin Congress in each case affirmed; meantime, however, in apostasy to the New Testament and in concession to the Koran, the Berlin Congress partitioned the ethnological Bulgaria (created by Russia in the treaty of San Stefano, a fact which will bear repetition), in the in-

Digitized by Google

terest of Christendom, into two wickedly-divided parts, and did other things malevolent and little, indirectly to prolong the Turk's stay in Europe, where he is a stumbling-block, a drawback, and a deadly day-shadow.

Nevertheless, the Mohammedan Empire, wherein is still contained the Holy Land, which the crusaders sought to recover seven hundred years ago, is shaken to its foundation and shorn of its prestige, to the ire of the Jew chief in London; and the Sultan, whose predecessors were potentates, would be forced to recross the Bosphorus back into Asia, if political jealousy, diplomatic intrigue, and mercantile selfishness were not made paramount considerations, and given influence over the moral sentiments and religious convictions prevalent in London, Vienna, and Berlin, three reactionary sinks in dynastic civilization, in contrast with Washington and Paris, the two flag-staff cities of the world in its march forward towards the end of the last chiliad, which, when reached, will close out the account of this planet with the universe, and scatter its pieces, we know not whither, nor whether in aerolites and meteoric stones, or other fugitives, perchance to strike a newer or an older world, and there provoke debate in a department of the creation of God, familiar to Him, unknown to us.

The Briton reads prayers to the Saviour out of a book and same time plots to continue the followers of Mahomet in Constantinople, lest Russia should restore it to Christian rule; and on the church of St. Sophia, built by Constantius II, rebuilt by Justinian, replace the minaret and crescent with the spire and Greek cross.

Great Britain coveted and took Canada from the French, and New Amsterdam, changed to New York, from the Dutch. How it coveted and tried to take New Orleans, and failed, makes a conspicuous chapter, ablaze with Jackson's fame, in military annals.

And nowadays, because it cannot make itself master in Constantinople, through a vassal or otherwise, Great Britain intrigues and marplots to prop and strengthen the Sublime Porte—sublimated porte is a fitter name—and prevent the Christians from retaking the capital city of the eastern empire of the Greek Church, which the Turk overturned when he captured Constantinople. In the "Dark Ages" the crescent flag threatened Europe with conquest, and the Christian religion, to which the world is indebted for all the progress made in it since the Saviour was born, had to contend against an adversary all zeal to smite, no mercy to spare.

At present time, therefore, whilst Great Britain is the ally of the Turk, whose prophet is Mahomet and whose book is the Koran, there is a consequential lull in English missionary effort to propagate in the Sultan's dominions the religion of Christ in the New Testament, which it was the ambition of Mahomet to extirpate.

In this missionary halt and rest in the Sultan's dominions, it seems to have occurred to certain of the busybodies who abound in England to send over to the United States missionaries of free trade to preach for open ports to British goods and free markets for the productions of British machinery and labor. When the foreign trade balance is against Great Britain it talks of reciprocity and kinship; when the balance is in favor it aspires to universal commercial dominion.

There cannot be affinity between two wide-apart countries with incompatible institutions, like the American Union and the Kingdom of Great Britain; because in the Republic the ship of state carries citizens who have the freedom of the deck and cabin, and are joint owners of the vessel, in equal parts; whereas in the kingdom, subjects on voyage

Digitized by Google

in the ship of state are carried in the hold for ballast, or for chattel assets, or a life-saving reserve, as the case may be, below six decks provided for princes, dukes, marquises, earls, viscounts, and barons, all with wreaths of ranks and titles, which are worn for collars on decoration days, and serve at other times for yokes, without the ribbons, on the necks of the multitude.

In sporting circles and among club-house fashionables the courtier boasts of the pure blood of his prince, and the genteel jockey boasts of the pure blood of his race-horse; and as purity depends on habits, and the blooded horse is trained in ignorance of haunts of vice, the jockey does not lose the argument.

To fashion "comparison is odious" indeed, where blood is the subject and the parties morally are color-blind. But physiology tells where and why the blood changes from red to blue and from blue to red; and the difference is the relative strength of cognac brandy on a dinner table and hydrant water tinted sky color with indigo, for rinsing clothes clear of soap.

The Briton, who at home is made to feel that it is the "line drawn at trade" which keeps him out of the society of the highest official and social caste in his country, ought to pause and consider that the American citizen is more than a British subject; inasmuch as every citizen has the same political rights as every other citizen, for no citizen is born to office by inheritance and all the honors are open to competition; whereas among British subjects feudalism survives in ranks and titles portioned among the few, and circumscribed civil rights are transmitted, with poverty and its accompaniments, to the down-trodden majority population; and though serfage and villeinage were long ago abolished technically by statute or proclamation, the social status of the workingman, where he is a subject, is as lowly and his comforts as few, and his opportunities for self-advancement in peace or war about as rare, as when he was a human chattel bonded for unlimited service to a master; because, where the social and political positions are absorbed in a class, and population is redundant, and the labor market is overstocked, there men, having no alternative occupation or prospect, must work for what they can get, to obtain food, and so keep hunger out of the household. Yes, that is the word, hunger.

What is it but *hunger* that makes one wild beast in the wilderness, or on the plains, or one monster in the sea, prey upon another? And that makes one fish devour another in the rivers and the brooks? Hunger—that insatiate yearning to satisfy the appetite given to everything in the animal catalogue to support life, according to the economy of nature and the purpose of the Creator.

The laws implanted for self-preservation reign and rule in animal life; the laws of God and the duties of his responsible creatures are described in the commandments communicated through Moses to the children of Israel; in the parables and precepts in the narrative of the earthly sojourn of the Son, which began at Bethlehem and ended at Jerusalem; in the sermon on the mount; and in the acts and epistles of the inspired apostles.

The Congress of the United States occupies a temple with doors open to the elect of the ballot; the members, admitted on tickets certified, arrive over roads direct from the election polls to the seats of law-makers; the Senators are received on certificates from legislatures chosen by popular vote, with delegated powers.

There is no hereditary seat in any American hall of legislation, nor anywhere in the American Union, and the term of office is limited.

Digitized by Google

The royal family and the hereditary nobles in England occupy the throne and high places under vested title wrested from the mass of population, who have no vote to cast for the chief of state, and rarely a chance to vote for a member of the higher branch of the national legislature; so that of the executive and legislative branches of the government two of the three are above and beyond the reach of the ballot, man's best, truest, most efficient friend. Nor does the occasional abuse of the ballot by law-breakers detract from its merit as a determinative power; for a not small percentage of the sins of the world lurk in abuses of the good things of the world. The ballot is as essential to freemen as stamens and pistils are to plants.

The ballot is the torpedo that imperialists and princes and the hereditary ranks have most horror of, for it demolished the empire of Napoleon III, and its business will be to clear the political waters of iron-clad dynasties, and, after boundaries shall have been rectified and armies and armaments reduced, keep open the fairway between ports in republics to the fleets of peace.

For a long time England has been the principal importer from the United States of fibrous staples and other raw materials, for manipulation with its home machinery and labor, for after exportation in miscellanies manufactured for its own account, carrying the trade in its own vessels both ways. England also is foremost in the elaboration of the metals, particularly iron, into ships, bridges, rails, implements, arms, utensils, cutlery, and tools. Moreover, England has meantime been principal banker, broker, carrier, stock and exchange dealer, and commission agent. But this mixed and multifarious business concentrated in an island in the sea, abreast the continent of Europe, and thence ramified over the earth in navigation channels as arteries ramify the body with blood from the heart, is in these times of railway, telegraph, steamship, and cablegram, dispensations in electricity and steam power, which put a rigging round the world, open to unexpected competition; and in some of its markets Great Britain has lost its supremacy and is being displaced and supplanted, particularly where native industrial skill is in training for advancement in diversified home occupations; whilst in other markets British domination is each year less absolute, and decrease and decline are more manifest in totalized results in quantities and values.

In truth, some of its continental competitors—Belgium is one—grown strong enough for aggression with specialties, have "carried the war into Africa"; for now there are articles of foreign manufacture on sale throughout Great Britain imported duty free, to the confusion of the doctrinaires of free trade, who prescribed for others what they did not expect to have to swallow themselves, in expectation of free trade limited to food imported for consumption, and to raw materials from foreign sources imported for exportation after manufacture into commodities, enhanced in value by British labor.

This system of trade, however, so self-assuring to the Briton as seen from his busy little island, did not include in the inventory of probabilities competitive free trade in his own bailiwick, from spectators of his lottery for the distribution of the prizes to himself, the blanks to his dupes. The Briton overrates himself and underrates his rivals, and hence where he was ahead on certain of the industrial courses, he is now only abreast with others equal in stamina and fresher in the race.

In the American Union, distinguished for its wealth of agriculture in corn, wheat and wool, cotton, rice, sugar, and tobacco, and for its plenitude of fuels, minerals, and metals, in coal, iron, zinc, lead, copper, sil-

Digitized by Google

ver, and gold; for its inland transportation mileage, comprising rail, lake, and river; and for its machinery, industries, handicrafts, and arts, there is an advanced opinion on the utility of protection to home labor, to make the nation strong and powerful and independent, and perpetually *insure the citizen* against European serfage in all its shapes.

Nor is this comprehensive tariff opinion a local or sectional sentiment; on the contrary, it is widespread and prevalent as well in the West as in the East, and will proselyte the cotton States, as they shall realize that without home manufactures they cannot develop into great commonwealths like other States not larger in territory nor more richly endowed with gifts in available resources.

Great Britain relied on protection in the infancy, and adhered to protection to the maturity, of its manufactures. But at the date of its qualified divorce from protection and its limited adoption of free trade, June, 1846, Great Britain had in prospect a population too large for its territory, measured by its capacity for agricultural production; whereas such a condition of affairs is not possible in the United States for centuries of time, because the Mississippi basin, for the subsistence of population, surpasses any corresponding region on the earth, per square mile, outside of China and Hindoostan; and is not surpassed by the Yangtsekiang valley with its rice-eating myriads, governed like bees and ants, and nearly as unlike American citizens as chop-sticks are unlike forks.

Cumulative American capital and accumulative American labor employed in the utilization of American home staples—of which there are enough for a catalogue of names—not in a local spot or section, but on all the watersheds and in all the basins, between all the isothermal lines which stripe the Union like its flag, are elements of competition suppliable from storages ample and sufficient, as the prices current in the home markets show, to regulate quotations to a scale equitable and just alike to investor and workman.

There is a rise and fall in prices influenced by the market between limits, like the ebb and flow of the tides influenced by the moon between limits.

There are exceptional differences in quotations in periods of speculation and depression, and there are exceptional differences between low water caused by an adverse wind and high water due to a freshet.

Quotations go up and down, like mercury exposed to heat and cold. And the weather of the market is variable in all cities, as the weather of the season is variable in all countries. Wherefore stability in prices need not be expected till the alchemist, who long ago appeared and disappeared, shall reappear reinforced, and demonstrate that base metal can be transmuted into gold, whereupon prices on the present basis of trade will cease to distract. But alchemy is behind, the millennium is ahead.

A diagrammatic table of the prices of English steel rails at London, from 1870 to 1879, has a fluctuating rise from 1870 to 1873, and a fluctuating descent thence to 1879, like the profile of a sharp mountain between two levels, one lower than the other. Scotch pig iron, early in 1873, sold for 145 shillings per ton; in July, 1879, for 40 shillings per ton, and in January, 1880, for 75 shillings per ton.

## XXIII.—THE TARIFF AND THE COMATOSE COTTON STATES.

A tariff is as much a protection to cotton mills at Atlanta as to iron works at Pittsburgh. And no State can retain within its borders the

Digitized by Google

savings of its own citizens unless it contain a city large enough to attract capital seeking investment, nor can a large city be built anywhere (except it be a national capital where there are public departments and disbursements) without industrial establishments to employ population in manufactures and useful arts. Wealth and numbers cannot be accumulated on a site destitute of facilities for the conversion of staples into commodities for market, with machinery and labor.

Havre is not Paris, Trieste is not Vienna, but each is the seaport of a nation where imports are entered and exports are cleared, for account of Austria and France.

Norfolk is a near-sea harbor of export, but Norfolk is a small city compared with up-river Richmond, both in Virginia; and New Orleans is a port of export, but New Orleans is outgrown by Saint Louis as a Mississippi river-side city.

Agriculture "pure and simple" will never develop the cotton, rice, and sugar States of the American Union into communities like the band of States from Massachusetts to Missouri.

All the six seaboard States between Florida and the Delaware Breakwater were of the original thirteen that declared their independence at Philadelphia in 1776, and ratified the Constitution of the United States, framed at Philadelphia in 1787. And yet, in 1870, the principal cities in the four original States side by side south of the Potomac contained but a small population compared with the principal cities in the four original States of contiguous territory north of the Potomac, as witness:

| 1870. Charleston, S. C | 48,956 | 1870. Philadelphia, Pa | 674,022 |
| 1870. Savannah, Ga | 28,235 | 1870. Baltimore, Md | 267,354 |
| Total, four cities | 141,675 | Total, four cities | 2,134,194 |
| | | Deduct | 141,675 |
| | | Difference due to diversified developments and increments | 1,992,519 |

Of the fifty principal cities in the United States in 1870, Richmond was the twenty-fourth, Charleston the twenty-sixth, Savannah the forty-eighth; Wilmington, N. C., had only half the population necessary to rank it the fiftieth, for the fiftieth city, Fall River, Mass., contained 26,766 of population. Massachusetts, indeed, contained eight of the fifty principal cities of the Union in 1870—Boston the seventh, and seven others. New York also contained eight of the fifty principal cities, including the first and the third.

Had Virginia been less political and more commercial—and Virginia had the love of Washington, who was a pioneer advocate of internal improvements, anxious to connect the Potomac River with the Ohio River by canal, as the Hudson River was connected with Lake Erie by canal at a later day—Virginia would at the present time contain a very large population and have a seaport city and industrial mart to be proud of, inside the capes of Chesapeake Bay. Not one of the States contains as many natural harbors in tide water as Virginia, and yet the principal Chesapeake city, Baltimore, is in Maryland, up near the head of the bay, and distant eight times as far from the capes as Norfolk.

Contrast Massachusetts, New York, Pennsylvania, New Jersey, and Maryland with Virginia, North Carolina, South Carolina, Georgia, and Alabama, and credit the more rapid growth of the five agricultural, in-

Digitized by Google

dustrial, and commercial States, than the five States which are agricultural only, to the manufactures and trade fostered north of Washington and neglected south of Washington.

A comparison for contemplation:

| Square miles. | Name of State. | Census of 1790. | Rank. | Census of 1870. | Rank. |
|---|---|---|---|---|---|
| 7,800 | Massachusetts | 378,787 | 4 | 1,457,351 | 7 |
| 47,000 | New York | 349,120 | 5 | 4,382,759 | 1 |
| 8,320 | New Jersey | 184,139 | 9 | 906,096 | 17 |
| 46,000 | Pennsylvania | 434,373 | 2 | 3,521,951 | 2 |
| 109,120 | Total | 1,337,419 | | 10,268,157 | |
| | | | | 1,337,419 | |
| | Increase in eighty years (669 per cent.) | | | 8,930,738 | |
| 38,348 | Virginia | 747,610 | 1 | 1,225,163 | 10 |
| 23,000 | West Virginia (out of Virginia, 1862) | | | 442,014 | 27 |
| 50,704 | North Carolina | 393,751 | 3 | 1,071,361 | 14 |
| 34,000 | South Carolina | 249,073 | 7 | 705,366 | 22 |
| 59,268 | Georgia | 82,548 | 13 | 1,184,109 | 12 |
| 205,320 | | 1,472,982 | | 4,628,013 | |
| 109,120 | | | | 1,472,982 | |
| 96,200 | Increase in eighty years (214 per cent.) | | | 3,155,031 | |

It will be observed that the area of the four original States south of the Potomac is 205,320 square miles, against 109,120 square miles in the four original States north of the Potomac; so that in territory the Southern States named are 96,200 square miles, or 88 per cent., larger than the Northern States named; and also that in 1790, the date of the first census taken by the United States, Virginia, the mother of Jefferson, who wrote the Declaration of Independence, and of Washington, who was Commander-in-Chief of the American armies throughout the seven years' war for independence, contained more inhabitants than New York and Massachusetts together. Whereas, in 1870, New York and Massachusetts jointly contained 5,840,110 of population, whilst Virginia and West Virginia jointly contained only 1,667,177 of population.

## XXIV.—THE EARNERS AND DEVOURERS IN GREAT BRITAIN.

[Extract of a "Commercial History and Review of 1878," relating to the United Kingdom of Great Britain and Ireland, copied from a supplement to the London *Economist* of March 8, 1879.]

The number of persons engaged in the various industries, returned by the census of 1871, plus 7 per cent. for the increase of population,* appears to be as follows:

| Age. | Men. | Women. | Total. |
|---|---|---|---|
| Under 20 | 1,511,000 | 1,219,000 | 2,730,000 |
| 20 and upwards | 6,310,000 | 2,469,000 | 8,779,000 |
| Total | 7,821,000 | 3,688,000 | 11,509,000 |

*"The population in the United Kingdom in 1871 was 31,513,000, and in 1878 33,799,000."

Digitized by Google

Classified according to their occupations, the number stands as follows:

| Occupation. | Men. | Women. | Total. |
|---|---|---|---|
| Professional, dock-yard, police | 282, 000 | ..... | 282, 000 |
| Domestic service | 203, 000 | 1, 849, 000 | 2, 052, 000 |
| Commercial carriers, &c | 689, 000 | 61, 000 | 750, 000 |
| Agricultural | 1, 721, 000 | 178, 000 | 1, 899, 000 |
| Industrial | 4, 926, 000 | 1, 600, 000 | 6, 526, 000 |
| Total | 7, 821, 000 | 3, 688, 000 | 11, 509, 000 |

| | | |
|---|---|---|
| Here we have it of record that in 1878 the population of the United Kingdom of Great Britain and Ireland was | | 33, 799, 000 |
| Classified according to occupation, 34 per cent | | 11, 509, 000 |
| Unclassified, 66 per cent | | 22, 290, 000 |

| Leaving 94.4 per cent | | 31, 900, 000 |
| Deduct "industrial" classification, 19.3 per cent | | 6, 526, 000 |
| Consumers of "agricultural" and "industrial" products, 75.1 per cent | | 25, 374, 000 |

## Census of the United States, 1870:

| | |
|---|---|
| Total population | 38, 558, 371 |
| Population ten years old and over (73.21 per cent.) | 28, 228, 945 |
| Male population ten years old and over (50.51 per cent.) | 14, 258, 866 |
| Female population ten years old and over (49.49 per cent.) | 13, 970, 079 |
| Engaged in agriculture: | |
| Male | 5, 525, 503 |
| Female | 396, 968 |
| Total | 5, 922, 471 |
| Percentage: | |
| Male | 93.3 |
| Female | 6.7 |
| Total | 100.0 |
| Engaged in agriculture: | |
| From 10 to 15 years old | 499, 558 |
| From 16 to 59 years old | 4, 959, 890 |
| From 60 and over | 463, 023 |
| All ages | 5, 922, 471 |

The census of the United States in 1880 will develop a progress in agriculture since 1870 surpassing any previous decade; for America is

Digitized by Google

now a source of supply of food to Europe, which is peopled in disproportion to the measure of its crops, from the Baltic Sea to the Bay of Biscay; but in America hunting grounds and buffalo pastures undergo rapid conversion into grain fields, and acreage cultivable is unbounded in the immensity of the public domain.

Great Britain, in reverse of this, is seawater-bound on all sides, and trans-channel neighbors have cause for watchfulness if not distrust, for "British interests" include whatever is covetable, and are susceptible of latitudinous and elastic definition.

The site of the American Union carpeted and furnished by the hand that made the firmament a vault for adoration, is partitioned into States across a continent abounding in opportunities for the adjustment of occupation to the condition of the markets and the prospect of the times, in matters appertaining to agriculture in all the varieties of production, within five of the eight zones of vegetable life; and to those trained to manufactures, or the mechanic arts, or acquainted with mines, American citizenship is a passport to move from State to State, and a license to make a change of base, according to volition, necessity, or circumstance.

Thus America is in verity "a land of promise" to a subject who has aspirations for deliverance from thraldom in Europe, equivalent to serfage. And what that important factor in the spread of civilization, the honest immigrant who crossed the ocean buoyed by his manhood resolution and the hope which dwells in faith, when a sea voyage was a hardship and a peril, to here enjoy freedom in a strange land, has accomplished in his person and in his posterity, in adopted citizenship for himself and in children native born to a national inheritance common to all without caste or class in the civil code, is manifest to the hereditary bondsmen of the Old World, in the performance of a free people insulated from Asia and Europe, and established in a new Canaan not bounded by Dan and Beersheba, but by the Atlantic and Pacific Oceans, between Canada and Mexico.

## XXV.—JOHN RANDOLPH NOT A PROPHET, BUT A VIRGINIAN IN ERROR.

The name of John Randolph, of Virginia, is conspicuous in Congressional annals, and familiar to the American people. But his oratory surpassed his statesmanship, and to his eccentricity was due his notoriety among his contemporaries. Nevertheless the true rule of construction is to judge a man according to the dates of his avowed opinions; and if subsequent developments and events confute his assertions and confound his predictions, the spuriousness of his preceptorship is made apparent, and he takes rank among the false prophets, whose post-date followers consist of short-sighted observers, faulty thinkers, and credulous dupes.

At the time that John Randolph uttered his philippic in Congress againstthe Ohio River as a stream, "frozen up all the winter and dry all the summer," and dogmatically avowed that "Russia, with the exception of few of her provinces, consists, like the interior of America, of a vast inland continent desolated and deformed by prairies or steppes," and denounced a tariff, Great Britain imposed a duty of $32.50 on foreign iron bars imported in British vessels, and $39.62 if imported in foreign vessels.

His assertion, too, that Philadelphia could not "become a great manufacturing town, for which she wants all the elements of climate, *coal*, and capital," is a mournful proof of his restricted prescience, inasmuch

Digitized by Google

as Philadelphia to-day is America's fair ground, with exhibition buildings musical with machinery and men, in manufactures, mechanics, and arts, which here play the principal parts; for, indeed, articles in number beyond any other place—even Paris—are made for market in Philadelphia, by mechanism and hand-power, from a marine engine and its appurtenances to a surgeon's instrument in optics; from a steamship to a shell boat; from a wagon on wheels to a watch with wheels; from a boot to a bonnet, a rope to a ribbon; from hosiery for the foot to false hair for the head; from cloths, carpets, chandeliers and curtains, to notions, nicknacks, gewgaws, gimcracks, bric-a-brac, and toys; from things cheap and costly, made to wear for comfort and health, to things beautiful and becoming, made for embellishment and admiration. Painting and sculpture; and all kinds of contrivances, mechanical and artistic. Also jewelry, tailoring, millinery and mantua-making; including in the catalogue which appertains to Philadelphia as the city of arts in America, the innumerable manufactures of wool, silk, cotton, and wood; and of the metals precious and base, and the alloys bronze and brass.

Philadelphia is the Union headquarters and forecasted continental focus of the manufactured utilities of our favored America, reclaimed from nature by a type of man advanced beyond the rest of the world in civilization, patriots and statesmen and good people who heeded the sayings of the Saviour in the sermon on the mount and elsewhere, and avowed belief in the doctrines of the New Testament, when they built and launched the republic, a masterpiece ship of state, approved by a century of service.

In Christian America, organized for advancement, Philadelphia is a hive of industry where "busy bees" improve the "shining hour," to provide for current wants, and for winter and old age. And what is a city if not a hive with homes in honeycombs and cellars like cells, full or not full according to the harvest season and the succulency of the times?

[Extracts of a speech of John Randolph, of Virginia, in the House of Representatives of the United States, April 15, 1824, on a pending tariff bill.]

"The climate of this country alone, were there no other natural obstacles to it, says aloud, You shall not manufacture! * * *

"I know that a great deal will be said of our majestic rivers, about the father of floods and his tributary streams; but, with the Ohio frozen up all the winter and dry all the summer, with a long, tortuous, difficult, and dangerous navigation thence to the ocean, the gentlemen of the West may rest assured that they never will derive one particle of advantage from even a total prohibition of foreign manufactures. You may succeed in reducing us to your own level of misery; but if we were to agree to become your slaves, you never can derive one farthing of advantage from this bill. What parts of this country can derive any advantage from it? Those parts only where there is a water-power in immediate contact with navigation, such as the vicinities of Boston, Providence, Baltimore, and Richmond. Petersburg is the last of these, as you travel south. * * *

"But, sir, I must not suffer myself to be led too far astray from the topic of the peculiar advantages of England as a manufacturing country. Her vast beds of coal are inexhaustible; there are daily discoveries of quantities of it, greater than ages past have yet consumed; to which beds of coal her manufacturing establishments have been transferred, as any man may see who will compare the present population of her towns with what it was formerly. It is to these beds of coal that Bir-

Digitized by Google

mingham, Manchester, Wolverhampton, Sheffield, Leeds, and other manufacturing towns owe their growth. If you could destroy her coal in one day, you would cut at once the sinews of her power. * * *

"There, though all men are on a footing of equality on the highway and in the courts of law, at mill and at market, yet the castes in Hindoostan are not more distinctly separated, one from the other, than the different classes of society are in England. * * *

"Russia, with the exception of a few of her provinces, consists, like the interior of America, of a vast inland continent, desolated and deformed by prairies, or steppes, as they are there called, inhabited by a sparse population. * * *

"Men in hunting shirts, with deer-skin leggins, and moccasins on their feet, want protection for manufactures; men with rifles on their shoulders and long knives in their belts, seeking in the forests to lay in their next winter's supply of bear-meat. But it is not there alone the cry is heard. It is at Baltimore—decayed, deserted Baltimore, whose exports have more than one-half decreased, while those of Boston have four times increased—it is decayed and deserted Baltimore that comes here and asks us for protection of those interests which have grown up during the late war—privateering among the number, I presume. Philadelphia, too, in a state of atrophy, asks for the measure—Philadelphia, who never can, pass what bill you please, have a foreign trade to any great amount, or become a great manufacturing town, for which she wants all the elements of climate, coal, and capital. * * *

"The manufacturer of the East may carry his woolens or his cottons, or his coffins, to what markets he pleases—I do not buy of him. * * * Whatever may be said here of the 'misguided counsels,' as they have been termed, of the 'theories of Virginia,' they have, so far as regards this question, the confidence of united Virginia. We are asked, Does the South lose anything by this bill—why do you cry out? I put it, sir, to any man from any part of the country from the Gulf of Mexico, from the Balize, to the eastern shore of Maryland—which, I thank Heaven, is not yet under the government of Baltimore, and will not be, unless certain theories should come into play in that State, which we have lately heard of, and a majority of men, told by the head, should govern—whether the whole country between the points I have named is not unanimous in opposition to this bill."

In 1824, when John Randolph made the extraordinary speech quoted from, Virginia contained a larger population than Pennsylvania, and was only exceeded in population by the State of New York.

In 1870, Virginia and West Virginia, whose joint population was 1,667,177, were exceeded by New York, Pennsylvania, Ohio, Indiana, Illinois and Missouri, all of which six connecting States contain mineral deposits and promote domestic manufactures.

Randolph credited to the "beds of coal" in England her "manufacturing establishments," but he was oratorically oblivious of the coal of Pennsylvania, notwithstanding the sale and use of Schuylkill Lehigh coals in the Philadelphia tide-water market prior to 1824, and the fact that, in 1824, works were in process of construction to increase the delivery of Pennsylvania coal to consumers.

The Ohio River, too, albeit it may sometimes suffer from low water in midsummer or later, and be frozen in midwinter, has in spring and autumn, and during weeks between, periods of water supply ample for steamboat navigation long enough to accommodate an immense traffic,

Digitized by Google

and give the stream rank and consequence among rivers available for cheap transportation.

Pittsburgh, Cincinnati, Louisville, and other Ohio River towns, had grown into importance on Ohio River commerce, before a railroad was built in the Ohio valley, and what coal and iron have done for England in its industries, coal and iron are doing for States in the Union that appreciate coal and iron, and have practical wisdom to utilize their merits.

There is a commercial affinity between commodities convertible into coin, currency, or exchange, for work is rewarded out of what it produces above and below ground, for the market which is of the circumference of the earth, and where a population accumulates earnings, it draws its supplies from all sources accessible by land and by sea. Commerce is essentially cosmopolitan, and its base is the surplus of production over local consumption; for if neighborhoods did not produce in excess of necessity for subsistence, they would have nothing to sell, no means to buy the surplus products of other places.

The territory between the Potomac and the Mississippi abounds in staples of agriculture produced in excess of local needs, and which therefore are available for exportation to domestic and foreign markets; yet within this territory only a small portion, or percentage barely appreciable, is manipulated into yarn or piece goods, but is sent away in cotton fiber in bales of raw material to other States and to foreign nations for manufacture, some of it to come back in textile fabrics enhanced in cost by machinery and manual labor, both foreign.

The exportation of American cotton fiber to Great Britain commenced about the year 1787 (in which year the Constitution of the United States was framed at Philadelphia), and to this day the cotton-growing region south of the Potomac exports cotton fiber to England, and imports cotton goods from England.

Official value of cotton goods, yarn, &c., exported from Great Britain:

| | |
|---|---|
| 1697 | $29,575 |
| 1701 | 116,165 |
| 1751 | 229,930 |
| 1780 | 1,175,000 |
| 1790 | 8,311,845 |
| 1800 | 27,032,505 |
| 1820 | 102,549,630 |
| 1847 | 116,666,125 |
| 1860 | 260,062,150 |
| 1872 | 400,500,000 |
| 1876 | 338,000,000 |
| 1878 | 329,500,000 |

The cotton goods and yarn exports trade of Great Britain is substantially comprised in the last hundred years.

Surely the cotton States ought, by this time, to be satisfied that it is their interest to encourage the home manipulation of cotton fiber into domestic cotton manufactures. The States are seeded with cotton mills, which are operated at a profit to their owners; and if anything can keep the cotton States from growing rich and great, it will be the substitution of free trade for protection, and the continued neglect of their deposits of coal and iron, two staples which are bases of British manufactures, and two elements in the progress of other States which grow crops and establish industries to populate cities and keep capital at home.

Look at Pittsburgh, Cincinnati, Cleveland, Indianapolis, Chicago, and Saint Louis, and judge each by its resources without, its establish-

Digitized by Google

ments within. Why do not the aunt States between the Potomac and the Mississippi emulate the niece States between the Ohio River and the lakes? Why do the States between Pittsburgh and Denver develop and progress more rapidly than the correlative States between Washington and New Orleans? The former abut on the ocean, and have harbors open to the maritime commerce of the world, and also rivers that descend from the Allegheny water-shed into the interior basin of the continent; whereas the latter, though abundantly endowed with physical advantages, are not richer in natural resources, nor blest with a better climate than their seaboard aunts. But the Western States, though they do not forget the past, do not thespianize abstractions nor resurrect the skeleton of lost causes out of appropriate graves. On the contrary, the Western States are quick and sure-sighted to turn circumstances in the times and signs in the political zodiac to practical account, in sanguine expectation and forethoughtful preparation for the harvest which is ahead, for those who know when to reap and how to combat adversity to retrieve misfortune; along with the honest and industrious multitude of soil tillers, miners and herdsmen who consort with nature, including explorers, inventors and designers who consort with science, and machinists, artisans, and promoters of improvements and manufactures who consort with art.

Where the citizen is on the watch for opportunity for profit or advancement, the experiences of past time are treated as a library book of receipts for refreshment of the memory and irrigation of the mind, because in practice judgment rather than experience is his guide, and he trusts more to promptitude than to procrastination.

## XXVI.—WHY IT PAYS BETTER TO MANIPULATE HOME STAPLES THAN IMPORT COMPETITIVE FOREIGN MANUFACTURES.

New York, the postal, financial, commercial, maritime, and periodical center of the American Union, is a dual city, domestic in its proclivities, foreign in its politics, a paradoxical condition which time will end—as the boys in the public schools grow into men.

London accumulated population and wealth mainly on profits derived from exported manufactures and imported luxuries and necessaries, not omitting raw materials like cotton and wool for manufacture into goods for home consumption and exportation to foreign lands. But the handling of foreign goods between ship and shelf is a process which costs few dollars and gives occupation to few hands compared with the cost of labor bestowed on iron between its primitive condition in the ore bed and its final consumption in anchors and needles and a thousand things between.

And so likewise does the labor bestowed on a bale of cotton in the processes of conversion into muslin, calico, and thread enhance its value to the manufacturer and its cost to the consumer. The same, too, is true of wool, flax, and other fibrous products of the ground.

And as the manufactures of iron, cotton, and wool comprise most of the volume and value of British exports, the development of English manufactures stimulated the expansion and increase of London, the capital city of the kingdom.

And what is true of London is equally true of New York City, except that London is the seat of Parliament and New York is not the seat of Congress. But New York has a continent in its rear, and London is on an island in the ocean.

Digitized by Google

Contrast the sum disbursed in New York City for handling grain shipped on through bills of lading from the West to Europe, and for hauling from steamship to railway station imported goods shipped on through bills of lading from Europe into the Mississippi Valley, with the sum disbursed for the labor of a thousand persons employed in an industrial establishment in New York City or its vicinage. Employés must have houses to live in, clothes to wear, food to subsist life, and thus home industries create home markets.

The States east of Ohio are permanent markets for the agricultural products of the States west of Ohio. And to Chicago, or any other interior trade center, a machine shop, cotton factory, or woolen mill, or iron-works is of more profit than a grain elevator, efficient as the latter is as an auxiliary in transportation; for skilled labor evolves textile fabrics out of cotton and wool fiber and transforms woods and metals into furniture and hardware; whereas unskilled labor merely moves commodities at clearance and transfer stations and terminal destinations.

Thus the locomotive works at Paterson are of more consequence to New Jersey than the coal piers at Jersey City and Hoboken, where fuel is dumped into cars and boats and coastwise vessels.

Coal in place in the mine is worth per ton only a royalty of twenty-five to fifty cents; but when interest on colliery plant, cost of mining, labor and charge for transportation are added, the price of coal to the consumer at tidewater represents the cost of production made up in major part of the price of labor, and in lesser part of margin of profit to cover exhaustion of mineral, depreciation of works, and interest on investment. All these are elements of cost in coal at market place.

A locomotive engine is a representative of labor, from the iron-ore pit to the railway track, for the furnace and rolling-mill and the construction shop are between the ore pit and the head of a train. Wherefore, primitive in the ground, the material in a locomotive is not worth one per cent. of its price to a railroad company.

Every industry has its ramifications, and these harmonize in a community of interests and avocations, including agriculture; for distant markets are beset with uncertainties, as wheat is the product of many lands, and a succession of poor harvests in the same country is not likely to occur twice in one decade in the ordinary course of nature.

That New York City contains advocates of free trade is true, and that Philadelphia contains advocates of free trade is likewise true, but in the latter city they are as few as sane persons in insane asylums or innocent persons in prisons; whilst in the former city they make up in noise what they lack in numbers; for intelligent adopted citizens have knowledge of the European labor market, and understand how and why, where the working force is too large for constant employment on the limited work to do, there is no option but minimum pay or idleness; for Europe is unlike America in having no opportunities for alternative occupation, and hence here, when one pursuit is overfull, another pursuit is only part supplied, possibly in the same neighborhood or State, or perchance in a distant locality, where population is not crowded, if not sparse.

This alternative occupation is illustrated in the summer harvester, who in winter is a wood-chopper, whereby he finds employment and obtains compensation throughout the year.

Adaptability to a new base is an American characteristic, wherefore it is easy to find an American workman whose labor-life is subdivided

Digitized by Google

into as many callings as there have been panics and depressions in his experiences and wrestlings with fickle fortune.

In Europe, where all the walks and ways of livelihood are full to overflowing, a workman who steps down and out of his place can find no vacancy to fill, for there is no room unoccupied anywhere. And herein is one of the evils of overcrowded population, a problem for Great Britain to solve, albeit the attempted solution may compel concession from the landed aristocracy that will tend to extinguish the feudalism which oppresses subjects into serfs in everything but name. May Providence hasten this deliverance to the poor man!

Where there is a concentration of land-ownership in a caste created by law or patent and called noble to exalt it, and great wealth is gathered in few hands, "the rich get richer and the poor become poorer," in ordinary times; but when domestic discontent ends in overturn, upheaval, or revolution, and reconstruction follows, then a new distribution of public honors stimulates the vitalizing arterial red blood in the masses to nobler aspirations and higher hopes. The venous "blue" goes back and is dyed over again.

The difference between the citizens of France and the subjects of England widens with every year; for in France investors increase in number, whereas in England investors decrease in number; showing that the laws of France tend to the distribution of means among the many, the laws of England on the contrary to the concentration of wealth in the ruling classes and the spread of poverty among the masses.

Citizen workmen of America, look to Congress! Be assured that free trade will give the American market to Europe, or reduce wages in America to the European standard of starvation pay. England at times contains thousands of men idle, and thousands of men on short hours, or who have work four days, more or less, in a fortnight. This condition of the labor market leaves the English workman no option but to accept the compensation offered him; for, although we read of arbitration between committees of employers and committees of employés in the mutuality of interest in conciliation, and all that diplomatic preface, still it must be considered that, in dissemblance and finesse, the frank workman is not a match for a maneuvering master.

Look at the conventions held by political parties, and observe how committees manipulate platforms and fix and refix "the slate," according as committee men are dexterous or dull. This, to be sure, is called *management*, and so it is, to the winning side; and what the losing side may call it is of little consequence after negotiation is ended, and the conclusion reached is binding on both sides.

Citizen workmen of America must remember, moreover, that the opulent can afford to be indifferent in a struggle between labor here and labor abroad, because wealth seeks affiliation with fashion and force, and where there are titled swells there will be rich snobs.

As riflemen practice to hit the bull's-eye on a target, so the dealer, with whom a transaction is a shooting match, aims to hit the dollar.

The maker of an article is prone to meditate the process of its construction and inquire of himself concerning the possibility of improvement; whereas the dealer only cares about what he can get an article for, and what can he get for it.

The citizen workmen of the United States, and these comprise its body and its brain, for everybody in the Union, except here and there a drone, works in some way, and so earns what he wears and swallows, must take heed lest doctrinaires in Congress, who walk in a light radiated from a

Digitized by Google

magnifying reflector behind the sun, vivified by Edison's electric illuminator; and foreigners and agents of foreigners, along with an occasional indigenous snob, in town and country north of Washington and west of Maine; and Bourbons and Pocahontasians and abstractionists between the Potomac and Mississippi, jointly intrigue to degrade citizenship in America to the bottom level condition of serfage in Europe, the inevitable downward transition if protection be surrendered to free trade; as where there are hereditary orders and honors there are resultant underneath castes and classes; and where there are legalized ranks graduated to a scale, royalty will cap the column and labor constitute the bottom stone.

Great Britain, which, of all the powers, is the only one that meddles in American Union affairs, is the chameleon of dynastic statecraft, and can wear as many colors as there are "British interests," supposititious and real; but for reciprocity with the United States, Great Britain is incapable and impotent, because it has nothing of its own to proffer that is not already possessed by the United States. Moreover, reciprocity is mutuality in good intentions and equality of consideration; but Great Britain buys American cotton because it cannot grow cotton equally good in India, and Great Britain buys American breadstuffs and provisions because its population has appetite for consumption beyond the capacity of its agriculture for production. Its acreage it cannot increase, though its population has been augmented till now it is redundant.

As to what Great Britain asks for, through its many mediums of communication, including after-dinner speeches made for the advertisement of ducks in peacock feathers on this side and parliamentary owls and literary parrots of the other side, it will suffice to say that what is omitted is beyond the horizon of its covetous eyes and the range of the telegraph; for Great Britain is for self, self, self, here, there, and everywhere, in both hemispheres; and consequently it is not satisfied if it cannot have its own way in the human family, where it disturbs the rest of the strong with its bluster and show of false teeth, and confiscates the valuables of tribes defenseless against modern guns to its own bottomless pockets.

History has repeated itself many times since Babylon, the typical trade center, was moved by events between intervals via Carthage, Venice, and Antwerp to a temporary base on the Thames, whence, if the Congress of the United States continue a rational body of law-makers, it will be ferried over a Jordan wider than the original, to the new continent which is midway between the two oceans that roll between London and Pekin.

England imposes a *tariff on the ballot* to protect its royal dynasty and hereditary lords from the elective franchise, and in obliquity to shame urges free trade in the industrial arts with American citizens whose opinion is the law of their land, and who are themselves the state, exalted above subjects considered chattels of a crown, bonded for service to superiors in rank, but not superiors in manhood stamina, mental might, and moral worth.

Think, think, and consider the difference between the American citizen and the European subject, and pause and weigh the responsibility you are under to God and to mankind, ye Senators and members of Congress, when in session at Washington, and during recess at home.

1402 SPRUCE STREET, PHILADELPHIA, *January*, 1880.

VIEWS OF THE "JOURNAL OF COMMERCE."

The CHAIRMAN. We have also received from the editor of the *Journal of Commerce* (who had been invited to appear before the committee, as all the journalists of the city have been, or are invited to appear and express their views before the committee, or assist it in any way they can in its investigation) several important articles which have appeared from time to time in the *Journal of Commerce*, bearing on the subject-matter of the resolution which directs the investigation, and which, as he cannot appear personally by reason of his engagements, he wishes to be considered by the committee as a statement of his views, suggestions, and recommendations.

The letter and accompanying articles are as follows:

OFFICE OF THE NEW YORK JOURNAL OF COMMERCE,
76 BEAVER STREET (CORNER OF HANOVER),
*New York, September* 11, 1883.

HON. AND DEAR SIR: I am so intensely occupied in the discharge of my duty as editor-in-chief of a large daily paper that I cannot spare the time, except at great personal sacrifice, to attend a session of your committee. My chief assistant is spending several months in Europe, and I must write all the editorials in our paper with my own hand.

I have done what I could to throw light, through our columns, on the subjects you are investigating, and I inclose several articles, asking that they be accepted as a substitute for my personal attendance.

Thanking you for the courtesy of your letter, I am,

Yours, very respectfully,

DAVID M. STONE,
*Editor-in-Chief.*

Hon. H. W. BLAIR,
*Chairman Senate Committee, &c.*

[From the Journal of Commerce, August 8, 1883.]

DEFENDING THE STRIKERS.—The partisan politician is earnest and vociferous in defense of strikers and their supposed rights. His gains, as he believes, all lie on that side. The employers are few and the strikers are many, and the latter are very strong in their prejudices; hence, if he would secure the popular vote he must side with the majority. The newspapers that support the unions and their liberty to strike, may be governed solely by principle and fancy that they are only in favor of the largest freedom in a free country; or in addition to this they may believe that their issues will find the largest sale if they advocate the popular side. We have seen grocery stores "boycotted" for selling yeast cakes made by a firm whose hands had left them in an unsuccessful strike, and porter-houses put under the same ban unless they declined to sell the beer made by an obnoxious brewer; why should not a newspaper suffer if its editor dared to speak his whole mind concerning the spirit which promotes and sustains these conspiracies?

Besides the politicians and the public journals there is a class of people whose sympathies with workingmen are so strong that they feel like sustaining them even when they cannot justify their action, and there are large numbers of honest toilers who themselves give in their adherence to the unions, and contribute both in money and influence to their support, without stopping to question the methods by which these

Digitized by Google

organizations propose to defend the rights of labor. The sole avowed object of the unions is to help the workman to improve, if possible, his condition and prospects, and to defend him against oppression and injustice. It is hard to ask one who lives only by his labor to turn against a movement that seems to be wholly in his interest, and not a few who cherish many misgivings about the action thus recommended are afraid to speak out their convictions lest they injure a cause that makes its sole appeal to them in defense of their rights.

We have letters from many of these who have read our recent articles on this theme, and who, we can see by their questioning, have been thereby a little shaken in their allegiance to the authority which proposes to speak for them and to regulate their employment. We are glad to notice that some, at least, of the workingmen are not too much blinded by passion and prejudice to listen to the voice of reason, and we desire to call their attention to some further particulars in the evidence that the spirit of strikes, instead of being in the interest of freedom, is the spirit of intolerance and oppression.

Take the strike of the telegraph operators: On the whole the men have shown unusual forbearance and good temper. There have been few cases of violence to non-union workmen, and but little bitterness of language toward their late employers. The man who, at their earliest public gathering, avowed that he and his fellows did not hold the telegraph lines sacred, and that before they would fail in the strike the wires should go down, was not tolerated by the majority present, and his purposes and threats were disavowed and condemned. There have been cutting and tangling of the wires, but not on any large scale, showing that this exhibition of the spirit of revenge was the work of a few desperate or misguided men.

But there was a storm last Thursday, and there was open and public rejoicing all over the country among the strikers in the avowed hope that many of the wires would thus be leveled, and the work of the company be greatly retarded. The public suffering was not thought of any more than it was on the day these strikers suddenly left their posts with messages half sent, on which a thousand human hearts were wrung with anguish. Between pulling down the wires with their own hands and praying for a storm to level them, or rejoicing in such wide-spread destruction, there is a narrow gulf, easily bridged and divided by a single step. This hope of damage to the wires was not the expression of a desperate man, but a very general outspoken subject of rejoicing among the entire brotherhood.

The other day there was a strike in a newspaper office at San Francisco. The *Call* employed twenty-five or thirty printers, of whom only a part belonged to the trades union. After proselyting was carried to its fullest extent nine were found to be unyielding, preferring their own liberty and independence to the slavery of the typographical society. The union men then "struck" for the dismissal of these nine independents. It was not a strike for wages. It was not a demand for shorter hours. It was not a desperate remedy for oppressive rules. It was not a revolt against any form or appearance of injustice. It was a strike in behalf of intolerance. It was a blow in favor of despotism directed against the most sacred personal rights; not labor against capital; not the weak combining against the strong; not the slave, stung to madness, turning against his tyrannical master, as the shouters represent the strike in general. It was the tyranny of a majority against the equal rights of their fellows. It was monopoly against liberty; the organized band who sought to wreck the life and hopes of their independent peers.

Digitized by Google

The men denounced were not incompetents working for lower wages. They were skilled craftsmen, reputable and equally respectable, but they must not work for a living because they would not join the typographical society. Turned out of that office, forbidden to work in other similar establishment, they were to be, as far as the union could ordain it, fugitives and vagabonds on the face of the earth, their families and themselves to be fed by the hand of charity, or to be driven out from among men to die of starvation and leave their bones to whiten some desert plain.

This is the spirit more or less freely exhibited in every strike. Sometimes the movement is not against non-union men, but against members of a union differently organized. For instance, there are two associations of cigar-makers. One is the International Union and the other the Progressive Union. The latter is the fiercer and more ultra body. In a factory where they were in a majority they insisted that the members of the former should be expelled. The cigar-makers (employers) have an organization quite as indefensible, we suppose, as the associations among the workmen. They notified the two bodies of unionists that if they did not settle their difference they would close all their shops. The men refused, and all work stopped. It was a "lock-out" in place of a strike. After weeks of idleness and much negotiation it was supposed at the close of last week that the difficulty was arranged. The shops were opened Saturday morning, and the men gladly went to their work. But the same Mordecai remained unsubdued in the King's gate. At one factory twelve of the best workmen belonging to the International Union had been retained. Whereupon all the Progressive men put on their coats and went out on a strike. Wages and hours and rules and everything else they had at their own dictation, but they could not allow twelve men of another union to work for a living in their presence.

From these illustrations our friends who have discussed this subject in their letters to us will see that they are not exactly the "sons of liberty" and we, who condemn strikes, the "champions of oppression." The little finger of a model striker is thicker than the loins of the most overgrown of the "greedy capitalists" when it comes to a question of intolerance. The man who claims the right to prevent a fellow laborer from earning his bread by honest toil because he does not happen to agree with him in the pronunciation of his shibboleth is not in any sense a son of liberty, but is in spirit the most cruel tyrant the world has ever known. He kindles the flame of persecution with less to provoke or justify it than any who ever bound his victim to a stake. The slightest scratch on the skin of the ordinary striker reveals this Tartar in the blood, and those who defend and justify the workmen in their strikes are greatly responsible for the wrong and suffering that follow.

[From the Journal of Commerce, August 13, 1883.]

THE RIGHT TO COMBINE.—The *New York Times*, in upholding the right of workmen to combine in order to force an advance in wages, has the following: "The only 'rule' that we know of * * * is the right of free contract. A man who is receiving a dollar a day has a perfect right to say that he will not work for less than two or for less than two hundred, or that he will not work at any price, and so long as he and his family do not become chargeable upon the public it is nobody's business how long he refrains from working, and there is no power which can lawfully compel him to resume work. And what one man may do, a few dozen or a few hundred men employed in factories or workshops

Digitized by Google

may do, or the '10,000 to 40,000 men whom some of our modern corporations now employ.' Why not? What is the difference?" Is there no difference? A man is dissatisfied with his treatment by his grocer, and resolves to abstain from trading with him. Thus far he may be right. But he wishes to force the grocer to change his method of doing business, or to drive him from the trade, and he therefore urges other customers to combine with him to effect that object. These men all conspire together for this purpose. They buy nothing themselves, and they hang around the grocer's premises to keep new customers from calling. They may not resort to any acts of violence, such as breaking in his windows, upsetting his fruit baskets, taking the wheels off his delivery wagon, or pulling the plug out of his vinegar barrel. They may simply content themselves with combining to withhold their own custom, and in persuading, as far as arguments (and a few wholesome threats) will go, all other families from buying anything at his store. Is there no difference between the individual action and this conspiracy to ruin the dealer unless he will yield to their demands?

An employer wishes to reduce the wages of his men. He asks them to consent to such a reduction and they refuse. He deems it essential to the continuance of his business, and as they decline to work for any lower wages he discharges them and shuts up his shop. But before he does this he visits all of the employers in the same line of business throughout the country, and they all agree with him that they will not give a day's work to one of these discharged men, and that they shall thus be forced to go back into the shop at the lower wages offered them or remain idle. They go further and pledge themselves to pay a certain portion of their profits while his shop is closed, he agreeing to do them in turn the like favor until the men in all the shops are at work on lower terms. Or there may be a lock-out at once of all the shops under a combination to force the wages down, all of them taking advantage of a dull time, and having prepared beforehand a considerable available surplus of manufactured products.

We do not believe that there is any trades union in the country which would not denounce such combinations among employers as the height of oppression and a robbery of the laborer of his just hire. We would not guarantee the safety of premises from which workmen had been ejected in pursuance of such a combination for the highest premiums ever paid on a policy of insurance. The difference between the individual and the associate action, as the latter is now conducted, is the difference between a single holder of flour asking more for his stock than a customer is willing to pay and the action of monopolists who combine to control and withhold the entire product until the public are starved into paying what is deemed an exorbitant price.

We have just received from the other side of the water a very simple statement of the effect of such a combination upon a special branch of trade in a great city. The workmen were thoroughly united, and therefore very strong. They had accumulated considerable means, most of them having accounts in the savings-banks and some of them owning their own homesteads. They combined and dictated unfair terms to their employers, driving one after another out of the business. The most serious step was the limitation of the number of apprentices and their absolute refusal to allow the children of their employers to learn from others the trade or secrets of the craft. As one after another of the seniors died there was no one qualified to take their places. The craftsmen chuckled over this as placing the business entirely at their mercy. But it did more—it broke up the business altogether. Limit the learn-

Digitized by Google

ers as they would, the employers necessarily decreased in a ratio more rapid than the diminution of workmen. They combined to have their own way in order to increase their store of golden eggs, but thereby they killed the goose which laid them.

The management of the mills—the employers not understanding the practical part of the business—fell into the hands of mere hirelings and no profit could be made, the terms dictated by the workmen taking away all chance of success.

This has been going on for thirty years. There were then in Glasgow 68 cotton-spinning mills, with 1,163,575 spindles and 14,057 operatives. These have dwindled to 22 mills, with 729,000 spindles and 3,645 operatives. An intelligent observer on the spot declares that "the chief cause for this great falling off may be summed up in a single word—trades unionism." The London *Economist* sustains this declaration, and traces without fear of contradiction the steps of the decline. It is not a little strange that the more intelligent among the great body of workingmen everywhere do not see that a strike can effect no permanent improvement in their condition, and that in every such effort they are aiming a blow at the fountain of their prosperity.

[From the Journal of Commerce, August 15, 1883.]

HOW TO PROTECT LABOR.—In another column will be found a communication which refers to our recent articles on the equities of a strike, and propounds a very important question, viz: How should the telegraph operators have proceeded to secure a fair compensation for their labor? The law of supply and demand cannot be repealed by legislation, by the tyranny of employers, or by combinations of the employed. We have shown in former articles that a general advance in wages is of no material benefit to the laborer. The price of everything purchasable soon adjusts itself to the new relation, and, other things being equal, it makes no difference to the workman whether he earns $6 a week and spends $5 for his living, or earns $12 a week and spends $10 for the same items. At first it would seem that he gains by it, if his earnings thus exceed his expenses, since in the latter case he saves $2, while in the former he lays by only $1. But this difference is only nominal, as the $2 will purchase in the one case only the same as the $1 in the other. A gain of $1 is really as much, if the man can support his family on $5 a week, as a gain of $2 when the cost of living is doubled.

We have said that the two cases are the same to the laborer, other things being equal; but other things are not equal, and as soon as the adjustment is reached the proportion is always against the laborer when wages advance and prices of living are higher. A family living on $10 a week may not consume any more than when prices are so low that they can buy the same necessaries and comforts for $5, but they will not obtain the same supplies for twice the money when prices have doubled. It takes a greater amount of nominal capital to carry stock at the doubled price, and a greater profit is charged by the dealer and the middleman. Besides, the buying is done with far less economy when greater sums are received and expended. The man who earns but $6 a week and spends $5 for living will count every penny; if he earns $12 and spends $10, he will think less of sixpence than he did before of his penny; if he earns $24 a week and spends $20, a shilling is of no more account than a penny was when he lived on $5.

Besides, wages are a great help to foreign commerce. The equalizing effect of high wages cannot be extended so well to foreign merchants.

Digitized by Google

Physicians in New England charged 50 cents a visit when skilled labor was $1 a day; they put their charge to 75 cents when carpenters began to ask $1.50, and to $1 when wages rose to $2. But suppose they sent a prescription by mail for a sick man in Europe, whose wages had not advanced? This illustrates the effect of advanced prices on the export trade. A shoemaker once asked $2.50 for a pair of custom boots; the cost of his living doubled, and he put his price to $5; it doubled again, and boots went up to $10. His fellow mechanics and his other customers had their wages, too, increased, and, with the exceptions noted above, $10 to for their boots meant the same to them as a quarter of that price did in the earlier day.

But when it came to sending boots out of the country, the case was very different. With foreign nations, where trade was fully reciprocal and confined wholly to the two countries, the relative charges for imports and exports could be adjusted. If a pair of boots would buy five yards of silk, the exchange would be the same whether the boots were $2.50 and the silk 50 cents, or the boots were $10 and the silk $2 per yard. The foreign laborer, however, has other fields at his command. He will sell his silk in the dearest and buy his boots in the cheapest market. He will sell the United States his silk at the standard we have set, and buy his boots in England or Germany.

While a general advance in wages is, therefore, of no profit to the striker, there is a method of improving his condition open to every workman. This is to better his service by making his time and skill worth more than the average of his class, and then to avail himself of his right to have this recognized by his employer. Suppose there are a dozen telegraphic operators employed in an office. If the average pay is $40 a month, there are men among them better worth $50 than the poorest is worth $30 per month. If they were all free to seek a proper adjustment and the employer free to concede and enforce it, two or three of the best would soon be paid $60, the average remain at $50, and the poorer have to take $30 or leave the service, the whole compensation remaining the same.

The trades union shuts the door on all such ambition to gain higher wages by better service. The dozen men in the case supposed combine to divide $480 a week among themselves, insisting that the poorest operator among them shall have the same as the best. In fact they will strike at once and leave if the service of an operator, however poor, is compensated at a less rate than the best receive. Only for this mistaken policy by which the best workmen covenant with the poorest, and everywhere insist upon working at the average price instead of the advanced pay they ought to receive, there would be no need of a strike, and all who are entitled to it would in a very short time be paid the higher prices they fairly earn, the gain to them being taken off the pay of the poorer craftsmen who ought not to have it.

A first-class operator could then go to his employer in his own name and respectfully ask him to investigate the character of his service and to increase his recompense. If he really was head and shoulders above his fellow-laborers, his employer would think twice before he would let him go; and if free to make the difference, would grant him an advance in wages, deducting the amount, if necessary to his business, pro rata from the inferior operators. Why should a first-class man in any department of skilled labor be compelled by a combination to work at the same rate as the poorest "stick" in the guild? The employer does not wish it; he would gladly in his own interest make a discrimination, but in general he is not allowed to do it. Who cannot see

Digitized by Google

that every man whose skill and genius and executive ability are above the average is held down to a dead level of uniformity with the rest by this unfair but inexorable rule which lies at the foundation of all trades unionism? It is the advance among all the laborers of a class which helps no one permanently. Shoemakers and tailors strike and obtain more wages; increased cost of shoes and clothing make carpenters, bricklayers, and plumbers strike for the same, and they receive it. Higher clothing and rents make the 'longshoremen and the day laborers demand an increase. Doctors, lawyers, clergymen, and everybody else must come in for a greater compensation. No one is helped by such a movement, and many are greatly injured. But a readjustment on the principle of giving the better workmen more and the poorer less benefits those who are entitled to it, and is a constant stimulus to improvement. Shoes as a whole cost no more, clothes are no dearer, rents are no higher; but the outlay is more equitably distributed among those who fairly earn it. We have thus endeavored to show that while a general advance in wages helps no one, a discriminating readjustment of wages helps all the better class of workmen without doing injustice to any. There will come a time, we hope, when each workman will be free to make his own bargains for his own labor, and employers will be free to recompense each according to his several ability.

[From the Journal of Commerce, August 22, 1883.]

THE LESSON OF THE STRIKE.—The late strike of the telegraph operators and linemen has been very costly as well as unsuccessful. It is said that there are 12,000 belonging to the Brotherhood and that at least 8,000 left their post at the dictation of the organization. The strike lasted just a month, and it will be two weeks more before the majority of the operatives will resume their labor. The loss in wages alone cannot be reckoned at much less than half a million dollars. In strikes among laboring men the saddest feature is the injurious effect upon the habits of the idle operatives. They generally group around saloons and indulge largely in strong drink, not only because time hangs heavy on their hands, but also to pledge each other and to maintain a show of conviviality. There was less of this among the telegraph operators than was expected. Some of the men drank heavily, but the great majority, we are happy to say, were sober, thoughtful, and well behaved. A few contracted evil habits from which they will not soon recover.

It is certain from the testimony of the operators themselves, now that they are at liberty to speak freely, that the strike was not their own free, voluntary act. We stated this at the beginning, and although it was vehemently denied, we are now fully sustained by the positive assertions of the most intelligent among them. They were not only deceived by misrepresentations, but they were coerced by their associations and surroundings into the step which their better judgment told them was unwise and which they now so much regret.

We have seen this so often in the past that we knew it must be so in the present case. Two or three noisy men in a shop begin to denounce the employer, the rate of compensation, the methods of business, and are found harping continually upon the list of assumed grievances. The body of the workmen under this discipline become restless and more or less discontented. The leaders then insist upon a strike. The majority in their hearts are unwilling to take such a step. They know it would be far wiser to bear the ills they have than to seek redress by such a violent measure. But they are taunted with cowardice if they hesitate,

Digitized by Google

they are denounced if they refuse, they are accused of selfishness in being unwilling to make some sacrifice for the good of their fellows, and they are threatened with being disowned and disfellowshipped in case the appeal is successful without them. We know of many cases where two or three reckless, unprincipled workmen, totally unworthy to be recognized as leaders, have turned out in a strike a score or two of their associates much better and more intelligent than themselves, when if a secret ballot could have been taken not one of these followers would have voted for it.

In the case of the Western Union the only possible chance the strike had of success was in the insolent, overbearing treatment of the community by this great monopoly, and the certainty that the operators would have on this account a large measure of public sympathy. We trust that the directors and other officials of the telegraph company, if they are as shrewd as reported, will take to heart the rebuke thus administered, and will see to it that their lease of life and power hereafter does not depend wholly on their wealth and craft. An acquired "good will" will be found worth more than a costly plant in maintaining their hold upon the public patronage.

Only those who have been behind the scenes know how much this failure has done for the future of workingmen in this country; and in the lessons to be drawn from its defeat it may be worth to them all it has cost. We do not suppose that the striking operators knew how far-reaching was the plan of which their turnout was the initial step. They were selected to lead in the movement for various reasons, some of which are sufficiently obvious. They were enabled by their means of instant intercourse with each other to extend and perfect their organization and to act together as a unit, and they were thus, like a large army, all within the sound of a single voice. They were to dictate terms to their employers, and by their success to place their organization in a position to aid every other which should follow them. The engineers, firemen, brakemen, conductors, and other railroad employés were to strike in their turn. Then the iron, coal, and mining operatives generally. Then the skilled craftsmen of all kinds, who were to help each other to attain their end.

After all these various strikes had resulted in success the whole fraternity of laborers of all classes were to be organized into one grand brotherhood, and through their chosen and recognized leaders dictate terms to legislatures and to Congress. The principles and objects of the trades unionists, and to a certain extent of their associates, the communists, were to be established by law in all parts of the country. Limitations were to be put upon the hoarding of all profits of any permitted business, the remainder, if any, to be divided among the workmen employed in it; no person to be allowed to own more than a given amount of real estate or a stated sum in personal property; the taxes to be taken from the shoulders of those of moderate means (as if any but producers could be taxed by any system!) and to be levied upon the wealthy until the accumulations of the latter were reduced to the required standard; provision to be made not only for the education of the masses at the public expense, but for their homes and amusements, out of the common purse thus filled by exactions from the overplus of the rich.

We do not mean that if the first step thus inaugurated had succeeded, all this, or any considerable part of it, would have been realized; but it was in the plan, and there would have been a vast deal of trouble created in the attempt to carry it forward. This has been postponed, if not wholly defeated, by the lesson learned at so much expense and suf-

Digitized by Google

fering, and it will be some time before the effort will be renewed. For all this the workingmen themselves have most reason to give thanks. Anything which disturbs the peace and order of society, or renders the title to property, great or small, in any sense insecure, affects the laboring classes more than any others in the community. A few days ago a socialistic reformer read a list of the "luxuries and vagaries" that would be abolished when the workingmen came into power. If the threat could be carried out, more than half of the workingmen in the world would be thrown out of work at the same instant of time. More than two-thirds of life's busy industries are directed to supply "artificial wants." If nothing was produced except the bare necessaries of food, clothing, and shelter, the idlers would outnumber the active two to one. If cotton, woolen, and silk goods were henceforth to be fabricated without reference to the gratification of taste, and the property rendered useless by this change could be sold at a reasonable percentage of its cost, the proceeds would pay off all the public debts of the nations, and give what was promised the freedmen—a mule and a piece of land to every family.

The communist would soon learn that even the wealthy have their uses, and the whims of fashionable life at which they sneer give light and cheer to many a lowly fireside.

[From the Journal of Commerce, September 10, 1883.]

THE INCOME TAX.—Since our last article on this theme was published several new advocates of the tax have come to the front, bringing with them arguments never before heard in its favor. Among the most prominent we may mention Mr. John Swinton, who made an earnest appeal in its behalf at Thursday's session of the Senate committee. Mr. Swinton is a newspaper editor, and therefore is supposed to be well informed upon current topics; and as he had prepared himself especially to testify before the committee on this subject, we were not a little startled by some of his assertions.

He declares that the income tax "was the most popular tax ever imposed" in this country. We suppose he means by this that it was popular with the people who were not troubled by its provisions. It was so devised that only a few hundred thousand of the thirty-five millions of the people paid any assessment whatever upon their incomes. And it rested very unequally upon the several States. Of the eighteen millions revenue received from it in the last year of its existence, 39.0899 per cent. was paid in New York, 15.5481 per cent. in Pennsylvania, and 10.4042 in Massachusetts, these three States paying 65 per cent., or about two-thirds, of all that was collected in the forty-six States and Territories comprising the Union.

We cannot comprehend the following, which we copy from the fullest report we can find of Mr. Swinton's testimony: "The income tax was never repealed in this country. The act by which the system was claimed to have been repealed never passed the Senate by the required number of votes, which is two-thirds. It was hurried and rushed through at the close of a session, and few have ever questioned the regularity of the proceedings."

We are astonished that any intelligent person should make such a statement, and still more so that other editors should copy it approvingly, as if there could be no doubt of its truth. We have not yet seen anywhere a refutation of this glaring misstatement. In the first place, we know of no requirement of a two-thirds vote in the United States

Digitized by Google

Senate to repeal a tax bill unless it is in the effort to pass the measure over the veto of the President. Besides, a very little study of the legislation concerning the income tax will show that there never was an act passed repealing the law under which the levy was made; on the contrary, without any fresh action of Congress the law expired by its own limitation.

The act of June 30, 1864, placed a tax of 5 per cent. on incomes in excess of $600 and not exceeding $5,000; 7½ per cent. on the excess over $5,000 and not exceeding $10,000, and 10 per cent. on the excess of $10,000. The act of 1865 made the tax 10 per cent. on the excess of $5,000. Chapter 184, laws of 1866, enacted that the tax thus imposed should be due and payable "until and including the year 1870, and no longer."

The last three words were added to appease the popular clamor in favor of its repeal. It had been levied as a war tax, and the subjects, although greatly harassed by its execution, had paid it without open murmur, on the ground of its necessity. The war being over, there was a general revolt against its provisions, and a demand from all the more intelligent portion of the people that this special exaction should cease. It was known to be in direct violation of the provisions of the Constitution, and although the courts strained the interpretation of the fundamental law on behalf of the Government, and decided that an income tax was not a "direct tax" in the sense in which the words were used in that document, every one felt that this was a subterfuge and a blot upon the judicial record.

To appease the clamor and yet retain for a while the revenue from this source the act was passed continuing it for four years and "no longer." When it was about to expire in 1870 by the limit quoted, an attempt was made to renew it at the current rates. After a spirited debate this was defeated, but by chapter 255 of the laws of 1870 it was re-enacted at the rate of 2½ per cent., exempting all incomes of $2,000, and providing that it should be levied and collected "for the years 1870 and 1871, *and no longer.*"

Now, what becomes of the scene so graphically described by Mr. Swinton? The bill for the repeal of the tax smuggled through at a late session of the Senate by less than the requisite vote is altogether a creature of his imagination. The tax never was repealed. It was modified and extended, and finally, execrated by everybody, it expired by its own limitation.

The Constitution carrying out the doctrine of the fathers of our Republic, that taxation and representation should go together, made provision that "no capitation or other direct tax shall be levied unless in proportion to the census." There is not a writer on political economy, great or small, ancient or modern, who does not include the income tax as a direct tax. Adam Smith gives it as the best definition of a direct tax, saying that "taxes are of two kinds—direct, as the tax on incomes, and indirect, as duties on imports and the like."

But, apart from this, an income tax must always be odious from its inquisitorial character. Some recent advocates have attempted to refute this argument on the ground that all direct taxes are inquisitorial, and this is no worse than others in that respect. Such an assertion will not bear a moment's examination. The tax on real estate does not pry into the owner's business, nor does a personal tax inquire after his profits. A man may own a house, and ten, twenty, or fifty thousand dollars in personal propesty, subject to taxation, and yet have not a dollar of net income. To execute the income tax fairly every individ-

Digitized by Google

nal in the United States must be compelled to make a full disclosure of his or her personal affairs—what receipts they had for the year, and precisely from what sources; what expenses and losses are chargeable against such receipts, and what is the net income.

Most of those who so flippantly pronounce in favor of the law do not stop to consider that under such an act, if justly administered, all persons must be called to this account every year of their life. These superficial thinkers argue that after making a liberal exemption only the nabobs and rich people will chafe and rebel, because they only will be taxed. They forget that in order to ascertain who will be taxed and who exempted every person must annually give an account of his entire business transactions, showing his net gains or losses for the year. Such Government inspection is most intolerable, and persons of a sensitive nature who would be exempt under the terms of the proposed law would feel the examination far more than the rich monopolist who would suffer no pain from the disclosure. The tax will never be levied again in a time of peace without producing a revolt that will astonish the promoters.

The CHAIRMAN. As it is somewhat difficult to extend formal written invitations, I should like to have it well understood by the press throughout the city, and by everybody who is interested in this subject, that we shall be obliged for any assistance whatever that may be rendered in any way.

Mr. CALL. That is the feeling of the committee.

## RELATIONS OF WESTERN UNION TELEGRAPH COMPANY AND ITS EMPLOYÉS.

The CHAIRMAN. We have received a written communication, written with considerable ability, signed by a gentleman of this city, who closes his communication by saying, "Begging pardon for the intrusion, and regretting that I cannot voluntarily appear before you, I am," &c. It touches mainly upon telegraphy and the relations which have existed between the Western Union Company and its employés, as well as to some extent upon the general subject. He desires this paper to be examined by the committee, but for some reason does not care to have his name given to the press.

The communication is as follows:

THE BRUSH-SWAN ELECTRIC LIGHT
COMPANY OF NEW ENGLAND,
*New York, September* 7, 1883.

*The honorable Gentlemen composing the Senate Committee on Labor:*

GENTLEMEN: I am an ex-telegrapher. I was connected for over nine years with the Western Union Company, in this city, and I consider that a brief relation of my experience may tend to disabuse your minds of the impression that Messrs. Green and Gould have been trying to make, that the Western Union is organized for beneficient purposes. When I entered the service I was most forcibly struck with the injustice of paying unequal salaries for equal work. For five years I did the work of men who received $80 and $90 per month for $65 and $62 per month. This statement I can prove without a particle of trouble. During my stay on the New York night force I was so sick several

Digitized by Google

times that I could not hold up my head, and upon applying to the night manager of the office to allow me to go home I was refused a relief, and I knew that I should have risked my position, if not lost it, had I left the office without the permission of the manager. When I first went on the New York night force the hours of service were from 5 to 7 p. m., *every other Sunday off.* When I left, the hours were from 5.30 to 1, *one Sunday off in eight.* The salaries in this time had been systematically reduced from $5 to $20 per month. The night-force men were allowed twenty minutes for lunch, in the company's lunch-room, upstairs. Operators were not allowed to leave the building to take lunch outside. They were obliged to carry lunch, do without, or put up with the vile stuff of the Western Union lunch-room, and pay more for it than the like quality could be had for in restaurants outside the building. I have waited in the Western Union lunch-room from five to ten minutes to be waited upon, and have been reported to the manager for being out *twenty-three* minutes for lunch. When any protest was made to the injustice of our treatment we were told in soothing accents that we were "chronic kickers." I left the Western Union to take a position with the Gold and Stock Telegraph Company before that company was absorbed by the Western Union. As soon as Jay Gould absorbed the Western Union a new system of oppression was inaugurated. When the Western Union absorbed the Gold and Stock Telegraph Company the telegraph stock receivers in the main office were compelled to do clerical work after their day's work was done, the clerical force having been greatly reduced to carry out the Western Union policy of economy. Last spring, before I left the service of the company, my hours of service as stock reporter on the Mining Stock Exchange were increased over 20 per cent. When I asked for a slight increase of salary to cover the increase of service (which was equal to a ten-dollar reduction per month), the answer I received was that my "place could be filled at short notice for $10 a month less than I was getting." This, after ten years of faithful service with the company. I know a young lady who was employed to receive stock quotations from 10 a. m. to 3.15 p. m. Just before the strike a Western Union superintendent told her he could fill her place at a less salary, and they were then contemplating which would be the most economical plan, put her in the general operating room to work nine hours, at her present salary, or compel her to do clerical work at a reduced salary, for longer hours. I am not citing special instances, but trying to give you examples of the Western Union's general policy. To speak a word about myself: I have worked eighteen hours a day for years in order that I might gain my freedom. I have done so, and I tell you it is like passing from the eternal regions of darkness to a very elysium to leave the service of that company to work for people who have souls.

I do not consider myself an expert, but if any capitalist will build a wire for me from New York to Philadelphia I will run the wire and guarantee a 20 per cent. dividend on the investment. This can be done by charging a cent a word for telegrams and allowing double the Western Union salaries to operators and messengers.

Last fall I met an old gentleman in the Catskills who knew Jay Gould when he was the innocent, crying, and praying boy Mr. G. would have you think he was. This old gentleman, speaking of Gould as a boy, said he had a reputation of being a "scamp" the country round. I need only call the attention of your honorable body to his connection with Erie, Black Friday, the elevated railroads, New York, and other trans-

Digitized by Google

actions, to show that he has not yet considered the feasibility of self-reformation. If Western Union is worth its "earning capacity," why are not telegraphers who earn twice as much as they get worth their "earning capacity"? If competition of labor governs salaries, why should the laboring classes of this country, through their Government, not raise a competitor for Western Union? I am sorry that I cannot appear personally before your body, because there are many things I should like to speak of which in this hasty letter I am compelled to overlook. I will, begging your pardon, make one suggestion to your body, which is that if you don't legislate in some way to save the "little fish" from the unmerciful destruction of the "big fish," something will be done, and that before many years, when the "little fish" will combine, rise in their physical power, and fairly raise Cain, not only for the "big fish," but for our Government itself. The poor man is being oppressed by the tariff system, by convict labor, by an open Castle Garden, by land grants in the West, and by the grasping monopolists, for whom all laws seem to be made. We can't stand it forever, you know. The time has come in this country when honest, sober industry, working for forty and fifty years, can earn nothing but a sufficiency to keep himself and family from actual suffering. I know hundreds of such instances, despite the soft soap of Messrs. Gould and Sage, and one more panic such as we had from 1873 to 1879 will throw this country into a revolution that will surprise you. If you can read the signs of the times you will see such a cloud now darkening the horizon in the labor demonstrations of the present. Don't neglect your duties, don't be bribed, check these "big fish" in their devouring course, or disaster will come very soon and very swift.

Begging pardon for the intrusion, and regretting that I cannot voluntarily appear before you, I am,

Most respectfully,

JAS. P. KOHLER,
*An ex-telegrapher, 853 Broadway, New York.*

THOMAS M'KINLEY ON SCHOOL-TEACHERS' PAY.

The CHAIRMAN. We have also received a communication from Thomas McKinley, 148 East Twenty-sixth street, in this city, who expresses himself with some acrimony with regard to the conduct of society towards its weaker members, and makes many suggestions to the committee which seem to be written in the spirit of one who feels himself very deeply aggrieved. He says he prepared a statement for a former committee that was treated without any proper consideration, and that he had his labor for his pains; that his friends, however, had notified him that he would have no better reward; and he submits this communication evidently feeling that he will receive no more attention from this committee than from any other. I have sent him a personal private written communication notifying him to appear before the committee to testify. This was nearly two weeks ago, since which time I have heard nothing from him. He is respectfully invited to complain of this committee when it has done him any wrong.

The communication is as follows:

*Senate Committee on Education and Labor:*

GENTLEMEN: Several years ago, just after the labor strikes which caused such an excitement in this country, a Congressional committee

Digitized by Google

was in session in this city for the purpose of ascertaining the causes of the general depression in business and devising a remedy therefor. At that time I was engaged in preparing a paper containing my views of the subject, for the consideration of the committee, but as they adjourned before the paper was finished I did not present it to them. When I was preparing the paper my friends told me I was wasting my time, as "the committee would never accomplish anything of benefit to the community; it was not intended that they should; that they were here only to pull the wool over the eyes of the people and quiet them down," &c.

I thought at the time that my friends were wrong, but after the lapse of these years I find they were right. I have yet to learn of one single beneficial effect of the labors and deliberations of that committee. In fact I cannot recall to mind that they ever reported to Congress even. And to-day we find in the United States a state of affairs similar to that which they were called upon to consider; and we also find another committee, this time from the Senate, sitting in the same place and taking the same kind of testimony as their predecessors did, and for what purpose? Is it to beguile your time during vacation, or is it to again befool the masses? Pshaw! gentlemen, adjourn and go home; your work is unnecessary. "Them asses" are still willing to vote for the "old hacks"; their patience is not quite exhausted, and if it is, your befooling will not ward off the day of reckoning long, and when it comes the reckoning may be more serious in its nature on account of it. But as you are the Committee on "Education and Labor," perhaps you only consider those two subjects. Look at this: This being the first week in September, I supposed the public schools would be open and the scholars again at their lessons, but I find that the schools open next Monday, the 10th. The present vacation has lasted ten weeks. Are you aware that the teachers in the public schools are paid for those ten weeks, and not only that, but paid in advance at the commencement of the vacation; also that they have one or two weeks' vacation at Christmas time, for which they are paid, and when they do work it is only for five hours a day for five days a week? And how many thousand other employés of the Government in its numerous branches are favored similarly. Why are they treated so differently to the mechanics and laborers of the country? When I work at my trade of machinist and lose fifteen or thirty minutes in a week, it is deducted from my pay; and the word "vacation" is unknown among us. Through the heat of summer and the cold of winter we are bound down to the lathe or vise, if we are so fortunate as to have work to do, ten hours a day, for $2 or $2.50. The above are only samples of many such cases; is it any wonder, then, that the bare-armed workers of the country get dissatisfied and go on strikes, when they feel that there is something wrong, though they may not know where the wrong is exactly, or how to correct it?

I could go on in this way for a month and give you and Congress enough work to keep you busy for years if you intended to do anything, but of course you don't intend anything of the kind, so I guess I'll stop. I only wanted to mention the case of the school-teachers, as I think it a glaring one.

Yours,

THOMAS McKINLEY,
148 *East Twenty-sixth Street, New York.*

SEPTEMBER 4, 1883.

## D. ABEL'S SUGGESTIONS.

The CHAIRMAN. We have also a letter from D. Abel, of 158 Jay street, Brooklyn, N. Y., with recommendations of what he deems would be useful remedial measures which might be enacted by Congress for the benefit of the people generally, and especially of the poorer classes, denouncing monopolists with great force of language.

*Senate Committee on Education and Labor:*

GENTLEMEN: As a citizen, having certain opinions, I think proper to call your attention to them, and will place same under three heads, viz:

1st. Limit monopoly by not allowing some to accumulate millions; say, place the limit at half million dollars (or place such a tax upon above that amount that would virtually confiscate it). That is, when a man has made that sum let him retire and enjoy the benefits of his labor, thus giving others a chance in the battle of business. For I claim that, as a common family or nation of people, as soon as one part of the family begins to control large amount of capital it oppresses by monopoly the other part, or gathers a tax off poverty.

2d. Redeem the bonds of the United States with a non-bearing-interest bond that can be used either as a registered saving or as a current money, thus bringing that amount of capital into the commercial business of the country and make land the security of investment.

The poor man has taken the greenback undisputed, without interest or guarantee; our soldiers fought the war with the greenback; but this relic (United States bond) is left to grind the life's blood out of the working people, and making the rich richer and the poor poorer. It is a very absurd idea of the poor, hard-working man paying an indemnity, entailing upon themselves a set of paupers that are living upon the result of their labor.

3d. Monopoly or "millionopoly" has grabbed the best land of the country. Have they improved it? Yes, somewhat, by building railroads and selling their watered stocks to the public at about ten times their value. But the people, with our vaunted pre-emption laws, are left helpless. Who among the working class have been able during the last decade to accumulate enough money to settle in the West? Instead the shackles have been tightened. They have been driven into the cities, and there they are to-day, crowded together, obliged to stay, too poor to leave. The West has been populated by direct importation from Europe. Emigrants, who when they arrived with a little money, seeing the deplorable state of the poor in the cities, went West and did better. To-day we have an army of about 25,000 men, 80 per cent. foreigners, many who can scarcely understand the language. "*Assisted homes*" in the West, making every man a soldier in return if required, and you have an army that is fighting for bread and country. We hear of the very small cloud on the horizon—revolution, times of blood. History repeats itself. The history of the world gives us many instances where riches became a tyrant and had to be put down. Does our legislation of to-day tend to the same source? I, as an individual, have an idea that if there ever is a social revolution the millionaires will be badly used, and it will take some time to raise a new crop.

Yours, truly,

D. ABEL,
158 *Jay Street, Brooklyn, N. Y.*

## GEORGE H. PROCTER'S VIEWS.

The CHAIRMAN. Mr. George H. Procter, of Middletown, N. Y., sends a communication, in which he says he would like to be called before the committee, and incloses a printed slip of four pages entitled "Anti-monopoly Fallacies," which seems to be written with considerable capacity and vigor. The committee will be glad to listen to any man who appears, but it is impossible to summon the entire country.

The communication and accompanying slip are as follows:

MIDDLETOWN, N. Y., *September* 6, 1883.

Senator BLAIR, M. C.,
*New York City:*

MY DEAR SIR: I would like to be called before your committee to put in evidence a pamphlet I have just had published upon "Anti-monopoly Fallacies" (I inclose copy for yourself); also to give other evidence, as I have made a study of the matter of capital and labor as employed many men in the manufacturing business.

With regards for your impartiality,

Respectfully, yours,

GEO. H. PROCTER.

### *ANTI-MONOPOLY FALLACIES.*

In a late issue of the Sun appeared a communication from the modern reformer, F. B. Thurber, esq., asking who are communists. In reply, let me inform the reader that an authority says "That communism is the name that is given to the schemes of social innovation, which have for their starting point the attempted overthrow of the institution of private property."

The communist of the class to which Mr. Thurber and his coadjutors belong would overthrow the rights of private property. This is what the very respectable gentlemen who compose the executive committee of the Board of Trade and Transportation argue when they would have the Government take possession of the telegraph lines in the country and establish a postal telegraphy.

The principle of private property has been called by one who was by no means a blind worshiper of the social condition which has been built upon it, "That primary and fundamental institution on which, unless in some exceptional and very limited cases, the economical arrangements of society have always rested."

To attack this primary and fundamental institution, namely, private property, (and what are corporations but the aggregation of private property?) indicates minds so bold, as well as imaginative, that it might well be thought that assaults upon it would be limited to a class of individuals rendered desperate by having nothing to lose by a general social revolution, and not to such respectable gentlemen as compose the executive committee of the Board of Trade and Transportation who favor the confiscation of property by our Government.

One of the arguments used in favor of the Government controlling the telegraph system of the country is that England makes it a part of its postal system. The cases are not analogous, as in England the postal telegraph is part of the civil service, and until we have a permanent civil service as an established institution it is not safe to give such a great power into the hands of any one political party.

Digitized by Google

The temptation for its abuse in a heated political campaign would be too great, the liberties of our people might be assailed, and the repetition of the political troubles of 1876 would be possible.

In an editorial commenting upon Thurber's communication, the editor of the Sun says: "We will ask him in turn how it would do to have the Government turn out all the express companies and monopolize the whole business of carrying express packages through the country?" Seeing by the daily papers that the senior member (a reputed monopolist) of the firm that Mr. Thurber is connected with, has, with others, recently incorporated a new steamship line to Baltimore, is there any argument against the Government controlling the steamship lines of our country, any more than the telegraph companies, and regulate the charges for service performed? Both are private property, and, as we have stated before in our argument, to assail private property is communism.

The Sun says further: "Mr. Thurber's great bugbear is the encroachments of corporate power, and he sees no way of fighting them except by concentrating everything in the hands of the Government, and he quotes Senator Bayard as affiming the necessity of 'centripetal' forces which would conteract the 'centrifugal.' Now, the writer admits that the force that is best able to cope with corporate power is our Government; but as Abraham Lincoln described our Government 'of the people, by the people, for the people,' a Government exercising its influence through judicious laws and the power of public opinion, as far more potent for the protection of labor against capital, and the encroachments of corporate rights upon those of individuals, rather than the concentration of power in the heads of our Government and the possible abuse of that power by any political party."

In a recent article in the New York World, I stated:

> Louis Blanc, a leading communist of the past, in his day wanted his Government to undertake the regeneration of society by the organization of labor under the Government, holding that the evils of large capital and destructive competition could and ought to be cured by the State, the largest capitalist of all, and that the Government should purchase or gradually absorb the large industrial institutions of the country.
>
> Now, we say our Government has all it can take care of, and much more than it handles well, as the case now stands. It could not conduct the service of a great corporation perfunctorily as well as that corporation, or various corporations, as a matter of business. The anti-monopoly party in its mad career would sweep into the Government's omniverous control all the railroads and big institutions of the country. The safety of our country lies in the opposing of this paralyzing communistic spirit. Give our institutions virility and individuality.

We believe Mr. Thurber is a gentleman of means. The opinion that a communist is a man who has no property to lose, and who therefore advocates a general redistribution of wealth, is very wide-spread and popular. It has been estimated that Robert Owen, during the course of his long life, devoted no less a sum than £60,000 from his own private fortune to the promotion of communistic schemes. The immenes pecuniary and personal sacrifice he made for the cause of communism shows that he at least was animated by motives the direct opposite of the selfishness and sloth attributed to the advocates of communism. Essenes Sir Thomas More, Saint Simon, Father Rapp, Fourier, and Louis Blanc, leading communists in the past, were men of social standing and good repute in their days, as well as men of wealth.

To be a communist it is not necessary to be a Louise Michel and lead a mob to attack bread-shops and thus assail property. The anti-monopoly party of to-day, in their attack upon corporations, as we have

Digitized by Google

stated before, assail private property, as what are corporations but the aggregation of personal property, and, as another authority says, "a corporation is an association of persons which the law treats in many respects as a person."

The anti-monopolists denounce the evils of the power of corporations; the hopeless poverty of the poor, side by side with the self-regarding luxury of the rich, seems to them to cry aloud to Heaven for a new political party. Call it anti-monopoly or communism, the terms are spnonymous.

Has it never occurred to them to adhere strictly to their advocacy of a more perfect administrator of justice in the execution of our laws and necessary legislation, leaving the principle of private property and competition to their old predominance in the economic world?

Anti-monopoly, to be successful, requires to be accompanied by important reforms in legislation, towards which existing society, founded upon private property and public opinion, is gradually finding its way. The power which our Government, as at present constituted, has shown of adapting itself to altered circumstances, and of assimilating by slow degrees the concomitants of the most revolutionary theories, is strong proof that existing evils do not deserve to be dealt with in the summary manner designed by the anti-monopoly party.

While we cannot but admire Mr. Thurber's phenomenal industry in the promulgation of his ideas, and the warfare of himself and confreres, against the venality and corruption of our legislators—and by venality we mean the prostitution of their services for reward, monetary or otherwise—yet we regret Mr. Thurber's apparent ignorance of history and want of knowledge of political economy, as well as the fundamental principles of government that our republic is built upon, which principles are a rebuke to the advocacy of the confiscation of corporate property by the Government as advocated by the communistic members of the anti-monopoly party. As a poet aptly says:

What is communism? Why! one who has yearnings
For equal division of unequal earnings.
Theorist or bungler, or both, he is willing
To fork out his penny and pocket your shilling.

## POLITICAL AND ECONOMIC SCIENCE.

The CHAIRMAN. We have received from the McAdam Political Scientific Club of this city a memorial, dated September 6, 1883, addressed to the committee, as follows:

NEW YORK, *September* 6, 1883.

*To the honorable the Committee on Labor and Education, Senate of the United States:*

GENTLEMEN: The McAdam Political Science Club has followed with deep interest the testimony which has been laid before your honorable body from so many worthy representatives of the people, and finds in the very confusion and conflict of the advices given the strongest confirmation of the reasonableness of the suggestions which it desires briefly to offer.

The evidence before you proves nothing more conclusively than the rarity of clear convictions as to social rights and social duties, as to cause and effect in industrial developments, as to the laws of trade, as to what remedies for evil lie within the province of governmental au-

Digitized by Google

thority, and what are beyond the interference of politics or the regulation of the ballot.

This club, organized itself for the study of these subjects, and composed entirely of men who work for wages, would urge that the first step toward bettering the condition of the wage-earning classes is education in political and economic science, to the end that they may direct effectively and for good the tremendous forces which a free vote has put into their hands.

We would therefore suggest that, so far as they lie within the scope of your work, you make the following recommendations:

(1) That the elements of political and economic science be taught in the common schools.

(2) That trades union organizations make discussions in these lines a part of their regular proceedings.

Submitted most respectfully,

THE MCADAM POLITICAL SCIENCE CLUB,
ED. A. CASEY, *President*,
JAS. F. J. DONOHUE, *Committee*.

## THE FREE LABOR LEAGUE'S SUGGESTIONS.

The CHAIRMAN. We have received from the Free Labor League of the United States, No. 22 Second avenue, New York, a written memorial of considerable length and much ability, signed by William Clarke, M. W. Free Labor League, secretary:

FREE LABOR LEAGUE OF THE UNITED STATES,
*No. 22 Second avenue, New York.*

*To the Senate Committee on Education and Labor:*

GENTLEMEN: Because of the repressive methods of capital which "blacklists" its exposed opponents, and because of the existence of penal codes which restrain us from our constitutional privileges of free speech and public assemblage, in consequence of which unjust enactments and rules, in view of our present helplessness, we are compelled to associate secretly and are unable to personally present our grievances.

Nevertheless, although impressed with the fact that any desired relief must come from our own united action, we desire to place upon the records of your committee our solemn protest against all laws now in existence and all customs now prevalent in this alleged civilization which infringe upon or trammel in the lightest degree our inalienable rights as expressed in the Declaration of Independence, namely, "Life, liberty, and the pursuit of happiness."

We hold that the present feverish financial system is in direct contravention of every human right pertaining to those who work for a living, in that it perverts money from its true purpose, replacing it with what is known as capital, and by its machinery of banking and special laws this capital is able to multiply itself almost indefinitely and thus weaken and oppress the workers.

We maintain that the requirement of money in the economy of the world is only for the purpose of measuring the work of man and to enable the producers of all the wealth of the earth readily to exchange with each other the fruits of their labor. That capital so-called is not necessarily money, but the shadow of money; but under the system we here assail it possesses all the importance of money itself and by its fraudulent methods of reproduction arrogates powers belonging only to the Government.

Digitized by Google

We claim that gold and silver when used as money should either cost in labor precisely the labor they presume to buy, or that the production of these metals should belong to the Government alone, so that any profit arising from their manufacture should recur to the Government for the benefit of the people; but we claim that the use of these metals for money is unnecessary and costly and that they should be discarded.

We call attention to the fact that they are the very chains which hold down the workers of the Old World and that that which is vaunted as the richest country on the globe has a system of white slavery, the horror and shame of which is not equaled in history. It is this system which is now fixing itself on this country, and if successful the effect will be simply to hand back to the mother country the land wrested from her in the last century.

Already foreign customs and laws prevail to an alarming extent. In everything but name our commerce is subservient; her capital buys our land and products required for our own people, and thousands upon thousands of her citizens are here employing our workers and grasping the fruits of their toil.

We therefore demand the demonetization of gold and silver, and that the Government shall release itself from debt by the institution of tariffs which shall in effect be prohibitory except with those countries in which labor shall be declared free. That export duties be placed upon all productions of the United States except where an actual surplus is known to exist, and except upon unoccupied lands and incomes all taxation should cease. That all laws relating to banking and the collection of debts be repealed. That Government works of various natures be at once put on foot at which men could always find employment and which would serve to fix the price or value of labor.

We demand, in short, the abolishment of superficial capital and its replacement by the issue of money by the Government which shall be legal tender, and we hold that this money may be of paper, this being at once the cheapest and most convenient material of which money can be made; and we point your committee to the fact that all capital which is not money *is paper* for which no one is responsible; that if this said capital were money as is here proposed that the volume of the currency would be increased by untold millions, that debt and interest being forbidden there would be no use for this money save to buy labor and its products, and consequently to get this money the armies of idlers would be compelled to work. Millions would swell the ranks of labor, and your prisons and pauper houses would vanish and schools of science rise in their places.

When your committee shall have concluded its present sitting we invite you to closer examination of our great East Side Cloaca. Here in the space of less than two square miles dwell not less than one million human beings in lair-like tenements and rotting hovels; here you may view the practical outcome of the system of capital invented by the Jews of the Middle and Dark Ages and improved by Christianity. From here are fed your insane asylums, your State prisons, and your pauper-houses. Here and in like but smaller places, amid squalor and destitution, are bred the painted harlots your civilization produces to spread disease and suffering to coming generations of men; here dwell the men who

> Impatient strike the law,
> And mount the prison's gloomy van.

And here amid it all "capital" compels its workers, the producers of all the wealth you enjoy, to live; here they sullenly rest after hard day's

Digitized by Google

toil; here their young are born to die young. The statistics of the board of death will show you that they die at tender ages, to the extent of 70 per cent. of all who are born in this frightful place. Every street is a River Ganges, where crocodile-like landlords live upon the babes tossed to them by demented mothers. On every corner of every street stands a United States Government tax gatherer in the form of a liquor seller. A Government which obtains its chief income by converting the food of the people into alcohol, whereby both body and mind are destroyed, is fitted to reign in the fabled hell of the Jews, but nowhere else; and yet this is what all the great governments of civilization under the teachings of capital are doing to day.

"Reform it altogether!" Let there be no piecemeal work! Let the system go out of sight, even as the system of black slavery went out in a night, though it cost a million of men's lives. The system of white slavery is fully equal in shame and suffering to anything that was ever alleged against black slavery. Men, women, and children are as effectually sent to servitude and death as though they were passed over an auction block. Such things cannot be and last. In conclusion, we beg to state that we fully understand what the continuous crack of the rifle over the Creedmoor means; what the vigorous drilling of the State's militia means; what the efforts on the part of "capital" to nationalize this same militia mean, and are taking measures accordingly. "Capital" is scarcely ready as yet to remove the ballot-box it has polluted with a view to its destruction, so that for the present we look to that and to you for relief. When that relief shall not come in due course, when it shall become a little more plainly evident that the shameful wrongs of the Dark Ages are not to be obliterated in the dawn-rays of justice and intelligence, then will they perish in the light of blazing cities.

Respectfully,

WILLIAM CLARKE,

*M. W. Free Labor League, 7, Sec.*

## LAND AND ITS TAXATION.

The CHAIRMAN. We have also a pamphlet that is apparently well-filled with information, entitled "Land, and taxation of same," signed by "Farmer."

The pamphlet is as follows:

### *LAND AND TAXATION.*

Land has received the attention of geographers, geologists, and chemists, and has been treated with such ability that results of the greatest importance have been reached. The necessities, comforts, and pleasures of life have been placed within the reach of nearly all civilized men. The placing of these possibilities within the reach of so many has been due to the researches of the scientist and the thought of inventors, combined with the efforts of the industrious. From the thought and investigations of the scientist, the practical artisan and agriculturist have been enabled to reach results which for a period of greater or less duration are considered perfection. Enjoyment of the triumphs of knowledge, combined with labor, have created new desires for still greater achievements, forward steps being soon taken which constantly lead to such results that past accomplishments fade away like dissolving views. Among the material results has been the building of large commercial cities within a gen-

Digitized by Google

eration, which, if destroyed by flood or fire, are replaced with a celerity that is difficult of realization. The tourist leaving our Atlantic seaboard cities passes over 2,000 miles through a region in which all of the towns, villages, and farm homes denote energy, thrift, and comfort. Distance has been abridged by construction and operation of a railway system which, if judged by the service it performs, may be considered complete in all its appointments and performances. The tonnage moved by which is facilitating and enlarging the exchanges of the country and the world in a manner never dreamed of by the ancients or expected by our ancestors. The movement of persons and property which a few years since was considered marvelous, is now esteemed as being only one of the ordinary requirements of the times, and, if not promptly complied with, additional lines are brought into existence whenever there is an apparent need of increased facilities. The statement made by Lord Macaulay, that, "of all inventions—the alphabet and the printing press alone excepted—those inventions which abridge distance have done most for civilization of our species. Every improvement of the means of locomotion benefits mankind morally and intellectually as well as materially, and not only facilitates the interchange of various productions of nature and art, but tends to remove antipathies, and to bind together all the branches of the great human family." This has been illustrated on a scale of magnitude in our country which has no parallel in the history of mankind. Enlarged and increased transportation facilities have caused the disappearance of provincial differences once so marked in this country. In fact these have almost entirely disappeared, and soon it will not be known that they ever existed.

When general peace and prosperity prevail through the country we do not realize the value and power of our transportation facilities, and the manner in which they can be made effective. But when war prevails and large armies with supplies and appliances to render them effective, or when a large city is destroyed by a sudden calamity and supplies of life in its vicinity are inadequate for existence, and celerity in movement of large quantities of food or material is required, then we realize their importance. Other specialties might be cited, but as all are based upon the land and its development, what is true of any one is true of all.

In scientific research and in the mechanic arts—so far as the beautiful is concerned—we do not compare with the Old World. But so far as practicability and production are concerned, we have by application of machinery and physical treatment of land excelled most portions of the world. Our large consumption per capita and export of food prove this.

We have applied new and original methods in the use of machinery, the results from which have no parallel in history. The ingenuity of our inventors has been supplemented by our cultivators; these have responded promptly, the ability and disposition of the latter, enabling them to efficiently utilize with the best results the creations of the former. But with all our wealth of originality and industry, which is so general, regardless of rank or station, we have made the great mistake of following the example of our English ancestors regarding the political and financial treatment of land—that is, in regard to taxation of same; it is almost exempt in England and too nearly so in our own country. The few thousands of wealthy, the millions of poor, and the hundreds of thousands of paupers there, compared with the more equal distribution of wealth here, is largely due to the difference in price of land and the forms of taxation. The amount of taxes which we place

Digitized by Google

against our land, and the value of same, is what makes the difference in the mental, moral, and physical condition of the masses here and there.

In England and Wales are 30,000 land-owners, and 7,000 of these own four-fifths of the whole island. The incomes of the people there are as follows: 8,000 have $25,000; 2,000,000, $450, and 4,500,000 have only $150 per annum; paupers number over 800,000; over 17,000,000, being two-thirds of the population have no income beyond daily wants. Is it any wonder that from such large numbers without income that the ranks of the pauper multitude are kept up to so near one million? Notwithstanding her long line of illustrious sovereigns, her devoted philanthropists, her brave soldiers, whose courage is undisputed, her still more courageous statesmen who have battled so nobly for the right, it is doubtful if so great a disparity exists in any modern Christian nation. To revenue of $325,000,000, land contributes but $5,000,000 taxes. The $320,000,000 from other sources is only another way of saying that it comes direct from the avails of industry.

If one-half the taxes were collected from the land, the industrial classes would be allowed enjoyment in excess of what they now enjoy by whatever $160,000,000 would purchase. Agricultural operations are perhaps conducted, so far as the tenants are concerned, under the most adverse conditions endured in this pursuit, the statistics in relation to which are almost beyond comprehension, and are of a nature to excite the liveliest sympathy for the class by whose exertions the food supply is furnished and indignation against the owners of land.

The total acreage of England is in round numbers 37,000,000 acres. The rental, including poor rates, is $820,000,000, or $27 per acre on the 30,000,000 acres of arable land. This is a burden which would crush out of existence any other body of men excepting the sturdy yeomanry of England. No other race under the sun could bear up under such a load as this. Advised as we are from official records of the burden under which the present generation stands up so nobly, complying without revolution against unjust ancient customs, we cannot doubt the legendary or historical accounts of the loyalty and valor of the English yeoman. One need know no more than this to know that the Englishman is a respecter of law and all that pertains thereto.

That discontent is beginning to manifest itself among the English tenantry at having to pay $27 per acre rent while the owners of land pay less than one per cent. of the taxes on same is not surprising. The astonishing feature is that they have so long and so patiently born the wrong without going beyond protest. It may be supposed that if all taxes were levied upon the land, owners would increase the rent; this would be impossible, as the present charge is all it will bear under the best-known farm management. All that can be paid, keeping the wages of farm laborers down near the starvation point, is already being wrung from the tenants. The result would be that owners would have to perform some portion of the labor for self-maintenance, instead of existing as they now do, upon exertions of others, which comes to them in the form of rent. This or a surrender of certain luxuries which would insure more comforts to tenants and laborers would be inevitable. The tenant system in this country is on the increase.

The late census discloses the fact that 25 per cent. of the farms in the country are being cultivated by tenants—a greater proportion than at any previous period. This is an indication that on account of the advance in the price of land, that it is getting beyond the reach by ownership of many who must exist by cultivating it. It also proves that the owners of one-fourth of the farms of the country are, to a certain

Digitized by Google

extent at least, being supported by rent, or in other words upon, or by, the exertions of others. Their personal right to do this cannot be denied; but if all taxes were levied upon land, and productions were exempt, rents would decline to such an extent that owners, as a rule, would have to cultivate.

The tenant system would not increase, but would rather tend to decrease; with diminution of rent, land would decline in price and ownership would be more common, that is enjoyed by greater numbers than it now is.

If all taxes were collected from land, and owners had to cultivate, they would not desire to hold the ownership of more than they could well and profitably cultivate. This would naturally cause owners to put it in market for sale at prices within reach of all who wanted it for cultivation. Our tenant system on the yearly or one-crop plan is a bad one.

The tenants are apt to acquire migratory habits, not having the opportunities to exercise the thrift that is usually inseparable from the ownership of land. The owner of property has constant and ever-growing inducements to improve and increase its value. His disposition and aims lead him in the direction of increased productive power with a force that is unknown to tenants.

It is not in the nature of things to be expected that tenants should have the ambition or independence of thought or action which ownership gives. There is not the spur to action that is sure to bring future rewards; there are farmers who know and who act on the theory and practice that in every working hour value may be added to a farm.

Largely the profits arising from agriculture consist in improving the quality of the land, which, in consequence, brings greater productions or a higher price for the land if sold. This is a class of profits in which tenants rarely if ever participate. Prevented by his relations to the land from enjoyment in one of the best and surest class of profits, it is not strange that the tenant is generally poor and that he remains in this condition. Considering all things, he had better own forty acres than to rent or farm four hundred owned by another. Given the best conditions for agriculture, and first or highest may be considered the ownership of the land, then nature is man's best friend; she responds with a generous hand to all his efforts; if he is faithful to his trust she seldom if ever betrays him. Were all our taxes levied upon the land, no one would want it except for occupation or use, which in the main is for the purpose of cultivation, or matters directly or indirectly connected therewith. Speculation would lessen, perhaps cease entirely, thus removing a very prevalent evil, the effects of which are periodically felt with results of the most disastrous character.

No one could hold farming land and pay taxes—which would have to be levied upon it—if all other property was exempt, unless cultivation of such methods as would insure large returns were constantly applied to it. Those who would make any legitimate use of it could have all their wants or pleasures required; beyond these there would be no object in holding it. As to do this would only be depriving those who would make good use of it of the privilege; it would simply repress production without benefit to any, but with damage to all. The farmers, of whom there are so many who are land poor, that is those who are holding more than they can cultivate or utilize in any profitable manner, would lessen in number. Educational, social, and other matters depending upon co-operation of numbers, would be greatly enhanced in power and value. Burdens which a thin or sparse popu-

Digitized by Google

lation cannot maintain, would be easily carried, wealth would soon appear where in many places the struggle for a bare existence is now a severe one. There would be larger investments in improvements and in personal property of all kinds that would add to comfort and health, largely increasing the enjoyments of life. Large sums now invested in unused unproductive land would soon take other directions and be invested in more useful things; there would be an improvement of method upon our present advanced methods of cultivation, bringing a corresponding increased production. Dr. Gregory's definition that a farm is simply a machine, for forcing plants from the earth, and that, like any other machine the more skillful the manipulation, and the better the conditions under which made, the more service would it perform, would be illustrated and proven.

The tenant system involves great loss of time, the owner is idle or at least is not under the discipline of regular employment, which is invaluable to every man. The tenant as a rule is employed only during the growing and harvesting season, during the other portion of the year he is idle, or largely so; he has no intererst in making any permanent improvements, cannot as a rule grow any live stock, has to buy many things which the owner of a farm does not have to buy, and has few things to sell. The system has many bad features, and few, if any, good ones. The speculator could not with all taxes on land hold alternate quarter sections while and until the labor performed on settler's quarters had raised the value of his land fourfold, as has frequently been the case. It may be claimed that the settler's land also advances; this is true, but it does not invalidate the fact that while benefiting himself he is also benefiting those who make no acknowledgment or return for same.

It may also be said that the homestead law prevents this, but as a matter of fact it does not; the speculator buys out large numbers, perhaps half of the pre-emptors and homesteaders, and realizes largely upon his investments and the labor of the other half. It may be supposed that it would be an injustice to land-owners to exempt the stocks of merchants and manufacturers, but community combined with competition would soon effectually regulate this, the farmer's personal property—all his gains and accumulations from land would be free, and the inducements to have and hold this kind of property would soon so increase as to place him on equal terms so far as exempt property was concerned. Where land is high in price it might decline, but this would not in any manner affect its value, judged by the standard of utility, which is the safer one by which to be governed.

It is well to keep in mind a clear distinction between price and value; the former often changes suddenly, depending as it does on many contingencies; the latter does not vary much so far as purpose of cultivation is concerned. We can see no harm that can come from land being kept down to a low price; this has no connection whatever with its productive power, nor has it even the most distant relation to it.

In a country where most of the land is rented, naturally owners would like to have the price rule high, and to keep it advancing, but in a country where owners cultivated entirely, rent would be unknown. And could it be entirely eliminated, so far as its personal exercise by landlords is concerned, it would be the greatest blessing that could be conferred upon mankind. The same or a given amount of labor is required for production, regardless of price. In the absence of rent the labor is the main factor; it is at least in all cases the important and unchangeable one, so far as quantity required is concerned. The power,

Digitized by Google

which for ages, rent has exercised over labor and capital, is one of the strangest anomalies in the world's history. Long and bloody wars have been fought over mere trifles when compared with this, and the arbitrament of this question will not long be deferred—by the ballot let us hope it may be done instead of by the sword.

Land has not the potency in the absence or want of labor which has generally been accorded to it, its true value (not price) depends upon the labor performed on or the business transacted over it. The land on which are situated buildings in which the largest stocks of goods are sold, hotels which entertain the largest numbers, banking houses which buy and sell the greatest amount of securities, exchange, or letters of credit, is always highest, for the reason that great utility is involved, that is, the useful, substantial wants of the greatest numbers are provided for.

The low price of land has been the broad, firm basis of prosperity in this country, from the landing of the Mayflower to the present time; to this and not to any peculiar American genius is it due. Because of the three factors of land, labor, and capital the share of the first, viz, land, has not been in excess of the two latter as has been the case in the old world. Where these conditions are changing to the reverse (that is, where land is getting more than capital and labor, or either of them) in our own country, prosperity of the whole population begins to show signs of lessening. If there is growing, as is claimed by some, an unequal distribution of wealth, wherever it exists it is chargeable to this cause and to no other. Comparison between our Eastern and our Western States and conditions ruling therein tends plainly to prove this.

The ignorant and envious may charge in vain that the large owners in railways are monopolists, but the charge will not stand one moment, when the facts are traced in connection with each other, and properly placed so as to be clearly comprehended. They are simply purveyors to public wants, as much so in principle as any doing the same kind of business on a smaller scale. Those who charge them with being responsible for the growing communistic sentiment, do not consider all the elements which constitute the case. They apparently forget, or deny the incontrovertible fact, that economies, which cheapen the service and lessen the cost of production in large transactions, are frequently of greater benefit to the public than they are to stockholders. And if all these so-called monopolists were translated bodily, with all the certificates of ownership of properties they represent, all so represented would remain intact just as it now is, performing the same or more likely enlarged functions. This cannot as truly be said of owners of large landed property, because the prices of land and charge for use of same continually advance, while the charge for railway service notoriously lessens all the time from competition—has, as a matter of fact, been for years lessening, and often at times when every other species of property was advancing in price. And further, mechanical property of every description is perishable, requiring from use and natural decay constant renewals, which land does not. When used for any other purpose except cultivation this is an additional reason why land should bear all taxes.

The nearest approach to monopoly that is effective, and likely to become more so, is beyond much doubt land, in its being so lightly taxed. The more equitable and liberal the laws regulating access to land, and its occupation and use, the greater will be our prosperity and the longer its continuance. The practices or legislation that steadies its price and that keeps it from advancing, will enhance past, and tend to largely increase

Digitized by Google

future prosperity. Anything which tends to advance the price of land makes it an unsafe basis of credit, the security of which lessens very generally in proportion to the advance, and often becomes the destroyer of all, or at least of general credit. Whenever it is accredited with having a utility which it does not possess, evil results must some time ensue, and the longer these are deferred, very generally the greater they are.

From the "John Law" scheme to the last panic, the history and results of land speculation are uniform as regards finality. The general course of land operations are, that small cash payments are made, and paper promises are issued for deferred payments, the land being the only basis for redemption.

The time when interest on deferred payments exceeds in amount more than the land can earn is the danger point, whether it be at time of purchase or later on. Once an era of speculation begins it is ordinarily carried to a great excess; large numbers expecting to realize fortunes embark in the business; as the purchasers increase in numbers the price advances. Proper judgment, if it ever existed, as to real values and what truly constitute the same is abandoned; soon the anxiety of holders to realize or efforts to force redemption of worthless paper brings on a crash, which, if it only ruined operators, the loss to the world would be small, but unfortunately the business of all is damaged by general unsettling of values, and many innocent creditors are ruined. The hardships of the latter are often peculiar and saddening; as a rule they are not active business men, but are largely made up from the aged and inexperienced of both sexes, who have been deceived and deluded by the golden promises of high rates of interest made by the too hopeful land speculators.

The failure of Jay Cooke and others did not cause the panic of 1873. Extensive railway construction was no more chargeable therewith than would have been excessive corn growing. More mileage has been constructed during late years than in the same number previous to 1873, and yet no evil effects have resulted. Railway construction is simply an exchange of capital for railway; no money goes out of the country. In fact, it has brought it into the country, largely by bonds sold abroad. The additions not yet improved to so many towns and cities, had more influence in causing the panic than had construction of railways. Mr. Cooke's failure would not have caused a tremor in this great country, had not large numbers been engaged in issuing irredeemable paper on land as a basis, far beyond its true value. They had virtually called it what it was not; had attributed to it a utility which it did not possess, never will, never can, that is beyond the legitimate wants of population.

Land cannot legitimately advance except under influence of aggregations of population, and the latter must be in proportion to the former, or disaster is sure; nothing can avert it. It therefore seems clear that the legislation, viz, taxation, which keeps down or steadies the price is the wisest. And if all taxes were collected from the land it would assume and maintain a stability in price which has not yet prevailed, because the demand for it would mainly be confined to those who required its best and only legitimate uses. The best social, physical, and financial conditions, embracing health and comfort, mental and moral strength, the accumulation of property and maintaining same, largely—it may be said entirely—depends upon the cost of land; that is, when the welfare of all is concerned.

The history of our country and its accomplishments is an exemplification of possibilities and realizations, based on cheap land, which can-

Digitized by Google

not be disregarded, nor will they be denied if correct evidence is given due consideration. American genius and individuality which is credited with so much and which is extolled so highly, had its origin in the free or cheap land to which came our ancestors. Unfortunately they were, and we continue to be, somewhat influenced by the wrong forms of municipal and legislative administration which drove them into exile. They are perhaps not yet of the same intensity, but being the same in principle, may become the same in effect, possibly even worse, if time enough is given. And certainly now, after more than two centuries, it is time that any of the relics of the Old World wrongs that taint or poison our system be eliminated therefrom.

Had our legislators given the thought to the science of government that our professional, mercantile, and mechanical classes have given the affairs that have engaged their attention, anything that is wrong would long since have been righted. Unfortunately, representatives and public servants do not perform service under the same conditions that commercial and professional agents do; fixed tenure of office gives the former an exemption from the full performance of duty and a license and power which the latter cannot exercise.

Fixed tenure of office is probably the weak spot in a representative form of government. We shall never have a system so perfect that there will not be weak spots, until human nature changes, and of this there is no likelihood or prospect. Simple legislation by which a public servant could be summarily deposed for neglect of duty or abuse of power, would be worth more than all the civil-service schemes we have heard of, or of all the laws relating to same that we shall ever have.

Difficulties incidental to and inseparable from the advancing price of land are increasing; these are too numerous to be alluded to in detail. The one which overshadows all others and which, if lessened, would cause the disappearance of many that are incidental thereto, is rent. This has its origin in ownership of land and cannot be eliminated, but it can be modified by taxing land and exempting productions.

The exactions of rent reach all; they are perhaps most arbitrary with and severe upon the landless; but large numbers, in fact all, who own homes and farms, make large contributions to those from whom they purchase supplies or services. Its most cruel feature, or what may be made such, is its transferability; dealers have no reason to care what they pay if they can charge the same to customers. Its effects upon masses of the poor in our cities is deplorable, distressing many, debasing others, who are a dangerous, and, holding the ballot, may and do become, an evil, element. They are used by unscrupulous politicians who gain and hold power from the cheapness with which they can purchase the votes of those who, by their situation and surroundings, care not who govern them.

If those who have cause to think that our form of government is a failure, from the ease with which the elective franchise is perverted, and the consequent growth of political corruption, would take action in the direction of removal of primary evil causes, their confidence in our governing powers would be restored.

Another class are slandering our capitalists, inciting the desperate to deeds of violence against those whose fortunes are embarked in facilitating the world's exchanges, which contribute to the comfort of all. If these would interest themselves for a change in our form of taxation, they would be much better employed than they now are.

Fortunately these destructionists are few in number when compared

Digitized by Google

with the whole; the majority of civilized men being constructionists, the power of the former for mischief is limited.

It will require long and earnest effort for the formation of a public sentiment having strength enough to cause a change in our form of taxation. But if made as suggested the benefits will soon manifest themselves, not rapidly, perhaps, but slowly, surely, gathering cumulative force with time, and at no distant day many who would be in the opposition now, will, as has often been the case, in other reforms, be among its firmest supporters.

FARMER.

JUNE, 1883.

## STRIKES AND THEIR REMEDIES.

The CHAIRMAN. We have also received a treatise of several pages upon Strikes and their Legal Remedies, by a Pittsburgh Lawyer, which appears to be well written.

The document is as follows:

*SUGGESTIONS RESPECTFULLY SUBMITTED TO MEMBERS OF THE LEGISLATURE REGARDING LABOR BILLS AND CLASS LEGISLATION.*

By "A PITTSBURGH LAWYER."

Such bills have already been presented at this session, and others of the same kind likely will be. They are of the species known as class legislation, which is always regarded with suspicion. Strenuously urged, as they alway are, by private interests, through the medium of professional labor agitators, whose occupation depends on their activity and show of accomplishing something for their constituents, they are sometimes lobbied through, in conflict with the first principles of civil liberty. An instance of the kind is found in act No. 173 of the Laws of 1881, page 147, which converts an innocent transaction into a crime, and virtually forbids men to make their own bargains.

It is not the purpose of this paper to prejudice the fair consideration of any bill, but, with all due respect, to urge upon legislators the duty of careful scrutiny of their provisions, and their bearing on the general public welfare. It may not be out of place to advert here to some well-established facts and principles regarding the subject to which this class of bills relate:

1. The object of legislation is the welfare of the community generally, without discrimination or favor to one class over another. Therefore, no class ought to be exempt from the punishment of a crime or the penalties of a criminal law which all other classes are subject to. This applies to the special acts which would exempt workingmen from liability for criminal conspiracy; and also to all present or prospective legislation forbidding workingmen from entering into contracts with their employers regarding their wages or time, or manner of payment. This and all other such legislation, if carefully scrutinized, will be found in its tendency to be in the interest of the men who govern labor organizations, and would have workingmen driven into them, and to only act or contract through them. These men would have workingmen believe that, by banding themselves together, and by organizing strikes under laws exempting them from liability for wrong-doing, and by preventing others from working, or mills and mines being worked without their consent, they can arbitrarily and artificially increase wages, and procure for their labor whatever they please to ask, regardless of the principle

Digitized by Google

of supply and demand. Such a thing is impossible and chimerical, and among a free people we all know it to be a fallacy. Its attempt can only create disturbance and injury to the working classes themselves as well as proprietors of industries requiring labor.

It will also be conceded that the prosperity and consequent welfare of the entire people of this State depends greatly on her mining, manufacturing, and other industries requiring the employment of labor; and also, that the success of these industries depends greatly upon their having a fair field and equal rights in its employment with other States and localities where similar industries exist. In so far as you hamper and obstruct the investment of capital in these industries, in this State, by unusual or undue restrictions on the employment of labor, to the same extent you divert capital into the coal and iron districts of West Virginia, Ohio, Missouri, and other sections where such restrictions do not exist. The effect is equally injurious to the employer and employé, as also to the entire community.

2. It is the common right of every man to hold or dispose of his property or labor according to his own free will and pleasure, without dictation or compulsion from others. Any interference with this right, whether by legislation or usurpation, is an infringement of civil liberty under our constitutional bill of rights. Every employer has the right to employ or discharge his employés, according to the terms of his engagement with them, and to accept or reject their propositions without having the safety of his property endangered, or his work obstructed in consequence; and every workingman has the right to engage his services, or refuse them, on his own terms, and whether by contract, written or verbal, or for a period of time longer or shorter; and he is entitled to the exercise of this right without injury to his character or person, or evil consequences to his family from odium thrown upon him or them by any caste or organization of workingmen in the same line, or otherwise. It is hardly necessary to advert to the fundamental right of every man of sound mind and lawful age to make bargains and contracts concerning his labor, or anything else that belongs to him. It is a right, indeed, which legislation cannot deprive them of, under the constitutional bill of rights, "forbidding legislation impairing the obligation of contracts," and which, by implication, forbids legislation prohibiting men from making contracts for all lawful purposes.

This is adverted to because agitators of certain labor organizations threaten to procure legislation to forbid the making of all contracts of any kind, concerning labor, between the employer and the employé. They complain that such contracts constitute a grievous hindrance in their way when they think proper to declare a strike, and that they encourage a class of workingmen to remain outside their organization; that these outsiders refuse to contribute and set a bad example to the workingmen who belong to the organization. They therefore urge that no contract whatever be signed or entered into between the workingman and the employer, whether for a day, or a month, or a year, or otherwise, because, under such contracts, the employer can hold back a percentage of the wages in order to secure performance on the part of the employé, and this constitutes a barrier against the agitators, and because it holds out an inducement to workingmen to enter into such contracts on account of the greater certainty and permanence of employment which such contracts afford.

A notable instance of this kind took place at the Waverly coal mines in Westmoreland County. About seven years ago that company adopted the co-operative system, under which each miner's wages is regulated

Digitized by Google

upon a sliding scale, according to the price which the coal brings in the market, and the miner allows 10 per cent. of his wages to stand as a forfeit for the fulfillment of his contract. This arrangement has worked beneficially and satisfactorily, both to the miners and the proprietors ever since, and has prevented strikes, except on two memorable occasions, when officials of the miners' association of the district interfered to break it up by procuring members of the association to be employed, and then fomenting discontent and discord among those working under the contract. In this way, on two occasions, they succeeded in producing a partial strike among the men, the last of which, however, resulted disastrously to the agitating officials who got it up. It required more effort in the way of threats, and greater exhibition of force in the way of encampments and boycotting, and other appliances than were justifiable, and two of the ringleading officials were arrested, convicted, and punished by the court for misdemeanor.

In order that you may see the fairness of the contract mentioned, and may see how unjust are the objections made against such contracts, a copy is printed in the appendix hereto, to which we ask your attention. The company were never at a loss for labor under it, and of the better class, not of the floating idlers who only work at a place long enough to relieve their immediate necessities; and miners working under it were always content and satisfied, except when tampered with by labor lodge officials. The officials of the miners' association have united with the Knights of Labor officials to procure legislation to prevent all contracts, as a hindrance to their purposes of holding the working class in subjection to their organizations. We therefore ask your attention to the matter that you may consider the contract referred to and see for yourselves whether any free man has not a right to make such contract if he sees proper, and whether there is anything contained therein which it would be a hardship on his part, if an honest man, to fulfill—this being the contract in particular which has created the opposition and clamor of labor organizers against contracts in general.

If co-operative labor is advisable, as Mr. T. V. Powderly, a leading agitator, holds, we can see no reasonable objection to the arrangement which this contract provides; and whatever arrangement is made to produce co-operation and good-will and regular employment, either between workingmen themselves or between them and those who supply the capital, there can be certainly no objection to having such an arrangement reduced to writing.

We desire to raise no contention with labor organizations of any kind. We think that workingmen who choose to do so have a perfect right to join them. But there are a large class of workingmen who prefer to be free to act at all times for themselves. We submit that these men also have a right to protection in the exercise of their freedom, which the spirit of free government provides. We submit, also, whether it is sound statesmanship to extend too much encouragement to organizations and combinations of any kind, whether among workingmen or capitalists, or any other class of society. More especially, we think that sound statesmanship would rather discourage than promote organizations of the secret oath-bound order, in view of the evil results of the Ancient Order of Hibernians, or Fenians, in Ireland, and the Molly Maguire lodges in this country. Not that we class the Knights of Labor organization with Fenians and Molly Maguires, but the element of organized oath-bound secrecy in both must lead to the same evils. We know that oppression exists in Ireland, yet the pastoral letter of the bishops, by authority of the Pope, tells the Irish that "secret societies among them are establish-

Digitized by Google

ing a tyranny compared to which the oppression they profess to remove is liberty itself." Why the necessity of oath-bound secrecy? Certainly no necessity where there is nothing wicked or unlawful and dangerous to conceal.

3. You cannot fail to see that legislation of this kind is class legislation and calculated to be one-sided and prejudicial to not only the operators, but the general public. Operators or the public are never consulted about its effect on the business. They are closely engaged at home, and pay little or no attention to legislation at Harrisburg, relying on the wisdom and intelligence of the legislature to prevent the enactment of special or unfair and partial laws. On the other hand, these bills are always urged by a lobby of persistent professional labor agitators maintained at the capital by labor unions and similar organizations.

4. Why should one class of the community be exempted from punishment for criminal acts for which all other classes are punished? Yet this is just what the special legislation to modify the conspiracy law and exempt workingmen from the penalty against criminal conspiracy aims at.

5. Again, why should coal operators be singled out and made insurers of their employés against all accidents to the person? Why should miners, as a class, or railroad men, as a class, be specially protected beyond all others in like dangerous employment? How could men risk their money in operating mines or factories or railroads if made liable for accidents, as one bill proposes? Why should the employment of productive capital in such business be specially discouraged in this State beyond other States? Or why should men of lawful age, and competent to contract, be denied the privilege of making contracts for their labor, either written or verbal, because they are coal miners or proprietors of mines, as another bill proposes?

Yet you will find on your files bills for all these purposes, and all tending to one ultimate end—to drive workingmen into labor organizations, there to be ruled with the iron rod of the demagogues of the mines and professional organizers. Such legislation must result in no one being allowed to learn a trade or get employment unless he belongs to the lodge or union and submits to the payment of all lodge dues and exactions, and works or goes idle at the dictation of union or lodge bosses. If this system gets sufficient legislative encouragement and protection it will eventually extend the power of the union over the workingman till it reaches the tyranny of the ancient trade guilds.

6. A fundamental vice in all such legislation is that it goes on the theory that rates of wages can be regulated arbitrarily in defiance of the rule of supply and demand, which regulates the price of everything else.

It needs no argument to a mind of ordinary intelligence and observation to show the absurdity of this theory. In this age of rapid and cheap transit of information and workingmen from one country to another, and one locality to another in the same country, labor flows and wages find their level everywhere, like water. They may be temporarily obstructed, but never permanently fixed or restricted by combinations among the men of a particular locality. If they succeeded even to disturb the general market value of labor or its product ever so little, the cheaper labor and product at other places would flow in to diminish or destroy, not only the trade of their employer, but their employment also. Competition in all mining and manufacturing pursuits, at the present day, is very great, and profits reduced to a very fine point. If higher rates of wages could be permanently fixed and established

Digitized by Google

throughout the whole nation, and a tariff existed to keep out all product of foreign labor, there might be some show of reason for such legislation, but even then it could result only in a general increase of the cost of living, as all other trades, professions, and occupations would be compelled to follow suit and make a general raise all round.

7. You will have observed, also, that the main point aimed at is unfair to the operator, and has never benefited the employé. The main point is the *compulsion* of the operator to submit to the employés terms. This element of compulsion is sought to be promoted by most of the legislation in question, by extending legal protection to strikes and strikers engaged in boycotting, or holding the works, as they express it. A strike without more or less of the compulsory element, to prevent other workingmen from taking their places, or those opposed to the strike from working on, would be a rope of sand—perfectly harmless and unobjectionable. It is right and lawful for workmen, dissatisfied with their position, to quit, and to quit in any number as they please, and it is fully allowable to them to advise their fellow-workmen to follow their example; but here their right ends if they are honest and fair men. When they quit and are paid their wages their relation to the works and to their employer ends there, and if fair and well disposed they will leave in peace. But this is just what a strike does not contemplate at all. Its purpose is to force the employer to take them back on their own terms, and it proposes to do so by stopping the works, by preventing any of their fellows from working on, and preventing outsiders from taking their places; and the appliances used and approved for this purpose are encampments by the strikers about the works and every exhibition and menace of force and violence short of its application; also, actual violence to men's moral nature, as the use of vile and scurrilous language and epithets towards those who would disobey their orders: *scab, blacksheep, &c.*, hurled at them and their wives and children as they appear, or pass along the public road, or to the children at school. Another effective appliance used for the purpose is a fife and drum to escort all recusants to and from their work, to the music of the Rogue's March. It was calculated to arouse the indignation of every man having the spirit of freedom to see how diligently these and similar appliances were used during the great strike of last summer in the Panhandle district, where men who preferred to earn a living by their work at $3 wages to going about begging, were escorted in this fashion to and from the mines, and all the abuse that low and vulgar scurrility could invent was constantly heaped upon their wives and children. To the credit, however, of our native-born Americans among the miners, they did not participate in these manifestations.

But what is the outcome of all such wrong-doing? Loss and distress to the perpetrators. The uniform verdict of all workingmen is that strikes never benefit them; and yet the demagogues among them are constantly agitating strikes and devising ways and means to evade the law of criminal conspiracy, and constantly invading the legislature to obtain legislation to protect them.

8. It may be presumed that as intelligent men you are not carried away by the low demagoguery of labor union organs or professional labor organizers. These organs are making money. Their proprietors in some instances getting rich, and the labor-agitating profession receiving fat salaries. From what source? Why, out of no other than the abundance of gross ignorance among our working population of foreign birth. You will have observed that few, if any, of our native workingmen are ever found in labor troubles. That was noted by the newspa-

Digitized by Google

per reports last summer regarding the men engaged in the extensive strikes in and about Pittsburgh. Nor do you find any, or if any, but very few, native workmen acting as labor organizers, or union officials, or labor organ editors. There are always enough smart men among the foreigners to fill these positions. This accounts for the paucity of the labor vote at the late elections. Every proprietor of mines knows that few of the foreign miners are naturalized; and when long enough in the country to get a vote they have become too intelligent to be ruled by demagoguery. It is not that our own people are better by nature, but they are better informed; have received the advantages of a better education; understand the principles of free institutions and the functions of government better. They see the absurdity of all attempts to evade the natural effect of supply and demand in wages, and of attempting to regulate them by compulsion towards their employers or fellow-workmen.

As this kind of legislation, therefore, is urged by a class who depend on the ignorance and gullibility of another larger class behind them for support and maintenance, it is to be expected that all manner of falsehood and misrepresentation will be resorted to in order to blind and mislead the ignorant mass.

## MISREPRESENTATIONS.

Among these misrepresentations you will have noted their constant harangues against capital, and the attempts to represent labor and capital as antagonistic to each other, when, in truth, no other antagonism exists than exists in any other position where one party's interest is to get what he wants as cheap as he can, and another party wants to get for what he has to sell as much as he can.

Again, they represent capitalists as in combination to oppress workingmen. You know of your own knowledge this is untrue. You never, in all your experience, knew of a combination among operators to depress wages or injure workingmen. The attempt would be futile, and capitalists are too intelligent to make any such attempt; and, in face of the absurdity of such a proposition, you see it constantly put forth that organizations among workingmen are justified on the ground that they are necessary to meet opposing organizations among capitalists. They would have it inferred there are such organizations, but never attempt to point them out. Who are the capitalists of to-day? The workingmen of a few years ago. Who will be the capitalists of a few years hence? They are among the workingmen of to-day who have energy, industry, independence, and intelligence to act for themselves; to think, and act, and work, and deal for themselves, discarding dictation, and refusing submission to any class, whether of capital or labor. They are the men who keep out of labor unions and the payment of union dues; or, if they are inveigled into them, they make trouble, refusing to join when strikes are proposed. They don't suit to belong to a union, as they prefer to belong to themselves, and to do as they deem best for their own benefit. They would not be a machine under union rule, or always keep their nose to the grindstone as laborers. They go to work to make and save, and as soon as enough is accumulated to buy a team, or house and lot, they become capitalists in embryo, and eschew labor union bossism, communism, and everything else detrimental to the law and good order of the community at large.

It is not infrequently urged also that our laws discriminate against workingmen and in favor of capital. We defy them to produce an in-

Digitized by Google

stance of the kind in our law books. On the contrary, the discrimination is just the other way, and in favor of workingmen, so far as it goes. You find no acts of assembly favoring capitalists as a class or otherwise; but you do find acts everywhere favoring workingmen; even exempting them measurably from the penalties of the criminal law imposed on capitalists and all other classes, as in the instance of criminal conspiracy. Mr. T. V. Powderly made such an assertion in his article of last August, in the North American Review, and all he could find in our statute books to give the slightest countenance to his assertion was the act forbidding trainmen on a railroad from striking between the points of termini in order that exposure of goods to depredation or of passengers to delay and hardship might be prevented. He was hard run, indeed, when he could find no other specimen than this of discrimination. All civilized nations, for the necessary protection of freight and passengers, forbid trainmen from deserting their trains while on the journey, and sailors from deserting the ship while on the voyage. So, too, political demagogues are apt to make assertions of the same kind; some, indeed, whose character and abilities should raise them above such practices.

It is also not infrequently pretended that our laws forbid workingmen to organize, which all men of intelligence know to be untrue. It is true, organizations for unlawful purposes, or for the accomplishment of a lawful purpose by unlawful means, are forbidden generally to all classes, except to workingmen. The labor agitators have gotten the law against criminal conspiracy so modified as to exempt their class, as they claim, and now they are agitating to modify the law still further, in effect not only to enable them to combine and conspire but to accomplish such unlawful purposes as preventing the proprietors of mines and mills from operating them, or hiring help to operate them, except on terms dictated by the special union of the locality.

Another misrepresentation made by the agitators has reference to monopoly. They represent all aggregated capital as monoply. You would suppose that every firm or corporation having capital invested in any industrial pursuit was a monopoly. All these uses of capital, however, contain no element of monopoly, but are highly beneficial in their respective spheres. It is only when capitalists, whether individuals or corporations, combine to inflate or depress prices of commodities to the public prejudice, or to accomplish any other purpose injurious to the public or individuals, such as forestalling the market in an article of common necessity, that monopoly and its evils are produced. It is a wrong to be condemned and suppressed wherever possible; and it need not be denied that such combinations do too frequently exist among our leading capitalists and corporations, but they have never been known to exist for the purpose of depressing wages. It is wrong, however, to represent all possessors of capital, or all who unite their capital in a legitimate business, to be conducted in a legitimate way, as monopolists. Our largest and most useful industrial enterprises could not be maintained without aggregated capital; and without such industries where would employment and wages come from?

But it is not in capital or the aggregation of capital alone that a monopoly may exist. It can be created in labor as well as anything else of value to the public. The very end and aim of our present labor unions and Knights of Labor, outside of their charitable purposes, is to form a monopoly in labor, and to obtain for it more than its market value under the natural law of supply and demand; and the monopoly so established, regarding labor, is just as injurious in effect so far as it goes.

Digitized by Google

Political demagogues and labor agitators of the day are incessant in teaching false doctrines regarding labor and capital and their relations to public welfare. According to them you would suppose that labor was the sole producer of wealth, and that to it all property owed its value, and that society and civilization depended on it; when in truth it is but one element, though a very important one, in producing the wealth of the community, and it can rightly claim but equal protection under the law with the thousand and one other classes of producers and contributors to the common weal. Arts and sciences, manners and customs, thought, habits, and principles—all and every occupation, condition of body or mind in which the various members of the industrial hive are engaged go to make the market without which the products of labor would have no value as a factor of wealth. Each man's labor might serve him to catch game or till the ground for his own subsistence, but would be otherwise valueless. If he could not dispose of his surplus products or surplus labor where would pay or wages come from? And to create this market requires the interposition and exercise of all other qualities and faculties of society. Workingmen are therefore entitled to the same rights and consideration as capitalists and other classes, but no more. Whilst their condition or occupation by no means degrades them below other classes it does not elevate them above others. All are equal.

> Honor or shame from no conditions rise;
> Act well your part—there all the honor lies.

The industrious laborer who does his work well and fulfills his domestic relations properly is as worthy as the judge or the senator who discharges his duties faithfully, but is not above them. The character as well as the acts of men are factors in the creation of a market and the production of wealth.

An eminent writer on social science speaks of it in this way:

### THE RELATIVE POSITIONS OF LABOR AND CAPITAL AS MORAL AND PRODUCTIVE FORCES.

"Adam Smith taught that the wealth of a people is its sons, and that this is also the political economy of the Old Testament. For a solid, simple scheme, to stand by and work on the world over, and right through its whole history, there is nothing better in Mill or Ricardo than this elementary view of the matter. Human character is the basis on which it all rests. Labor can be defined so as to include every kind of human activity, and even the principles of morality. Still, as a practical doctrine to lay before the people, it is a false and dangerous position that labor is the source of wealth. A thousand things which no one would think of calling labor enter into it, such as experience, taste, ingenuity, knowledge, patience, perseverance, and so on through the whole list of human capacities, and, we may add, of human desire. It is a tremendously dangerous thing to point out all the rich works of a great city—to the domestic palaces, to their furnishings and adornments; to the wares in the shops, the silks, laces, vases, gems; to the horses and carriages, and other identifications of a complex and advanced civilization, and then tell the crowd of workingmen that they made it all. They did not make the thousandth part of it. They did not furnish the essential and critical thing in the production which gives the whole its magic charm and supreme value. The moment this thought gets into their mind the other comes chasing in after it—that this is their work; the world is all wrong as long as they cannot own it and

Digitized by Google

have the good of the work of their own hands. If labor is the source of wealth why is not the laborer entitled to all he has created? That is the short method that lies under most of the workingman's discontent. They have been told that labor, and nothing but labor, is the source of wealth. They believe it, and for the next thing they are all up and afire to pull down the iniquitous system (as they see it) which compels them to work but forbids them to enjoy the fruit of their labor. Things are likely to grow worse than better, until they make workingmen see some elements in the production of wealth which they do not think of when speaking of labor. We have floated off in our speculations too far, from the very simple elementary proposition that the requirement and desires of men are what make the market, and that the human character is the basis of economic value.

"Thanks to the good sense of the people, they are still wiser in this matter than many of their teachers. They have not lost faith in the old-fashioned political economy of the Bible. They do not forget that character in all its aspects has as much to do with the production and conservation of wealth as labor, and they have still a faith in the economies of honesty and justice which does credit to them as men."

## ARBITRATION.

We do not see any good in arbitration boards. They are also based on the erroneous principle that men do not understand their own interests or know how to make their own bargains, and should have guardians appointed over them. Could there be a greater absurdity in legislation than Senate bill No. 30 on this subject? Judges without salaries in a court which would take up their whole time if there should be fools enough to resort to it. A court, too, without attorneys, agents, or advocates to represent the parties or their cases. Employers should have no objections to this, as they are supposed to be generally better able to conduct their own cases than the other side. A court, too, which anyone may turn his back on if summoned to appear before it; and if he does appear or brings suit in it no judgment can be entered against the losing party unless he consents to it. A court, also, with a code of procedure so complicated as would require an adroit practicing lawyer to carry a case through without being upset by a certiorari from the regular law court of the district. A court where, if judgment was entered after trial and consent given to the decision, as required, the successful party would have a good time to carry it into effect. Final process against miners to compel them to go to work—attachment, of course. They would have to be caught first, and then worked in chain gangs in order to hold them; and if the court went into an investigation of the state of trade, and the condition of an establishment to ascertain whether on the whole it was making or losing money, with a view to decide as to the wages it ought to pay, the court would have rather a large contract on its hands. All the proceedings of such a court would be entirely nugatory without compulsory power, and compulsory power cannot be given. Laborers cannot be arrested and put to involuntary labor like slaves, and employers cannot be compelled arbitrarily to hire labor at a higher rate or on better terms than they choose to give. That would virtually take the management of a man's business out of his hands and be downright confiscation.

But it is thought it might do some good as a court of conciliation. This, too, is doubtful. If the interest of the parties on both sides does not lead them to conciliation and concession it will never come of litiga-

Digitized by Google

tion in any form. Serving subpœnas, examining witnesses, and the red tape and delays of a quasi lawsuit will never bring them together. No, if employer and employéss cannot attend to their own affairs and interests there is no use in the law appointing either guardians or advisers for them.

## STRIKES AND CONSPIRACY.

The following article has been approved as sound by several eminent lawyers:

### LAW OF STRIKES.

Workingmen, like all others, have the right of meeting together at all times to discuss and consider whatever they may regard as material to their interests. They have also the right to argue and discuss and to try to persuade each other to any particular view or the adoption or rejection to any particular measure just as all men have.

They have also the right to advocate any measures they please through the medium of the press, as all others have.

They have equal rights with all other classes, and the majority of them are intelligent enough to know this. The only difficulty arises from the demagogues among them wanting more rights than belong to other classes.

They have, of course, the right to demand higher wages or better terms of their employers, and the right to quit work, all at once, or as many as see fit to do so, if the employer refuses to comply; and they can refuse to return to their employment if he persists in rejecting their demands. They can do all this and not be liable to the law for either conspiracy or damages. But if their employer definitely refuses their demands, their rights, as against him, end there. They cannot coerce or compel him and he cannot coerce or compel them, and all acts and measures taken in that direction render them or him law-breakers, as the case may be. If their demands are refused it is their duty to depart in peace. The employer has the choice of granting their demands or losing their services. This is a fair matter of business. Every intelligent workingman will admit this; and this being so, if the employer elects to dispense with the services of the men instead of granting their demands it is his right to do so, and in that case common sense and common honesty require that the matter should end there. Every honest man will admit that to force him to take back the men on their own terms, by direct or indirect means, is an outrage on law and social order and all business principles.

And just here is where the pinch comes in the strikers' case, as the very essence of a strike is compulsion; compulsion of the minority to quit work and join the strike; compulsion of outsiders to stay away and not fill the places of those holding out, and compulsion as between the strikers themselves to compel the wavering to hold out—and all this with the ultimate purpose of compulsion of the employer to concede their demands. Take away this element of the strike and you entirely emasculate it. It becomes a rope of sand. The rejection of the proposition of the strikers by the employer ends it at once. Indeed, it cannot amount to a strike without this element of compulsion, for the very term implies an intention on the part of the strikers to hold out, and there would be no holding out without an object which can only be to compel the employer to give in and grant their terms.

Now, it is this element of compulsion, and the means resorted to to enforce it, which render strikes unlawful, and for several years the labor

Digitized by Google

demagogues have bored the legislature to legalize this compulsory element, and, as they think, with some success. If compulsion is a right which workingmen are entitled to have enforced through the means of a strike, then, of course, the law ought to give it to them, and give it in clear and unambiguous language; but such is not the character of the legislation so far obtained on the subject. A little consideration, however, will show that to enact the law in plain terms would expose its absurdity so that even the stupidest legislator would be shocked. Let an act be framed declaring that when the majority engaged in any particular work declare a strike it shall be unlawful for the minority to work on, or for others to take the places of the strikers, and that all violations of this law shall be punished by fine and imprisonment; or that the strikers may use the necessary force to prevent the work going on without their consent or their demands being granted. It is plain this takes the control of his property from the employer and deprives workingmen outside the strike of their constitutional rights. Yet this is just what the legislation in question has aimed at in an indirect way. If strikes were legalized to the extent demanded the next step would be an act requiring the employer to operate his works, or allow the strikers to take possession and operate them on their own terms at his expense. This is the logic of all such legislation.

The first step taken in this direction was the act of 1872, Purdon's Digest, page 351. It made it lawful for workingmen "to refuse to work if in their opinion the wages are insufficient, or their treatment brutal or offensive, or the employment contrary to the rules of any association to which they may belong: *Provided, however*, The constitution and rules of such association are conformable to the Constitution of the United States and of this State; *And provided further*, That such workingmen shall not in any way hinder persons who desire to labor for their employers from doing so, or other persons from being employed as laborers." This act, with its proviso, was really but an expression of the common law of the State as it then stood.

By the above provisos added to this act, on its passage through the legislature, it will be seen that the "virus" of compulsion was entirely extracted and the law left as it was before, because the law never was otherwise in either this country or England, that workingmen could not leave their employment if they deemed their wages inadequate, or their treatment brutal, or the employment contrary to the rules of their church or any civil or social association to which they belonged. It was only when the strike was intended to take undue advantage of the employer when filling some important order, or getting out some special work that would occasion great loss and disappointment, as the getting out of a newspaper or the like, that strikers were indictable at common law, and such attempts to take advantage of a special emergency of the employer have not been legalized yet.

Of course, this enactment, with its provisos, did not meet the expectations of the labor demagogues when put to the test as affording the right of compulsion, and the next effort was the act of 1876 (Purdon, 2037) which provides that the second proviso in the former act of 1872 "shall be so construed that the use of lawful or peaceful means, having for their object a lawful purpose, shall not be regarded as 'in any way hindering' persons who desire to labor, and that the use of force, threat, or menace of harm to person or property shall alone be regarded as in any way hindering persons who desire to labor for their employers from so doing, or other persons from being employed as laborers."

This was intended, and is claimed by strike agitators, as giving full

Digitized by Google

power to the strikers to do any and everything short of assault and battery, or murder, or the destruction of property, in order to compel the employer to accede to their demands; and to use all manner of scurrility, ridicule, and vile epithets, as scab, black-sheep, &c., and derisive music of fife and drum, as the Rogues' March, &c., to compel others to join them. But a very little consideration will satisfy any one that this construction cannot be given to it. In the first place, such a condition of things as this would involve would be contrary to the spirit of the Constitution, both of this State and of the United States. Again, an act of this kind, in derogation of the common law, must be strictly construed, and only effect a change so far as plainly expressed or implied; and this act expresses no such extreme or radical change as is claimed for it; and so far as it has received any judicial construction it is unfavorable to the latitude claimed for it. Thus, in the important case against Jones and Anderson, in the Westmoreland County court, where on the trial this act of 1876 was overlooked and disregarded, and the law laid down as if no such act existed, but, after being fully considered on the motion for a new trial, and argued on behalf of the defendants by Hon. Edgar Cowan, one of the ablest jurists of our State, the court saw no cause to change its rulings, or for granting a new trial on account of this act; and the supreme court seem to be of the same opinion, as they refused to allow a writ of error after the whole case was laid before them, so that it may be fairly inferred that this act does not give strikers the license they claim under it; and indeed the act itself is clear enough on the subject. The means used must be lawful and peaceful, and have a lawful purpose, and shall contain no menace of harm to person or property.

Now, this excludes the usual appliances resorted to to maintain a strike, such as remaining on or about the premises in force, for the unlawful purpose of deterring their fellow-workmen who would go to work, or others from taking the places vacated. To take away men's free agency in the pursuit of happiness or any lawful pursuit of daily life, whether done or attempted by the application of actual force, or by calumny, insulting, epithets or menacing gestures, is clearly illegal, and would be neither lawful nor peaceful as a means, or for a lawful purpose, if that purpose was compulsion; and whilst such appliances might not be a menace or harm to person or property in all cases, yet they are clearly illegal on other grounds. Much less would bands of men hovering about the works, or encamped, or marching in force with or without drums, or other hostile demonstrations, be lawful. Such appliances would constitute a standing menace of harm to both person and property, and be punishable under the law; as also all confederated with them, and aiding and abetting, by use of money or otherwise. The continued maintenance of a strike, with or without hostile demonstrations, at works of any kind, is calculated to deteriorate their value, which is in itself harm to the property, and consequently a menace of harm. The plain duty of the strikers is to leave the place in case their demands are declined. They have the right to stop work and make their demands, and the employer has the alternative of losing their services or complying; but when he has made his choice the law as it now stands, and ever did stand in any well-regulated community, extends no right to the striker to exercise compulsion on his employer, or on other workmen, under any shape or pretense whatever. The foundation principle of free government is the equality of every man with all other men in all the rights of life, liberty, and pursuit of happiness; and every obstacle thrown in the way of any man to pursue his vocation, or in the way of

Digitized by Google

any man or set of men in the lawful management of their own affairs, is an infringement of this principle. Every man has the right to work or not, and for whom and on what terms he pleases, but he must allow others the same privilege; and every employer has a right to employ or not employ as he pleases. This is liberty and freedom. It may be noted, also, that these acts belong to what is known as class legislation, and include only workingmen, as mechanics, laborers, &c., and no other class; certainly not the gentlemen labor agitators who do no manual labor, but are salaried officials of a class professing to have a government of their own, separate from and in some features at variance with the common law of the land governing other classes.

A case lately decided in the Schuylkill County court also has some apt remarks on the subject, as follows:

In the case of Russell & Co. against Curren, Owens, and Keating, some important points on the subject of conspiracy were decided. Russell & Co. leased the Etna colliery in Schuylkill County, and put one John Smith and his son at work in one of the gangways. They worked for some days, when Curren, one of the defendants, claimed that as he had been employed in that gangway by the former proprietor it belonged to him. This claim was resisted for some time, but finally, under threats of a strike, Curren was put to work with the Smiths. In a couple of weeks he was discharged for inefficiency, when all the workmen in the colliery quit work, and it was closed up for some time. The trades union to which the men belonged upheld Curren in his course, and suit was brought against him and the officers of the society, and they were convicted. Justice Ryon, in his charge, held that "all confederacies wrongfully to prejudice another are misdemeanors at common law, whether the intention is to injure the property, person, or character of another"; also, that "it does not matter at what period any one enters into the conspiracy; if he knows the object and aids in its execution, he is responsible for all that was done before he entered into the combination"; and further, that "one has no right to dictate whom the owners of the property shall employ to work it, nor to say the work shall not be done by such as the owners may employ to do it."

---

## APPENDIX.

### CO-OPERATIVE CONTRACT BETWEEN OPERATOR AND COAL MINER.

Witnesseth, that said miner agrees to enter the coal mining department of said operator's business on the following terms and conditions:

1. Said miner shall mine coal in a proper workmanlike manner, making the average daily output of a regular miner, and not absenting himself from work without leave, unless for sickness or other unavoidable cause, and shall fill into separate wagons so much of the bottom coal and also so much of the room slack as may be required for charging coke ovens.

2. Said miner's pay and share of profits shall be ascertained as follows, viz, for the large coal and nut coal by him put out in the same wagon, the large coal passing over the one and one-half inch screen, shall be estimated at 3 cents per bushel of 76 pounds on board cars at tipple; to this shall be added the price the same sells for in market after deducting cost of transportation, and the aggregate amount so ascertained shall be equally divided between the parties hereto, share and share alike, this estimate to be made monthly before pay-day, and said miner, or any one by him authorized, is to have free access to all books and papers in order to ascertain the accuracy of such estimates. The bottom coal and room slack filled into separate wagons shall be separately paid for at 30 cents per wagon for bottom coal, and 25 cents per wagon for room slack.

Digitized by Google

3. The miner shall receive his share and pay at each monthly pay-day, less ten per cent. to be retained as security for fulfillment of this contract on his part.

4. A mutual object of this contract being to secure to the operator a more reliable supply of coal and steadier trade, and to the miner more steady employment and freedom from dictation and assessments of self-constituted labor organizations, and to secure both parties from the loss and trouble of strikes. The said miner stipulates that he will not strike or quit work, or join or encourage any strike among his fellow-workmen, nor promote any combination or association calculated to hinder or discourage other miners from taking the places of those who do quit work, or in any way to hinder or impede the progress of the work; but on the contrary, if he becomes dissatisfied with his situation under this contract, he shall leave peaceably according to the terms hereinafter set forth.

5. Said miner agrees to remain in said employment for one year from this date unless he becomes dissatisfied and desires to leave, in which case he shall give said operator sixty days' written notice of such intention before quitting work, and in quitting shall clean up his room in the pit, take out his tools, and give up possession peaceably of any tenement-house he or his family may occupy under said operator, and thereupon he shall be entitled to claim and receive all back pay and retained percentage, or share of profits belonging to him.

6. Ten per cent. as aforesaid of said miner's earnings and profits shall be retained as security for the faithful fulfillment of these articles, and which, together with any unpaid wages, shall be wholly forfeited to the operator by a breach thereof; but all earnings and profits, except said retained percentage, shall be paid him at each monthly pay-day; and at the end of the year, or earlier termination of this contract by the miner giving the sixty days' notice and leaving without breach on his part, he shall be paid all retained percentage or back pay, and shall be paid interest at the rate of —— per cent. per annum on any amount thereof exceeding fifty dollars from the date it reached that amount; and so on for each succeding fifty till paid.

7. If said miner continues over the year in said employment it shall be regarded as a renewal of this contract on the same terms and conditions.

8. In case said miner violates this contract by going on a strike or declining to work, and the amount of retained percentage at the time should not be deemed by said operator adequate to compensate for the loss he may sustain, the said miner may be regarded as a tenant at will or sufferance of any tenement he may occupy under said operator, and on five days' notice in writing to leave he may, without any legal process or judicial proceedings, be evicted and removed with his goods and furniture therefrom by the operator, with the aid of a constable or other peace officer and such other assistance as may be necessary, using no undue violence or force more than may be necessary for the purpose, and said miner stipulates to hold said operatór harmless and free of all cost or trouble therefor.

9. In case said operator on his part desires to terminate this contract before the end of the year, and the miner is performing his part, said miner shall be entitled to sixty days' notice in writing and payment of all back pay or percentage from the operator before the contract is rescinded.

The above has been twice tested in the courts by striking miners and lodge officials and pronounced a fair, legal, and binding contract.

Of course all contracts for lawful purposes entered into by parties competent to contract are legal and binding. The form is special, but shows the application of the principle. Whether co-operative or not, such contract can be legally made, and can be secured by the retention of a percentage of wages to secure its fulfillment; and there is no more hardship in this than any other kind of security required in business transactions. To many workingmen it is an advantage, as it accumulates a fund which they would otherwise spend. In this or any other kind of contract the main thing is to have the actual bargain clearly stated; and that there may be no complaint of misunderstanding each party should have a copy. This contract has been in use for nearly twenty years at Braddocks and seven years at Smithton collieries, with much satisfaction to both parties. The 10 per cent. retention has always been found proof against strikes; but on that account it meets bitter opposition and unwarranted denunciation from the officials and agitators of the various labor organizations.

## TENEMENT HOUSES.

Almost every mining and manufacturing establishment is under the necessity of erecting tenement houses for their employés. These are so essential to operating the works that it is desirable to have them for the occupancy exclusively of those engaged in the work. It is important, therefore, to regain possession as soon as an employé leaves or is discharged, or when a strike occurs, in order that the houses may be filled with those willing to work. It will be seen that the foregoing contract contains a stipulation for this purpose, and no separate lease is needed. But those who have not adopted the contract system need a lease with each employé, in order to prevent the long and tedious delay and expense of regaining possession under the ordinary landlord and tenant laws. The following form is in use with practical advantage by many of our leading firms. It does not contain a waiver of the three hundred dollar act, except for cost of legal process. As the chief object is to get possession, the employer would hardly care to harass the occupant by taking his goods for the small arrears of rent that might be due, and in most cases the goods would not pay the cost of distraint. Few employés will put the employer to the trouble of forcible ejectment, but as there are always some who may give trouble, it is best to have a lease with all. And under a lease of this kind, if the employer resorts to the summary remedy of ejecting the tenant, as provided therein, without resorting to the entry of a judgment in ejectment, and an evil disposed tenant should sue for trespass or damage, he would be estopped and have no standing in court unless he could prove that his employer used more force and violence than was necessary for the purpose. (See 1 W. & S., 90.)

### EMPLOYER'S LEASE.

This is to certify that A. B., employer, lets to C. D., employé, that certain tenement house, &c., upon and subject to the following conditions, and not otherwise, viz:

1. To do no damage thereto; make repairs at his own expense, and not sublet.
2. To pay ——— dollars to said employer each month for use and occupation.
3. Whenever he is discharged, or leaves said employment, he shall leave peaceably within five days thereafter, or upon five days' notice to leave, given to him or posted on the premises: *Provided*, In case of severe illness of himself or a member of his family they can remain until capable of being removed.
4. And in case he or others in possession under him fail to comply with any of the above conditions, he and they authorize said employer to take to his assistance any constable or peace officer, and enter the premises, forcing open the door, if need be, and remove him and his family and others and their goods therefrom, and to regain exclusive possession thereof; or at said employer's election, in case the employé or others shall resist to an extent endangering the public peace, the employer may enter an action of ejectment therefor against him in any court of competent jurisdiction; and in that case said employé hereby authorizes and empowers the prothonotary or any attorney of such court to appear for him and confess judgment against him for possession forthwith, with costs and nominal damages, and with waiver of all exceptions and objections in regard to any errors or irregularities in said judgment or subsequent process issued thereon. And in case resort is had to said last-mentioned remedy, said employé hereby waives the $300 exemption law, as regards liability of goods for costs. And in case of resort had to either of said remedies by said employer to regain possession, he shall be held released, free, and discharged from all cost and damages for or in regard to his so doing, or the eviction of said employé and others from said premises; it being well understood that said tenement is for the occupancy of the employé only whilst engaged in said employer's work, and we agree to modify the law of landlord and tenant accordingly.

## *THE NATURE AND CAUSES OF STRIKES, AND THE LEGAL REMEDIES APPLICABLE THERETO.*

[The first part of this pamphlet was published and distributed among the members of the legislature, February 14, 1883, at the instance of some coal mining and manufacturing operators; and as now supplemented with directions for the prevention of strikes, and advice, and explanations regarding legal remedies for their suppression, a few extra copies are offered for sale to pay cost of printing. This second part, it is hoped, will serve to answer the numerous letters which the author is receiving about the conspiracy laws, and legal and other remedies for preventing and suppressing strikes; and about forms of contracts and leases, &c. The author has retired from the practice of the law, and would avoid notoriety and the labor of correspondence as much as possible. He therefore withholds his name, but the publishers are at liberty to give it to any party specially interested.]

### CAUSES OF STRIKES.

Ignorance of the true relations of labor and capital, and the rights of the employer and the employed; also, the misrepresentations of demagogues and the uncertain teachings of the newspaper press on the subject, are among the chief causes at the bottom of labor troubles. If the true relations between the workingman and his employer were clearly understood there would be no ground for strife or complaint, and the occupation of middlemen and mischief-makers would be gone. No cant or inflammatory declamation against proprietors would be listened to if it was fully and clearly understood that proprietors have a just and perfect right to employ labor as cheap as they can, and are to be expected to act accordingly; as much so as to purchase their tools and materials as cheaply as they can; and that employés have the same right to demand and get all they can for their labor, and that no odium can attach to either side by acting on these principles, but that all the wrong and odium attaches only to the party denying or hindering the other in exercising these rights.

Proprietors have no right to combine and use means to depress wages or hinder workingmen from getting employment; nor have workingmen any right to combine and use means to either prevent fellow-workingmen from taking employment, or to prevent proprietors from obtaining labor. The wrong is equal on either side, and what is needed is clear utterances of the press as a public teacher to this effect, so that the proper degree of blame and odium be cast where it belongs—on the party invading the rights of the other. There are no combinations of proprietors of the kind indicated for depressing wages; but if there were, it would not justify strikes or counter organizations or combinations on the part of the workingmen, as two wrongs do not make a right, or one wrong justify another.

If this rule was observed, the amount of work to be done and the number offering to do it would regulate the market price and fix the rates of wages, and leave no room for controversy or crimination and recrimination. No odium would attach. The proprietor not giving the market price could not get labor, and the laborer asking more than the market price could not get work. It would be purely a business transaction on either side, and after all that agitation and organization can do, it comes to that at last. It is a law of trade inherent in the nature of things. It has been so in all time. Strikes and labor organization are no new invention. The history of the ancient trades guilds proves how little good and how much oppression such organizations are capable of inflicting on the working classes. They have been tried and found wanting long ago. Demagogues may rant about the wages which proprietors ought to pay, and may indulge in gushy declamation to ex-

Digitized by Google

cite the sympathies of the unthinking crowd. Who but an idiot would expect proprietors, out of mere sympathy, to give higher wages than the common rate, or to employ more men than they needed? As well might merchants and farmers be expected to dispose of their commodities for less than they were bringing in the market, because it would confer a favor on the purchasers.

Proprietors are not behind other classes in the exercise of charity, but charity rests on other principles. Those who pretend to couple charity with business are generally found to be humbugs or hypocrites. Distress excites sympathy and is relieved by charity, whether in or out of employment.

You will have observed that in all the declamation of labor organs and labor demagogues against capital and its employers, as oppressing workingmen and depriving them of their rights, they never attempt to describe what the rights are of which they are deprived, or how oppressed. They point to distress or destitution without stopping to ask the causes, and ask you to infer it to be all the fault of the employers for not paying higher wages. Why should the employer pay more than he can afford; and who is to be the judge of that but himself? How much improvidence, extravagance, intemperance, indolence, and general worthlessness, or a glut of labor in the market, and dullness of trade and depressed prices of product have to do with it, they never inquire. It suits their purpose better to flatter their dupes by taking all the blame off their shoulders and placing it on their employers. They would have the employer pay them wages high enough to supply all their wants and allow them to work as they please, regardless of how it might affect himself. If he declines such a modest proposition, they are instigated to strike instead of exercising their right to go where they can do better. They are taught to assert the absurd right to compel higher wages, whether it suits the employer or not; and if he refuses, then to regard him as their enemy, and stop his works and hold them idle till he submits. How would it better their condition if he withdrew his capital from that branch of productive industry and left them to enjoy their idleness?

And it is under pretense of empowering workingmen to enforce just such an unjust and unfounded right as this, that class legislation is sought to enable labor organizers to hold the owners' works idle without incurring legal punishment, and the fetters of organization to be fastened on the working classes.

And here I may consider the chief argument with which labor organizers seek to captivate operators to join their standard; that is, the effect which a perfect

GENERAL ORGANIZATION

would have in controlling labor and preventing strikes. Candor compels me to admit that, if carried to the extent Mr. Powderly and his friends claim for it, and it should become universal and be legalized to the extent sought for, it will afford a most effectual preventive of strikes and labor troubles. Under it the workingman could move neither hand nor foot. It matters not what name the organization assumes, whether Knights of Labor, or trades unions, the principle is the same—the unification and universality of the organization is the result aimed at, and from which the beneficial effect is expected. The ancient trades guilds attained perfection on this score. No employer could get labor, nor any laborer employment, without the sanction of the guild of his craft; and all crafts, as is sought for at present in the Knights of Labor sys-

Digitized by Google

tem, were united under one general government or head. Labor of all kinds was organized into a perfect union, with ample powers conferred by law to carry out its purposes; and it is true that, whilst the organization remained in full force, it did, to a great degree, prevent strikes and labor troubles, because workingmen were powerless to act for themselves—the guild acted for them.

I notice this phase of organization more at length, because many of our manufacturers and mining operators are becoming favorably impressed with it, and think that if fully empowered to control labor it would have a salutary affect. They regard with approval the conciliatory influence and authoritative bearing of President Jarrett and his associates of the Amalgamated Iron and Steel Association in controlling puddlers and other iron workers during the past year, and they declare that it would be much easier to obtain their required labor through the officers of an association than to deal directly with the men themselves.

This is also pretty much the view taken by the newspaper press, so far as it gives any distinct views on the subject. I select the following from the Pittsburgh Sunday Critic, whose utterances are usually well considered. The editor is commenting on the result of the potters' strike at East Liverpool, and his remarks illustrate the drift in this direction:

> The Knights of Labor have received their first defeat. The vital principle of their organization was at stake in East Liverpool. For the present the victory is with the master potters. The conditions were not favorable to the knights. But, however pleasing the present state of affairs may be to the pottery firms, we opine that they will yet, and that speedily, see the day when the conservative influence of such organizations will be a necessity to them. The Knights of Labor and its kindred society, the Amalgamated Association, have done much to establish harmony and a permanent working basis in Pittsburgh. They prevent strikes, curb unruly spirits, and fix wages in a spirit of equity. The knights, strong in numbers and in public confidence, can afford to receive this temporary defeat with equanimity. Meanwhile, they will do well to avoid such unpromising encounters, and to see that some of their injudicious acts at East Liverpool are not repeated elsewhere.

It is claimed by those who take this view that when the organization is perfected, labor will become so completely under control that no refractory or *unruly individual*, or number of unruly individuals in the same employment, can create a strike or labor disturbance of any kind whatever. If dissatisfied with their employer, they must apply to the local officers of the organization, and after their complaint is investigated they must abide the decision. If against them, they must go back to work under their employer, and could not seek employment elsewhere under penalty of being struck off the roll of the organization, which would prevent them getting any employment at all. If in their favor, the employer must redress their grievance or suspend operations. He will have no alternative, as he can get no outside or free labor to supply the places of his men. There will be no room for him to struggle against the decision. It will be a mere business matter, either accede to their terms at once or suspend the work. No occasion will be presented to either side to hold out under the hope of outside relief. All labor will be in the ranks of the organization, *nolens volens*, and subject to the imperious orders of their superiors, and if the decision is adverse to the men they have no other alternative but to obey and return to their work. No lost time, or engendering of ill feeling by disagreement among themselves as to the best course to pursue; that is decided for them. No holding out to compel the employer to come to terms. If they disobeyed their superior officers in any way, or failed to pay organization dues, their license as members would be revoked and they could

Digitized by Google

get no employment whatever, as no union men would be allowed to work with them. Doubtless an employer of labor would be required to take out a license from the organization in the first place, before his labor would be furnished him, and in doing so he would have to agree to submit to the regulations. The organization would fix wages from time to time in each different locality and trade throughout the entire country, so as to equalize rates according to cost of living and the facility of production. There would be no contention between union and non-union men; all would be driven into the organization, as none could get employment outside of it. It would necessarily be clothed with legal authority to forbid the employment of non-union men, or the association of union with non-union men in the same work; otherwise the organization would not be perfect as a body politic in law, according to the notions of the agitators at Congress and elsewhere. Nor would there be any over hours or extra work or output allowed. That would be allowing some to rob their fellows by doing more work and getting more wages than their share. Then would be brought about a fraternization of employers and employés, through the medium of their mutual friends, the organization officials. Self-interest would cement both parties to the organization—the one to get work, the other to get wages—and the power of the organization over both would be so complete that neither could gainsay its authority, and the necessity of the organization to keep mines and mills in operation to get wages for the men, and consequent income to the organization, would moderate the demands for advance of wages and compel submission by the men. The number and age of apprentices at each particular institution would be fixed, as also all holidays, and the hours and methods of work which all would be compelled to conform to.

In short, it is claimed for perfect and complete organization, such as is proposed by Mr. Powderly and other Knights of Labor advocates, that it will produce perfect peace and uniformity in the employment of labor throughout the nation.

I have thus fairly stated the theory of labor organization and the reasons put forth by its advocates, both by employers and representative agitators. But I do not believe in it, and my reasons are these: It has been tried in the past and found wanting. The more perfect the trades guild organizations became, the more intolerant and oppressive they became. Then the experiment was under far more favorable circumstances than are afforded now. The people were far more ignorant then than now, and the greater the ignorance the better the condition for implicit obedience to superiors. Slavery is possible only where ignorance is gross. Then it necessarily reduces men to mere machines. It places the industrious on the same plane with the lazy drone. No one can work over hours or produce more of an output than another. The expert workman is put on a level with the botch. There is no room for individual enterprise. Self-assertion, laudable ambition, and competition in well doing are suppressed. Any one attempting to better his condition would lose caste, and perhaps have his license to labor revoked. Men must work on as their officers directed—once a workingman always a workingman—no hope to rise. We need only to go to the Chinese labor companies of San Francisco for a true specimen of organized labor. The cooly goes where and at what wages he is directed by his master, through mere ignorance and force of habit—not because the laws and institutions of this country compel him. The men wanting Chinese labor go to the officers to negotiate, and the same would be the course as regards the employment of all other kinds of labor if

Digitized by Google

the Knights of Labor should once get their organization as perfect and thorough as they propose to make it. I do not think they will extend it much further than it is, however. They may hold within the meshes of their net the ignorant foreign immigrant labor for awhile, as it comes into the country, but as soon as they become fully acquainted with the situation individual enterprise and self-interest assert themselves, and payment of lodge dues and submission to lodge dictation is cast aside. It is impractical for any organization to hold free intelligent workingmen in subjection. They get to know too much. The operators of mines and mills need not expect the millennial day of labor employment to be ushered in by the Amalgamated Association, or Miners' Union, or Knights of Labor, because the day of entire control by any organization will never dawn. Long before it reached perfection most of the members, except the officials, will perceive the truth contained in the bishop's letter, already quoted, and see that they were creating a tyranny over themselves compared with which common slavery would be comparative liberty.

But whether organized or unorganized, and notwithstanding all the bombast about an irrepressible conflict between labor and capital, one thing is certain, that so long as capital wants labor and labor wants wages, they will come together and be found marching on, hand in hand, improving the world and bettering its condition. Mischief-makers may produce family jars between them, but mutual self-interest will still keep them together. They are joined of God; or, according to modern godless philosophy, their union grows out of the wants and condition of human nature.

### RESPECTFUL TREATMENT.

I need hardly advert to this as a preventative of strikes. Every man's own good sense will suggest the necessity of kindness and consideration for the men employed by him. They are apt to feel keenly any treatment suggestive of an inferiority of condition. Whilst we all know superiority or inferiority does not depend on men's positions as employer and employé, but on the innate character of the man himself, yet many of them do not realize this truth, and respectful and conciliatory consideration of their requests, whether made individually or by committee, is always best, and it is wise to consider well and give a direct and positive answer, in respectful terms, as soon as possible. It ought to be considered well before the answer is given, because, whatever it is, it should be adhered to firmly. Nothing has so bad an effect as vacillation and change. The men soon discover the weakness and hesitation which produce it. It strengthens their determination, makes them all the more importunate and frequent in their demands.

### THE CONTRACT SYSTEM.

The writer's experience is all in favor of it. He has been connected with coal operators who have used it for over twenty years, and it has worked well invariably, both in preventing strikes and securing steady trade to the operator and work to the men. Its effect in preventing strikes lies in the fact that it provides a money security against a strike. At a mill or mine men are employed from day to day as occasion arises. Consequently the contracts of the men never expire at the same time, and if a strike is inaugurated all who join in it forfeit the retained percentage of their wages. Hence the consent of the majority can never

Digitized by Google

be obtained to strike, and any who become dissatisfied have to leave in the ordinary fair way in which all employés ought to leave when they choose to quit. The contract works no hardship to him. He knows the terms and wages before he engages, and to engage his services for sixty days or any other stipulated time, is a voluntary act which every honest man is in duty bound to fulfill, as he would fulfill any other solemn promise or engagement. It is a mutual contract and is as binding on the employer to give him work, whilst the mill or mine is running, and he does his duty, as it is on the employé to do the work presented. It indeed, in many respects, is an advantage to the employé to obtain steady wages, and his retained percentage never comes amiss at the end of his term. The self-interested cant of the labor demagogue that the contract system is semi-slavery or bondage, is ridiculous nonsense. If a man has the right to contract for his services for one day or a week or a month he has the right to contract for two months or more, as he pleases. It is his own matter. The employer assumes no right over him to compel him to contract at all. Nothing, however, is so bitterly opposed as the contract system by the union and lodge officials and the labor-governing class generally. The regular employment and better condition of affairs among the men, wherever the contract is in force, is an eyesore. It provokes comparison and a rebellious spirit among their subjects in regard to the dues and assessments, and periods of idleness prescribed and enforced by the union bosses.

At the Waverly mines, in the winter of 1881, the union officials of the district determined to break down the contract system in operation there, and accordingly a strong effort was made by handbills and by appeals and denunciation of the system in the labor organ, and secret emissaries were sent among the men to importune them to strike against the contract system. Then, when it was supposed they were ripe for a revolt, a meeting was called, but when put to a vote a majority refused to join the strike unless the union officials would pay them the retained percentage which they would forfeit. This was acceded to rather than give the matter up, but the officials eventually failed to raise the money, and only succeeded in causing a partial strike by a small minority. The efforts made, however, to produce it exceeded the scope of harmless persuasion allowed by law, and the consequence was that two of the more prominent union officials were prosecuted and found guilty of conspiracy and suffered the penalty of fine and imprisonment imposed by the court.

An objection may arise in the minds of some that sufficient numbers cannot be had for the purpose of their works under this system. This was not the case at the Waverly mines, or the Braddock mines, where the system was so long in force; nor would it arise anywhere else after the system was once fully established. Those employés trying it soon recognize its benefits. It is also worthy of consideration whether employers will not be eventually compelled to resort to this or some similar system for the employment of none other than free labor in their establishments. The labor that is under and subject to the dictation of labor bosses of lodge or union cannot be said to be free, and employers cannot depend on it without being constantly subjected to annoyances and interruption in their work. The men are not free agents, but belong to the union or lodge. To depend on this kind of labor, therefore, the proprietor of mill or mine must himself submit to the rule and power of the organization owning the labor. This might do, if he could rely on the contract with the labor organization with any degree of certainty, and its interference with the operation of

Digitized by Google

his work did not become too oppressive. At the present rate of encroachment and interference, however, by the union-labor bosses, in the operation of the union mills and mines, it is pretty evident that a crisis will soon be reached when the question must be determined whether mills and mines are to be run by labor organization officials or by their owners.

The time may not be far distant when Knights of Labor and similar organizations will become so aggressive upon the liberties and pockets of workingmen and their employers that both will find it necessary to cast off the yoke and become independent. Then the contract system, or some other like it, will come into more general use. As regards the contract for the purpose of preventing strikes the points are, a specified time, a retained percentage as security, and different dates of ending. All else is adjustable according to the requirements of the business and the stipulations of the parties to the contract.

## LEGAL REMEDIES.

Notwithstanding all the precautions that may be observed strikes will occur. Reason and prudence will not always prevail. Inadequate wages sometimes and inflammatory teachings of demagogues at other times will breed discontent, and demands be made which the employer does not see his way safely to allow. The leaders, or tho whose assume to be such among the men, will then resort to the usual means of compulsion of the employer—a strike. He cannot accede to their demands. They are misled, perhaps, to believe he can or will, and that they can make him come to their terms. It is presumed the employer has already fully considered the situation and concluded that their demands cannot be granted. Then a suspension of his works must follow if a strike is inaugurated. He pays off his men and discharges them, and has a right under the law and common justice to expect them to leave. But they won't! they not only won't, but won't let others take their places, or those well disposed among themselves to work on. An erroneous idea prevails in the public mind, and is countenanced by the press, to the effect that a strike means merely the stopping of the work on their own part by all or a number of the employés in a particular employment. This would be entirely legitimate and unobjectionable. Men have a right to quit their employment whenever they please according to the terms of their engagement. If it is an engagement to work from day to day they can quit at the end of any day; if an engagement to do work by the quantity of product they can quit work during any day; if employment is by the week or month, or months, they can quit legitimately and fairly according to the terms of their employment, whatever they may be, and be entitled to their wages. They may do so, one or more of them. Or they may quit contrary to the terms of their agreement; as, for instance, if they are working under the contract system, and they quit before the end of the time, they can do so; the only consequence is the forfeiture of the retained security. All this they can do with impunity, either as regards the civil or criminal law. But nothing of this kind amounts to a strike. All engaged in any particular work may quit in this way at the same time, but this is no strike. The strike begins whenever the men band themselves together to remain and hold the works, as they term it, and prevent the work from going on by secretly or underhandedly hindering and intimidating those among themselves who would continue at work, or others from taking the places of those who refuse. The usual appliances to

Digitized by Google

accomplish this unjust and unlawful purpose are so well known they need not be described. Every proprietor has the undoubted right, as declared by all courts of law, as well as by common sense, to carry on his legitimate employment without let or hindrance. No man nor set of men have the right to band themselves together on or about his premises to obstruct him or barricade his works either by boycotting or encampment. They do so at their peril. If the law protected them in such a course it would virtually amount to confiscation of the proprietor's business and property. If they can hold the works for a day they can do so for a year, or any other time. When the proprietor is placed in this situation he is compelled to inquire what remedies the law provides to vindicate his rights and protect him from such an outrage. When the usual efforts at reconciliation are exhausted and the strikers assume the attitude of holding the works and preventing others from taking their places, or by words and actions have otherwise rendered themselves amenable to the law, and they have been respectfully requested to cease contention and to go in peace, then and in that case a legal remedy had better be resorted to at once and prompt and vigorous action taken. Hesitation and vacillation on the part of the proprietor to assert and vindicate his legal rights only does harm by prolonging the agony.

### SURETY OF THE PEACE.

Surety of the peace is often resorted to with good effect for this purpose. When the strikers encamp or loiter about in the vicinity of the work at which they have been engaged, no matter whether on the premises or not, and it is given out by them that they are on a strike, this virtually implies that they will not continue work themselves nor allow others to take their places, except through trouble and strife. When they appear determined in this course, and resort to the usual demonstrations, to notify other workingmen of their purpose, to warn them off, and perhaps, by making threats by signs or opprobrious language, casting odium on men disposed to work, and opposing attempts on the part of the proprietor to operate his works, this condition of affairs alone endangers the public peace, and is calculated to produce violence and bloodshed; and, as common experience has fully demonstrated, is apt to end in the destruction of property or personal injury. If, therefore, the circumstances are such as to excite the fears of the proprietor, or superintendent, or other agents engaged, whether there has been an encampment established or not, they are justified in making an information before a justice of the peace, or alderman, stating the facts and circumstances on which they predicate their apprehensions of injury to person or property; and, if they are so serious as to warrant apprehension, the law will interfere to prevent and protect, and the magistrate will issue his writ to the constable to arrest and bring before him all or as many of the strikers as are named in the complaint. On the hearing, if it appears to the magistrate that the party or parties making the complaint had reasonable grounds of apprehension, he will require each of the defendants arrested to give good and sufficient bail for his good behavior and appearance at court. The amount of bail required generally is from $500 to $1,000, and as this bail must be of a substantial nature, the proceeding is highly calculated to put a damper upon any violence which might otherwise occur. If the party is able to give bail, the bail will keep an eye upon him afterwards. If he is not able to give bail he goes to jail to await the action of the court at the next term, when, if the strike continues, and

Digitized by Google

the danger of an outbreak remains imminent, the court will continue and enlarge the amount of bail required; or, if the danger is over, will discharge the parties on the payment of costs.

Two occasions of this kind occurred in the summer of 1882. One was against a number of strikers at the Alpsville mines. When the case came into court the strike had ended and the parties were discharged on the payment of costs, amounting to some $40 each. Another occurred with strikers at the Homestead Steel Works, and resulted in the same way. Usually, when this remedy is resorted to, the strikers find it more to their advantage to consent to break up the strike and go and seek employment elsewhere than to find bail, or go to jail, and then attend court, perhaps, for weeks, and finally be mulcted in heavy costs. Strike organizers have an erroneous theory that, so long as they desist from the use of actual force and violence, and use no direct threats of injury to person or property, they may do everything else with impunity—that they can surround the works by encampments, and indulge in abusive language and scurrilous epithets towards fellow-workmen or their employers, as much as they please. But the courts don't seem to take this view of it. They take the view that an encampment, with martial music or drilling demonstrations, and prowling about to barricade the works from other workmen, is in itself a standing menace of harm, to both person and property; and the frequency of felonious assaults and murders and burnings resulting from strikes would justify this view. In one of the cases referred to, one party, a defendant, when called on, admitted that, whilst on the strike, he and others were in the habit of patrolling the neighborhood of the mines, both by day and night, but had no other purpose in doing so than was perfectly peaceful. He was asked what, then, he went to such trouble for, and replied he was looking after his rights. He was told by the court that after he was paid his wages and ceased to be employed he should not have expected to find his rights lying around there. He had no further right in the works, or their operation whatever; that such proceedings were a wrong on his part and a trespass on the rights of others, and, therefore, that he was a proper subject for surveillance of the law.

If the noise, threats, or disturbance is such as is calculated to produce a breach of the public peace, it is sufficient to support the charge, although no actual breach has occurred. The use of language by one to another, or by one set of men toward others, which would amount to slander, or to libel, if written or printed, or the use of derisive or disparaging language, rhymes, gestures, music, or pictures, by one man or set of men toward others, is unlawful and highly calculated to produce a breach of the peace, and hence any one interested in or about the works or mines where such conduct is indulged in would have the right to make the complaint and apply this remedy. See the principles of law commented on in 2 Grant, page 510, and numerous other cases.

The court holds "that where conditions exist calculated to produce a breach of the peace they are not to be permitted to continue, because they have not produced actual violence or resistance. The actual resistance and collision on the part of or with those opposed will not," says the judge, "in all probability long be wanting, and we may have the realization of what the unlawful act has a tendency to produce—breaches of the peace of a more unmistakable character. It is the duty of the conservators of the public peace to prevent this if possible."

The idea of the remedy by surety of the peace is to *prevent*, not redress, injuries. Wherever an attitude is assumed by parties, which, in the usual course, if persisted in, is calculated to provoke a breach of

Digitized by Google

the peace, the remedy applies. It used to be held by an eminent judge (McClure) of Allegheny County, that for one man to call another to his face a liar, thief, blackleg, or other opprobrious epithet, was so directly provocative of a breach of the peace as to justify an arrest at once, no matter how peaceable the man using the language might be, as the actual outbreak would come from the other side, and it was the public peace, not the actual damage done, which the law protects under this remedy.

It is the safer course, and in the line of duty, for the proprietor to put under bond, for surety of the peace and good behavior, all the promotors of the strike so soon as it is fully declared and developed. When the men have declared their intention not to continue work except on the proposed terms, and you have decided not to grant them, and have paid them off and made known your decision, that is the end of it, if no mischief is intended on their part. If well disposed, they will leave in peace and good will; but if they show a disposition not to do so, and you find they are hanging around the neighborhood without looking for work, and secretly and underhandedly dissuading others from taking their places, you may be sure the intention is to compel you to take them back. This is assuming an attitude hostile to your rights, and danger may fairly be apprehended. It needs no open expression of an intention to commit violence to justify apprehensions of it. If the indications are such from which violence may result, it is sufficient. You would not keep a keg of powder in your dwelling, nor will cities or towns allow a powder magazine within their limits, although in both instances perfectly harmless, unless, perhaps, a spark might be dropped. The history of strikes everywhere shows that the frequency of violence resulting from them is such that courts would be compelled to take notice of it as a fact, inherent in their nature. Within the scope of present memory we have the homicide at O'Neill's coal works; the slaughter at Twenty-eighth street; the crippled workingmen at the Homestead Steel Works; and, whilst writing, the morning paper relates the atrocity of a gang of strikers at the Saint Louis Vulcan Iron Works, only less fatal in its result than the Phœnix Park assassinations at Dublin.

It is noteworthy that in all such instances the union, or other such organizations to which the strikers belong, immediately disclaim all connection with the outrage, and are the strongest in denouncing the perpetrators. This is always the case. The universal panacea, not only here but elsewhere, to avert the odium of crime, is to deny all connection or complicity in its perpetration. The Land Leaguers and Fenians deny all affiliation with the Irish Assassination Society, or Invincibles, and are especially loud in their denunciations of the cold-blooded murders of men, women, and children by that organization; and it is unquestionably true that a vast majority of Land Leaguers and Fenians in Ireland, and Knights of Labor, and those belonging to similar associations in this country, such as are at the bottom of most of our organized strikes, are civil and honest, and well disposed, and abhor violence and wrong of any kind. But there are wicked and evil-disposed men among all classes, and strikes and labor organizations, and communistic and nationalist and agrarian societies, especially of the secret order, afford the conditions of bad men to put into execution their evil designs. Such combinations of men, for purposes at variance with the regular government and general laws of the country, supply the fuse to the powder of the bad and worthless spirits among them. No matter how good and innocent the intentions of the majority, yet if these good and innocent people place themselves in a position which, according to all

Digitized by Google

experience is imminently liable to produce mischief, they must be held accountable for the mischief if it follows. Protracted strikes seldom end without violence and injury to person and property; therefore, those who engage in them must share the responsibility, however good may be their intentions, and must be taken to intend to produce the natural effect of their own actions. The intention of a strike is compulsion; the natural effect of compulsion is resistance on the part of the workingmen who do not engage in it, or of the proprietor; and the necessary result of resistance is violence. Hence the necessity for placing men under bonds who assume an attitude calculated to produce an outbreak and breach of the public peace. Indeed, the indications of hostility in most strikes are unmistakable. When bands of men establish encampments, institute drills, and march at the tap of a drum, it requires no stretch of reason to infer a hostile intent.

### CRIMINAL PROSECUTION.

This is another legal remedy, and is the one which, perhaps, is more frequently resorted to than any other. It is commenced by complaint or information before an alderman or justice of the peace in the same manner as the complaint for surety of the peace; it may be for assault and battery, or arson, or any other offense known to the criminal law, of which the strikers have been guilty; but that for which strikers are most frequently prosecuted is the offense of criminal conspiracy. It is this remedy and this offense which strike agitators and labor organization officials of all kinds have been and are still working so hard to be freed from by legislation. It was this which they aimed to abolish, as regards their class, by the amendment of 1872 to the conspiracy law, and the supplement of 1876, already mentioned. But why workingmen as a class should be exempted from what in itself is a crime, and which all other classes are punished for, they have never made apparent. Just as well might they ask to be relieved from the penalties of the criminal law against larceny, embezzlement, robbery, arson, or any other criminal offense. Criminal conspiracy, from which they wish to be released, is just as much a crime as any of these. It is therefore in place to consider what amounts to criminal conspiracy, so that the party making the complaint may know whether the actings and doings of the strikers are of such character as will support the charge. The law describes or defines criminal conspiracy to consist in the combination or uniting of two or more persons in a joint purpose to commit an unlawful act or to accomplish a lawful act by unlawful means. You will observe, therefore, that to constitute this offense there must be two or more persons. They must be united in the same common purpose, and that common purpose must be to do something wrong and unlawful, or to accomplish some lawful purpose by wrong or unlawful means. The general law of the State would hold it to be unlawful for any set of men to hinder or obstruct the working of mines or mills, or any other legitimate pursuit; and this being the case, it would be unlawful for them to unite or band themselves together to accomplish that purpose whether they did accomplish it or not. If the means resorted to for the purpose were of the nature to provoke a breach of the public peace, as insulting the other employés, or the proprietor, or his agents, or calculated to hinder by intimidation and exciting fears in the persons who would otherwise engage in work, such as lurking about the premises, marching in processions, encampment, and the like, these and similar means would be unlawful, so that in such case both the object and means would be

Digitized by Google

unlawful. This, as I have said, is the general law, as applicable to all the inhabitants of the State; but strikers and their abettors claim to have procured special legislation exempting them from its penalties. In regard to this alleged exception, I would refer you to the article, "Strikes and Conspiracy," at page 18 of this pamphlet, and what is there said on the subject. The injustice of singling out one class of citizens and allowing them to engage in the commission of a crime with impunity, which is allowed to no other class, is so glaring that I apprehend the courts will not be inclined to extend the scope of this special legislation beyond its actual terms. You will observe the occupations named in the act. They clearly relate to bodily labor. It can hardly be construed, therefore, to include the gentlemen occupied in the mental labor of creating and governing organizations and the management of strikes and labor disturbances. It has not been so extended, and a doubt was suggested by the learned judge of the Westmoreland County court, whether it can be extended to protect such men. It will be observed, that by the words of the act the exemption is limited to laborers, workingmen, and journeymen (Purd., 351). You will observe that the pith of this remedy consists in a conspiracy by two or more persons to do something which is unlawful, or to do something lawful in itself, by resorting to unlawful means to accomplish it. Therefore you must be able to prove the conspiracy; that is, the confederacy or joint intent in the same purpose, and also the unlawfulness of the purpose, or the unlawfulness of the means resorted to, or intended to be, to accomplish it. You may make your complaint or information against as many as you think are united in it; but it will do if as many as two turn out to be so united. On the trial you would be entitled to a verdict only against as many as were shown to be guilty; the others would be acquitted. And on the trial it is not essential to a conviction that the purpose had been accomplished, or means used. The intent and conspiracy are enough to convict. Nor can it be held, if experience of the results is to be regarded, that the banding of men together, in force, and parading with martial music in the neighborhood of mines or mills, with the avowed object of hindering and preventing their operation, unless by the employment of themselves on their own terms, is either lawful or peaceful; nor can the object be held to be lawful if it is to prevent the exercise of a legitimate industry. So it would seem on a fair interpretation of the proviso of 1876. The ordinary and usual methods of strikers would not admit them to its protection. A combination of men to accomplish an object by terrorizing can hardly be adjudged lawful and peaceful; and that strikes have this effect is well established by the usual results of violence and injury attending them. "By their fruits ye shall know them." But I need not repeat what is said in the article already referred to. If it is concluded to resort to this remedy, the complainant will set forth the facts in his information relied on to constitute the offense. This being sworn to, the magistrate will issue his warrant and arrest all parties charged, or as many of them as can be found. When brought before him on the day appointed for a hearing, the prosecutor, with his witnesses, should attend in order that a preliminary hearing may be had.

The case is not expected to be gone into at large. One or two or more witnesses on the main facts on which the charge rests is all that is necessary. If, on this hearing, the magistrate deems that reasonable grounds have been shown that the offense has been committed, he will hold the parties to bail for their appearance at court, there to answer; and if there is an apprehension of danger to property or person in the mean time he may require bail also to keep the peace. The bail, as for

Digitized by Google

surety of the peace already mentioned, is from $500 to $1,000, according to the nature of the case. This information, with the recognizance of the parties and their sureties, is returned by the magistrate to the court before the first day of the next term; or, it may be that some of the defendants, not being able to give bail, are committed to jail, there to await trial. After the information is returned to court an indictment is drawn up by the commonwealth's attorney, and is laid before the grand jury. The prosecutor and his witnesses are heard by the grand jury—no witnesses are heard for the defense—and, if the grand jury is of the opinion that *prima facie* case is made out, they return a true bill; otherwise they ignore it, and direct who shall pay the costs. If a true bill is found it is set down for trial afterwards, in due course, and is then tried before the judge and a regular jury. Witnesses for both sides are there fully heard, and the jury have the benefit of the instructions of the judge on all legal questions which may arise. If found guilty the defendants are punished by fine and imprisonment, the fine not to exceed *five hundred* dollars, and imprisonment not exceeding *two* years.

## CIVIL SUITS.

This, according to the writer's experience in numerous cases in which he has been counsel for plaintiffs, is a more efficient remedy than by criminal prosecution—the remedy last above described. It is technically known to lawyers as an action on the case in tort. It is not commenced before an alderman or justice of the peace, but by an affidavit and precipe filed at once in the prothonotary's office. A writ called a capias is forthwith issued by the prothonotary to the sheriff. The bail required to be given by defendants is indorsed on the back of the writ; in most cases it is fixed by rule of court, but in an aggravated case the court, on application, will increase the amount. When this writ is placed in the sheriff's hands it is his duty at once to proceed and arrest those named in it as defendants, and they have to give bail in the amount specified or go to jail; and it is the sheriff's duty to see that the bail is responsible, so that if the parties charged as defendants, or any of them, fail to appear in court and abide the result of the case as the writ requires, the bail will be able to pay the amount of the bond. When the parties are arrested and give bail, or go to jail, as the case may be, the sheriff returns to the prothonotary's office the writ, with his return thereon, stating the arrest and the bail taken. The plaintiff's attorney then files his declaration or complaint in the technical form, and in due course the defendant's attorney enters his plea. The case is then at issue without more ado, and is set down by the prothonotary on the list for trial at the next term, in due course; and when the trial comes on it is tried before the court and jury as any other civil or criminal case. If a verdict is given for plaintiff against defendants it is for a definite amount of damages, which each and all are bound to pay or be committed to jail. Imprisonment for this kind of debt is not abolished. If unable to pay, and re-arrested on final process and committed to jail, they can only get out by getting bail to take the benefit of the insolvent laws; and before they can do this they must have been in jail for a certain number of days. Discharge as insolvents is attended with considerable expense and delay, and does not extinguish the judgment against them, which remains in full force if they should ever have property to be taken in execution under it.

The advantages of this remedy over that by criminal prosecution are its greater directness and efficiency. It begins in court at once; it does

Digitized by Google

not go before a grand jury. The bail taken by the sheriff is apt to be more reliable—the sheriff is more potent in making arrests than the constable is likely to be. The proceedings are less liable to be baffled by influences of party politics, or other influences in the grand jury, or elsewhere. When it comes on for trial the names of the jurors on the panel can be scrutinized by both sides, and friends and partisans stricken off, and the whole proceeding is under the supervision of the court. The jury has only to find the amount of damage which plaintiff has sustained by interruption of his business, loss of time and trade, injury to property, or other wrongs whatever they may be, but nothing to do with its payment, or defendants' punishment. Of course, the amount so found is entirely within the discretion of the jury, from 6 cents upwards into thousands, as justice may require; or, in case they deem the charge frivolous or unfounded, they find in favor of the defendants. In that case the plaintiff is compelled to pay the costs. If the verdict is in the plaintiff's favor, however, the defendants have to pay the costs, as well as the amount of the verdict. The jury has no power over the costs in a civil suit. There is another advantage in favor of this remedy, in its being more comprehensive. It may include whatever wrongs the defendants or any one or more of them have committed, of whatsoever kind, provided they amount to an infraction of the plaintiff's rights, and are cognizable at law. The jury can find against one or as many of the defendants as are guilty, and in favor of the others. The modifications of law regarding criminal conspiracy, contained in the acts of 1872 and 1876, already mentioned, are in terms applicable, and limited to criminal prosecution for conspiracy, and not to this remedy, or wrongs which may be vindicated under it. (See P. L., 1175.)

These modifications are limited to the classes named, and exempt them from punishment for the criminality only, in the following words, viz:

Without subjecting any person or persons so refusing to work or labor to prosecution or indictment for conspiracy under the criminal laws of this commonwealth.

Class legislation of any kind is regarded with jealousy.

Discriminations made by law in favor of *classes* are peculiarly in need of some great public exigency for their justification. (9 Harris, 434.)

Acts which would not subject the parties to punishment for criminal conspiracy would sustain this action for damages. It would seem the modifications in question have reference to the prosecution of the defendants for the crime, and not to exempt them from liability for damages they may have committed when claimed in a civil suit. If one man alone, or any number of men, should by unlawful means hinder, prevent, or obstruct another, willfully and maliciously, in the prosecution of his lawful business, to such an extent as to occasion him loss and injury, such wrong-doer or wrong-doers would be liable to a verdict against them for the amount of damage done. Conspiracy might constitute part of the grievance, but defendants would be liable independently from any question of conspiracy, if the facts warranted; thus, slander of the product of plaintiff's mines or mills might be joined with a complaint of conspiracy, or any other wrong perpetrated by the defendants. If a number of men conspire and combine together to do wrong there is no reason why they might not be liable to pay, although not liable to be prosecuted for it as a crime. The criminal law has reference only to the offenses committed against the public or commonwealth; the civil suit has reference only to the injury done the plaintiff in the case. The commonwealth, by legislation, might waive her remedy without interfering with the rights and remedies of private citizens for loss sustained; and the

Digitized by Google

punishment prescribed for offenses against the commonwealth being both fine and imprisonment, the legislation of 1872 and 1876 would contemplate relief from the hardships of imprisonment and the odium of criminality, whilst in the civil suit imprisonment after the verdict is not in contemplation, the verdict being for a sum certain, which the law presumes the defendants will pay and avoid imprisonment. Another advantage in favor of this remedy, the jury before whom the case is tried is not so liable to be carried away by the clap-trap oratory of the defendants' counsel in sympathetic appeals to their feelings, presenting the hardships to the defendants of an inevitable imprisonment if the verdict should be guilty. The verdict in a criminal case is simply guilty or not guilty, and no more. The extent of the fine and imprisonment is left discretionary with the court, to be fixed when sentence is given, and the jury have nothing to do with it; but their apprehensions of severe punishment of the defendants are liable to be played upon by counsel in a criminal suit, and unless the defendants are greatly in the wrong the jury is apt to merely put the costs on them, or divide the costs between the parties. Another advantage: This remedy is governed by imperative rules of law; the rulings of the court on the evidence, and on points submitted, and the law laid down in the charge are all subject to exception and review in the Supreme Court, and, as a matter of right, without the exercise of any discretion on the subject by any court, in allowing an appeal or writ of error; whereas, in criminal cases, to obtain a writ of error or appeal the whole case has to be printed and laid before the court, and then it is optional with the court whether to allow it or not. In short, this remedy is more practical, and more to the purpose in the way of suppressing strikes and labor troubles, than the remedy by criminal prosecution, and it includes everything that criminal prosecution contains, except attaching to the defendants the odium of criminality and the certainty of imprisonment for a time longer or shorter. As the purpose of every reasonable proprietor is peace, protection, and redress, and not vindictiveness, I have always given the civil remedy the preference in my legal practice as a lawyer, wherever the situation is so serious as to compel the proprietor to go beyond the simple remedy of surety of the peace.

It is all very well, and in the line of prudence, for the proprietors of mines and mills to get along with their men the best way they can. It is best, perhaps, in a practical business point of view, to humor the men and tickle the vanity, even going so far as to grease the palms of their leaders, if need be. To keep your works running may justify all this, and it may do very well so long as the wages and terms of labor do not go beyond market rates. Until that point is reached in your concessions you can afford to employ union or organized labor; but whenever the interference of the union labor bosses begins to usurp the management of your works, and their demands for increased wages exceed the wages paid for similar labor in your branch of trade in other sections of the country, the conditions change. You are bound to call a halt, as a necessity. You must hold the exclusive management of your works and must put your product on the market at as low prices as others in the same line. To disregard these principles is certain ruin.

Now, as this ultimatum is rapidly approaching, if the present rate of progress in the organization of labor is to be credited, the trite question occurs, what are you going to do about it? Your safety lies in the fact that neither the men nor their leaders can afford to let you stop and remain idle, or if you do stop they cannot afford to let you remain

Digitized by Google

idle long. They must have wages. If they cannot get such as they want they must take what they can get.

The support of their leaders or officials depends, as well as their own, on the wages received at the regular pay-day. Now, there are two methods of escape from the dilemma for you and them both. You can temporize with the organization principle by affiliating with the officials. Their own interest, and the necessity of the case, will dispose them to render ready assistance in bringing the men to your terms. To enlist the organization officials in your favor and manage the men through them may succeed, at least for a time. Many of the operators of the mills and mines of this region think this course entirely practical, and that it presents the best way out of the difficulty. The press is also beginning to hint at the great benefit which will be afforded to operators in this way, whenever labor is so fully organized as to give the officials of the organization full control. They claim that much benefit has already been derived to the iron trade of Pittsburgh from the control of its labor by the Amalgamated Association, exerted in favor of the operators.

I am not sanguine, however, that any such benefit can be permanent. The men expect more from organization than it can confer. Their general idea of the benefit of organization is high wages and little work, and whenever their officers limit them to such wages and terms as the market affords they will soon discover the folly of paying officials and maintaining an organization at heavy expense to obtain for them rates of wages and terms of work which they could just as readily obtain without any officials or organization whatever. The opinion which I have formed, from over twenty years' experience in the employment of labor, is that whenever organization interferes with the management of the works, or demands terms which cannot be granted without loss, it will be the better course to exclude union or organized labor entirely, and employ none but free labor. I dislike indirect methods—to deceive men by governing them through third parties, although of their own appointment. Better to say to them openly they cannot be employed, as they are not their own masters, and you do not choose to deal with irresponsible parties, who might withdraw them when their labor was most wanted. You cannot intermix union labor with free labor; therefore better have it entirely free. Where this was the rule I have never found any difficulty in obtaining all the labor needed. There are always enough independent spirits among workingmen who dislike the yoke of organization—its burdensome assessments and arbitrary regulations—and are ready to think and act for themselves whenever they have a fair opportunity. In works where organized labor is in full possession considerable difficulty will, of course, be experienced in making the change; but the change once made effectually and maintained, there is no further trouble. And I think the necessity is approaching, and not very far distant, when proprietors will be compelled to this course. It will be a necessity bearing equally on the men and the proprietors. The men must have wages, which they cannot get without employment, and the proprietors want to operate their works rather than let their capital lie idle. Neither Knights of Labor nor any other organization, however backed by class legislation, can stop the wheels of industry. An imperious necessity impels them on.

In labor troubles much mischief is done by the vacillating course of some proprietors. Proprietors owe it to themselves, as well as to the men, to act promptly and fairly and firmly when a demand upon them is made on behalf of the men. They ought to know whether they can

Digitized by Google

grant what is demanded or not, and make their decision accordingly, and stand by it. Justice to the men requires this, so that they may at once seek labor elsewhere if they think they can better their condition, or return to work. It is this vacillating course which encourages the men to stop and hover around the place, threatening the peace of society and endangering property, with a hope of compelling the proprietor to change his mind. If known that there was to be no change in such case, there would be far less difficulty arise from prolonged strikes. Proprietors have sometimes been so vacillating and undecided in their course as to change their determination after weeks of trouble and strife, and after employing and operating part of their works for a time with free labor, but finally giving in to the strikers' terms, and then, at the instance of the labor bosses, discharging the very men who had stood by them and continued at work all through the strife. No meaner, more ungenerous, or mischievous course could be conceived.

I have now described the three customary remedies, so that a party involved or likely to be involved in a labor trouble may obtain a general understanding of their nature and applicability; not with a view to enable him to commence or manage a lawsuit. All the information I have given might only lead him into trouble if he attempted to act as his own attorney. Although if the attorney selected has not had much experience in this kind of litigation he may find some useful hints in these pages. In the last remedy described, for instance, the affidavit to be filed with the precipe or order to the prothonotary to issue the capias requires to be drawn with much technical precision, in order to lay the legal grounds to support the writ and hold the defendants to bail when arrested under it. This a lawyer of ordinary skill can readily do, whilst the plaintiff might state in his affidavit everything which he thought essential, and yet omit some allegation which would result in a discharge of the defendants. It is best to apply to an attorney at the very outset, and proceed strictly according to his advice. Mistakes are more likely to be avoided, and, besides, should mistakes occur by having parties arrested without reasonable or probable cause, or otherwise, the attorney serves as a scapegoat for whatever is done under his direction. Very few of these suits ever go to trial. Strikers are mostly of the nomadic or floating class. They are apt to consent to desist and leave peaceably, and, in that case, the plaintiff or prosecutor may as well arrange to let them off with or without payment of costs, as he may see fit. It is only when the leaders of an organization are implicated, or some question involving their interests is at stake, that funds are raised, and assessments made on working members for a vigorous defense.

Inasmuch as an attorney at law is necessary to the application of any legal remedy, a word here in regard to his choice may not be amiss. Nearly every business man has the acquaintance of an attorney whom he prefers, and to whom he applies whenever he has occasion for professional services; but to such as have not, I would say in cases of this kind, avoid extremes. Go neither too high nor too low. In the one extreme you may meet with humbug or extortion, and in the other extreme trickery or incapacity. You want an earnest, energetic, reliable man of good character and sound common sense, with a clear head and respectable knowledge of the law and practice of the courts; one who will take the trouble to learn and comprehend all the facts and circumstances of your case, and who can, in a clear and persuasive manner, present the evidence and arguments in your favor to the court and jury. Such a man is more likely to bring you through safely, and with a more

Digitized by Google

satisfactory result when you come to settle up with him, than either a lower or a higher grade lawyer. I by no means underrate the value of high talent in the profession, but the employment of such talent is unnecessarily expensive, and its possessor is apt to be so full of business more congenial to him that he may give your case far less attention than it requires. I have seen many mistakes made by men when in a difficulty of this kind retaining a lawyer of great public celebrity. Flashing eloquence and the arts of oratory are not near so potent with the clear-minded courts and jurors of the present day as is often supposed. Dogged tenacity and earnest perseverance will accomplish more in all ordinary legal controversies.

## CONCLUSION.

Whoever reads these pages, and has had experience in employing labor, knows that the best men in his employment are never the prime movers in a strike. Discontent and agitation begin with those who always prefer idleness to work whenever they can get a plausible excuse for it. They are never satisfied with their wages. They have imbibed the erroneous idea that the world is bound to maintain them whether they work or not. They belong mostly to the floating class of workingmen, who are always ready for any new movement that turns up, and are foremost in advocating among the men the views of the professional paid agitator, who glides about from mine to mine and mill and mill, like a good missionary, to teach the uninitiated what he calls their rights. The better men in the work are mostly overborne by the greater energy and glibber tongues of this class. Steady, well-doing men are quiet, modest, and unobtrusive, and as like to oppose anything having the appearance of benefit to their class.

When a proprietor, therefore, is placed under the disagreeable necessity of making arrests under any one of the three remedies above mentioned a sense of justice requires him to discriminate as far as he can, and arrest only those who are most in the wrong.

The fundamental cause of strikes and labor troubles lies in the want of a clear comprehension of the true relations of labor and capital—employer and employé. Ignorance affords a foothold for professional paid agitators to inculcate wrong views and excite unreasonable expectations. This, again, sustains demagoguery, both in and out of legislative assemblies. We have to remember, also, that many of the members of the legislature, elected to enact our laws, are just as ignorant of the true principles of liberty and popular government, and the relations of labor and capital, and other questions of social economy, as the workers in our mines or mills; hence it is that the general assembly at each successive session is flooded with bills of a character which any one moderately acquainted with the principles of our State and national government would consider to be either pernicious or absurd; and as so many who are elected as law-makers are greatly more in fear of doing anything which might injure their popularity with particular classes of voters than of doing their duty to the general public it is not to be wondered at that such bills are sometimes enacted into laws. The chief protection of the industries of the State against this species of special or class legislation is its absurdity, which mostly renders it ineffectual. Indeed, its worst effect consists in exciting false hopes among workingmen and subjecting them to further imposition at the hands of demagogues. We all remember the strenuous efforts of the labor demagogues to procure the act of 1872, to exempt workingmen, as they claimed,

Digitized by Google

from punishment for the offense of criminal conspiracy. Four years sufficed to show them that their labors in this line were abortive. They then tried again, by the amendment of 1876, to accomplish the same end, and they are now, it seems, pretty well satisfied that this attempt was abortive also, as they are at it again, agitating for the abolishment of all conspiracy laws, however criminal the conspiracy may be. They find it a rather difficult task to convert criminality into innocence, or to make it lawful for one class of citizens to do what is unlawful in all others. Their chief attack, so far, has been made on the law of criminal conspiracy, but those who read and understand the other two legal remedies, above described, will see that even if they succeeded in abolishing punishment for the crime of conspiracy they would still fall far short of accomplishing their purpose. In order to do this much more of the criminal and civil law of the land would have to be abolished. It would have to be enacted that no laborer, workingman, or journeyman, should be l able to be placed under bonds for surety of the peace, or good behavior, no matter how violent or dangerous he might be, nor punished for acts calculated to produce a breach of the peace, nor for conspiring with others to commit murder or any other crime, unless some overt act was committed in its execution, nor be liable, under the civil law, for any damages he or they might cause to person or property by holding the works idle under a strike. It will likely be a long while, however, before a sufficient number of demagogues can be found in the legislature to go to this extent, and till then those who understand their legal rights, and know how to maintain them, will find that the common and statute law of the State is not wanting in providing an adequate legal remedy for any wrong done or threatened to be done.

## PROTECTION OF AMERICAN INDUSTRY.

The CHAIRMAN. We have also from the New York Association for the Protection of American Industry the address of the board of managers to the public February 1, 1883.

The address is as follows:

*ADDRESS OF THE BOARD OF MANAGERS OF THE NEW YORK ASSOCIATION FOR THE PROTECTION OF AMERICAN INDUSTRY.*

[Managers: Ulysses S. Grant, Le Grand B. Cannon, Edward H. Ammidown, Benjamin G. Clarke, Solon Humphreys, George B. Butler, Charles S. Smith, Charles L. Tiffany, William L. Strong, James A. Burden, Frederick A. Potts, Cornelius N. Bliss, Alfred R. Whitney, Daniel F. Appleton, John Roach, William A. Gellatly, William A. A. Carsey, Selig S. Fisher, Levi L. Brown, Dexter A. Hawkins.]

Hamilton's celebrated Report on Manufactures, made to Congress December 5, 1791, while he was Secretary of the Treasury, pointed out with statesmanlike clearness and ability the course for this country to pursue to become wealthy, powerful, and independent.

But the growth of manufacturing industry in the United States received its first material impulse from the embargo and non-intercourse measures prior to the war of 1812; its next from the tariff for protection in 1828; its next from that of 1842, and its final and most effectual impulse from that of 1861; the latter consequent on the war of the rebellion.

Previous to those measures which, in June, 1812, were followed by declaring war against Great Britain, our supplies of manufactured goods were received almost wholly from her. Immediately on passing the

Digitized by Google

embargo and non-intercourse acts, our manufacturing industry, essential to our safety and prosperity, received its birth as one of importance. In December, 1810, President Madison, one of the fathers of the Constitution, and who will ever be regarded as a wise statesman and a true patriot, thus announced this event in his message to Congress:

"I feel particular satisfaction in remarking that an interior view of our country presents us with grateful proofs of its substantial and increasing prosperity. To a thriving agriculture and the improvements relating to it is added—a highly interesting extension of useful manufactures, the combined product of professional occupations and of household industry. Such indeed is the experience of economy as well as of policy in these substitutes for supplies, heretofore obtained by foreign commerce, that in a national view the change is justly regarded as of itself more than a recompense for those privations and losses resulting from foreign injustice, which furnished the general impulse required for its accomplishment. How far" (he adds) "it may be expedient to guard the infancy of this improvement in the distribution of labor by regulation of the commercial tariff is a subject which cannot fail to suggest itself to your patriotic reflections."

In his message of the following year he presents the necessity of support to our manufacturers in the following words:

"Although other subjects will press more immediately on your deliberations, a portion of them cannot but be well bestowed on the just and sound policy of securing to our manufacturers the success they have attained and are still attaining in some degree under the impulse of causes not permanent. . . . Besides the reasonableness of saving our manufactures from sacrifices, which a change of circumstances might bring on them, the national interest requires that, with respect to such articles as belong to our defense and our primary wants, we should not be left to unnecessary dependence on external supplies."

These recommendations were followed by the declaration of war in June, 1812. In the succeeding month the low duties on the importation of foreign goods was increased 100 per cent. In case they were brought in foreign bottoms 10 per cent. was to be added even to that rate.

All who are familiar with the history of this conflict recollect well the sufferings endured at the outset of the war by soldiers for the want of clothing, blankets, and arms. These had previously come from abroad. It was this want and the danger resulting from it that so earnestly impressed President Madison.

In the message of 1813 he says: "If the war has increased the interruptions to our commerce, it has at the same time cherished and multiplied our manufactures so as to make us independent of all other countries for the more essential branches, for which we ought to be dependent on none, and is even rapidly giving them an extent that will create additional staples in our future intercourse with foreign markets."

During the next year the treaty of peace, late in December 1814, was signed at Ghent. In President Madison's message of February, 1815, announcing it, he thus again refers to our industries:

"But there is no subject which can enter with greater force into the deliberations of Congress than a consideration of the means to preserve and promote the manufactures which have sprung into existence and attained an unparalleled maturity throughout the United States during the period of the European wars. This source of national independence and wealth I anxiously recommend, therefore, to the prompt and constant guardianship of Congress.

Digitized by Google

On the promulgation of the news of peace in 1815 the manufacturers of Great Britain immediately sought to regain the position they had occupied up to the time of our embargo and non-intercourse acts, in furnishing us with manufactures; and notwithstanding their own firm adherence to a high protective system, they, through their emissaries, urged that it was impolitic for governments to take any part in directing or indicating the employments of men. On the strength of his important and enlightened experience President Madison, in his seventh annual message, thus disposes of this main foundation of the theory of free trade, and presents conclusive reasons for adopting the policy of protection.

He says: "However wise the theory may be which leaves to the sagacity and interests of individuals the application of their industry and resources, there are in this as in other cases exceptions to the general rule. Besides the condition, which the theory itself implies, of a reciprocal adoption by other nations, experience teaches that so many circumstances must occur in introducing and maturing manufacturing establishments, especially of the more complicated kind, that a country may remain long without them, although sufficiently advanced and in some respects even peculiarly fitted for carrying them on with success. Under circumstances giving a powerful influence to manufacturing industry it has made among us a progress and exhibited an efficiency which justify the belief that with a protection not more than is due to the enterprising citizens, whose interests are now at stake, it may become at an early day not only safe against occasional competitions from abroad" (these had already commenced), "but a source of domestic wealth and even of external commerce. In selecting the branches more especially entitled to the public patronage a preference is obviously claimed by such as will relieve the United States from a dependence on foreign supplies, ever subject to casual failures, for articles necessary to the public defense or connected with the primary wants of individuals."

Congress, in April, 1816, lowered the duties under the tariff to what was supposed to be a proper peace basis, but the true situation with respect to Great Britain was not sufficiently considered. Her tariff was then nearly prohibitive; her navigation laws excluded us from trading reciprocally with her extensive colonies, and her manufacturing industry was then established and aggressive. Our duty on manufactures of iron was reduced from 30 to 20 per cent.; on cotton goods from 30 to 25 per cent., and on woolen goods from 30 to 25. These new rates, as the result proved, were wholly insufficient for the protection of our infant manufactures, and Great Britain poured her products upon us with destructive results.

Importations into the United States from 1814 to 1818 were as follows:

| | |
|---|---|
| 1814 | $12,965,000 |
| 1815 | 113,041,274 |
| 1816 | 147,103,000 |
| 1817 | 99,250,000 |
| 1818 | 121,750,000 |

Mr. Madison's message of 1816 thus deplores their effect: "It is to be regretted that a depression is experienced by particular branches of our manufactures and by a portion of our navigation. As the first proceeds in an essential degree from an excess of imported merchandise, which carries a check in its own tendency, the cause in its present extent cannot be of very long duration. The evil, however, will not be viewed by Congress without a recollection that manufacturing estab-

Digitized by Google

lishments, if suffered to sink too low or languish too long, may not revive after the causes shall have ceased; and that in the vicissitudes of human affairs situations may occur in which a dependence on foreign sources for the indispensable supplies may be among the most serious embarrassments."

Whole volumes of free-trade theories are answered in this large and bitter experience. Not only was the policy of the tariff of 1816 as between us and Great Britain not reciprocal, but the duties were too low to save our infant establishments from the enormous power of those of the English. Our tariff also had the vice in it of affixing a lower rate of duty on both cotton and woolen goods in 1819, thus creating distrust, while that of the English was permanent, and was aided by large capital and long experience.

President Monroe, who in 1817 succeeded Mr. Madison, in referring to the pecuniary embarrassments of our manufacturers and others, and to the British manufacturers, says in 1819, in his message to Congress:

"Their manufactures, for the want of a ready or profitable market at home, have been supplied by the manufacturers to the United States, and sold at a price below their current value in the place of manufacture. Although this practice" (he adds) "may be considered from its nature temporary or contingent, it is not on that account less injurious in its effects. Uniformity in the demand and price of an article is highly desirable to the domestic manufacture. It is deemed of great importance to give encouragement to our domestic manufactures. In what manner the evils adverted to may be remedied, and how far it may be practicable in other respects to afford to them further encouragement, paying due regard to all the other great interests of the nation, is submitted to the wisdom of Congress."

It thus appears from the testimony of Presidents Madison and Monroe that the first blow to the prosperity of our infant manufacturers came from the manufactures of Great Britain. There is conclusive English authority to the same point. In the article "Britain," in the Encyclopædia Britannica, edition of 1860, the following history is given:

"The United States, in no respect a manufacturing country, purchased from us merchandise to an extent annually increasing, and which, in 1807, had reached the amount of £12,000,000 sterling. Every addition to their capital, every year that they passed in peace and prosperity increased their value to us in a commercial sense, while every blow given to their productive funds necessarily operated in diminution of their purchases and payments. But far from acting on these impressions, the ministry of 1807 eagerly seized the opening given them by the violence of Bonaparte to assail the trade of America, and issued in November those orders which 'prohibited all direct intercourse from a neutral port to France or her tributary States unless the neutral vessels intended for such voyage touched first at a port in the British dominions and paid a duty.' * * * That the Americans would not submit to such humiliating conditions our Government was well aware, but it knew also that they had neither army, nor navy, and would not, for several years, resort to the alternative of war. * * * The trade of the Americans with the continent was suspended, and the remittances formerly made to us from the sale of their goods—remittances not overrated at four or five millions a year—were made no more. * * * But this was not all; the suspended intercourse and the subsequent appeal to arms induced the Americans to attempt to manufacture for themselves. This for several years excluded our goods, and when upon the return of peace British merchandise was poured into the United States

Digitized by Google

at prices so low as to defy competition the consequence, particularly in the year 1819, was the scene of general insolvency in the States, which once more recoiled with the most distressing effects on the British creditor."

The "general insolvency in the United States," to which the Encyclopædia Britannica refers, included the stoppage of nearly all the banks of the several States, and there occurred a period of severe distress never before suffered in our history. A large portion of our manufacturing industry shared in the general distress and ruin. This was in great part, as is abundantly shown, to the unfriendly policy of Great Britain. But the inadequate legislation of the United States exposed our weak industries to this fate.

The next step taken to start these industries into new life was the passage in 1828 and 1832 of tariffs which afforded greater protection. But immediately after that of 1832, approved July 14, was passed amending the one of 1828, it was, the next November, in a convention of the people of the State of South Carolina, by the ordinance of nullification "declared to be, together with the acts which it alters and amends, unconstitutional and therefore null and void."

The ordinance of nullification was to take effect in February, 1833, but a session of Congress to terminate on the 4th of March, 1833, having commenced, the time for the ordinance to take effect was postponed by South Carolina until after the adjournment of Congress, when the convention was again to meet to take the final steps. Mr. Calhoun, who was Vice-President, resigned, and was elected Senator from South Carolina. He took his seat in the Senate on the day when President Jackson's famous proclamation was presented. Subsequently the Force Bill was passed by Congress; both intended to maintain the laws of the Union. The greatest excitement prevailed throughout the country immediately after the passage of the ordinance of nullification.

Mr. Calhoun, on his way to Washington, while stopping in a stage at Columbia, in reply to earnest questions from citizens, surrounding the stage, who desired to know how the controversy would be settled, answered that when the shock came in the Senate, Mr Clay, who represented a State more agricultural than manufacturing, would propose a compromise which he would accept, and that acquiescence would follow its passage.

Mr. Clay, as Mr. Calhoun thus prophesied, did propose a compromise, and it passed, providing for successive biennial reductions in the tariff until 1841, when a uniform rate of 20 per cent. should be reached on articles of importation charged at a higher rate, and this duty was afterward to remain. This plan, which by degrees thus abandoned the policy of protection, was known as the revenue or free-trade basis.

Mr. Calhoun, on the adjournment of Congress on the 4th of March, 1833, in order to reach the convention before it should adjourn, proceeded to South Carolina first by stage, and, that being too slow, by open wagon, and having reached it in time satisfied the convention that the compromise legislation at Washington ought to be accepted, and it was so accepted by South Carolina.

In the notes of Mr. Webster's speech (addressing Mr. Clay in secret session of the Senate in 1833, on the compromise bill) published some years afterwards, at a period of great interest to the fortunes of Mr. Clay, in the New York American, appeared these words in capitals: "Sir, you are yielding to triumphant nullification." That such was the fact can scarcely be doubted, and it may be that by doing so it merely postponed the conflict which burst out in 1861.

At the time of the passage of the tariff of 1832 the amount of our

Digitized by Google

importations was only about $101,000,000 for the year. In 1836, after the first of the percentage reductions in the tariff had taken effect, the manufacturers of Great Britain repeated the experiment which culminated in 1819, and poured into the United States their manufactures to such an extent that our whole imports for 1836 amounted to $189,000,000.

In May 1837, immediately following these large imports, a crash, far exceeding in violence that of 1819, extended over the whole Union, and embraced all kinds and degrees of employments and of men. All the banks, including the United States Bank of Pennsylvania, stopped payments, and the disaster extended even to England and the continent. The suffering among our manufacturers, many of whom were utterly ruined, was universal and long continued: a result due to a bad banking system and to the complete desertion by the Government of the policy of protection to home industry, on the ground, set up by South Carolina, that this policy was unconstitutional. President Madison had warmly and wisely urged protection on the opposite ground.

In a letter to Joseph C. Cabell, of September 18, 1828, in noticing the new position of South Carolina, Mr. Madison writes: "A further evidence in support of the constitutional power to protect and foster manufactures—an evidence that ought of itself to settle the question—is the uniform and practical sanction given to the power by the general Government for nearly forty years, with a concurrence or acquiescence of the State governments throughout the same period." The distress and prostration throughout the country following the reductions of the tariff were so great and universal that a political revulsion followed. The Free-trade party in 1841 were turned out of power.

In 1842 the duties on imports were again increased to restore, encourage, and protect our enfeebled and drooping manufactures; but in 1846, and in March 1857, the duties imposed by the act of 1842 were again reduced to nearly the free-trade standard.

The following table shows the rate per cent. reached in 1841 by means of the action of nullification, and the rates in 1842, 1846, and 1857 on pig-iron, bar-iron, and on manufactures of glass, cotton, wool, and silk:

| | 1841. | 1842. | 1846. | 1857. |
|---|---|---|---|---|
| | *Per cent.* | | *Per cent.* | *Per cent.* |
| Pig-iron | 20 | $9 00* | 30 | 24 |
| Bar-iron | 20 | 25 00* | 30 | 24 |
| Glass | 20 | 30† | 40 | 30 |
| Cotton | 20 | 30† | 25 | 19 |
| Wool | 20 | 40† | 30 | 24 |
| Silk | 20 | 2 50‡ | 25 | 19 |

*Per ton. †Per cent. ‡Per pound.

The large importations consequent on these invitations to British manufacturers was followed in the fall of 1857 by the financial convulsion of that year, during which all the banks of all the States suspended specie payments, and the Bank of England, for the want of remittances from the United States, was compelled to suspend Sir Robert Peel's bill, limiting the amount of paper to £14,000,000, now £15,000,000, as the amount which may be issued by the Bank of England upon security of the public debt. As our duties were lowered our importations, aided by the action of British manufacturers, increased. Our importations were as follows:

TARIFF PROTECTIVE.

| 1854 | 304,562,381 |
| 1855 | 261,468,520 |
| 1856 | 314,639,042 |
| 1857 | 360,890,141 |

Great complaint of the British manufacturers was made in England for their imprudence in 1857 in sending, as they did, such an enormous amount of their goods to the United States, in excess of what could be paid for. It was to this imprudence that the disasters in Britain were due. The depression of the manufacturing interests of this country was so great that President Buchanan, in his message to Congress in 1857, mentions it.

In 1861, at the breaking out of the Rebellion, it was found that our manufacturing industries were so depressed and enfeebled by the free-trade tariff that they could not supply us with the materials necessary for our armies to sustain the Union. The duties were accordingly increased.

Under this stimulus our manufacturing interests have acquired a solidity hitherto unknown, due in great part to the permanence and consequent tonic effect of the legislation in this respect, and notwithstanding the existence for most of the period of a financial system inferior to that of France, Germany, and England, and notwithstanding also that the ocean-carrying trade is in the hands of foreign competitors in manufactures.

When these causes of inferiority shall be removed, as they may be under the influence of proper Congressional action, there will be no obstacle which may not be overcome in meeting the competition of manufacturers in many foreign markets.

Under the tariff bill of 1861 and its improvements the quantities of articles manufactured throughout the United States have greatly increased; prices of them have steadily diminished through home competition, and wages are at a point which enables the workman, if undisturbed, to live with comfort. Our manufacturing products now amount to over $5,369,000,000 annually.

A single case illustrates the principle. The effect of increasing the duty on steel will therefore be mentioned.

When the tariff of 1861 was enacted our production of steel amounted to less than 12,000 tons per annum. This production was limited mainly to that required in making the tools for which we have become famous throughout the world, and also weapons and springs. We wanted steel, however, in 1861, for guns large and small, for the various purposes of the war, for rails, and for use in numerous industries. Our production of steel has been raised under judicious protection from 12,000 tons in 1861 to nearly 2,000,000 tons in 1882. Our first steel rails were made after 1861, when the duty was 45 per cent. It was afterward raised to $28 per ton. The price of them in 1867 was $160 per ton in currency, say $114 in gold. It is now about $40 per ton at the factories. Our production of steel rails in 1882 was in the neighborhood of 1,500,000 tons; our capacity to produce them is about 2,000,000 tons per annum.

Digitized by Google

Mr. Morrill, the distinguished Senator from Vermont, claimed that the act of 1861, known as the Morrill tariff, was the birth of steel in America.

About the time of the passage of the act in 1870 increasing the duty on steel rails, Mr. David A. Wells, in an article written by him for the Cobden Club, claimed that it would be for the interest of the United States to buy and burn the factories for making these rails in this country, and to pension the workmen rather than prosecute the industry, as rails from abroad could be laid down here at from $60 to $62 per ton in currency, and that we would never enjoy the benefit of cheap rails.

The present price of steel rails at the factories, say $40 per ton, abundantly answers this article, published in 1872, by the Cobden Club, and shows the fallacy of the whole reasoning of the free-traders as applied to this country. But suppose we had bought and burned these factories and obtained from England the quantity of steel rails we have laid down in the United States, of our own production, amounting to say 6,000,000 tons to this time, what would have been the consequences to us? The price of steel rails in England in 1873 rose to about £18 per ton. Assuming that the price would not have increased under the stimulus of such an American demand, and that we could have paid for them, we should have taken out of this country and have distributed in England say $540,000,000.

Steel rails, according to Mr. Knight, last six times as long as iron; according to Mr. Wells, twelve times. All railroad men agree that they save the rolling-stock, cheapen transportation of all kinds, and promote the comfort and safety of passengers. How can any American not misled look otherwise than with satisfaction and with pride upon this instance of success in a great industry? Every interest in the country, agricultural, commercial, and manufacturing, participates in the advantages derived from this production. It shows conclusively the general beneficent operation of the tariff.

Notwithstanding, however, the benefits arising from the tariff of 1861, and its amendments, the belief is now entertained by a large portion of the people that a greater amount is collected from importations and from excise duties and taxes than is consistent with prudence and economy, and a reduction in the amount of both sources of revenue will undoubtedly be required by them from the present or the next Congress.

The question, therefore, arises whether this duty, as regards both sources of revenue, shall be performed by the present Congress, containing a majority of the friends of American industry, and so be in the interest of these industries; or it shall be left to the next Congress who may make the reduction, as in 1816, 1833, 1846, and 1857, in the interest of the foreign manufacturer.

We respectfully submit that it would be a fatal mistake to fail to pass a law reducing the revenue this session, and to pass it in the interests of protection to home industry and labor, and thus enable the friends of that policy to oppose, with a greater chance of success in the next Congress, any advance in the direction of free trade and low wages.

We present for adoption the following preamble and resolutions:

Whereas Great Britain, through ages of effort, has built up a manufacturing industry which makes her skill and power in this respect unequaled among the nations, and has accumulated the capital which makes London the great center of commerce, and the settling place for international trade, the place where the price is fixed of all the great articles of human industry, whether of near or of distant production, and now commands the carrying trade of the world, advantages which give the highest degree of protection, and constitute in the international competitions of industry an

Digitized by Google

unequaled, aggressive, and destructive force, ever wielded, as our history shows, without restraint, for her own benefit alone;

And whereas France, Germany, Austria, Belgium, Italy, and Russia are compelled, from the greater superiority of the English in capital, in finance, in industry, and in the carrying trade, to resist this superiority by protective tariffs;

And whereas the United States, on account of the vacillating policy of its legislation, the condition of its finances, and the higher rate which is cheerfully paid for American labor, is unable to compete with the cheaper foreign labor thus amply protected;

And whereas in our history disaster and distress have uniformly followed every resort to free trade, and prosperity has, without exception, attended the proper protection of our industries: Therefore—

Resolved, That the giving of adequate protection to American industry and of steady and profitable employment to all laborers in the United States is the true American policy.

Resolved, That in view of the excessive amount of revenue now collected by means of import and excise duties and taxes it is deemed incumbent on the present Congress to reduce the same, and to reduce the duties in the direction indicated by the report of the tariff commission within reasonable limits, so as to prevent imprudence in expenditure; and that this should be so done as to give adequate protection to our own industries and labor, against destructive and pauperizing competition from abroad.

Resolved, That we are in favor of restoring ocean navigation under our flag to the position required by the exigencies of trade, commerce, and manufactures and the advantage and safety of the country, but in American built ships, and that it is one of the highest duties of Congress to place the great industry of American ship-building on the foundation necessary for successful competition with the world at large.

Resolved, That we recommend to the legislature of the State to pass laws authorizing all domestic business corporations of magnitude to make allowances or pensions for faithful and long continued service in their behalf by persons who have become old or infirm in such service.

COOPER INSTITUTE MEETING,
*New York, February* 1, 1883.

### JAMES E. MAHN'S SUGGESTIONS.

The CHAIRMAN. I wish to file a written communication from James E. Mahn, corner of Furnace and Amy streets, Syracuse, N. Y., addressed to the committee, who is desirous to file his testimony before us at the risk, even of being considered a crank. I think I have heard that expression from some other source, "I am a laboring man," &c.

The communication is as follows:

SYRACUSE, N. Y., *September* 3, 1883.

*Senate Subcommittee on Labor and Education:*

HONORABLE SENATORS: My own special interest in the labor question impels me to thus volunteer my testimony before your committee at the risk even of being considered by you as cranky.

I am a laboring man, with no special trade or occupation, though I earn my subsistence by the sweat of my brow. I am fifty-two years of age, and was born and raised in the State of Indiana, and have held some responsible positions, both in civic and military departments. My foster father was the paternal sire of James N. Tyner, Postmaster-General under President Grant's administration. I have long felt a warm sympathy for the cause of honest industry, and taken much pains in informing myself in matters concerning the laboring classes, their moral and intellectual improvement, their prosperity, and general condition. So much as introductory remarks.

### DESIRE FOR WEALTH!

The two great objects of desire among mankind are the accumulation of riches in this world and to secure happiness in life hereafter. To

Digitized by Google

these ends the chief energies of men are directed, for without wealth no man can enter heaven—in the estimation of the world generally, and as we know nothing of that bourne, except from living human testimony, we have secured that goal, so far as the world can be cognizant, when we have got the public sentiment in our favor.

### WHY WE LABOR.

Men do not work for the immediate enjoyment and pleasure afforded from active employment, but for the pecuniary reward it brings. A life of arduous labor and toil is one from which every workingman hopes to be relieved sooner or later in life, but no wealthy person desires to change his condition of affluence and plenty for one of poverty and want.

### WEALTH NOT ALWAYS IN PROPER HANDS.

Wealth is not always to be found in the hands of proper and deserving individuals, but oftentimes belonging to sordid-minded and selfish people, and no statutory provision can ever place it always in the hands of just and honorable individuals. The honor and respectability shown by society to persons of wealth, even to those without intelligence or culture, makes the acquirement of riches desirable among all classes. The same selfish, avaricious disposition pervades all grades of people; every one wants to be richer than his neighbor.

There is no evidence to show that if the fortunes of the rich were taken from them (a spirit of agrarianism that should not be tolerated) and given to an equal number of the poor that a better condition of affairs would thereby be secured. It would be a change that would only affect the few without benefiting the many. Indeed, if such could be brought about, it would be an unwise policy to so suddenly change the life and habits of a class accustomed to active employment and strong diet to one of ease and luxury If the poor were made rich they would prove as exacting, or more so, than those brought up in wealth. The only remedy for such a disposition in mankind is a purer Christianity and higher civilization, which will not grant so much deference and respect to wealth without virtue, and show that intelligence and sound integrity are of greater importance than riches. This can be attained only by the more general education and the diffusion of knowledge among the laboring classes. We have many good and skillful mechanics and laboring men who are deficient in the science of social and political economy. A liberal system of education for the lower classes by the Government, and a less fostering care for the institutions of learning for the rich, is what our country is in need of at present. But we cannot afford to educate the poor of the whole world.

### WAGES.

The wages of mechanics and laboring men, so far as my information goes, are far better in this country than in any other country, unless it may be in some of the British colonies, in tropical climates, and they are better sheltered, clothed, and fed. At any rate, we find the working people from all parts of the world flocking to this country for the purpose of bettering their condition. At the same time it is true that capital is given a larger percentage upon investments. A high rate of percentage and wages arises from the active circulation of wealth and the large amount of labor employed in developing our resources and carrying on new and extensive enterprises.

In individual and private enterprises I think the profits of capital

Digitized by Google

and the wages of labor are more justly proportioned than they are in those of large corporations and monopolies. In my opinion this inequality between labor and capital in the latter is caused by unscrupulous and unwise legislation; in discriminating in favor of capital by our law-makers in granting subsidies, bounties, and franchises, and making tariff rates for the special benefit of moneyed corporations. The country has been injured by too much special legislation. The petition and prayer of all laboring men should be, "Honorable Senators and Representatives, let us alone; but if you must help the rich, help us the more, for we are in the greater need of help."

All enterprises not having special reference to national welfare, and engaged in for private gain, should be carried on by individuals and open to competition, but all enterprises of a national character, involving the interests and welfare of the people of the different States, requiring a large aggregation of capital, that in their nature are exempt from competition, such as banking, postal service, telegraph and trunk railroads, should be carried on by the General Government, but in such a way as not to allow the patronage to be used for the purpose of political aggrandizement. But the Government should have no more of such enterprises than are absolutely necessary for the protection of her citizens.

## PRISON LABOR.

Prisons should be made not only self-sustaining but a source of revenue to the State, to reimburse it for outlay in prosecuting criminals. It should be kept as a boarding-house for the indolent, but made as undesirable a place as possible consistent with the feelings of humanity, so that none should crave its hospitalities. Prisoners should be employed at such work as would be the most profitable to the State, regardless as to what class of workmen such labor might come in conflict, for no matter what they do they will come in competition with some of the wage-earning, and one class has no more right to be favored by the State than another. The labor should be with a view also of fitting the prisoner for making an honest livelihood after leaving the prison. Skilled labor is far less overstocked than unskilled, and, as a matter of justice to all, the convict should be taught some branch of skilled workmanship, where he would injure the fewest with his labor.

That the use of convict labor in manufacturing does not injure the prosperity of a place as much as where it is used in unskilled work. I would refer you to Auburn, N. Y., and Perryville, Tenn. One of the State's prisons is located at Auburn, and the convicts are employed in some of the trades, and the city is one of the most thriving places in the State, and boasts of its large manufacturing establishments. In the neighborhood of the other place named are coal mines, and the convicts are employed in digging the coal. The consequence is that the place has gone to decay; all the stores and shops are closed for want of patronage, for the convicts are supplied from contracts with outside parties, and there is no chance for industry or enterprise of any kind there.

Sirs, I believe if Congress would repeal all special laws enacted for favored corporations and individuals that capital and labor could adjust all their difficulties satisfactorily among themselves, through competition and by arbitration. It would be as impossible to pass a law for either that would be satisfactory as it would be to enact a protective tariff that would satisfy all the different interests of the country.

Hoping that you will give the subject your impartial deliberation, I am, respectfully, yours,

JAMES E. MAHN.

OTHER COMMUNICATIONS.

The CHAIRMAN. There is a large number of other communications all bearing upon the subject-matter of the inquiry and which I will place on file as soon as I get time, making acknowledgment of their reception in that way.

POSTAL SAVINGS BANK.

J. A. EMERSON sworn and examined.

By Mr. CALL:

Question. Where do you reside?—Answer. Now in New York.

Q. Have you had any special experience relating to the subject you desire to present to us?—A. I know considerable by experience and observation.

Q. Have you been connected in any way with the postal department?—A. I was.

Q. Have you been abroad?—A. I have been. I was educated in England, and have lived in England.

Q. You have given special attention to that subject?—A. I have for some years.

Q. Are you advised of its operation in England?—A. Thoroughly.

Q. Now, please state what you have prepared in the order you desire.

The WITNESS. I have been requested to submit to your committee a few remarks and some statistics in support of the following proposition: That the Congress of the United States be asked to extend to the working classes the benefits of the postal savings bank system, offering as it does convenience and facilities superior to any now existing for saving and accumulating part of their earnings for future use, and, above all, absolute security to the depositors.

This proposition has been discussed in the press occasionally, and I invite further discussion from the press, and the New York Herald, in whose columns, if my memory serves me aright, I have seen it favorably discussed, I trust will give it more extensive and favorable consideration. The postal savings bank system has been in operation in Great Britain for over thirty years. The increase from year to year and the large amount of accumulated deposits is the best evidence of its usefulness and its signal success. It has been there, and undoubtedly would be here, a great boon to the working classes throughout the country, but especially would it be so to the colored men of the South, the working classes of that section of country, who, since the collapse of that huge swindle known as the "Freedman's Savings and Trust Company," involving a loss to them of nearly $3,000,000, and the omission of Congress to make good the losses to the depositors as it ought to have done, as I shall hereafter explain, lost all confidence in savings banks operated under State laws or by private banking companies. They are therefore without any encouragement or incentive to practice habits of frugality, thrift, and economy, and save judiciously for a rainy day or when sickness, affliction, or old age overtakes them. The establishment of postal savings banks would offer this incentive, and the further inducement that they would know beyond the possibility of doubt that they were *this time* depositing their hard-earned savings virtually in the United States Treasury to be invested in United States bonds, and that the Government would be responsible to them for the repayment with interest of every cent.

Digitized by Google

I will now give you a brief outline of the circumstances under which postal savings banks were established in England, and how every money-order office in the United Kingdom is made a savings bank, bringing the invitation to be thrifty and saving to every home.

For many years the project of postal savings banks had been discussed in the press and by many eminent men who were laboring for the amelioration and improvement of the working classes.

In 1859, at the annual meeting of the Social Science Congress, held at Bradford, Mr. Sykes, a banker, of Huddersfield, a large manufacturing city in the north of England, read a paper evidently prepared with great care, which covered every detail of the subject, and advocated the immediate establishment of postal savings banks in connection with the money-order department of the general post-office. The subsequent discussion by the press seems to have arrested the attention of influential and public men. Mr. Sykes's plan was examined by competent authorities and found to be so clear and to promise such excellent results to the working classes, without any serious expense to the Government, that the postmaster-general adopted the measures and pressed it to success.

In 1861 Parliament passed an act establishing postal savings banks in connection with the money-order system, and provided for the investment of deposits in consols or exchequer bonds, and empowered the postmaster-general to act with the treasury and the national-debt commissioners to carry out the provisions of the act, designating their duties respectively.

This act also provided for the transfer of deposits from private savings banks to postal savings banks, and in 1863 Parliament was induced to pass an act establishing the mode of procedure whereby any savings bank may be wound up and closed, and the claims of depositors transferred to the post-office savings bank. This was done to relieve the small savings banks that the working classes had been depositing their savings in with considerable misgiving, the postal savings banks having absorbed their customers.

It is hardly necessary to observe that every provision is made by the Government and every precaution taken by the proper authorities to make the postal savings bank system perfect. Each depositor is provided with a deposit book, each deposit is entered in this book and is attested by the receiving officer and by a stamp of his office of the same date. The amount received is reported on the same day to the postmaster-general in London. Acknowledgment of each deposit is transmitted to the depositor, and this is to be conclusive evidence of his claim to repayment with interest. The depositor is entitled to repayment of the whole or any part of the deposit on making demand in prescribed form at any of the offices (not necessarily the one at which he made the deposits) within ten days after demand. The names of depositors and the amounts to their credit are not to be disclosed except to officials immediately concerned.

All the moneys are paid into and received back from the national debt office on the authority of the postmaster-general. Interest at 2½ per cent. is allowed on all deposits as soon as they amount to £1 ($5), but none on fractional parts of a pound. Facilities are provided free of charge, by means of certificates for transferring deposit accounts from ordinary savings banks to postal savings banks, and *vice versa*. All expenses are refunded to the post-office department out of the deposit fund.

A detailed account of the proceedings is required by law to be pre-

Digitized by Google

sented to Parliament annually by the postmaster-general and also by the registrar-general of savings banks, who exercises a supervisory authority over these banks.

The system of postal savings banks was put in operation in Great Britain in September, 1861. In March, 1864, a little over two years, it numbered 372,955 deposit accounts then open, with £4,097,492 ($20,487,460) accumulated deposits and interest, and also 2,000 friendly, provident, and charitable societies who seek the perfect security offered by the postal savings banks.

Year by year the number of depositors has increased, and in the last annual report of Postmaster-General Fawcett, of Great Britain, just published, it is stated that the total amount due to depositors, including interest, is £40,000,000 ($200,000,000), with an increase in the average annual amount of deposits of £3,000,000 ($15,000,000), the number of deposit accounts now open numbering over 1,500,000. Here is evidence of the most gratifying results from this system, and in the light of such authentic facts and figures as are here presented, one feels justified in saying that the establishment of the postal savings bank system by Congress would surely supply a much needed want, and be eminently wise and benificent legislation.

It is worthy of remark, and may serve to allay any hostile feeling to this measure in certain quarters, if I say that this new system is not a mere transfer of deposits from the old savings banks. It is almost wholly an addition to them, as the following statistics will show: Just before the postal savings bank system came into operation there were 1,600,103 depositors in the old savings banks, with accumulated balances amounting to £43,278,656 ($26,393,280). In March, 1864, two years after the postal savings banks had been in operation, the number of depositors in the old savings banks had increased to 1,887,510, a net increase of 287,407 new depositors, clearly showing that instead of injury the postal savings bank system had been a positive benefit to the old banks, and that there is evidently room for both.

Before leaving this subject I may be permitted to state for information and comparison that taking the old and the new savings banks in Great Britain together, there is 1 depositor for every 7 inhabitants of the London postal district, comprising in round numbers 4,000,000 persons; 1 for every 14 in England and Wales; 1 for every 17 in Scotland, and 1 for every 68 in Ireland.

The establishment of postal savings banks is of national importance, and will, in my opinion, be a national benefit. But, as I said at the outset, it will be of especial benefit to the freedmen of the South, who are so unjustly and maliciously accused of improvidence and thriftless habits, while the truth is, to say nothing of the cheating and shaving that is practised on them through their ignorance by the middlemen, if they had the opportunity and encouragement which is so abundant in the Northern and Eastern States, with the assurance that what they had accumulated through economy and self-denial would not be swept away by official swindlers, as in the case of the notorious "Freedman's Savings and Trust Company," they would gladly commence again to save and accumulate and become better and worthier citizens.

I now return to the statement I made that Congress had omitted to make good to the depositors their losses as it ought to have done, and I reaffirm it. I ask your attention to what I submit to sustain my statement. On March 3, 1865, at a session of the Thirty-eighth Congress, Congress granted a charter incorporating the "Freedman's Savings and Trust Company." Observe, the institution was not founded to carry on a banking business, nor did the charter empower the trustees to do a

Digitized by Google

banking business. The sole object of the "Freedman's Savings and Trust Company," as defined in the charter by Congress, "was to receive deposits on behalf of persons theretofore held in slavery in the United States, and of their descendants, and invest the same in stocks, bonds, treasury notes, and other securities of the United States." The interest on these investments was the only income to be derived from these investments, and this was to be invested in like manner as the deposits themselves.

The institution was organized and proceeded to carry out the provisions of the charter. At the end of the first year the accumulated deposits of the freedmen amounted to $200,000. In 1870 the managers of the bank, unknown to, and without the authority of, the depositors, applied to the Fortieth Congress to alter and amend the charter so as to empower them to use the deposits, which had then accumulated to over two millions, in loans to private individuals on real estate security as well as on other securities paying larger interest than Government securities, urging speciously as a reason for the proposed change that the freedmen would be greatly benefited by it, when in reality their purpose was to embark in questionable and dishonest schemes, as the sequel proves. However, on the 6th of May, 1870, Congress amended section 5 of the charter, so as to allow investments to the extent of one-half of the deposits in bonds, or notes secured by mortgage on real estate in double the amount of such loan. Of course the power of Congress is illimitable. But in altering this charter without the knowledge or consent of the depositors it violated their rights, impaired their security, and opened the door for all the fraudulent transactions and losses to the depositors with which the public are familiar; and the freedmen and their friends, while they insist that it is the duty of Congress to indemnify them for their losses, do not do so on the score of humanity or philanthropy, but they claim it is an act of simple justice.

The condition and assets of the Freedman's Savings and Trust Company may be learned by reference to the report of a committee appointed by the Forty-third Congress to inquire into its affairs. From this report, dated July, 1874, it appears that the assets of the bank at that time amounted to $2,693,095.20, and its liabilities were $2,870,031.78, leaving a deficiency of $175,936.58. This deficiency, although in itself a large sum, was only apparent, however, for the greater portion of the assets were represented by worthless securities and insolvent debtors. The bank suspended on the 30th day of June, 1874, over nine years ago, and three commissioners were appointed to administer its affairs. During this time they have paid at intervals of two or three years small dividends to the depositors, amounting in the aggregate to 62 per cent. without interest. The fact remains that the freedmen were swindled by this operation out of about $3,000,000, and that in common justice Congress should indemnify them.

I will close this statement by quoting a part of the report presented to the United States Senate April, 1880, by Hon. B. K. Bruce, chairman of a committee appointed to investigate the affairs of the bank. In this report, submitted to the Senate, Senator Bruce, chairman of the committee, says:

> Until 1868 the spirit and letter of the charter seem to have been recognized very faithfully by the trustees and officers who administered the affairs of the company, and until the beginning of 1870—
>
> The period when the charter was amended—
>
> there do not appear to have been in the administration any serious practical departures from the kindly and judicious programme indicated in the act creating the insti-

Digitized by Google

tution. In May, 1870, an amendment to the charter was secured, which embodied radical, and what subsequent events proved to be a dangerous and hurtful, change in the character of securities in which the trustees were empowered to invest the deposit of the institution.

Q. Have you anything further?—A. I have nothing further to state.

Q. What you have said comprises all the facts you wish to submit?—A. All the facts that I have to furnish to the committee at present. Any further elucidation the committee require I shall be happy to supply if in my power. My object is to bring the matter before the public for discussion as one of great importance, and one calculated to benefit the working classes immeasurably, I think.

Q. Do you think the Southern colored people would avail themselves largely of it?—A. I know they would. You know as well as I do that they have no means of saving now. If any saving is done in the South now, it is done on the personal reliance of colored men in old citizens whom they have known and whose word they think is as good as their bond. A good many of them have private banks, and with them they deposit small amounts, but the facilities for saving which are so common in the North and East are utterly unknown in the South.

Q. A prosperous colored man generally gets a piece of land as soon as he can?—A. This would lead to that result. A man would see the advantage of saving money and what he could accomplish with it. It would enable him to possess land, and when you give a man land and tie him to land you give him certain responsibilities which make him a good citizen.

Q. It is a very just view of the subject, I think, that you take. To what sum do you propose to limit the deposits; have you any definite idea in regard to the amount of deposits?—A. In England the deposit is limited to £30 a year. You cannot deposit in any one year more than £30 ($150). You can deposit from 25 cents up to any amount within that. For instance, a man has a deposit made in New York amounting to the maximum allowed by law, and he wants to go to San Francisco; he can jump on board the train and go to San Francisco and present his deposit book at the post-office there. They would communicate with the General Post-Office to know whether the amount stood to the man's credit, and as soon as they receive the necessary information they would pay him the money. So he could get his money transmitted from point to point free of cost, and in a secure way.

Q. The statistics you have presented are taken from official reports?—A. They are official British statistics, published by the proper office in England. If the matter receives that encouragement I hope it will—I have written to England for all the particulars, the act and the *modus operandi* complete, which I shall have in the course of two or three weeks—I shall continue to urge the matter.

Q. Have you any idea of the number of persons who deposit sums like 25 cents and up to a dollar; have you any classification of the depositors by the amounts deposited?—A. I think not. The most they do is to give an average amount of the deposits to each individual depositor; and the average amount in England, according to the statistics of the post-office, is £28 ($140).

Q. The average deposit of each person?—A. The average deposit of each individual is £28 or $140.

Q. Those were the deposits for the year, I suppose?—A. For the year. The remarkable fact that strikes one is the enormous amount the postal savings bank has collected as deposits in addition to the large amount held by the ordinary or old savings banks, because those savings banks

Digitized by Google

ave not gone out of existence; on the contrary they are more perfect ıow, because the establishment of the postal savings bank compelled .he Government to exercise a more perfect and scrutinizing supervision of the old savings banks.

Q. Why is that so? What connection is there between that fact and the Government's supervision of the private savings banks?—A. Because the more secure the depositors feel of Government examination and supervision of the old savings banks, the less they will be likely to lose their business. The postal savings bank appealed to the poorer working classes, men who do not know where a bank is, who are not in the neighborhood of a bank, who would feel a considerable delicacy in going into a bank to deposit 25 cents, whereas they go into the money-order offices which are scattered all over the country in England as here, and deposit 25 cents. The thing is simple, immediate, and convenient. It is no expense to the Government. I am not asking the Government to incur a cent of expense. In England it is no expense to the Government; the expenses are paid out of the deposit fund. Even if it was an expense to this Government I do not see why the Government should not assume the expense. I think the Government can afford it. If it can take the duty off perfumery and off bank checks, it should not scruple to spend a million or two for the benefit of these men who are such large producers. Take the yield of cotton produced last year by these men; it is something amazing—6,992,234 bales of cotton. This is from the official figures published recently; this is what these men have produced. Suppose you take into consideration what they consume and see the enormous amount of money one way and the other they put in circulation in this country, helping to build up and increase its wealth.

Q. Have you anything in your tables to show the amount of colored and the amount of white labor engaged in the production of cotton?—A. I have endeavored to get that information at different points in the South, and the best information that I can get is that 95 per cent. of the labor that produces cotton is colored to 5 per cent. white.

Q. That is a mistake?—A. That is what they tell me. I mean the labor in the field.

Q. I know much the larger portion of the population in those States is white, taking all the cotton States together.—A. But the colored labor produces cotton. Take Arkansas; there are more white men there than colored; but how many white men do you suppose produce cotton?

Q. A great many on the Mississippi River.—A. But I am talking now of taking hold of the plow. In the northwestern section of the State, where the grains and cereals are produced, I have seen white men there working in the field.

Q. Even in my State, the most extreme Southern State, there always was, even in the days of slavery, a very large proportion of white people that produced cotton themselves, working it with their own hands.—A. I understand that number has very much decreased since the war.

Q. No, it has very much increased. The number of people who have been compelled to make a living has been recruited very largely from other employments since the war.—A. I have never seen the figures collated, and it is a matter of guess-work. I have inquired at one point and then at another; I have inquired in South Carolina and Tennessee, in Mississippi, in Arkansas, and in Missouri, about two years ago, on that special point.

Digitized by Google

Mr. CALL. The cotton upon the river lands, the alluvial lands, is generally made by colored labor, but on the uplands, to a very large extent, by white labor.

CONDITION OF COLORED PEOPLE IN THE SOUTH.

By the CHAIRMAN:

Q. Where do you now reside?—A. In New York.

Q. What is your business here?—A. I am writing for the press.

Q. What press?—A. Two or three newspapers.

Q. A correspondent?—A. Yes, sir; a general correspondent.

Q. You have resided in Washington?—A. I have resided in Washington.

Q. From what part of the country do you come originally?—A. I was appointed from Arkansas to the Treasury Department in Washington.

Q. What have been your opportunities for learning the condition of labor in your part of the country?—A. I lived in the South four years, was mixed up with business operations, and saw something of the political atmosphere.

Q. You were not born in the South?—A. No.

Q. Where were you born?—A. In Europe.

Q. How long have you lived in the United States?—A. Fifteen years.

Q. Are you a citizen?—A. Oh, yes, sir.

Q. You were speaking of the condition of the colored people as being victimized, by reason of their ignorance, by the middlemen. I should like to have you give the committee any information you have in regard to their industrial condition a little more fully than you have in connection with your idea that a postal savings bank would be beneficial to them.—A. In pursuance of what passed between yourself and me, Mr. Chairman, I divided the subject and assigned that portion of it to Mr. Fortune, whom I brought here with me for the purpose of presenting it to you, and he is preparing very carefully a paper to cover that branch.

Q. Is he present now?—A. Yes, sir; Mr. Thomas Fortune, editor of the New York Globe. He is not prepared to take the stand now, but is preparing a paper. I brought him to present him to you this morning, and to make some arrangement about the time he should appear before you. I had begun to prepare some facts and figures on that subject, but after what you said to me I thought I would ask Mr. Fortune to take the whole subject.

Q. You stated to me that you had some knowledge of some business arrangement or understanding between parties in the North and the middlemen of the South. Have you any information in that regard that this other gentleman will not be able to give us?—A. You refer, I think, to what I said of the traders in the South who cheat the laborers. These men who are working on shares open accounts with them. They seek their custom; they go amongst them just as drummers do among their customers and seek their custom. They get them a little in their debt to-day, first by lending them a little money or giving them a little credit. Finally they open an account with the understanding that they are to sell very cheap. They get a pass-book and simply follow what is known as the truck system in the North; they will lend a man 25 cents and charge him 50 cents. At the end of eight or nine months they will have that man in their debt $250 perhaps. I speak from my personal knowledge, for men have brought their books to me. From the first entry of

Digitized by Google

that 25 cents they charge them 2 per cent. a month, 24 per cent. per annum, on that money, and if they don't pay that money or make it so absolutely certain that the middlemen will get that money, he garnishees their cotton directly, and by the time it gets out of the garnishee process the man gets nothing.

Q. This, I understand you, is not done by the planters?—A. Not by the planters. What I would call the better classes of Southern men would scorn that kind of thing; they would help the negroes to defeat it.

Q. Did you hear the testimony of Mr. Calhoun yesterday?—A. I did not; I read a part of it.

Q. Do you find that a substantially just statement?—A. Mr. Calhoun's testimony is in the main just and true, but he says certain things that I cannot exactly comprehend.

Q. I do not care to invite any criticism of his testimony at length. You may state any facts, but I do not care to have your statement put in form of an attack upon the testimony of Mr. Calhoun. I understood you to say that generally his statement was a very fair and just one?—A. I think in the main it is fair.

Q. If you have any facts to state you can state them, but not with any reference to his testimony, because I do not want to put gentlemen in the attitude of being criticised.—A. Probably the conclusion that would be drawn from a remark of his he may not have intended.

Q. You may not draw any conclusion from any remark he made here. If you know any fact to present you may give it.—A. Then I will not touch his testimony more than to say that I think in the main it is correct.

Q. Any fact that you know that will throw light on the investigation of course we shall be glad to receive.—A. I have not read the whole of his testimony. I have only read that portion of it published in the Telegram.

Mr. PUGH. That is very imperfect and unsatisfactory.

By the CHAIRMAN:

Q. You have spoken of the "truck system;" how prevalent is it under your observation?—A. It is very prevalent along the banks of the Mississippi.

Q. How in the interior of Arkansas, Louisiana, and Mississippi, among the smaller farmers?—A. It is just as strong there; but it comes more to the surface, more to the eye. In the interior these men help themselves.

Q. You understand it is equally prevalent in the interior as along the banks of the streams?—A. Oh, yes, sir.

Q. How as to any correspondence between the business interests of those traders and parties in the North?—A. These men are supplied by wholesale houses in the North. I have seen several that I know of, friends of mine, within the last week or two here getting their supplies—men right from Little Rock.

Q. The stock which is subsequently sold to the negroes under the system you speak of?—A. Yes, sir.

By Mr. CALL:

Q. Do you not understand that to be general? Do they not cheat the white people just as much as they do the colored people when they get the chance?—A. No; I think not. Illiteracy is not so great among the white people as it is among the colored people, and the white people

Digitized by Google

have some means or some friendly associations that enable them to prevent that kind of thing.

By Mr. PUGH:

Q. Are not these stores generally found where there is the larger colored population?—A. Yes, sir.

By Mr. CALL:

Q. Was it not your observation, too, that for some years after the war large interest was generally charged by merchants when they had balances against persons who dealt with them on credit, something like 18 or 20 per cent. a year?—A. That was so to a certain extent, I believe; but I think that was only in certain branches of trade. There are very few legitimate trades that could stand that rate of interest. I am speaking of 1873, 1874, 1875, and 1876; it was a long time after the war.

Q. There are plenty of places in the South where interest is as large as that without discrimination of color?—A. Yes; and a man might pay that rate of interest in an emergency for an amount of money, but if you make that a continuous thing I don't think any man in any trade can stand it.

Q. Still, owing to various causes, I think it was a general fact in the South up to a very recent period of time that very exorbitant rates of interest were charged by merchants and everybody, and even then a great many of them failed; and it is so now in country stores to a certain extent.—A. It is a common thing for these people when they get their cotton proceeds to find that they are absolutely in debt to these men and they have had nothing from them but absolute supplies.

By the CHAIRMAN:

Q. What is the condition of the colored people and of the laboring white people of the South with reference to education in the common-school branches?—A. Do you mean have they equal school privileges?

Q. No; but I want to know the general condition, in regard to actual education in the common-school branches, of the colored people of the South and of the poorer class of white laborers?—A. I think the colored people avail themselves of the school privileges in a much larger proportion than the whites.

Q. Relatively you think they show a stronger disposition to avail themselves of such privileges as they have?—A. A much stronger disposition.

Q. How is it as to the actual attendance of the children of these two classes upon school privileges?—A. That is a matter of statistics.

Q. I ask for your knowledge, if you have any?—A. It seems to me that my answer would be a continuation of what I have just said, that they would go in greater numbers.

Q. You think that actually a larger proportion of the colored children attend school than of the white children of the same class I speak of?—A. I do think so. I am speaking of the laboring class, not of what we call the upper class, the class above them.

Q. Your observation is, as I understand you, confined to the Southwest?—A. To the Southwest.

Q. To Arkansas and that vicinity?—A. All I know of the South is more from reading and correspondence. What I know of the Southwest is from personal knowledge.

Q. You may state whether there are now existing in the Southwest sufficient school privileges or opportunities for the poorer class of colored people and the poorer class of white children.—A. I will answer

Digitized by Google

that question by the general statement that there is not. In the first place, the schools are not sufficiently numerous; in the next place, they are not kept open long enough during the season of the year when children ought to be going to school.

Q. State whether or not the pecuniary condition of these classes is to any extent a reason why schooling facilities are not provided in greater abundance.—A. That would depend so much on an elaborate statement that I do not think I am prepared to give it to you.

Q. You do not know whether they are rich enough to take care of themselves in the matter of common-school education or not?—A. The issue is raised in the South that the means for schools ought to be provided by the General Government.

Q. I was not asking you that question. I was asking you whether the schools exist, and you state that the facilities do not exist, and I was asking you whether their failure to exist was owing to any question of insufficiency of pecuniary means on the part of the people to support them?—A. No; they are quite able to support them.

Q. They lack the disposition you think?—A. Yes. I do not know any community in the United States that is not able to support schools, so far as my knowledge goes.

Q. Relatively, are they in that regard as well able to support good common schools as people are at the North?—A. In most places they are.

Q. Where is the want of the necessary disposition, then? You say the colored people possess it.—A. The colored people possess it; but those persons who ought to provide by legislation the machinery for the establishment and conduct of schools do not do it.

Q. To what States does that remark apply?—A. Probably more to some States than others, but as a rule it is practically so in the Southern States.

Q. Is your information of a recent character?—A. It goes back to not later than about twelve months ago.

Q. Have you traveled through the South?—A. Yes; I have traveled all over this country, from one end of it to the other.

Q. Are you aware of anything like a growing disposition among the Southern States to introduce and extend the common-school system among the people, irrespective of class or race?—A. They manifest that disposition certainly.

Q. And you think that progress is being made in the right direction in that regard?—A. I do; there is no doubt about it that they manifest a disposition.

Q. Have you any doubt from the tendency of things that within a few years the ordinary people, the common people, as we call them in the South, will have as good opportunities for education as at the North?—A. I have no doubt of that in the world. The condition of the South has been materially changed within the last four or five years. Some Northern people do not comprehend it. The substitution of home rule for bayonet rule in the South has revolutionized it. There is a better feeling there between all classes; as a rule, the relations between the colored and white people are peaceful and friendly; no doubt about that; they are working out these problems slowly, but in time they will work them out.

Q. You say the relation of feeling between the colored and white people is friendly?—A. It is.

Q. This extends to the masses, the common class of white people, as well as the planters and better classes, or more wealthy classes?—A.

Digitized by Google

I am speaking now of the masses of the colored people and the people who form, shape, and lead public sentiment in the South.

Q. Are not that class bringing their beneficial influences to bear upon the condition of the white people as well as the colored?—A. I think they are.

Q. And progress is being made in the matter of education among the poorer white people as well as among the colored people?—A. Oh, yes, sir.

Q. And quite as rapidly, do you think?—A. I do not know that it is quite as rapid. It may in certain isolated sections, but, as a general rule, I do not think so.

Q. Do you know anything of the establishment of higher institutions of learning, academies and colleges and industrial schools?—A. I have not given the subject any thought for the purpose of presentation to the committee.

By Mr. PUGH:

Q. Do you not know it to be a general fact that the laboring white people of the South and the laboring colored people as a general rule live in different sections; they do not live together in the same communities? Do you not know that to be a general fact?—A. Yes, sir.

Q. That explains what you said a little while ago, that where you have been and found a large population of colored people a larger proportion of the children went to the public schools. You have not been in those sections of the South where the country is occupied by the white laborers and seen whether their children go to school. You only state in reference to those sections through which you have traveled among the colored people?—A. Well, I happened to occupy a pretty prominent position in the State; I was personally intimate with the superintendent of public instruction in my State who held office at the time I was in office in the State. I was also intimate with the man who succeeded him, a Democrat, whom I saw on one or two occasions when I went down South, and I talked on the subject with him, and the result of my observation bears me out precisely in the statement I have made here, and it is sustained by the information I derive from both these gentlemen who were superintendents of public instruction of the State.

By Mr. CALL:

Q. The census shows the proportion of white and colored children who attend school?—A. Of course.

Q. Have you ever given any attention to the relative proportionate tax for school purposes in the Southern States and the Northern States since the war, according to property?—A. I knew it pretty well, but I do not know that I have it at my fingers' ends now. It was my duty to know it pretty well at one time, but it has escaped me now.

Q. Can you state whether the tax in the Southern States is as great, if not greater, in proportion to the amount of property, than in the Northern States, for school purposes?—A. I think in some States it is.

Q. I think it is generally so in proportion to property.—A. But the evil there is that in some of these States, where the school teachers are paid in school warrants, you know the warrants are depreciated in value so that literally the teacher gets nothing. I have bought a school teacher's warrants issued to him for a dollar for 15 cents, and did him a favor to buy from him.

Q. When was that?—A. In 1874 and 1875.

Q. In what State?—A. Arkansas.

Digitized by Google

Q. You cannot buy them now for that.—A. Probably not; but I will undertake to say that they are not worth more than 50 or 60 per cent. now.

Q. 50 or 60 is a considerable advance on 15?—A. Certainly.

Q. I do not know how it is in Arkansas, but I am very sure you cannot buy such warrants in any other Southern State for much less, if any less, than par. You cannot in Florida nor in Georgia, I know.—A. I am glad to hear that.

Mr. CALL. I doubt, though I cannot speak from personal knowledge, whether you can in either North or South Carolina, or in Alabama.

Mr. PUGH. In Alabama they pay dollar for dollar. The teacher either gets a warrant with 100 cents on the dollar or gets his money in greenbacks or gold or silver, just as he desires.

Mr. CALL. So it is in Florida.

The WITNESS. The change of things in the South has affected the value of these securities.

Mr. PUGH. You are right. Since home rule has prevailed it has restored confidence in the State.

The WITNESS. It has brought confidence and good feeling. I know it. I have relations with gentlemen who are political associates of yours who know all about it.

By Mr. CALL:

Q. Do you not think, considering the uncertainty of values of all kinds in the South at that time, and the general disorders which existed, that the assessment for school purposes was as much as the people could bear at the time you were there?—A. Certainly. You saw evidence of it on every hand; the products were increased, more labor was employed to the acreage; the commerce of the place was increased three or four fold in all commercial cities.

Q. You find no fault with the disposition of the people to establish schools and do the best they could under the circumstances?—A. None at all; but still there appears to be some impediment that I cannot point out that seems to prevent its consummation. Allow me to express the hope that some of the lights of the financial world will think the question which I have submitted to the committee worthy of their attention and favor the committee with their views upon it.

By the CHAIRMAN:

Q. You mean the postal savings bank?—A. Yes, sir; because if some man of note who is familiar with finance and the machinery that would have to be put in operation for this scheme would favor the committee with his views, the subject probably would command public attention in a greater degree than my humble efforts would enable it to do.

Q. You think if these institutions existed in the South the colored people would generally avail themselves of them?—A. No doubt of it.

Q. You think they would have confidence in a Government institution, notwithstanding the break-up of the Freedman's Bank?—A. I am disposed to think that the colored people as a class are superfluously loyal. They believe there is nothing in God's earth that is so perfect as the United States Government; and if you give them the United States Government as security they will deposit their money with it.

## PUBLIC LANDS IN THE SOUTH.

Q. Please give your opinions as to the desirability of the increase of small land-holdings among the colored people and the opportunities in

Digitized by Google

the South to obtain suitable lands at prices within their reach.—A. I respectfully submit to your honorable committee that the conditions upon which millions of acres of land are held by some of the Southern States, which rightfully belong to the United States, and which ought to be treated as public land and open to entry under the homestead law, are unjust and injurious to the citizens of that section in general, but especially so to the industrious colored men of the South, who are not able to pay the exorbitant prices demanded for farming land, and would gladly avail themselves of the opportunity to settle upon the land referred to at the maximum price, which ranges between $1.25 and $2.50 per acre, demanded by the United States. There are laws on the statute books which would seem to make it obligatory upon these States to sell this land, which they have not earned but hold and ignore the Government, as well as the wants and equitable rights of the people.

In the State of Alabama it will be found from official sources that there are 1,304,498 acres of land held by the State that should be in possession of the United States and open to entry.

In the State of Florida there are 992,548 acres of the same character that should also be open to entry.

In the State of Louisiana there are 706,405 acres, also the property of the United States, that should be open to entry.

In the State of Mississippi there are 198,028 acres of land which is also rightfully public land, the property of the United States, and should be open to entry.

There are 3,201,479 acres of land situated in a region of the country where labor is abundant and where the laborer would be glad to have the opportunity to buy and till his own soil, and it is hoped your honorable committee will urge upon Congress the wisdom of any measure that may accomplish this end.

The United States laws provide that sections of 640 acres of land shall, if desired by settlers, be subdivided into smaller tracts of 160, 80 and 40 acres, and, as already stated, fixes the price at from $1.25 to $2.50 per acre. If the land in the States named were subdivided in the manner provided, I venture to say that inside of five years there would be 50,000 thrifty homes and homesteads of 40 acres each, to say nothing of those of 80 or 160 acres that would spring up all over the South, increasing enormously her production as well as her consumption. This ought to make the question an important one from an economic point of view.

The public domain has been so rapidly absorbed by railroad corporations during a comparatively short period that it may seem surprising to say that although the first grant of land in aid of a railroad was made to Illinois in September, 1850 (Statutes at Large, vol. 9, page 466), and the number of acres amounted to 2,595,053, up to the present time, a little over thirty years, the sum total of land grants to railroads amounts to 159,354,178 millions of acres, of this land the Government has been cheated out of; but there appears to be no power short of Congressional action that can restore these millions of acres to the public use.

To show your honorable committee how imperative it is that Congress should enact a law that will give proper facilities to the colored men of the South to procure land and build up homes on the soil that has been so abundantly enriched by their patient toil for centuries, I will state that the vast public domain of the United States, which but recently was 1,000,000,000 acres, is now reduced to 250,000,000 acres of available land, of which the various States to which grants were made by the United States claim about 5,000,000 acres; and the estimate of the General Land Office in Washington is that it will require 125,000,000 acres

Digitized by Google

to satisfy the claims of corporations, although in many cases the land has not been earned, and is justly forfeited to and is now the property of the people of the United States.

This is a matter of vital interest to the future welfare and industrial progress of the colored men, who appeal to the justice and wisdom of Congress to give the subject early and favorable consideration.

## TRADES UNIONS.

The CHAIRMAN. I have here quite a number more communications that may as well be filed now as at any time.

We have a statement from Mr. Z. Balto, of 19½ Forsyth street, New York City, addressed to the committee, being a written reply to an invitation from the committee to testify before it. By reason of sickness he is unable to appear and sends this communication. He discusses trades unions especially.

The statement is as follows:

NEW YORK, 19½ FORSYTH STREET,
*August* 28, 1883.

*To the honorable Senatorial Committee on Labor,*
*Room* 100, *Post-office building:*

As a severe sickness has prevented me from complying with your honorable invitation of the 13th instant to appear before your honorable committee as a witness in behalf of my branch of industry, with your generous permission I beg leave to submit the following statement:

About my trade a great deal has been said before your honorable body by other witnesses. For that reason I have confined myself to a brief statement about "trades unions," and their "aims."

Among all societies in existence, trades unions apparently enjoy the most ill fame; and yet their aims and doings are not surrounded by any secrecy or disguised by any mystery, but are open to everybody who wants to hear them, and, moreover, who wants to inform himself about them.

To promote the economical conditions of the workingmen, not only at one trade but also in general, and by that means to secure to the vast multitude of workmen a higher stage in social life than they are now able to occupy—such is the aim of a trades union, and all labors of a trades union and all its efforts tend to this end. In short, a trades union is the visible incarnation of what is called the "labor question." But it is said, "Trades unions are the cause of numberless strikes." If the men asserting this would take only a little pains to investigate this question, they would find that strikes are very seldom on record or have nearly disappeared entirely where well-organized trades unions are in existence. It would be learned then that every well-organized trades union, as well as every intelligent workman, considers a strike an evil only to be resorted to when all arbitrary means fail, as a last remedy.

"Trades unions are nursing disharmony or strife between capital and labor," is another frequent accusation trades unions are treated with. Capital is the result of labor, as far as I understand it. How there can be harmony, disharmony, or strife promoted between labor and its product is something I do not understand. It cannot be the meaning that trades unions try to provoke strife between employer and employé; that would come under the heading of "treachery." In this regard I can assure the honorable committee that "treachery" is despised by

Digitized by Google

workingmen just as well as by any other class of men. Harmony, disharmony, or strife, have nothing to do with the labor question after all; consequently it would be very useless for trades unions to promote it.

Of the vast amount of wealth labor produces, it claims that the workmen do not get their proper share. What share labor should receive out of the immense wealth it produces, that is precisely the question called the labor question. The labor question is simply a question of "mine and thine"; not of harmony, disharmony, or anything else.

A third monstrosity is generally heaped on the neck of a trades union: "A trades union wants to rule the shop!" This I never have heard said by an employer, but it is a favorite phrase in the daily press. Now, if our most scientific men of the daily press would only once descend from their high position, and for only about two hours examine the interior of a large factory, they would find that in the first place the boss or the bosses rule; in the second place, the superintendent; third, the foreman; fourth, all the help the foreman employs, &c. In fact, there is nothing left for somebody else to rule. The workingmen themselves only care for their work, and if there were 100 rulers more it would not hurt the workmen, as long as they are treated like *men;* but this is what is most wanted, and I do not believe that the request, to be treated like any other decent man, is an indiscreet one.

Sometimes, of course, honest workmen refuse to work with such individuals who have proved themselves to be traitors to their fellowmen, just as well as they are traitors to themselves and their families, and, finally, to the whole community. If that is called ruling the shop, then I must admit that such thing happens.

Finally, I would respectfully call your attention to the Fourth Annual Report of the Bureau of Statistics of Labor and Industry, New Jersey, 1881. It reads as follows, page 117, viz:

"The most important argument, however, in favor of trades unions is the influence they have exerted on their own members. It must be borne in mind that these associations deal with the practical and most essential affairs of a workingman's life—with his means of obtaining a livelihood. While some include within their scope sick benefits, insurance, and other benevolent features, the primary object of a trades union is to enable its members to maintain wages, secure exemption from obnoxious rules, and generally to promote the interests of the craft. In the consideration of these questions the most delicate and subtle problems of social and political economy often require solution, which no statesman has yet been able to give. The meetings are attended by men representative of every phase of the workingman's social life—the good, the bad, the intelligent as well as the illiterate. While it is true that bad counsels sometimes prevail, it is easy to predict which must ultimately win in the struggle between the good and evil, between intelligence and ignorance, between right and wrong. Discussions take place on the most important questions of every-day life, and the better educated consult books of authority for the acquisition of knowledge, which is imparted to others, who in turn learn to think for themselves. Well-defined principles of action thus become understood, reason takes the place of passion and stubborn will. Men are taught their duties, and form new habits and modes of living to which they were strangers before."

All of which is respectfully submitted.

Most respectfully, your obedient servant,

F. BALTO.

DUTY ON IMPORTED LABORERS.

The CHAIRMAN. We have a communication from Boston signed by "A Workingman," under date of August 23.

The communication is as follows:

BOSTON, *August* 23, 1883.

HONORED SIRS: In the testimony of Henry George, esq., before your committee, he gives his opinion in favor of free trade, and from the fact of his being an advocate of labor against capital in the form of monopolies, I take it that perhaps his ideas run in a form something akin to my own, and they are that protection does not protect, and of which my explanation will be short and to the point.

As all of our laws in regard to the tariff upon importations are for the protection of our manufacturing industries, so I think that such laws should also protect the industry of labor, and in this way.

Now all employers of labor who claim protection for their productions insist that labor is a purchasable commodity, at its market valuation, just the same as their own marketable productions and manufactures, and so long as they make that claim, then, as a workingman, I claim protection for the workingman manufactured in the United States, upon the same basis as of any other marketable commodity which can be manufactured cheaper in any foreign country, and I insist that there should be a duty attached to every imported laborer, manufactured outside of the United States, for the protection of all workingmen that are manufactured within the limits of Uncle Sam's domain.

Then, sirs, protection will protect labor as well as capital, and the poor as well as the rich, and as a well-paid workman makes a good citizen, the country will be all the better for it, and as society only recognizes money bags, our only equality is our *ballot*, upon that rests my claim, as it counts one alongside of Gould's or Vanderbilt's.

A WORKINGMAN.

I dare not give my name; if this is noticed you will hear from me again.

LEGISLATION AS TO STRIKES.

The CHAIRMAN. We have also a communication from La Porte, Ind., signed by L. I. Gildersleeve, on the subject-matter of strikes.

The communication is as follows:

LA PORTE, IND., *August* 15, 1883.

GENTLEMEN: The matter of your investigations—specifically of strikes, and especially as a factor in the labor and education question—induces me to submit some thoughts, the immediate incitement to which is the report of your investigation of strikes in examination of telegraph operators.

Having been identified with telegraph matters more or less for thirty years this branch is of peculiar interest to me, though it would seem to require no special investigation to solve the situation therein at present, which to me seems apparent in very simple terms.

About $20,000,000 of actual investment, nominally representing and actually paying good dividends on four times the actual cost, without competition, and having and exercising the power in an accumulated profit of more than $50,000,000, of stifling any attempt at competition, yet requiring skilled operators with business ability and experience to

Digitized by Google

safely perform the work required, this monopoly has gauged the wages of operators by the very natural law of supply and demand, at about the rate of the common laborer.

The reasonableness and justice of the demand of the operators is not, so far as we know, brought in question; nor have we any more ground for surprise that such a corporation, under such control, should refuse to accede to the demand. The advantage, if any be derived from the strike, is simply the lesson that monopolies, by whomsoever controlled, are not to trusted, and, as far as feasible, should be prevented or discouraged, to which proposition there may be very little dissent; but when we ask, *how?* we indeed have a grave question. There is, however, encouragement of its solution in the association of the leading thoughts embodied in the present inquiry, viz, education, labor, strikes. The authority under which the inquiry is made, in connection with the chain of subjects, is specially encouraging.

In seeking for the cause of strikes and the remedy, we naturally trace first to labor and education, not merely with reference to the strike but as the ground of the social and political fabric, all gain being the product of intelligently directed labor, protected by good government; and as good government and wisdom are almost synonymous, so successful popular government and popular ignorance involve a contradiction; therefore, we look ultimately to the elevation of the people as the remedy or the means of assuring the remedy for all ills; but specific evils must if possible be specifically met; and while we look to a liberal education as the ultimate and radical remedy, the education as attained even partially must be utilized through just the agencies now acting, viz, representative effort, and this effort must strike both directly at the great evils and through remedial conditions at the cause.

I would trace back, thus, the telegraph strike is the result of wages actually inadequate to the labor performed and the necessary preparation and ability. The low wages are the result of an oversupply of operators and the disposition of managers of a monopoly to supply their wants at the lowest marketable rate. Another and important consideration is the inability of telegraph operators in general to enter at once any other field of remunerative effort. The importance of some means of at least providing the necessaries of life, independent of a precarious "position," especially when the employer is a monopolist, is apparent; and the most effective union or brotherhood would doubtless be for the operators to take their half rations, if at all, for a few months *before* rather than *after* the strike. Each individual could then control his own fund and be able to maintain his own strike. Monopolists know the power of a mess of pottage before a starving man.

After the direct effort to counteract the monopolizing tendencies of avarice, the province of legislation is to foster the conditions of individual independence, which, once established, virtually and actually breaks the power of the monopolist to oppress. The monopoly of the soil has in all time been the means by which the wealthy enslaved the labor of the poor. The power to monopolize air and water has been but partially and incidentally attained. This slavery—the control of the labor of one class for the benefit of another—is enforced by controling and withholding the conditions of individual independence. While we have free land there need be no severely oppressive slavery; but the use of the eminent domain as a mere vehicle for the accumulated hoardings of successful manipulators of fluctuations, to be controlled and withheld from use at their pleasure, is that at which the power of our Government in its incipiency was aimed to prevent. It is the curse of all old

Digitized by Google

countries, and when our lands come to be held beyond the hope of the poor we will have gone far toward the present condition of Ireland and England.

The relief which legislation may encourage in the present emergency would seem to be indicated in the use by the Government in the interest of the people, of the wonderfully increased facilities afforded by the recent improvements in means of communication, instead of permitting them to be used as an engine of oppression.

Very respectfully,

L. I. GILDERSLEEVE.

The adjustment of individual and community rights may be regarded as embodying the science of legislation and government. These are constantly varying with changed conditions, the development of the industries, of science, and customs.

There are, however, rights natural and inherent to which all human enactment must conform, and which cannot be violated without damage to the social structure. This is especially true in the abnormal growth of power of certain industries and individuals, in general at the expense of others, and is mainly the result of special privileges and special powers in holding or controlling certain natural elements which involve conditions of individual existence, and, as a consequence, of national prosperity; for it may be assumed that national greatness is but the result of individual prosperity, intelligence, and virtue.

These conditions of prosperity are, in the main, the free use of the elements of existence and protection in the possession of the fruits of labor. If controlled by an arbitrary power, whether an individual or corporation, a monopoly is constituted and a measure of slavery inaugurated, which may vary in degree from an imperceptible advantage to a levying of the highest tribute the use of the product will bear, and the lowest compensation to operatives which a virtual prohibition of the exercise of their labor elsewhere can enforce. Therefore, the first effort of legislation should be to secure to every one, and especially to the weakest individual, the free use of the natural conditions of producing sustenance by individual effort. It is, in short, to forbid a monopoly of the elements and conditions of production, and to secure to the actual worker the elements and possibilities of the successful exercise of his efforts.

L. I. GILDERSLEEVE,
*La Porte, Ind.*

AUGUST 15, 1883.

MINERS IN CONNELLSVILLE DISTRICT.

The CHAIRMAN. I present a memorial from W. F. Barkley, secretary of the Miners' Association of the Connellsville district, Pennsylvania, which I will read, as it is short, and that class of labor has not been heard before the committee to any extent:

*To the honorable Senate Committee on Labor and Education:*

I would be pleased to call the attention of your honorable body to the condition of the laboring classes in this region.

This is a mining district, known as the Connellsville coke region, which I believe to be the largest coke manufacturing district in America, if not in the world, and the profits, at times, the largest of any coal mines in America, yet the condition of the working classes the lowest.

We have lately attempted to organize a miners' association for the

Digitized by Google

purpose of obtaining the enforcement of laws enacted for our protection in this State as well as procuring arbitration in matters of differences which may exist between employer and employé, thereby avoiding strikes and lock-outs.

We organized nine mines; at three of these the men were discharged for joining the association, consequently we have a strike, or what we term a lock-out, when it is a principle and not a question of wage involved. A number of other mines have notified their employés that if they join the association they will immediately be discharged, as they will not have any miners who belong to any labor organization.

At one of the mines the miners called a meeting, without joining the association, for the purpose of electing a check-weighman, a law enacted at the last session, and known as House bill 112, giving them that privilege; but all the miners who attended the meeting were promptly discharged the next day, the companies alleged excuse being that they would not tolerate any of their employés holding meetings.

Some of the company's employ Slavonians and other foreigners who are unable to understand our language and our laws, and with these classes they take great privileges. At one place where we called a meeting the managers stood in the paths leading from the houses to the public ground and beat the Slavish back with clubs. The company has a large number of tenement houses in the inclosure where the works are, and have trespass notices posted in many places; consequently, any one wanting to visit any of their employés at their houses must get a permit from the superintendent.

Some of the association men who left the mines where the strikes exist have been refused employment elsewhere, managers telling them that they had orders not to hire them; some who got employment on a railroad have been discharged, thereby not only discharging us for associating with whom we choose, but preventing us from getting employment elsewhere.

Praying that you give our cause your earnest attention we remain awaiting your investigation.

W. F. BARKLEY,
*Secretary Miners' Association,*
*Connellsville District of Pennsylvania.*

MOUNT PLEASANT, PA, *August* 16, 1883.

VIEWS OF E. C. ALPHONSE.

The CHAIRMAN. E. C. Alphonse, of Orange, N. J., files a memorial with the committee. He is a workman and discusses matters relating to the interests of workmen in a brief memorial.

The memorial is as follows:

ORANGE, N. J., *August* 19, 1883.

*To the Senate Committee on Education and Labor.*

GENTLEMEN: The investigation which you are prosecuting makes very plain at least two facts. First, that the "irrepressible conflict" between liberty and slavery is still on, and will yield to no settlement but that of justice. Second, that the problem of the times is pre-eminently that of capital and labor. And that it is pressing for a just solution and demands, at once, the earnest attention of the statesmen, the pulpit, and the press, and indeed of all right-thinking and justice-loving people. The consideration of the question is called for, not only by the highest patriotism, but by the lower feeling of self-interest (security), that it may guard itself against the possible assaults of outraged

Digitized by Google

and despairing humanity. Acquaint yourselves, gentlemen, with the largely suppressed feelings and passions now rankling in the bosoms of tens of thousands of workers, and of the rapid spreading of this dissatisfaction; then you will comprehend the full meaning of my assertion.

Another fact, made plain before you, and to be known by everyone who keeps his eyes and ears open, is that of the over-abundance of labor, of the many constantly suffering for the want of employment, and standing at the same time as bidders for the places filled; thus keeping wages at the lowest point at which man can be had to labor. The exceptions to this condition is found in a few well-organized unions, in which the members stand by their interests with an intelligence and fidelity that merits the success they achieve.

This fact, gentlemen, of more laborers than labor is the tangible something you may deal with in a remedial way. This overplus of workers is due to the ever increasing use of machinery and of child labor. The children should be sent to schools, and kept in them, even at the expense of the public fund, and the hours for labor should be reduced to eight. Then the large standing army of idlers would find employment, become larger consumers, and help to support prices, and the overworked find relaxation from their toil. Congress can help in this matter by enforcing the eight-hour rule in all the Departments of Government. The reduction of working hours throughout the country would produce some beneficial results that would be permanent. Still, if conditions here were very much better than in Europe, the workers there would soon know it, and would rush in until an equalization would be effected. For such are now the close relations of the people of different countries, because of quick communication and cheap passage, labor flows readily from one to the other, as induced by hope of employment or better pay. Therefore, to cure permanently the ills of the producers you must dig deeper and find their root.

In my humble judgment, Henry George has demonstrated that the cause of these ills lies in the private ownership of land and its consequent monopolization; whether he would apply the remedy in the right way is not so clear.

Respectfully submitted.

E. C. ALPHONSE.

It is not out of place to add here that, in my opinion, the masses of the workers place little faith in the disposition of Congress to give them any aid. They think them corrupt and much in the condition of the Roman senate just before the fall of the republic.

E. C. A.

## THE TELEGRAPH OPERATORS' STRIKE.

The CHAIRMAN. The National Federation of Labor Unions, Washington, D. C., through A. M. Kenaday, chairman of special committee, file a series of resolutions adopted at a meeting of the Federation of Labor Unions held on the Tuesday evening preceding August 8. The communication and resolutions are as follows:

NATIONAL FEDERATION OF LABOR UNIONS
OF WASHINGTON, D. C.,
*Washington, D. C., August* 8, 1883.

Hon. H. W. BLAIR, U. S. S.,
*Chairman Committee on Education and Labor,*
*New York, N. Y.:*

SIR: At a meeting of the Federation of Labor Unions held on Tuesday evening, 7th instant, the subjoined resolutions were passed by said

Digitized by Google

body, and a committee consisting of Messrs. A. M. Kenaday, A. D. Brock, and John Tyler, junior, was appointed to transmit the same to your honorable committee, and invite attention to the petition contained in the third resolution, to wit:

*Resolved*, By the workingmen of Washington, represented in a federation of labor unions, that we regard the pending strike of the telegraph operators as the most important contest between combined labor and incorporated capital, in its immediate and ultimate results, ever before inaugurated in this country; and, as the vital principle of all labor organizations is at stake, the situation calls for the wisest judgment and most self-sacrificing devotion from every true friend of our cause.

*Resolved*, That we earnestly beseech the duly elected representatives of the laboring men and women of the United States in the general assembly of the Knights of Labor, the National Federation of Trade and Labor Unions, and in all other general assemblies having the welfare of the poor and the industrial classes as a basis of action, to select committees of their wisest and truest men to meet in conference, and devise a plan of organization that will consolidate the laboring classes in one compact body, believing that the occasion will develop the wisdom required and the instruments to put it in execution.

*Resolved*, That we respectfully petition the honorable Committee on Education and Labor of the United States Senate, now in session, to consider the propriety of recommending to the Congress the advisability of authorizing the Postmaster-General to seize, in the name of the people, and to attach to the postal service of the country the entire telegraph system of the United States, taking a full and complete inventory of all property so seized, and prepare estimates to be submitted to Congress, and justly remunerate the corporation dispossessed, and that the entire force required to conduct the business of transmitting messages for individuals, railway corporations, and the public press be sworn in as officers of the Government, and the entire business be transferred to the rolls of the Post-Office Department, subject to such rates of compensation and general regulations as may hereafter be provided by law, and that the committee will trust to the good sense of the people and their representatives in Congress to sustain them when that body assembles.

Respectfully, yours,

A. M. KENADAY,
*Chairman Special Committee.*

VIEWS OF ISAAC H. STURGEON.

The CHAIRMAN. We have also a communication from Saint Louis addressed to the committee by Isaac H. Sturgeon. He says, among other things, that his belief is that the whole trouble may be found in the fact that the working people are overworked and underpaid, &c. It is a long and elaborate statement which I cannot stop to summarize at this time.

The communication is as follows:

SAINT LOUIS, *August* 23, 1883.

Hon. HENRY W. BLAIR,
*Chairman Senate Labor Committee, New York:*

SIR: If you will permit me I will submit some thoughts in reference to the labor problem.

That the laborers of the country are dissatisfied, unhappy, and discontented must be apparent to all from the frequent strikes, the labor

Digitized by Google

organizations, and constant agitation that is going on in relation to their interests.

It would seem that the first thing to learn is the cause of this dissatisfaction on the part of our laboring classes. If ascertained that they have just cause for dissatisfaction, how is it to be remedied?

My belief is that the whole trouble may be found in the fact that they are overworked and underpaid. I am further convinced that this overtaxing of the physical powers of laborers is a great mistake in every view of the case. Without greatly benefiting the millionaire capitalist it is injurious to the laborer in many ways. Take, for instance, our large cities when laborers are compelled to live at a distance from their work to get cheap rents. To reach their work, the mother, often of a half dozen children, who has to do the cooking, washing, and mending, &c., for a large family, often her rest broken by a sick child, under our ten-hour system of labor, which prevails everywhere except under national authority, winter and summer must rise by 5 o'clock, which is long before day in the cold winter, to prepare the frugal meal for her overworked husband. He is off for his work by 6 o'clock and reaches it at 7 o'clock, when he works earnestly five hours, and then rests an hour, to resume and work five more hours, which brings him to 6 o'clock. He is worn out by the time the day's work is over; he feels exhausted whether it be winter or summer, but more so in summer. He leaves home before light and reaches home after dark in the winter, and, except of Sunday, scarce sees his children. In his exhausted condition, I know from personal observation, he is apt to take his glass of whisky when starting home to give him some spirit and life to reach home and have some cheerfulness for wife and children, and my convictions are that this overwork leads to most of the intemperance of our laboring classes. This overtaxing of the physical powers of the mother at home and the father at his daily toil is apt to lay one or both into early graves, filling our orphan and half-orphan asylums with children whose parents have literally been worked to death. It seems to me in every view of this matter I can take that the best interests of the whole country demand that every State legislature should imitate the example of Congress and establish and enforce eight hours as full day's labor. If eight hours can be universally established as a day's labor, and enforced both against the laborer and his employer, the question of compensation will regulate itself. If the eight-hour system can be universally established it will give husband and other members of the family two hours a day more to assist the mother, to give attention to the children and lighten the burdens of the wife and mother, and this should be the object of every Government to look after the happiness of the home, to take care of mother and the children. This is best for every nation. Take care of the family and do not allow the greedy capitalist to wear out these toiling millions who are the bone and sinew of the land, simply to swell their already overgrown fortunes. Ten hours' labor is too long. My observation teaches me this—especially is too long for boys and girls. I have gone through tobacco and other factories, where children are compelled to work to help mother and father along, and my heart has been made to ache in looking at many of the little pale-faced children that I could see were being worked to death. If eight hours can be established as a legal day's work it will serve to keep laborers from overworking, and will give employment to more persons and indirectly enhance wages; but to make the eight-hour law operative the legislature of each State would have to make it a penal offense against the laborer as well as the employer to work the man a larger number of hours, for unless this is done many laborers would, for additional pay, work over

Digitized by Google

hours and nullify a law for the happiness of all laborers. If the country can be convinced that public policy demands that eight hours shall, by law, be fixed as a day's labor, I imagine there will be little difficulty in finding the means to enforce it. There are many light employments to which such a law should not apply; these can be excepted. The first thing is to decide that the best interests of the laborer demand that eight hours be fixed by law as constituting a full day's labor for certain employments. The matter of compensation for the eight hours' labor cannot be fixed by law, but it is my impression that it will do much in adjusting wages on a satisfactory basis between the capitalist and the laborer. Every one must be convinced by this time that we have arrived almost at a point where we cannot go farther without serious trouble, unless we can allay this discontent with labor. The capitalist must by acts show that he feels for labor, that he takes a real interest in his welfare and happiness, and is ready and glad to make every possible concession to him he can. This is the only way. Labor is every year becoming more intelligent, and they are organizing and will protect their interests. They are the many—the rich, the few—and they are daily learning and teaching each other that capital oppresses them and grinds every dollar it can out of their sinews for the very least cent it can pay. Instead of this, capital will have to show generosity and a care for the welfare of its toiling workers. This will make the laborer the friend of capital instead of its enemy. And this "*irrepressible conflict*" between labor and capital will be more and more fiercely waged until some settlement shall be made, that each will know that the other is acting fairly and justly.

The capitalists are more deeply interested in a happy settlement of this labor question than the laborer, if possible. He has no millions of armed men here to shoot down the laborers; and whilst laborers and all should ever discountenance violence, there is danger unless the amplest justice is done to labor.

I remarked at the outset that the greatest trouble seemed overwork, and underpay. I hold that it is the true interest of every country to pay liberal wages for all employés, for clerks in mercantile houses, railroads, banks, and in all employments where clerical labors are demanded as well as to laborers generally. It benefits all. It enables those who toil for a living in any employment to purchase more comforts for their families. It increases the purchasing power of the country, and consequently more is sold. Business is helped in every way, and the home is made happier.

To enable our manufacturers and others to pay liberal wages to our laboring classes employed by them, we should with zealous interest protect them against the pauper labor of Europe. In protecting the manufacturer we should have in mind the protecting of the laborers he employs. All know we must have revenue to support the Government, and we must get it indirectly by our tariff on imported goods, or directly by internal taxation. So far as it shall be deemed wise to raise any portion of it from tariff duties upon goods imported into this country, it should be done with a view of promoting the interests of our manufacturing interests, and incidentally the laborers they employ. This is essential.

It seems to me, after leaving the question of hours and compensation, that the greatest benefactor to laborers and the man of small means or no capital is the statesman or statesmen who can devise a law or the means to keep money at the lowest possible rate of interest. If the rate of interest on money can be kept down very low, it forces the capitalist into building houses, giving cheaper rents, and into business pur-

Digitized by Google

suits of various kinds, affording employment to the masses; but if interest is high he lends his money on interest, instead of using it in manufacturing, opening mines, farms, building houses, &c., that gives employment. When interest is high it is impossible for the poor enterprising man to rise from his condition. The old-established merchant who has no capital to borrow can always keep down competition, as the young ambitious man could not borrow at high rates and compete, but make interest very low, and he will, with energy and economy, become a successful competitor with the capitalist; and this seems most desirable to offer a stimulus to the rising worthy poor young man, whilst by forcing capital into business and the development of the country employment is given to many persons. There is nothing much worse than to make it the interest of capital to be loaned out at high rates of interest. I regard it as at war with the best interests of the laboring classes and the country generally.

We have a most discontented set of laborers known as railway employés. They are the worst paid men, as a class, in this country, and whilst from their helpless condition we do not hear a great deal, there is certainly great discontent. And it is very natural this should be so. There are what are termed railway kings or magnets floating about through the country in their private parlor cars, drawing salaries varying from $10,000 to $100,000 for virtually doing nothing, and who never put one dollar in originally to build a railroad, and these men with bonds and stock enriching themselves, when not a cent of the stock or bonds ever was put into the road in any way, but went right into their pockets; and whilst doing all this they are grinding down every employé and brakeman to the very lowest wages. There should be found some remedy against thus loading down railroads with bonds and stock that was never put into the road. It is a fraud upon the public, and it is no wonder that that large and most respectable class of our toiling millions who earn their bread by the sweat of their brow should organize Granger societies against such nefarious practices. They know that all this increase of water bonds and capital is war upon them. They know that their hogs, horses, mules, cattle, sheep, stock, and poultry of all kinds, and grain, could be carried to market at less than one-half of what they pay if it were not that the railroads of the country are loaded down with bonds and stock upon which dividends are expected to be made, but which never went into the construction of the road in any way. I wonder that the farmers have not made open rebellion against being robbed of their labor to thus enrich men, many of whom never scarcely in their lives earned an honest dollar, and who spend their lives in bulling and bearing stocks to the great demoralization of the country and terrible wrong to the producers and consumers of the country. The addition which the farmer pays for getting his products to market is a charge upon every consumer, and affects most the laboring classes.

Another matter that needs remedying is the margining the grain, pork, lard, and other products, giving a fictitious value to flour, meat, and nearly all we consume, and operating most injuriously upon the poor laboring class, as the rich can bear what they cannot. The legislature and the courts of the country should cut up, root and branch, all this gambling in stocks and the provisions of the county as against public policy, and declare all such transactions fraudulent and not to be enforced by the courts or tolerated by the laws of the land.

With great deference and respect I submit the foregoing thoughts hastily penned at my desk this evening.

ISAAC H. STURGEON,
913 *Garrison Avenue.*

## ISAAC COHEN'S VIEWS.

The CHAIRMAN. We have also a memorial from Isaac Cohen, treating the subject from the standpoint of a workman. The point of his communication is that very substantial legislation touching the constitutions of the States and of the country is necessary, and that all constitutional amendments should be voted for by the people directly.

The memorial is as follows:

*AN OPEN LETTER TO THE HON. SENATE COMMITTEE OF INQUIRY.*

GENTLEMEN: As it seems to be your purpose to investigate what reforms, if any, can be adopted by the legislative powers of the land to better the condition of the people, permit me to call your attention to one already recognized in our political frame-work and which to be effective needs only extension. You are aware that an amendment to the national or any of the State constitutions, while proposed in different ways must be voted for—adopted—by the people. This gives the people the power to express their will. This power may heretofore not have been always wisely and judiciously exercised, which could not be expected when they were but seldom called upon to exercise this privilege; but if it were extended so as to apply to the making and unmaking of all national, State, and local laws of any importance, it would answer the double purpose, first of educating the people, because all laws after being formulated by bodies for that purpose should be submitted to the people a certain length of time to be published, thoroughly discussed, and finally voted upon. Under such conditions the judgment of the majority which would be irrespective of partyism could be trusted. Secondly, it would place both the power and the responsibility with them. You will discern in all the complaints brought before you that the people know that they are not, and that under our present system of franchise they cannot be, honestly represented. That reform in this respect is under the adopted system impossible, hence become more and more indifferent so as to leave the field to the unscrupulous. You will agree with me that it is as easy for a voter to vote for a measure than for a man who is to vote upon the same. If it be held that the people are incapable of wisely voting for their own laws then it follows that they are equally incapable of wisely selecting the men who are to make them for them. The objection of distance and territory with present and future facilities of communication will not hold good, nor will the objection that it would constantly confuse and call the people together, because let the fundamental laws once be established to suit and work in the interest of all the people, not one bill out of every one thousand now brought forth would be proposed. The consequence would be fewer and better laws. The difference is between the representative and the original. In regard to its money affairs, paper money being but representative and coin money the original, the Government seems to be unwilling to trust the representative but adopts the original. If the Government cannot trust a harmless representative, why should the people trust treacherous living representatives?

So long as the passage and execution of laws however good, are at the mercy of men who are liable to be in office to-day and out of office to-morrow, and who by the laws of nature (human and divine) make hay while the sun shines; so long as men are elected to represent their own or special interest, it will remain simply a competitive warfare in which the strongest (the money) power will come out ahead every time.

Digitized by Google

To honestly expect any reform under a system which subjects both the franchise as well as the representative to corruption is as you will see at a glance a mild form of delusion.

Suppose the working people were to elect every officer in the land, would that necessarily better their condition? No, because human nature, under the same conditions and surroundings, has always proved about the same. So long as the people do not themselves make the laws that govern them, they are sovereigns in theory but slaves in practice. So long as the people do not themselves make the laws they can in justice not be held responsible for them. The old motto applies: If you want a thing done well, do it yourself.

I am bold to assert that no measure of reform more radical and yet perfectly simple, legal, and peaceable, and capable of being used by all the people in the interest of all the people has as yet been submitted to you. It embraces all.

I am, with great respect, yours, &c.,

ISAAC COHEN.

## VIEWS OF JOHN P. GREGSON.

The CHAIRMAN. We have also a communication from John P. Gregson, of Mound City, Ill., in which he answers sundry questions bearing on the strike of the telegraphers.

The communication is as follows:

MOUND CITY, ILL., *August* 21, 1883.

Senator BLAIR,

*Committee on Education and Labor, New York City:*

SENATOR: Answering your favor of the 18th instant, would say that Master Workman Campbell, of Telegraphers' Union, failing to answer the question "Can you suggest an equitable distribution between capital and labor," the following is suggested, metaphysical distinction being ignored.

Intercommunication to-day is beyond State control, separate States cannot be brought to act harmoniously and intelligently, hence action on the part of the National Government becomes imperatively necessary in the interest of the general welfare.

Two modes are open. Great Britain furnishes an example of the first, being *absorption*. Our changing civilization requires that all and every mode of intercommunication shall be the property of the whole people, not of the favored few, to be managed for and in the interest of all.

If this change from existing system is for the moment impracticable, then by using the taxing power to limit the income of overgrown corporations to the extent of a fixed percentage on bona fide capital actually invested, the pay of superintendence at quintuple average earnings of our people, the remaining earnings divided between maintenance of lines and operating expenses, an equitable basis of distribution appears, and, as a result, a stable income to more investors, better service to customers of lines from improved facilities, increased pay to operators at a minimum of cost.

As State bank currency of ante bellum days has been driven from circulation by a 10 per cent. tax on circulation and a satisfactory substitute furnished, so may we reasonably conclude corporations analogous to State banks will see the way to establish harmonious relations with the great public from whom they receive such astonishing privileges and by whose tacit consent they continue to exist.

Digitized by Google

A brief résumé of the idea sought to be conveyed shows, first, an allowance for use of money invested; secondly, pay for brains and superintendence; thirdly, living pay for operating; fourthly, provision for maintenance and extension, and inferentially reduced cost of working.

Respectfully submitted by your obedient servant,

JOHN P. GREGSON.

The CHAIRMAN. We have a long printed communication from a gentleman in Davenport, Iowa, Mr. A. C. Fulton, in which, speaking of the labor question, he discusses in one article "the common sense of the matter," and in another "capital as a helper to labor."

The communication is as follows:

DAVENPORT, *August* 4, 1883.

THE COMMON SENSE OF THE MATTER.

EDITOR OF THE GAZETTE: If cutting cord-wood for a living at 50 cents per cord, and working in the field thirteen hours at 50 cents per day, and saving a portion of the pay, and having been threatened and snubbed because I refused to join in a strike, constitutes a laborer, then I am entitled to enter the Gazette's parliament.

The experience of centuries prove that the quantity on hand and the demand, whether of wheat or labor, controls the price. A corner in wheat or a strike in labor may create an unhealthy and temporary rise to be followed by a corresponding or greater depression. But, independent of a scarcity or a demand for labor, there is a humanity and right that should have an influence on capital and the employer in directing their sympathy and influence in behalf of the more needy and dependent of the working classes. There are a numerous class who merit the influence and sympathy of their employers, the people, and the press, far more than do the Chicago bricklayers who received $3 and $3.50 per day, and demanded $4 and $4.50 per day or strike; or the wire ticklers who, according to the press, received from $45 to $85 per month, and demanded that it should be nearly doubled.

I refer to the laborer who receives only from $1 up to $1.50 per day, and the men and boys in the various mills and factories, many of whom work at piece-work and who have to work from early morn until night at race-horse speed, never ceasing, to earn 60 cents to $1 per day. I also refer to the widowed mother, and the sewing girl of the attic and the garret who ekes out a miserable existence making drawers, undergarments, and overalls, at 6 to 12 cents per pair, and pantaloons at 30 to 80 cents per pair.

I solicit the press, as soon as it rights the wrongs of the "brotherhood," to extend its columns and sympathy to the neglected, weak, and oppressed sisterhood. No doubt the telegraph companies could and should have increased the pay of their forces, and perhaps a small advance at an early day would have prevented the present embargo. But to establish an eight-hour system would be of more injury than benefit to the people as a nation. Life is too short to use but one-third of our working hours in building up the world and keeping it in repair. Mills, factories, and farms cannot be run on eight hours out of the twenty-four, nor could they maintain a shift of hands; it might please the wire ticklers, but it would be baneful to the general good.

A combination of proprietors to raise the price of commodities or provisions beyond their real value is an act of injustice to the people, and

Digitized by Google

cannot come within that good rule of doing unto others as you would desire others to do unto you.

Capital and labor to succeed must act in harmony. Their interests are mutual. When I speak of capital I do not mean the mere dollars and cents that an individual or company may possess, but also the credit that they possess, which is more potent than the dollars and cents, and this credit is of value to labor, as it extends business and creates a demand for labor.

Many persons and journals are crying, "Give us cheap goods, cheap commodities," but those same parties strenuously object to the people and authorities putting all their force to work to produce those cheap goods. They declare that the convicts throughout the Union must not labor, but must be supported in idleness by a working people because the convicts produce cheap goods. Right and justice says, "Feed the convicts well and put them to work to the best advantage to produce cheap goods, then they will be useful to the State, enjoy good health, and return to liberty with a good trade."

If the sole object of a portion of the press and the numerous societies is to raise wages all that is necessary to do, gentlemen, is to amend the Chinese bill so as to include all European emigrants, and, as the various orders of workmen prohibit teaching apprentices, wages will go up to the upper notch, as Dennis Kearney asserts they have on the Pacific slope. This act would be far less atrocious than massacreing those who refused to enter the Pittsburgh strike.

To demand an increase of pay, or exorbitant pay, is right and proper; to abandon work at pleasure is also proper; but the despot "strike" is not content with enjoying those rights and privileges. No; the tyrant must constitute itself a legislature to enact laws for others and create a court and appoint a head center to act as judge, jury, and clerk of the court to decree who shall teach apprentices and who shall not, and who shall labor and who shall not. And should the unhallowed decrees of this court be disobeyed the club, the boot-heel, the shot-gun, and revolver are freely used to pierce, to bruise, and slay the body of him who was created in the image of the living God. And this scourging and death because the poor victim dared attempt to earn bread for his wife and little ones.

A. F.

## CAPITAL AS A HELPER TO LABOR.

EDITOR OF THE GAZETTE: I appear in the Gazette parliament to take up the labor and capital question where I left it in my article published in your issue of the 5th, which article on account of my modesty I issued over the initials A. F. I will endeavor to speak plain and give facts.

There is a very perceptible and growing disposition on the part of socialists, strikers, and no small portion of the press to envy, rail, and rant against moneyed men and moneyed institutions. At the same time there is not one of those persons that desires to emigrate to a country, or locate in a city or village, where all are as poo or poorer than themselves. They possess an instinct that tells them that to procure a living or wealth they must locate where wealth abounds. They who create or accumulate wealth are the "garners of Egypt" from which we draw in time of need. They can and do supply the wants of the destitute, and have built up the most valuable and important institutions of our country. If space permitted I could name hundreds of wealthy philanthropists. I will

Digitized by Google

mention the wealthy banker, Mr. Peabody, who bestowed millions on useful and lasting institutions in both England and America. I will also mention Stephen Girard, who was in his day the most wealthy man in the Union. He for years sheltered, clothed, and fed hundreds of the poor and needy, while also making provision for and had erected the most gigantic and grand combination of college and resident buildings that this Union can boast of, wherein thousands of youths have been clothed, fed, and educated, and an ample income provided to keep up this unequaled institution to the end of time. Let us for a moment come to our own city and look at the Griswold College and grounds, procured from "the garners" of Eastern millionaries. Very soon, too, $30,000 more will arrive towards establishing a college for young ladies in Davenport.

I have conversed with many strikers, and the prevailing opinion seems to be that to succeed in a strike will immediately put a surplus in their pockets. After succeeding, they find that they who did not save a few dimes per week out of fair wages will not save a few out of the larger sum. Mechanics, artisans, and laborers must learn that it is not the $9 or the $30 per week that we receive and spend that counts in sickness or old age, but the $1 that we save.

As evidence I will name a few instances in Davenport. I could name many of the dollar-saving people. Some years ago Mr. Keyser, a Swede, a rough carpenter with a family, came to Davenport with $4 on hand. He worked for a small capitalist with a large credit, who built for himself to rent or sell. Mr. Keyser at first received $1.75 per day, which was in time increased. His employer assisted him in purchasing a home; he saved, and built several small houses, and within eleven years sold out and purchased a large and well-stocked farm in Kansas for $8,000 cash. During this same period a Prussian laborer, John Litze, arrived with his family of five and a few dollars. He went to work for the same capitalist, and is now working on his twenty-eighth year with his first employer, who purchased for him the half block on Ripley and Thirteenth streets, where he has two fine dwellings, and one of Davenport's best physicians is his tenant. He has raised his family and is clear of debt, and $10,000 will not purchase John Litze's possessions. The question is, did those workingmen build up the capitalist or did the capitalist build up the workingmen to independence? Or, were the benefits mutual? In no other country on the globe could those men have settled and reached their present independent position.

Discontented workmen and the journals that encourage their discontent cry "bloated merchant," "mammoth factory," &c. They do not examine the small beginning, the economy, and years of toil that produced those mammoth factories. Envious mortals, go with me to the vast locomotive works of Baldwin, in Philadelphia, look back through the years of the past to their conception, and you will see a pale-faced boy of seventeen learning to turn iron; then the same boy, as the inventor of a valuable and now extensively used engraving instrument; then comes in its order acres of costly workshops, with a net-work of machinery, the motion of which causes your head to swim, and the product of which is this day benefiting the inhabitants of every quarter of the civilized world. Hark! the bell taps the hour to cease work, count if you can the hundreds of workmen that depart from this vast hive of industry? Messieurs journals and discontented strikers and socialists, do you envy the pale-faced boy, and claim a portion of his extensive possession.

There can be a wrong in even trivial acts, even in cutting a telegraph wire that is the property of another. Suppose a man in early spring

Digitized by Google

places a grain of corn within the earth; it springs up, he hoes and waters the growing stock, and looks with pleasure towards early autumn, when he shall feast upon the ear it bears; but, when autumn comes, a man slips in and steals the ear of corn and eats it. Would you not consider him a very mean man thus to steal the product of another's industry?

A. C. FULTON.

DAVENPORT, IOWA, *August* 11, 1883.

### VIEWS OF THOMAS MAYES.

Mr. Thomas Mayes sends a communication to the committee from 117 Madison avenue, Albany, N. Y., in which he attacks corporations.

The communication is as follows:

171 MADISON AVENUE,
*Albany, N. Y., August* 1, 1883.

HONORABLE SIRS: I chanced to see a paragraph in to-day's Times stating that you would meet at the general post-office to investigate the cause of labor strikes. I believe the colossal organism A has its emissaries B. B pretend to be the independent strikers. B demoralize C. C is mixed, say two or three per cent. of B. My experience commenced 1847 or 1848. I was bothered and annoyed, so I watched other and large places of business. One I am told done full $420,000 a year. It is now closed. I noticed this as I am familiar with a similar business in Europe that is still doing a prosperous business: Cause the organization A and B cannot do there quite as they do here. I have been in a perilous position for some years. The A and B have made several attempts on my life. It was only mere chance that I was not murdered on three or four occasions. If I can be of any use or give any evidence that will aid in stopping those misguided people I shall be pleased to do so.

Yours, respectfully,

THOMAS MAYES.

Hon. H. W. BLAIR and others.

### STATEMENT OF WILLIAM O. SHELLEY.

The CHAIRMAN. Mr. William O. Shelley, of Rome, N. Y., formerly a telegraphic operator, sends a statement of facts for the consideration of the committee.

The statement is as follows:

ROME, N. Y. *September* 5, 1883.

Hon. Mr. BLAIR:

DEAR SIR: I wish to call your attention to the following facts: Jay Hatheway was postmaster in 1840 and 1848. In 1846 I was called to the post-office—Gus Swan was called to the telegraph, 1st office; 2d operator, John Raymond; 3d, William O. Shelley operator. The second office I took was Lockport, N. Y., called Buffalo, Lockport and Canada Junction Telegraph Line. In this office I staid a long time. Next to Syracuse, N. Y., *Bain* line, some three or four months, Mr. Faxton as president, George Curtiss, president. He took William O. Shelley and placed in Albany. Then he removed him to Utica, that being a repeating office. Mr. Curtiss removed him again to Rome; there he staid till 1883; that would make him (1846) thirty-seven years in the business. In April S. B. Gifford, superintendent—having been appointed superin-

Digitized by Google

tendent of the Western Union Telegraph Company later—together with my daughter, told us we would not be needed after May 1, 1881. We asked him if he could give us a little more time. No, he said, he could give us no more time. We went down to New York and we looked around and found Governor Morgan, who said that our services were needed, and go back and it would be all right. We staid here in Rome, N. Y., and all was lovely. Governor Morgan, of New York, died April 18, or thereabouts, 1883. Then I told my family to look out. We did not see or hear from Mr. Gifford in some time, and I got rather nervous about the matter. Telegraphed to him and he answered that he would be down soon, as it was long in the end of April; he came down here, not till the end of the month—the last minute in the time came; he gave me no time to talk with him. Mr. Gifford sent a telegraph to Spencer and White, saying that he did not want his store, not till 7.30 p. m. I suppose he did not want me to put in another letter like Governor Morgan's. And that would be thirty-seven years I worked for the Western Union Telegraph Company. You can bring this statement to what Dr. Green said about your letter, will you not?

Yours,

WILLIAM O. SHELLEY,
*Formerly Operator, Rome, N. Y., Office.*

VIEWS OF FREDERICK KOEZLY.

The CHAIRMAN. We have here from Frederick Koezly, a resident of this city, a statement addressed to the committee.

The statement is as follows:

182 EAST EIGHTIETH STREET,
*September* 5, 1883.

HONORABLE SENATORS: By reading the papers I see that you try to find out the evils and complaints under which the workingmen suffer, and what remedies they propose and wish adopted; therefore, I take this opportunity to give you also my opinions and reasons for them, as appear to me the cause of all or some of this dissatisfaction. In obtruding myself it is not egotism. I am not a leader, but simply a humble citizen of this great Republic (and am afflicted with deafness), but should like to see and work for a better adjustment of our social system.

That there exists great dissatisfaction among the working classes is admitted on all sides, and why? Because they come to think and see that they are the producers of all the wealth, for which, however, they receive but only a very scanty living; they have to live on the coarsest food; clothe themselves cheaply and sparingly; dwell in huts and hovels, with few pleasures and no time for themselves, and over which circumstances, a man born poor, has *no* control, while at the same time millionaires, born so, live in all luxury on the fat of the land, dress in silk and velvet, live in palaces, some without having ever done one day's work, and spend their time in pleasures only. Can a man of the least understanding and common sense call such a state of our social affairs *just* and *right?* This social state has been brought down to our generation from a barbarous age, as so many other evils which have been abolished, and our *present* society will and must be reformed, either by wise legislation, or at last even by revolution. There is no escape from it; all laughing and ridicule will not prevent it. The criminals come mostly from the degraded poor, who have grown up in idleness, the curse of mankind, and do not belong to the *working* class; this idleness is equally the curse of the rich, who have the time and money to demoralize our

Digitized by Google

young women, and are given to gambling, but never brought to justice and punished.

Now, the workingmen begin to see this injustice and unfairness, and get restless. They are in a majority, but without sufficient intelligence, time, or money, are without power or influence, of all of which the rich are possessed in plenty, and know how to wield the power and keep it until taken from them in time by force, as history furnishes the examples. At present the workingmen are taxed the most. Tobacco and liquors are taxed the heaviest and used *mostly* by them (I am sorry that it is so, because they are an evil), but so far no legislation or taxation has been, nor will be, able to eradicate it. The men will use them as a pleasure to them, tax or no tax.

Peddlers and cartmen who follow it for a living are taxed and licensed, when at the same time all carriages of the rich are free!

About one-third of our population is this city live in large houses for one family, on about one-half of the land between Third and Eighth avenues, and the other two-thirds of people have to live packed in tenement houses on the other half. The well-housed ones have all the parks, while the ill-housed ones have not one; with the exception of Tompkins Square, which, until now, has been only a *barren* waste, and not a *park!* Then, streets and avenues in the thinly peopled half of the city are often swept twice a week, while in the crowded and narrow streets sweeping is done but once a week, if that much. Still they are equally taxed, if not more than the others. Is this right, fair, just, and well for the community? No sane man will dispute that it would be desirable for the welfare of a country to have its wealth as equally distributed as possible among its inhabitants. To attain this end, I propose this remedy: Abolish all our present taxes, and have *entire* free trade; all and every monopoly taken or regulated by the Government for the people. If the distance from Europe is not protection enough for any business, then it will not be worth while to develop it; for the nation establish a progressive income tax, the most just tax of all taxes and easiest borne. I would propose it on this scale: add one per cent. with every thousand dollars of income; tax $1,000 $10; $2,000, tax first $1,000 $10, and the second $1,000 tax $20, total, $30; the third $1,000 tax more, $30, total $60, and so on up to 90 per cent., and below $900 free. If in use it could be easily paid; the more a man had to pay, the better able he would be, and no man freed from it would be envied. This is *no more* confiscation than *any other tax;* no harm done to any one. A man who has amassed millions by his genius, whether honestly or not, can afford, and ought to pay, taxes, as he very often bleeds the whole public by his playing corners in all kinds of produce. For the city and State establish a *ground tax only.* No buildings or improvements on land should be taxed, as this would accelerate the building and farming business and stop speculation in lots and lands. This would encourage the industrious poor man, and give him great help to become possessed of some property, and in a comparatively short time a great middle class would spring up. Idleness could not be encouraged by it, but it would render it difficult for a man to amass millions, of which no one has any *need.* Trade, commerce, and all business would prosper if we would not have any millionaires among us, so neither would we have any paupers. We would have many less criminals, and not hear and read of one-tenth the suicides from poverty or being unable to obtain work. It would be better for all, even for the rich; their lives and property would be safer.

Yours, respectfully,

FRED'K KOEZLY.

## THE LAW OF COMPETITION.

RICHARD J. HINTON sworn and examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. My home is in Washington. I have just come from Texas and Mexico. I have been away a number of months.

By Mr. PUGH:

Q. What is your profession or pursuit?—A. Journalist.

Q. Please state the opportunities you have had of understanding the labor question and its relation to capital in this country and abroad; what thought you have given the subject. State any facts within your knowledge. Give us the benefit of your information and opinions on the subject.—A. I have been a journalist and writer, both upon general and special topics, for the last twenty-seven years, and since the civil war closed I have paid a great deal of attention to what is known commonly as the labor question; I do not call it so myself. I went to England in 1867 to study the co-operative movement and the trades-union movement. I went again in 1873 on other business, but made use of my time to continue my investigations. I think I may fairly say I have been a student and, I believe, a careful student as far as I am able, of the issues involved. In this country I am disposed to believe as a result of that observation and such thinking as I have been able to give, that what is termed "competition" is likely to prove as a system of society an utter failure.

Q. Competition between labor and capital?—A. The general form of trade and commerce and business. Students of sociology call this the competing form of life. The present form of life is commonly so termed by economists. I believe that it is likely to prove a failure, because true competition, the natural and acquired force of each individual in industrial and economic pursuits, is destroyed and rendered nugatory to a large extent by the possession in private hands and as a means of individual profit-making of the great natural forces and of the greater functions of civilization itself. By that I mean—speaking in the abstract, not as a concrete question at this time—that the land, the mines, the forests, and the water, instead of being instruments of general wealth-making, are perverted by the social system and legislation into instruments of oppression and monopoly. I mean further that the discovery and application of steam and other incomparable forces to scientific machinery have revolutionized industry to so great an extent that the practical effect is to form not simply a new plutocracy, but a system of feudalism by which, what may be termed in some expressions, the captains of industry become the lords of the land. I believe myself from my own observation that there is a fair and just competition of individuals. I do not believe in what is termed "communism," and I am not a "socialist" in the European sense of that term. I believe, however, that there are common properties and common forces which should be under the supervision of the community, and are not property in the sense that my coat, my watch, my purse, and my individual energies are property.

Q. You mean individual property?—A. I mean they are not individual property in that sense. Therefore as an observer and a student I have long since come to the conclusion that in this country at least the artificial person called a corporation, who is in possession of the public functions of a community, such as the railroad, the telegraph, and the

Digitized by Google

bank, is a person, speaking of him as an artificial person before the law, whose existence is dangerous to the safety of the Republic. I am a believer—and I may be called a "crank" for so believing—that it is quite possible to discover the difference between what I term common property and that which is individual property, as it was possible in the early days of this Republic and in the struggles that have followed since to discover a law of equitable distribution of power by means of the ballot. I think the want of to-day and the want of labor, and I would make that a larger term, and say the want of the producer, is the gradual and speedy, too, evolution of a law of equity in the distribution of the results of industry. At present all legislation tends to the destruction of men and the preservation of property, whatever form it takes. I do not hold that to be a crime against those who legislate. It is rather a condition of society. In this country no love of property ever sprang in the main from any body moved. We were turned loose on this continent to cultivate it and capture it, and we have done it, and the very intense respect for property, much of which is not in any honest sense of the term property, grows out of the American peoples' reverence for law and a respect for their own individuality and the struggle that has ensued.

So much for my general theory. I believe the only possible way by which equity can be reached is the lawful evolution through the growth of public opinion of some form of legislation (and I say "legislation" because legislation has made the present system) which will tend directly and positively to produce a more equitable distribution of the results of industry and the productions of enterprise and of skill. At present the creditor class runs the country, not the enterprise that is struggling, but the men who have already achieved and have won.

Q. The same capacity for self-government upon which our political system is founded, you think is insufficient to secure an equitable distribution of the proceeds of the labor of the members of this mass upon which the Government depends for its existence?—A. We have only developed, in my judgment, one side of the problem that is before us. We could not do anything else besides developing one side up to a certain point in our history, or the history of any modern nation struggling out of old conditions. That point of resistance and development was the political, the securing before the law of the equal rights of every individual. That we had to fight through. I am myself a thorough believer in the doctrine of Demosthenes, that a democracy is not to accomplish all its results through law, and for that reason I am not a believer in the sneers that are so common in unthinking newspapers or writers of newspapers about paternalism; about a paternal government. I am not afraid of a government that co-operates with the people in an endeavor to correct the evils that may grow up in any community. I believe we are upon the verge of a period when we must settle what perhaps is termed the social question, the economic question, when we must determine whether society cannot be so organized that at least seven or eight out of every ten human beings in it who work for living are absolutely liable to penury or poverty of the worst kind if by any accident or by any unfortuitous set of circumstances the bread-winner becomes disabled. In this city six-tenths of the people here, if they were sick a month, would be paupers, dependent on the charity and kindness of their family and neighbors. I believe that we cannot have liberty unless we can organize that species of poverty some time out of existence. It is a species of poverty which largely bears on the environment of the social and political order, in the creation of vast fortunes by means of legislative franchises, in the indifference which that struggle produces to the wants of

Digitized by Google

men, to their necessities. I think that we have got to face this question of whether or not a grinding poverty is the law of civilization. At present we do everything we can not to face it. No man states it but he is denounced as a communist; no man thinks of it and utters his thought aloud but he is pronounced to be a crank. It is the serious question of the day, in my judgment, and no profession on this continent is so open to that objection as the one that I have followed for twenty-seven years. There are no men who lie so distinctly by inference as the ordinary writers for the newspapers on all these theories.

### THE RAILROAD SYSTEM.

Q. What part can the Government take in remedying the condition of society that you describe?—A. No railroad exists except by virtue of legislative action, securing a public franchise, exercising the highest evidence of sovereignty—the right of public domain. I think that it is fairly within the power of State or nation to exercise in this country a power of supervision and direction—I do not say ownership—I say power of supervision and direction.

Q. How far should that supervision and direction extend?—A. In my own judgment the tendency is towards direct ownership.

Q. Direct ownership by the Government?—A. Yes, sir; of the system. That is my judgment, and a man has no right sitting in such a position as this without he gives some reason why he has an opinion. It fell to my lot once in doing some work for a public man to make a thorough examination of every law at that time, 1875, there was in any statute-book of any nation using railroads in the world. Those that I could not read myself were translated for me. I made a thorough examination of the railroad system in every civilized nation, and I find that the United States is the only country in the world through its States and its national authorities that does not intend under some form or other to exercise sovereign supervision over that great function, the transportation function. England comes next; but England has upon her statute-books laws which give her at any time the right to assume direction, and she always has preserved the power of supervision and the power of lessening profits. She has not exercised that, but she has preserved it. I find as a part of my own investigation that the one country in the world—a small country it is true—where the railroad system has been most admirably managed, where I believe there has never been an accident of a serious character, where for the distance traveled the cost is less—and that is Belgium. The King of Belgium at the time of the inauguration of the railroad system, standing on his throne and addressing his parliament, declared that in his judgment railroads were a public function equivalent to the arteries in the human body, and that to surrender them to private profit was to betray a trust which the health of that body required should be maintained. That was the substance of his remark. Belgium has never surrendered the main lines of travel, has always conducted them by the state. They do not travel as fast in Belgium as we do, but they travel safer. They do not have as many luxuries on the cars, but they pay less for what they get, a great deal; they are quite as civilly treated, and they have their remedies before the courts because they have only the state, which they help to make. There is not a Latin nation in the world which does not preserve the sovereignty over the railroad system. I have just come from Mexico.

Q. You are aware that our Government, where it delegates these

Digitized by Google

powers to private corporations, claims the right of supervision that you say we ought to have, and the Supreme Court of the United States has affirmed the existence of that power in the Federal Government, so far as the railroads chartered by the Federal Government are concerned, and the States undoubtedly claim and exercise that power.—A. I am perfectly aware as a legal proposition that that is true, but I am perfectly well aware also that we never exercise it, and that the statement is of the vaguest and most shadowy character when it comes to be put up as a practical factor, and that all the legislation of the land has been in the other direction.

Q. The State of Alabama, for instance, and the States of Georgia and South Carolina, that I happen to know personally about, have commissions that exercise powers over the rates of transportation, a very efficient board in each State, who seem to be giving very general satisfaction in their control and administration.—A. I have some knowledge, a knowledge which a newspaper man gets who edits papers, that since the inauguration of the idea of State supervision by the State of Illinois some twenty-two or twenty-three or twenty-four States—I forget the exact number—have established a system of commissions and supervision more or less positive in character. I take it it is part of the growth of the republican idea. By that I do not mean party idea; I mean philosophical idea.

Q. The abuses of the power of these private corporations created the necessity for this supervision?—A. Undoubtedly, and I believe that there will be a greater supervision; but I take a point beyond the question of abuses. I stand for my own self upon the belief that you cannot surrender these great functions, so far as the entire question of public transportation is concerned, to private individuals, called a corporation, in the manner we have done, without tending to enormously accelerate the tendency towards those vast accumulations of property and wealth in private hands, and I do not believe that wealth can safely accumulate in that form and in that manner in the hands of men who are practically irresponsible tax-gatherers. For every dollar they get above the legitimate amount of profit it seems to me they are gathering a tax from the community in which they are operating. I do not believe that these men—they are easily named and easily thought of everywhere—are safe citizens of a republic. I believe the power they exercise for the control of political action, for the influencing of public opinion through newspapers and various forces, is of a dangerous character, and must ultimately do one of two things: it must produce an oligarchy under the name of a republic, or it must bring about by the attrition of public agitation a change in the method of control.

Q. What are the two most powerful elements in society that regulate the price of labor and property? Are they not transportation and currency?—A. I think so myself.

Q. The power to furnish a transportation and furnish a currency is the power of regulating prices of labor and property?—A. In some degree.

Q. You can proceed.—A. I should not make the statement as broad as your question would indicate. I think the control of the transportation and currency ist he control of the two forces that, in the large and commercial sense, make conditions, which conditions more directly affect—they do not directly affect. My point is, that the general capacity of these functions or forces of the economic condition is such that they make the environment in which labor and the producer live without so immediately and directly, excepting in isolated cases or class interests,

Digitized by Google

unaffecting him personally, until the conditions of society have been built so that he is then affected and cannot move out of his case. I am of the opinion of Charles Francis Adams, that railroads, banks, and telegraphs are irresponsible tax collectors. I do not know what Mr. Adams' present opinion may be since he has become a great railroad magnate, but he so put it into a book once, and it stands there. That was his judgment, that for every dollar a railroad or telegraph company collected—he was speaking of railroads more directly—over and above the legitimate profit belonging to its outlay and to the administration of the system, was, in that degree, a tax upon the community.

I think there is one formula which has been often expressed in the American press, which was first uttered by Sir Henry Tyler, who was then the chief inspector of the British railway system, and it was afterwards made from the bench by Lord Coleridge, who is now in this country, that railroads are public trusts charged with remuneration for private capital invested. It seems to me to cover the entire thing. If that remuneration is left entirely to the hands that administer that public trust, whether it is direct or through private agencies, so that they make a personal profit of it without regard to the conditions that surround society, of course it is going to be made as large as possible. That is human nature. If I were a railroad manager I should try to get all I could, and so would any of us.

Q. Have you any fear of the abuses that would grow out of the control of railroads and telegraphs by the agents of the Government under the control and supervision of the Government?—A. I have not as much fear as I have from the other source. I realize, of course, clearly that in the present inefficient machinery of Government, and especially of the "civil service" (using that term which I do not like—I would rather say "civil administration"), there may be a great many evils; but taking the country which, perhaps, is nearer to us in its public manifestations of personal liberty, that is Great Britain, and taking the one example we have had in Great Britain of the absorption of one of these functions by the Government, that is the telegraph, no one who has studied that question will deny for a moment that there is better service, more honest service, more prompt and speedy service in every way by the English postal system than there was under the private system. I am an Englishman by birth, though I am an American citizen and have lived here thirty years; I have been backward and forward, and I have kept up the interest that belongs to my birthright, and I think that is true. I think any one who has studied that question will come to the conclusion that the result of the English postal system has been to give Great Britain a better telegraph service than she had under private corporation management. I think the result will most distinctly be the same in this country, and in the change that I believe in I think the postal telegraph is the first step in that direction, and one which is coming.

I do not myself believe that such a change as the ownership of the great corporate public functions, such as the railroad and the telegraph, will be sudden, nor will it come to ownership for a long time. I believe the process of evolving that change will create the staff of assistants and servants to carry it out and the means of protecting the country against any undue influence that they are supposed to exercise. I have been a political writer and an active partisan, and I am not so much afraid of the public servants as the general talk of the doctrinaire gentlemen who sit in their closets and never go out among the people. I think Mr. Jay Gould, for instance, to-day has more power than the President and the whole of his Cabinet to elect members of Congress,

Digitized by Google

any number of them, within the range of his seven or eight thousand miles of railroad that he directly manages not a direct influence but an indirect one. I think that he can nominate and control the election of more members of Congress than any President and Cabinet; that if we had control of his roads, the public opinion of everybody along them, the education that would be evolved by an examination of accounts, the alertness with which every farmer would look into this public service to see whether his freights were carried at proper rates, would bring about an education that must all the time tend to correct abuses.

I have worked as a telegrapher in my time, and, so far as my knowledge is concerned of telegraph operators, I have never found a working operator anywhere who has not been in favor, if he has thought anything at all of the question, of a Government service instead of a private service; and if he was an intelligent man he would usually give very good reasons for it, and reasons which would tend to show that his employment as a specialist, an operator, by the Government would make him prouder, more self-respecting, feeling more dignity, and much more likely to do well, and none the less a citizen. I have a belief, too, that if the changes of the functions of government go in this direction, the fact that the people you have to employ are specialists, experts, will put them outside very much of the range of the direct influence, which gentlemen fear so greatly, of Governmental control of politics. There may be something of that sort done.

As to another question, take the telegraph. I know it is very generally supposed that the Government might obtain control of the secrets of the telegraph. I do not think there is half as much danger of that as there is in the present Western Union system. I have had some experience during the last few months of how leaky the Western Union telegraph office may be, but I prefer not to mention the office, because it would reflect on the unfortunate man at the head of it, and he might lose his place. I have done an immense amount of telegraphing.

Of course these are only theories and deductions from my own observation, but I think a newspaper man who pays attention to his business ought to be a pretty well trained observer after he has done a quarter of a century's work, and his views have some force in them if they are really honestly and fairly expressed. I have paid a great deal of attention to this subject; I have written a number of papers at different times relative both to the postal and railway systems. My own belief is, to return to what I said at the first, that competition is impossible where combination is possible; that the tendency to-day is to throw all the functions of society, or the great ones, into the hands of private individuals by means of combination. It is the establishment of the wages system. To change to a system of that kind would be simply to establish a system of scientific slavery without ownership, which does limit a great many of the evils that chattel slavery might produce. It would make labor simply the creature of society, and it would continually swell the ranks of labor by lessening the number of the middle class. They would be ground out all the time. The people who are most bitterly hostile to-day to the discussion of the labor question are the people who are going to suffer the most by the growth of the plutocracy and the proletarian; that is, the middle class. My friends in the newspapers are ground a great deal, and are likely to be with every increase of capitalistic power over the press. There is no longer any freedom of opinion except in specialist work. The editors have no freedom unless they own the paper that they manage. I do not agree with Mr. John Swinton on that subject—I saw his statement—nor do I agree with his statement about the wages of journalists.

Digitized by Google

PAY OF JOURNALISTS.

By the CHAIRMAN:

Q. State your knowledge about that matter.—A. In my opinion there are not 500 men known as reporters—of course there is a distinction to be borne in mind—technically, there are not 500 men in the United States as reporters who earn $40 a week by the exercise of their profession as reporters. I do not mean shorthand reporters who have certain specialties; I mean men who are employed as local reporters upon the daily press of any great city. Instead of its being the average it is rather the exception. It runs much nearer to fifteen or twenty-five dollars a week than it does to forty or fifty. A witty friend of mine said to me, writing from Boston: "Don't come here, Hinton; reporters in Boston get less than car conductors, and have no opportunity to knock down." My experience on newspapers in the great cities is that the only way to preserve any species of independence is to become a specialist, to write about particular topics, special things that they want to know more about. Then you can preserve a certain amount of freedom of brain that you cannot get otherwise. An editor is simply a manufacturer, a mental mechanic, working what is ordered. It depends on whose hand is on the crank as to what the work is that he is doing. That is true of the great city press of this country, and I have edited and worked on newspapers from here to San Francisco in nearly every leading city. It is not creditable, in my judgment, to the insight of the keen-witted and clever young men who are on the press that, as a rule, they are the meanest in their criticisms of all attempts to change conditions of that kind by being the loudest in denouncing every man who has an opinion different from the conventional idea about social economic matters, as a crank or a communist. They get less pay and work harder as a rule than any other class of employés in this country who bring to bear anything like an equivalent amount of intellect and capacity.

Q. Is it not then a fact that they are more closely enslaved, if the word is a proper one to use, by their environment?—A. I do not think so.

Q. Do you think they are in a situation to do otherwise than to manufacture, as you say, to write that sort of thing, to produce that sort of commodity which their employers want to deal in?—A. I do not think they are.

Q. In other words, you mean that the newspaper industry is reduced to a lower and worse condition than that of the factory operative?—A. I would not say that quite.

Q. What is it?—A. Because the men employed on newspapers are men, as a rule, of culture and character, and they make socially for themselves personally a better environment than the factory operative can do as a rule.

Q. I do not have reference to what is outside of the employment, but in their relations to those who pay them?—A. I think that is largely true.

Q. Suppose that a man produces what the proprietor does not want, he does not sell it then?—A. He does not get an opportunity to sell it.

Q. He neither remains employed nor can he sell that piece of property?—A. Certainly not. He has to be versatile enough to do that. I brought in this illustration and made this statement first because I am a journalist myself, and secondly, because it seems to me that the bondage, if it may be so called, of the metropolitan press to the great capitalists is due to the present form of the telegraph system in this

Digitized by Google

country, and also to the other agency, the Associated Press, which is necessarily a servant or co-partner of the telegraph. If we had a postal telegraph to-morrow in working order in this country there would be a larger amount of journalistic work, more independence of action, more newspapers like those that Greeley founded in the past and others that I could mention, than there is at this day in any of the great cities of this country.

Q. Do you not think that the Associated Press as it is now managed really makes an effort to secure whatever events occur and to transmit the information to the various newspaper establishments, leaving them to select and work over this matter as they may see fit?—A. That in the large sense is true, but in another sense it is not. All the great news which affects any great corporation is entirely biased in its transmission. Take the telegraphers' strike. I was editing a daily paper at El Paso, Tex., at the time. The great daily papers from this city and from other cities came from two to three and four and five days after the telegrams. Unmistakably, the work of the reporters in their interviewing and their gathering of the news which appeared in the columns of these great daily papers presented a different aspect of public opinion from that which the Associated Press dispatches presented.

Q. In what respect different?—A. The Associated Press dispatches were unmistakably favorable to the Western Union, to the corporation side; not altogether, of course, but I mean the general tendency. The reports printed in the daily papers and the editorials of leading papers in this city and elsewhere were of a character adverse and critical of the action and position largely of the Western Union Company. These were not transmitted; these facts were hardly ever stated. If they were stated by special dispatches to the great city press that was one thing, but the great country press did not get them. The majority of the three or four thousand presses belonging to the various associated press associations did not get these things; they got what the Western Union Telegraph Company wanted to have sent, in the main. That is my judgment. I sat night after night watching it, and that is what it seemed to me.

By Mr. CALL:

Q. Would not that same line of argument in regard to the evils arising from the large amounts of capital invested in the press and the domination of money over the editors, lead to the conclusion that the Government ought to own the press and do the intelligence business too?—A. I can only answer by the one country in the world which has a free press, as free as our own.

Q. I speak of the argument, not the example?—A. I do not think so, because this Government is a government co-operative, belonging to the people, and influenced and affected by the people.

Q. Those are reasons that flow from the Government; but I ask does not the logic of curing the other evils by the public action of the Government lead to that direct conclusion?—A. To the Government's having the same influence over the press?

Q. Yes.—A. I think not.

Q. Why?—A. The reason why I think not, speaking on the spur of the moment, is that the vast number of opinions and forces which go to make up what we call the Government are so diverse on matters of this kind, and would be, that there could be no concentrated influence, no manipulation of press dispatches by Government agents. In a conti-

Digitized by Google

nental country like this, whose eastern and western limits are nearly 6,000 miles across, taking in the Aleutian Islands, you cannot possibly reach a concentration of opinion.

Q. Neither can you with a railroad?—A. Yes, you can; because the tendency is to that kind of combination, and the law of self-interest, no matter what the local necessities may be on the general proposition which will affect the railroad system, will secure unity of action everywhere among railroad men or among telegraphers.

Q. I just understood you to say that that unity of action was already secured over the press by the control of capital, and that the editor was like a crank turned around that belonged to the man who owned the machine. I am only asking if the logic does not lead to that result; I do not question the force of the suggestion as to the great power of money everywhere?—A. I realize, of course, the force of your suggestion. I hope I have not conveyed the idea that I have only looked at one side of the question.

Q. I am impressed with the force of the analogies you make?—A. I am thoroughly a believer myself individually that in a country where there is freedom of action through free discussion these evils cure themselves much more rapidly, but unmistakably such evils will exist. There are lapses and laches and ignorances which grow up in public opinion, but the attrition of public opinion is worth more. You cannot shut up the officers who manage the Government in a bank parlor; you know what they do; you can drag it out into the light and discuss it.

Perhaps also I might give a little illustration, which has often occurred to my own mind, of what I mean by the way people are educated in governmental work. Mr. Chase, during the middle of the war, deemed it necessary that the public should know something about the Government finances. He had to appeal to the general public in the States that were defending the Union at the time, and he without law caused to be published a monthly statement of the condition of the Treasury. I am sure that any middle-aged journalist and editor will recognize the truth of the statement I shall make, which is, that before the war very few men connected with the press or anything else had any idea from month to month of the general condition of the Treasury of the United States. I think that now the poorest and most indifferent printer running the most indifferent country newspaper anywhere on this continent knows a great deal more than the great city editor used to know before 1860. These constant publications have laid open the general condition of the Treasury, and they have got in the habit of considering it, discussing it, thinking of it, talking about it, and knowing about it. I think in the same way much of the evil which you can see now in regard to railroads and other things under governmental supervision would be gotten rid of by the rapid process of such education, such discussion.

(At this point the examination of the witness was suspended, to be resumed hereafter.)

The committee here took a recess till 2 o'clock p.m., at which hour it reassembled.

## INDUSTRIAL ART SCHOOLS FOR WOMEN.

Mrs. FLORENCE ELIZABETH CORY sworn and examined.

By the CHAIRMAN:

Question. You are a resident of this city?—Answer. Yes, sir.

Q. State your employment?—A. I am the principal of the School of Industrial Art for Women, and I am a designer.

Digitized by Google

Q. State to the committee, in your own way, the subject-matter you have in your mind in reference to your pursuit and the school which you have established, its efficiency, and its present and prospective usefulness in the way of furnishing occupation and culture to women?—A. Perhaps it would do as well to tell a little of my own experience first. Seven years ago I wished to become a designer for carpets, having made up my mind to that effect by seeing a very ugly carpet and wondering why more beautiful ones were not made, and I could find no one who could tell me where I could learn anything of the kind, or even where carpets were made. I looked in the encyclopœdia and found very unsatisfactory instruction there, telling me merely that carpets were made in the United States, but not telling me where they were made or how. Finally, during the centennial year, I was looking through a pile of papers, Harper's Illustrated Weekly, and they were filled with illustrations of the centennial exhibits. Among others was one of the carpet department at the Philadelphia exhibition. This design was made with divisions, and over each division was the name "Yonkers," "Hartford," "Lowell," &c. I took the first name I came to, which happened to be Hartford, and wrote a letter to the Hartford Carpet Company asking them if designs were in demand, how much they were paid for, how they were made, whether one was restricted in color, and where I could procure the paper from which to make these designs, if they were made on paper. I waited two weeks and received an answer, stating that designs were in great demand, that they could not possibly fill the demand in this country for designs for carpets. This happened to be for carpets alone, not for any other industrial branch. They were very much pleased with the idea of a woman thinking of designing, as I seemed to be the first one who had ever thought of anything of the kind, and Mr. Martin, the agent of the Hartford company, who wrote to me, said that as women bought carpets he thought it was a very good thing for women to design them, as they would know better what women would like. He sent me as full instructions as he could by letter, five designs to look at and several sheets of paper. I made three or four designs and sent them to him, having had no instruction in drawing or painting, or anything of the kind. Of course they were returned to me as being very imperfect, but he thought with instruction I might be able to please them, and advised my going to the Cooper Institute, in this city. I gained admission to the Cooper Institute, and came here and found that they knew less about it than I did myself, because in the three months that intervened I had been finding out as much as I could about it. In the Cooper Institute, in the women's art department, there is a normal class, in which they profess to teach designing. They do teach the elements and principles of designing, and teach them well, but they do not teach practical designing; they do not teach it as applied to any one practical purpose, neither do they teach it in any other school in the country that I know of. The Institute of Technology in Boston comes the nearest to it. For instance, at Cooper Institute they might teach a young lady, as they would say, to make a wall-paper design; set her down with paper and brushes and colors, and it might be a very beautiful design that she would make, but she would not know, and neither would the teachers, whether that design could be printed by the machinery or not. She would not know how many colors she should use, how the colors should fill the size, the dimensions of the drawings, or anything of the kind, because the teachers do not know. I was very much disappointed in that way at not learning anything really practical.

Digitized by Google

I visited all the carpet departments in all the principal stores here in New York, and studied carpets. I finally found in one of the carpet departments in A. T. Stewart's, a book called the "Carpet Trade Review," which gave me the information I wanted to know—that is, where carpets were made, and whom they were made by. I found that a number of the agents were here in New York City, most of them in Worth street. I went to Worth street, and almost the first person I called on was Mr. William B. Kendall, who was president of the carpet association of the United States, and agent of the Bigelow Carpet Company. He was very much pleased with my idea, and sent one of his designers up to give me a lesson. It was the second lesson really, because old Mr. Barber, of Albany, just before his death, gave me my first lesson in carpets. Then Mr. Kendall sent me with a note to the head designer at the carpet factory in the city. There is only one factory in this city, and that is Mr. E. S. Higgins', at the foot of West Forty-third street. He sent me there, and the head designer very kindly offered to give me six weeks instruction, which he did. I learned a great deal there. At that time I was still a pupil at Cooper Union, but by the end of the time I had taken this practical instruction they thought me competent to teach a class at Cooper Union, and I taught a class of seventeen girls and women, which was the first class of the kind that had ever been taught in this country, and probably in the world anywhere; at least they told me so at that time. Then, three years ago, I taught a class at the Ladies' Art Association rooms on Fourteenth street, a very small class, however. At that time I was not a teacher, and did not profess or intend to be. I was a designer, and earned my living in that way; but there seemed to be such a demand, so many women wanted to know, so many were trying to learn at Cooper Union and the other schools, and had met with the same difficulty I had encountered, that is, that the instruction was not practical, and many of them hearing of me, came to me and asked me to help them. I presume I helped hundreds of women in three or four years, by giving them instruction, giving them hints, and telling them as well as I could, until there began to come so many of them that I could not attend to my business and them too, and I decided to start a school, which I did two years ago, classifying them, of course, and confining them to regular hours, so that I had leisure for my other business and to teach besides. I think that answers your question.

Q. Is there any other school like yours in the world that you know of?—A. There was no other school when I established mine.

Q. Either in this country or any other?—A. Not that I know of, exclusively for women. There are other schools of design; there are very fine schools of design in Paris; there is a very good school at South Kensington, in England, connected with the South Kensington Museum; and there are schools of design all over Europe, but none that are exclusively for women that I know of.

Q. Yours is meant to teach women what they teach men?—A.—Yes; to teach women what they teach men, and in the Lowell Institute they teach men and women both, as far as they go. They teach designing for prints and they teach designing, I think, for some wall papers practically, but they do not teach all kinds of industrial training practically.

Q. Give us some idea of the opening that seems to you to exist in this direction for employment for women.—A. I think it is one of the best openings for women labor in the country. It is remunerative; it is easy work; it is just as easy as for a lady to sit down to paint any-

Digitized by Google

thing for her own amusement. There is a great demand for patterns which cannot be filled by the designers already in this country. There is not a manufacturer of any extent in the country but that sends abroad for hundreds and some for thousands of dollars' worth of patterns yearly. They are not all patterns that can be woven or printed just as they come. For instance, a wall-paper manufacturer when he sends to Europe for patterns does not send for a pattern that exactly fits his own machinery, and they are not always, strictly speaking, wall-paper patterns. Sometimes they are silk, and chintz, and cretonne, and bits of carpet, anything that will be a good idea for the manufacturer. After they are brought to this country the designers that he employs adapt them to their own requirements. Sometimes they will take a flower from one piece of chintz and a geometrical figure from a piece of wall paper and other forms from other things and combine them all and make one design out of the four or five. In that way they waste a great deal, sometimes buying a pattern for merely one form that is in it and the rest is useless. These designs are brought from England, Scotland, France, and all over Europe. They send men over there, pay their expenses, and pay for the designs, hundreds and, some of them, thousands of dollars yearly. These designs could be made just as well in our own country and by women. Women will be just as competent, after they are trained, to do it as men, and some of them are as competent and more so than some of the men now. Of course it takes time.

Q. For what purposes are patterns and designs needed? You mentioned prints, wall paper, and carpeting. In what other industries are they wanted?—A. In this country carpets of all grades, wall papers of all grades, silk for dresses and handkerchiefs and ribbons—everything of that kind. There is very little lace manufactured in this country and I think no lace curtains, though they are talking of establishing a factory now for that purpose, but there are embroideries of all kinds, those made by machine, and the Hamburg edgings are made in this country. Furniture chintz, which I did not include in calico, tile, all kinds of repoussé work in silver and gold and brass, carpets, designs for furniture, gas-fixtures, almost anything you look at that is ornamented is made in this country and there is a demand for designs. Of course some factories require more than others.

Q. State a little more fully as to the competency of women to do this kind of work, to receive the necessary training, and what aptitude do they develop for actually doing this work as well as men do it.—A. They learn very readily. I would not hesitate to take any young girl or lady of average intelligence, and I am quite sure I could teach her to become a designer in two school years. Of course a girl having natural taste and regular genius for this kind of work would do much better than one who had not, but any one with any intelligence at all can learn to design, although some will do better than others; but if they can understand the machinery and the requirements of it, and I see no reason why they should not, they can learn to design and to make designs to meet the requirements of the machinery. Every kind of machinery, of course, has different technicalities and requires a different kind of pattern to be made for it. Even in carpets every grade of goods has to have a different kind of pattern made in a different way and adapted to the loom which will weave that grade of goods, whatever it may be.

Q. How many have you instructed these two years, and between what ages?—A. Two years ago I opened school with 2 pupils; at the end of the third week I had 5 pupils, and at the end of the school year I

Digitized by Google

had 41 pupils. The second year I opened the school with 38 pupils and closed with 75 pupils. Then I presume in the two years I have had 20 or 30 private pupils who were not regular pupils at the school. This year the school opens on the 1st of October, and I cannot say just how many are coming because I am receiving letters of application every day, and calls four or five every day. I know that the school will open with large classes this year.

Q. You are, of course, obliged to employ teachers in addition to your own services?—A. Yes; I have a teacher, Miss Perkins, who has been with me since the opening day of the school in the elementary class, and Miss Charlotte B. Coggswell, who has taught wood engraving for ten years at Cooper Union, will teach for me this year. Mr. Stone, who has been foreman of the Gorham Manufacturing Company, I think, but I will not be sure of this—either the Gorham or another firm quite equally well known—twenty years, will teach repoussé work on brass, silver, gold, and copper. I am to have architecture taught in the school also, but the practical designing I teach myself.

Q. How old are these pupils?—A. Last year the youngest pupil I had was fourteen years old, and the oldest one was sixty-two or sixty-three, I would not venture to say. I have a number of pupils with gray hair and glasses. The first year of the school all but four were older than myself; perhaps you can judge.

Q. That would not be making you very old.—A. Thank you.

Q. Can you give us some idea as to the remuneration which they command when they are fairly well qualified to be employed?—A. Yes, sir; I can tell you the remuneration that men receive, and women should receive as much, and I think they will when they are employed regularly by a manufacturer. They receive a regular salary, just as any business man does employed by the year, and the salaries are variable. A first-class designer for body Brussels will receive anywhere from $3,000 to $6,000 a year. They generally receive about $4,500 or $5,000. An ingrain designer receives less. I do not think a good ingrain designer could be employed for less than $2,500. A moquette designer receives a little more than a body Brussels designer, but not much. Six thousand dollars is a good salary for any designer for any purpose, although they have received more. I believe one designer receives as high as $10,000.

Q. Are they Americans, or foreigners who have come here?—A. Almost all foreigners. There are a few Americans, but the best designers, as a rule, are foreigners, for this reason, that the foreigners have schools, and the Americans have not. Foreigners are trained, especially the Frenchmen. They have free good schools where any artisan, without pay, can go and receive instruction in all these branches; here we have not, and, consequently, we have to suffer for the lack of them.

Q. The salaries which you have mentioned, of course, apply only to those who are the most skillful?—A. Yes.

Q. The leaders in the art; but what can an ordinary designer earn?—A. Those are what they call the ordinary designers. For instance, take Mr. Higgins's carpet factory on Forty-third street, as that is in the city. They have one head designer, and then they have under him anywhere from fourteen to sixteen altogether, men and boys. The boys are employed at the rate of about $3 a week when they first begin, and all they have to do is to grind colors. They keep them grinding colors for the designers—mixing shades and grinding colors. Then, if they are at all competent, from that they get to copying, that is, with simple patterns, ingrains; then they will be paid from $7 to $10 a week.

Digitized by Google

Then from that to laying in bronze, and finally working on the higher patterns, and if they have a taste and genius in that way, by that time they should have picked up a great deal from seeing the other designers work, and finally become designers themselves, and that is the only way in which people in this country can become designers, by entering young and learning the business from what they can pick up, because designers will not teach it and there are no schools. Designers are afraid to teach it, because those taught might do better than they, and take the bread out of their mouths.

Q. Relatively, as shown by facts. how does the work of those who have been educated with you compare with that of other designers?—A. Very favorably. The difference is just here: my method of instruction is thoroughly systematized. I begin at the beginning, and any pupil that is graduated from my school understands thoroughly all the technicalities for all the fabrics. For instance, if she enters the carpet class for all fabrics, she learns the technicalities of all, which is more than many male designers in this city can say, even the best. You take a designer here in this city or in the country anywhere in any of the carpet factories, and as a rule he understands only one kind of designing. For instance, an ingrain designer does not know anything but ingrains. He may know a few points, but he does not know thoroughly well the technicalities and practicalities of body Brussels. A body Brussels designer may know nothing whatever about ingrains. But my pupils can tell you every technical part of every kind of fabric, of every quality of goods. They may not be able in two years, and of course they would not be, to make as pleasing a design as a designer who had worked for ten, twenty, or thirty years, but I think they would understand machinery quite as well, if not better, and it requires practice, of course, to be able to make the designs.

Q. Can you answer from your observation this question, Whether women appear to possess as much natural aptitude for this work as men?—A. Yes, sir; I think they do and more. I think they have a greater taste. It comes more natural to them.

Q. You think that here is a field of industry specially open to women?—A. I do most decidedly. I think it never should have been occupied by men, and I do not think it ought to be any longer when women are trained to it. It is pleasant work; it is very simple; it is what a woman can do; it is not hard at all, and I do not see why the men cannot go into the harder fields of labor and leave the simpler fields to women; not that I am strong-minded at all, but a woman certainly has the taste, and the skill is nothing, any more than to learn to paint a picture, and you all concede that women can do that.

Q. You think they are certainly reduced to the condition with sharp competition of being able to hold their own?—A. Yes, after a little while; not now. I do not think they need fear us for four or five years to come, but then I think they will. There are few now; in fact I am the only real full-fledged woman designer that there is; and then there are my pupils, of course, but the school has only been opened two years, and I do not profess to graduate them before two years.

Q. Have you any objection to stating in what directions you work principally as a designer yourself?—A. On carpets, almost exclusively. I have made designs for wall-paper and for tile and for various things, but my business is carpets.

Q. For what firms or establishments do you do work?—A. I am not employed by any one firm. I make designs and sell them and receive orders from different manufacturers. I received within the last month

Digitized by Google

two orders from England for patterns, one from Leeds and one from Warwick. I have had orders from Philadelphia, and I have worked for quite a number of firms. I have sold oil-cloth designs also to Messrs. Potter & Co. and to Messrs. Bailey & Co. I have worked for the Bromley Carpet Company, one of the largest carpet firms in Philadelphia. I am not employed by any special company, but sell designs as I make them to whoever wants them or whoever will pay me the most.

Q. Have you any reason to think that your work is not valued as among the best they can get?—A. Last year one of the patterns that I made was exhibited at Sheppard Knapp's as the handsomest carpet they made that year. I think they sold as much of it as of any carpet they had in the store at the time. That was one of the Bromley goods.

Q. About how many carpet factories are there in this country?—A. There are from 75 to 100 carpet factories in the United States. The greater number of them are ingrain factories, and they are centered in Philadelphia. Of the best factories I think there are five probably that stand on a par as far as the quality of their goods is concerned.

Q. Do I understand you that this business opens out in the direction of all manufacturing where forms of beauty and of utility and adaptations to good taste are required?—A. Yes, sir; and not only as applies to manufactures, but to other things. For instance, we teach in the school interior decoration.

Q. What do you mean by that?—A. We teach women to understand what is beautiful and true, so that they can decorate their homes or become decorators for other's homes, and to decorate rooms and buildings, making them beautiful at the smallest possible expense, because all the tasteful things are not expensive by any means. Some of the most beautiful things are very reasonable, if women only knew how to look for them and use them.

Q. Do you think any common country or city girl could better qualify herself for the duties that naturally devolve on the sex by instruction in this art?—A. Yes, I think she could in this way: I think she could make her home happier and more pleasant by making it attractive, and where it is beautiful it is attractive. Of course the more attractive she can make it and the least expensive, the better that will be for her husband.

Q. I should think there was in that direction a great field where this sort of instruction might be given to advantage, and I should think homes would be more likely to be established under these circumstances. What do you think of the cultivation of this quality that you speak of as an accomplishment to women as compared with music and painting? Which is the more important for women to have really, this quality you speak of and this power to decorate a home, or the other accomplishments I have mentioned?—A. I think industrial art by all means, for several reasons: In the first place, as far as painting goes, any one with any taste whatever would not care for a picture unless it was really good, and there are very few who can make really good pictures. There are a great many who daub and make something that is very pretty and paint something on silk or satin, frittering away their time and not counting that time, but consuming time. Half the money expended on industrial designing would teach them to do something really good, and if they were compelled, through force of circumstances, they could turn it to good account. When it comes to music, there are hundreds of thousands already in the field. There is hardly a house now but has a piano, which is drummed to the annoyance of the neighbors and most of the people in the house; but this art is something new. It

Digitized by Google

does not offend any one; even if you do not accomplish anything you do not do any harm by it. Of course it does not require as high a talent to make a good designer as it would to make a good picture-painter by any means; it does not profess to be higher at all; it is within the scope of every intelligent person.

Q. Can you give us some more definite idea as to the extent of employment as a business that might be afforded to women, and to what extent there might be an outlet for employed women in this direction?—A. It will be some time, of course, before women can practically compete with men already in the field, even though they have to send abroad for patterns, because there is that prejudice against women which there is in every new avenue opened to women's work. I do not care what women start to do, they are always opposed by men at first, but they have succeeded a great many times, and I think they will succeed in this. I speak of them altogether, and not any special men. I think women will compete successfully with men, and I think it will not be many years—I hope during my life-time—that the designers will be all women, and that the men will find something more manly to do.

Q. How expensive is instruction in this art? I do not mean to ask in regard to your own school, but if these schools should spread generally, and there is no reason why they should not be in every city and village.—A. No reason. I only wish they would be. I am fitting a number of my pupils now for teachers. They prefer to be teachers than designers.

Q. As this taste is cultivated, of course a demand would spring up in every home in the country?—A. Certainly. It is already springing up.

Q. Tell us more about that. Is the cultivation of this knowledge in women going on generally?—A. It is, most decidedly. About eight or nine years ago—I will not be positive about the time, but it was not later than that, though it may have been longer ago—Christopher Dresser wrote in his "Principles of Design" that judging from the carpets Americans used on their floors and ordered from England—at that time a great many people would not have anything but an English carpet; they considered that an American carpet was not half as good, whereas it was better, but they did not know that, and American manufacturers used to put the English marks on to deceive the public—the Americans were the most uncultivated people on the face of the globe. That is changing. The carpets used to be execrable with large flowers. I have seen flowers as large as a man's head and larger, roses in the most brilliant colors you can possibly imagine, bridges, fences, baskets tipped over, pagodas, almost anything and everything you can think of that ought not to be walked on put upon a carpet. Carpets of that class now are almost entirely dropped; where they are made at all they are confined, you might say, exclusively to tapestry, which is a poorer grade of carpet, a cheaper grade of carpet, and is bought by only the common, uncultivated people. You will see them hanging out on the Bowery, over on Ninth avenue, and such places, and you will find them all through the West, but the best houses, such as Sloan's, Arnold & Constable's, and all the large stores that have large carpet rooms, have the better grade of goods and handsomer patterns, patterns in quiet colors, tastefully arranged, and really beautiful works of art, with nothing that could offend the sense of propriety of any one in walking over them, or offend the taste in any way.

Q. Will the sunflower soon be obsolete?—A. I thing so, if it is not already.

Digitized by Google

Q. How in regard to designs for furniture?—A. I cannot tell you as much about them. They have been making good furniture in this country longer than they have good carpets, but I think that most of the designs come from England for furniture, or the ideas. They are reviving the old furniture of Queen Anne, and the old Chippendale furniture, making designs after that style. Eastlake started the ball rolling as far as furniture is concerned. There are furniture designers in this country.

Q. Do you think that sort of thing is to curse us very extensively in this country?—A. Yes, sir; I do not think that after a few years they will send for designs for anything abroad.

Q. As bearing on the question whether this culture is within the reach of those of ordinary means or those who may be actually dependent on themselves for a living, I should like to know, in a general way, whether these pupils of yours have been persons of wealth or persons of ordinary means, perhaps a little short of the money that is necessary to get on with in this world?—A. As a rule, persons of ordinary means; some of them poor, quite poor. I have only had two or three pupils that might be called wealthy, and they were girls, as I considered them of a great deal of intelligence, who wanted something to do besides just frittering away their time, and thought it best to learn this art, so that in case of reverses they might have something to depend upon. If they never needed it, certainly they would be learning something, and it would be an employment and an amusement to them now. Then I have had pupils who were very well off. Every pupil I have ever had has been cultivated. I have never had an ignorant pupil yet.

Q. They have an idea they had better do that than nothing?—A. A great deal better. They like it better, and, as I say, it may be turned to account if they ever wish to do so, or ever find a necessity for it. Last year I gave free instruction in the school to eleven pupils who could not afford to pay. I have had to make easy terms for some, reduce the terms, or give them a longer time to pay in.

Q. Must there not probably also spring up a large occupation for women in teaching, in the instruction of this same art?—A. Yes; quite a number of my pupils have become teachers already. I think not less than eight or ten are teaching now. Some two or three of them have formed small classes in this city, not in the schools, however, because as yet the schools do not seem to take it up—for instance, the public schools. I wanted to introduce this in the public schools in New York City, and I saw one or two of the members of the board of education. I saw Mr. Edson, the mayor, who was very favorable indeed to my project, which was to give free instruction. I offered to give instruction free this year on Saturday mornings to one pupil from each grammar school in the city, the pupils in the grammar schools to compete—the drawings they are obliged to make in the school any way—that each teacher should have the privilege of selecting the girl pupil who had made the best set of drawings throughout the year in that school, and she was to come and join this class. Mr. Edson was very favorable indeed, and wanted it carried through, but Mr. Walker, the president of the board of education, said that they had decided they could not form an arrangement with any private school; they had only done so in one case; that was in the case of Bushnell, where there were various influences brought to bear, and they did so, but they should refuse to do so again. It is just the children of that class of people who send their children to the public schools who ought to be educated in this branch, and whom I most desire to reach.

Digitized by Google

Q. Explain to the committee your method of instruction.—A. I begin with a pupil who enters the school and knows nothing whatever of drawing. First, she is taught to judge of distances by making lines of certain lengths and judging the lengths by her eye. For instance, I say to the pupils, "Draw a line three inches long." Nothing is copied in the school; everything is drawn either right from the mind or from the object. They draw this line. Probably not one in the whole school will make it just three inches long. After it is drawn they test it, find out whether the line is too long or too short, and find out what the difference is, and draw another one, which, of course, more nearly approximates the proper size. After they have had exercises of this kind I give them lessons in dictation. For instance I say, "Draw a square three inches square." The only guide they have is the hand and the eye. They draw a square. Then perhaps the next dictation will be, "Draw its diagonals and diameters; then bisect the sides, and from the points of bisection draw lines," either diagonal lines, vertical, or horizontal, anything I have a mind to dictate. So I go on from step to step until the first thing they know they have a design. They did not know what it was to be; it may be a chair, it may be a goblet, or just a haphazard design that would do for a tile. They all have the same thing without seeing each other's drawings or seeing anything at all—just from what I tell them to do. That gives them the idea of how to lay out a design systematically and geometrically. Then I tell them, "Now make that design yourselves in the same way; draw a square, circle, triangle, any geometrical form you wish; divide it with any subdivisions you like, and connect these points by lines, either curved, straight, or any kind of lines you like, and see what the result will be," and before they know it they have made a design. They hardly understand what they are doing until they have made one or two designs. Then they begin to see how it is that you lay out these designs, and from that go on step by step. All the floral forms they have to draw from nature. I have flowers in the school, and they draw and paint them. That is one of the steps. Then when it comes to the advanced design, by that time they have learned to make pleasing forms, and when they draw a flower they not only draw the flower and paint it as the artist would do, but they resolve it into its elements; that is, draw the flower front view, back view, side view, front and back of the leaf, the roots, every part of the flower they can get, the more the better. Then they pick this flower to pieces. They draw and color one pistil; they draw and color a stamen or the pistil; they cut the side part in two, and see what geometrical figure that is, for every flower and every part of every flower is based on some geometrical figure. That is one of the first things they learn. They also learn on what geometrical figure each flower and leaf is based. For instance, I hold up a flower or leaf and ask them "What figure would inclose that best?" whether it is triangular in shape, oval, elliptical, or what it is. Then this flower, as I said before, is resolved into the elements, and each element drawn separately. Consequently by the time they are through with that flower they understand its manner of growth and everything that belongs to it, and they have ever so many, say from seven or eight up to twenty or thirty, different forms to derive from the one flower. When they come to combine these elements into a design that design will be pure; if they make a design from a rose there will be nothing but rose elements introduced; there will be the rose seed-pod, the thorns, the rose itself, and all the various portions; so that it must be pure throughout. Another thing, they will never make the mistake, after studying a

Digitized by Google

flower in that way, of putting ivy leaves on roses, and putting spring flowers with those that bloom in the fall, and so on. They know every flower they study thoroughly through and through. They begin with the natural plant and the natural drawing, and finish the full size working design derived from that.

Q. This process is repeated for the two years?—A. Yes, sir. The first year is taught what I have just been telling you, the geometrical arrangement, the conventionalization of flowers, the drawing of flowers from nature and adapting them to the simple designs, the designs in which I can teach the technicalities in the first year; that is, print designs. The technicalities are very simple as concerns wall-paper, chintz, calico, or anything that is printed. In the second year I teach the principles and the technicalities of machinery, and teach designs for all fabrics upon which the design is brought to the surface by the Jacquard loom—for all designs that are woven are brought to the surface by a Jacquard loom—whether they are red and white table-cloths, linen table-cloths, carpets, silk, or any fabric in which the design is brought to the surface by machinery and not printed on the surface. There are three ways of applying a pattern to surface. The first is by weaving the cloth or manufacturing the paper, whatever it may be, and printing the design on the surface after the surface itself is finished, as in calico and in wall-paper and some kinds of silk, and in other things, too. Then another way is by printing the threads before they are woven, as is done in tapestry carpets. Tapestry carpet is formed of only one thickness of wool. The threads are wound around a drum and a pattern corresponding to the pattern we have made on paper is printed on these threads. Afterwards the thread is put in the machinery and woven, and as it is woven the pattern comes up in spite of itself, as the threads bring it up to the surface. The third method is by taking wools of different colors—that is, each wool is all one color; it is not printed in bands or strips of color—these different colored wools are brought to the surface in their proper place and form a pattern by means of the Jacquard. That is the case with body Brussels, Wiltons, silks, and a great many other fabrics.

Q. You are a lady of American birth?—A. Yes, sir; I was born in Syracuse, N. Y.

Q. So that you have demonstrated in your own case that an American woman can do this if an American man can?—A. Yes; and I have had no instruction at all further than I have told you. Everything that I know I have picked up myself and bored people by questioning them to death. I visited a representative factory, of not every industry in the United States, but of a great many. When I finished the carpets, then I attacked wall-papers; when I finished the wall-papers I went to Paterson and visited the silk mills, and so on; so that I understand the machinery thoroughly, and can tell you all about the manufacture of almost every industry in the United States. There are very few that I cannot.

Q. Have you any knowledge which might be useful to the committee in regard to the extent to which women are needing employment?—A. Yes, I can tell you a great deal about that, but I do not know that I could make you realize it by telling you. If you could see the women that come to me, widows, orphans—I cannot tell how many of them—clergymen's widows and children who come to me by the hundreds for help, you would realize it. They want to learn designing, want to know what they can do, think they never can design, and want to know if there is anything else they can learn in that way. I cannot tell you the

Digitized by Google

number, but really it is pitiable to see the number of women who need work right here in this city and cannot get it. There are hundreds and hundreds of them. I have had them come to me with poems that they have illustrated beautifully, wanting to know if there was any way they could get them published. One lady was sent to me by Miss Grace Dodge, a daughter of Mr. William E. Dodge. She is quite a friend of mine and she sends me a great many that she does not know what to do with and hopes I can find something for them to do. The lady she sent me had made a beautiful clock. It was a lovely design. It was very elaborate on the face. Each hour was represented by a figure; I do not remember it all, but it was a very handsome thing. She had taken it to a number of jewelers, but none of them were ready to make it just then. Mr. Tiffany said they were very busy, indeed they had more orders ahead than they could possibly fill; after a while they might take it, and so on from one jeweler to another. Some would not even look at it. Finally she came to me in despair to know if there was any one she could go to, or any one I could send her to, or anything she could do with it; if she could have it published as a book illustration. I do not think the poor woman ever found a market for that clock.

Q. How great was her necessity?—A. That particular woman, I think, had not one cent in this world, had nothing only what friends gave her, and that was of very little dependence to her as it happened. Others have come to me. One poor girl came to me not very long ago who did not know where she was going to get a bed to sleep in that night and must have something to do. The lady that I boarded with two years ago was very charitable in that way; numbers of girls and women she has let sleep there for two or three weeks and given them their board—cultivated girls, too.

By Mr. CALL:

Q. Residents of the city here?—A. Yes, some of them, and some of them come here to study and do not like to go home. There was one lady came to me yesterday who said she had nothing to do and must get something to do. She did not want to go home. There was a pride about it. She had come here to earn money and had expected to do so, but found that she could not. What she had expected to do she could not get to do, and she had either to get something else to do or go home, and she said she would not go home, she would die first.

By the CHAIRMAN:

Q. She probably will die, then, or will she find employment after a while?—A. I hope she will find something to do. It seems very hard.

Q. What is there that women can find to do?—A. Heretofore they studied phonography and stenography and telegraphy and photo-coloring; quite a great many have found employment at photo-crayon where they wished to take up art work. A great many of them have become agents for selling books and things of that kind. That seems to be the last step when they cannot find anything else to do. The trouble with my work is that it takes some time to learn it. A girl cannot go right in and go to work. It has got to be learned first, and that takes time.

Q. I suppose they can probably get so as to earn a living in some of the least difficult forms of work in a year?—A. Yes; some of my pupils who entered the school last year found employment almost right away. One lady came from Lafayette, Ind., and one came from Utica, N. Y. The one who came from Utica was the grand-daughter

Digitized by Google

of a clergyman there, Rev. Dr. Gazzam, an Episcopal clergyman. She was quite a genius. They entered the school on the 1st of October and on the 1st of January they both got situations in Mr. Hobbs' wall-paper factory in Brooklyn, one as an original designer and the other as a colorist, one at $10 a week and the other at $15, which was very good indeed to begin with. The youngest pupil that I had, who was only 14 years old, sold two designs, one at $8 and one at $10, and then she got a prize of $20. All that more than paid her tuition. Several of my pupils earn money; many of them paid their entire expenses, and some helped to pay their expenses, while others did not make anything, and never will.

Q. Do you think that there is any city or village having two or three thousand inhabitants where such a school as you speak of would not be useful and well sustained?—A. It would be useful, and it might be sustained in a measure, but it would be difficult to sustain a school very far away from a factory, for this reason: it is not always pleasant and it is not always best (because all these business men are not reliable, I am sorry to say) to send your designs to them. Such things have been known as designs having been sent, copied, and returned with "we don't want them" after the copy was taken. If you are near a factory and can go yourself with the designs, you stand a great deal better chance of selling them, or, if you do not sell them, you take them away and you know that they are not stolen. So I should not advise any one to start a school or work to any very great extent very far from a factory. If you were near enough to a factory to go, say, two or three times a year, or to the agent or some member of the firm, and sell your designs, that would do very nicely.

Q. But outside of the hope of immediate employment of the girl for a livelihood, with reference to her future condition in life, this education, I take it, you would hold to be quite essential and important?—A. Yes; as far as that goes.

Q. Wherever there is to be a family it would be well that the wife should have this same instruction?—A. Yes; it would be a very great benefit if the women of the country knew more about it, I think—beneficial to the country and to the people. It would bring a great many dollars into the country that now are expended abroad, and there is no reason why all this money could not be made by people at home, and by women as well as by men. Certainly full grown, intelligent women ought to do as well as boys. They take boys in the factories when they are 13, 14, or 15 years of age, just common boys, not particularly cultivated, workingmen's and artisan's boys who had a common-school education, and some of them hardly any. Some of them turn out to be designers and others do not. It seems as if women ought to do as well as that. They earn their living. Of course they do not get as high salary as if they understood more about the business.

Q. Is there any other matter that occurs to you that you would like to state?—A. You asked me something about the expense of learning. I cannot tell you anything excepting as regards my own school for the reason that I do not know where women can learn; no one will teach them. A designer will not teach them at any price. The manufacturers will not allow their designers to teach them in the first place, and the designers would not do it if they did, and there are no schools with the exception of my own, that I know of.

Q. The designers are as bad as the trades unions in that respect?—A. They are certainly. In my school there are two terms throughout the school year in every year. In the elementary class the terms are $15

Digitized by Google

a term or $30 for the entire year. In the advanced class the terms are $25 a term or $50 for the entire year. The terms were put down just as low as they possibly could be to cover expenses from the very fact that the girls and women who came there to learn could not afford to pay high prices; if they could, it would not be necessary for them to learn this branch of industry, and as they had to learn to earn their living the terms were made as low as possible.

Q. Where in the city is your school?—A. On the corner of Twenty-third street and Eighth avenue, in the Grand Opera House this year. In has been in my own private residence, 251 West Twenty-third street, heretofore. This year I have leased the former rooms of the Erie Railway Company. There is one very large hall that seats between five and six hundred people comfortably, and three offices. One was the office of Hon. David Dudley Field, one Mr. Jay Gould's, and the other Mr. James Fisk, jr.'s. I do not know how long ago they gave up their offices, but the rooms are very handsome, very large.

Q. Instruction is given by the blackboard very largely, I suppose?—A. Yes, sir; my instruction is given entirely by lectures. I have a small platform and I give a lecture. If they have had lectures before I tell them at the preceding lecture to this one just what my lecture will be this time. For instance, I tell them "in the next lecture I will tell you about ingrains." Then I give a lecture on ingrains, telling them all about the machinery and illustrating it on the blackboard as I go, telling them all the requirements to make the design, just how to do it to the minutest particular. I leave nothing undescribed, and I illustrate what I say by designs already made by good designers, so that they can see just exactly with the illustration I make on the board what is required. My lecture lasts anywhere from twenty minutes to an hour, depending on the subject. Some are much more lengthily described than others. I only give them one kind of a fabric or one kind of an industry at a lecture. Then they pass to me the designs they have made since the preceding lecture. I hold up each design before the whole school and criticise it before them all, so that they may not only get the benefit of their own mistakes but those of other pupils, and that is a great benefit. They learn as much by their mistakes as by what they do right. I criticise them very severely, and then give them instruction as to what to do for the next lesson. That ends the lesson as far as I am concerned. Then they can either make at home or at the school their designs and drawings to bring to me at the next lecture.

Q. I should judge from your description that practically there would be hardly any limit to the number of pupils you might instruct at the same time?—A. Any number, provided my room was large enough to hold them.

Q. Do the other teachers you have mentioned give instruction in the same way by lectures?—A. No, they cannot; for instance, with brass *repoussé*, which is very noisy work; it is hammering all the time. When you get 20 or 30 girls hammering on brass you cannot expect them to hear a lecture very well at the same time. In the elementary class they require more individual instruction than they do in my class.

By Mr. CALL:

Q. How many scholars have you?—A. I closed the school last year with 75 pupils. This year I do not know how many are coming, but I think the school will open with very nearly that number, if not quite.

Q. Has that been the average?—A. That was the actual number, 75 pupils last year.

Digitized by Google

Q. How many the year before?—A. I closed the school with 42 pupils the year before, but my school does not open with as great a number. The first term they do not all come; the second term, after the 1st of January, the school is full. Perhaps two-thirds of the total number enter the first term. One reason for that is that a great many of them are not in the city as early as the school opens and a number of them have a great deal of holiday work on hand, because a great many of my pupils are earning their money, and have to earn their money to go to school with, and they paint on silk and satin for the various stores, and make things of that kind for the Christmas holidays to sell, and they could not have time to do that and go to the school too. So they wait until the holidays are over and then begin the 1st of January. Then again, others have studied some and do not need the first term's instruction, they know all that we include in that, and enter the second term and then go right on with the class in the second term.

Q. How many assistants have you?—A. Last year I had four, this year I have six.

By the CHAIRMAN:

Q. Do you give instruction daily, or not so frequently?—A. There is school daily, but the classes have had to alternate heretofore on account of my not having room enough. I had my school in my private house, in the parlors. I gave up the second floor to the school. The classes were very large, larger than I expected, so that we had to have alternate days; but this year I shall try to have the instruction daily. I have not really decided.

Q. This seems to be a very fine opening for perhaps the great mass of American girls, either in the direction of an actual occupation or the acquirement of a very practical or useful accomplishment. Do you know of any way to reach the girls who are not able to pay for this instruction?—A. That is what I want to do. I am not a business woman aside from the school, so that I do not know that what I am now going to say is right. I want the members of the legislature to establish a school in this State where girls and women can go and receive free instruction just as they do at Cooper Union, free instruction in industrial design. It ought to be introduced into the public schools, but it seems very hard indeed to get it practically in the public schools. They do teach drawing, but they only teach it one day in the week, and the poor children forget from one week to another what they have done the week before, and it really does not amount to much. I do wish there could be a large school built here in New York City where girls and women could go and receive free instruction. That is the dream of my life.

Q. You do not look on this then as a new and useful thing which you want to utilize wholly for your own benefit?—A. No, sir; I do not. I would not want to teach for nothing, though.

Q. Do you know of any way to reach the women and girls who need employment and who are now without it?—A. I think I should find a way very quickly.

Q. How?—A. I should announce it in the public schools in the first place. I should go to the teachers in the public schools and have them announce it to all the pupils in their school; then I should go to the Young Women's Christian Association and all associations of that kind where poor girls are apt to go; I should also have notices in the Cooper Union and such buildings, and I should advertise. I am a great believer in advertising. I advertise largely.

Digitized by Google

Q. After all, do you think that this would relieve to any great extent the demand there is among women and girls for work, for an opportunity of supporting themselves?—A. I do certainly, but it would take time. They would have to be instructed well, and they would have to have a certain amount of practice before they could successfully compete with men, because the men designers have been in the business for years. When establishments get a designer they will do almost anything to keep him, because they are very hard to get, they receive good salaries and, of course, they will not let them go.

Q. Disregarding this specialty altogether, take the poorer people in this city, those who have less than they really ought to have of this world's goods, do you think the men and the boys or the women and girls are really the most suffering and the most needy?—A. The women and the girls, there are so many things that a man can do. If a man is out of work and out of a job he can find something to do by going and cleaning somebody's yard. He can do something of that kind and get a few pennies anyway; he can be a tramp, if necessary, and as a rule he would reap what little benefit he got, whereas the girls and women seem to have so few things they can do. When it comes to sewing that is starvation almost. I think it is terrible, the prices they pay women for sewing.

Q. What are some of the prices?—A. I cannot tell you exactly. I have read, but I do not remember the exact amounts. I know in some of the wholesale furnishing stores they make coats, and vest and pants and shirts, for six cents apiece, vests for three to six cents. I will not be sure on these points. I have read them. I know it is perfectly terrible to think of a woman's wasting her life at such work and for such prices,

Q. Do you come in contact with any of this class at all?—A. Not very much. I have a little, but not to a very great extent with the very poorer classes.

By Mr. CALL:

Q. Have you any idea of the number of persons who might be employed in this work of designing?—A. Yes, a slight idea. I cannot tell you exactly; it would need statistics for that. As I said before there are from 75 to 100 carpet factories; I know there are over 75; I do not think the number reaches quite 100 in this country. Some of these factories employ only one or two designers and buy a great many outside designs; others employ 15 or 16. I think 20 would be a large number of designers for any one carpet firm. Then when you come to silk and wall-paper and all the other things, it is just about the same. I cannot tell you exactly, but the large wall-paper factories employ about the same nnmber of designers that the largest carpet factories do. There are hundreds and hundreds of men in this country employed as designers.

Q. They find employment in these large factories?—A. Yes, large and small both. The small factories pay just as good a salary to a designer who can do the same work as a large factory does, only they do not require as many of them, for they get out a smaller quantity of goods.

Q. Besides the carpet factories, the wall-paper factories, and the silk factories, what others are there?—A. There is a large factory on South Fifth avenue where they embroider by machinery tidies and all kinds of decorated work, piano covers, table covers, and things of that kind. They employ a great many designers, and pay them $25 a week. One of my young lady pupils secured a good deal of work from them.

Digitized by Google

Q. Are they employed in factories that make shirts?—A. Yes, sir.

Q. In cotton factories?—A. Yes; everything that has a pattern has to have something to make it by.

Q. Laces too?—A. Yes; but there are very few laces made in this country; no lace curtains; no large laces. I think there are only one or two lace factories where they make lace edging; but very little of that is made in this country; that is almost all brought from abroad. The Hamburg edging, white Hamburg, is made a great deal in this country.

Q. You think, then, several thousand persons at least could find employment in the present state of the art?—A. Yes, indeed. The furniture trade takes a great many designers, but to design for furniture you have to be something of a joiner and understand carpentering. You might make a beautiful design, but you must make a practical working design as well, drawn to a scale.

Q. Have you known any women who had learned that branch of the art?—A. I know of one or two who have designed successfully for furniture. I do not know them personally. I know that in Chicago there is one lady who has designed for a furniture house for some time. I do not know her name; I have read of her.

Q. What were you saying about working in brass?—A. Brass *repoussé*. It is a new industry for women, although it has been done a great deal in this country, more particularly, however, on copper and silver and gold. It is raising a pattern on the surface of brass by pounding it out from the back. You draw your pattern on a piece of brass and lay it on a board of soft wood, pine or something of that kind, and pound it on the back and that raises it up on the surface on the reverse side.

Q. That requires a good deal of skill?—A. Not much. My little girl can do it. She has made quite a number of pieces in brass *repoussé* candlesticks and things like that. That is easy work.

Q. Do you think that would afford any extensive employment?—A. As far as that goes, I do not think it is anything that will last very long. It is a popular thing at present, and a person may make a great deal of money just now, but it is not standard, and will not last as long as the other industries.

Q. Have you given any attention to the subject of other employment for women?—A. Not particularly; I have not had time, I have been so busy in this one branch. Of course women come to me all the time. A number of people have asked me to join different associations and societies, but I have not time. I have all I can do to attend to my own work; still I am always interested, and I hear a great deal one way and another, but I do not pay any special attention to it.

By the CHAIRMAN:

Q. Is there any other matter you would like to tell us?—A. I think not. I do not think of anything just at present.

By Mr. CALL:

Q. Are not women finding considerable employment now as clerks in stores?—A. Yes; quite a good many. There is only one disadvantage to that, that so many of them have to stand all day, and it is a very severe strain. If seats could be provided for women, as they have in one or two stores, I believe it would be a very pleasant employment, but I do not think it is a particularly remunerative one; it is fairly remunerative.

Digitized by Google

Q. Is there any reason why they should not be in the drug stores?—A. None at all. I think they would be very nicely situated in drug stores. I think it would be a thing they could do easily. They are employed as telegraphers a great deal. That is a very pleasant employment for women.

RICHARD J. HINTON'S examination resumed.

EFFECTS OF CORPORATE CONTROL OF THE TELEGRAPH.

By Mr. PUGH:

Question. If you have any facts which you have collected in the course of your researches in reference to special industries or industrial education, we should be glad you would give them to the committee.—Answer. We were speaking of some matters in relation to the postal telegraph, opinions that I have had the audacity to entertain. I came down this morning from the town of Newburg, and, as an illustration of the difference between a private corporate enterprise such as the Western Union and a postal telegraph run by the Government as I conceive it should be as part of the postal system, I should like to call the committee's attention to a fact or two which I learned yesterday from the editor of a Democratic newspaper there, the Register, in conversation with him. I observed in the paper yesterday afternoon and the day before a very good compilation of news, headed, "From the American Press Association." The first day that I saw it it contained a number of dispatches which I had read in the New York City papers, abbreviations of them. I made some inquiries where I was staying. The gentleman of the house was an old editor, and he told me that it was furnished by a company who took the morning papers as soon as they were issued, the earliest copies they could obtain at half-past three in the morning, made this abstract of the news, had it set up, stereotyped, and sent the forms by express ready to go into the columns to as many towns as they had patrons within the circle of accessibility. I was interested to know about it, and during the conversation with the editor he informed me that some months ago they were receiving what were known as the Mutual Union Press Association dispatches by the Mutual Union Telegraph Company's wires. They had enlarged their paper for the purpose of admitting this telegraph news, and in order to secure a larger circulation. There are two papers in the town, and and the other paper has what is known among newspaper men as the franchise, that is it has the Associated Press dispatches, which no other paper can obtain without the consent of the association of that town. The morning paper in Newburgh will not admit the afternoon paper. The afternoon paper had secured what were known as the Mutual Union dispatches. This was some six or seven months ago—I forget about the date—when the Mutual Union was merged into the Western Union, but it was about that date. The association known as the Mutual Union Press Association were entering into contracts with papers like the Newburgh *Register* and others throughout the country, making a large circuit, for the purpose of leasing wires themselves and running wires into each office and putting an operator in the office to receive the news from the headquarters in this city. The prices for which they offered to do this work I was informed of, which placed every paper independent of the telegraph office and the telegraph boys, and actually placed them independent of all the commercial business of the telegraph office. They had leased wires as far as the Mutual Union would go, and expected to

Digitized by Google

lease over the Western Union. This particular paper—and he said it was the same case in other instances of which he knew—had enlarged its columns, gone to expense to admit this news, when the Western Union Company absorbed the Mutual Union and destroyed the whole thing, and the day after the absorption they were notified that they could receive no summary of news, no news dispatches, except at the regular commercial rates, which, of course, destroyed the enterprise at once. I bring that forward as an illustration, which I think every practical journalist will understand, of the continued operation of this corporate form of control over great functions of civilization like that of gathering the news and transmitting messages and intelligence.

In England no less a person than Mr. Gladstone has said in a public speech, not once but several times, that the effect of the postal telegraph has been to remove from London the seat of public opinion and power and to transfer it to the great provincial newspapers, who are able to secure in London or elsewhere at moderate rates of transmission all the best information and the latest news from the highest sources without any effort of private corporations to destroy them.

I have taken leave to say this because I do not want to be misunderstood about the remarks I made this morning in regard to my own profession. I do not mean to infer that editors, as a rule, are slaves or, knowingly, sycophants or anything of that kind.

By the CHAIRMAN:

Q. I did not understand you to intimate that, but that they were put in the attitude of the professional man, perhaps, who advocates a cause?—A. I have no doubt at all that there are plenty of newspapers who will say I said that. They are all independent and honorable, but a man writes a hasty report, he gathers only the salient points, and it goes over the country as the thing you said without any of the adjuncts and without any of the side issues, and every newspaper in the land takes up that partial statement and pounds away at the man who makes it. I have been through it and I know it myself. How can they do otherwise?

I have the names of two gentlemen that I took down from my friend's lips. The name of the manager of that Mutual Press Association was Mr. Schoonmaker, 169 Broadway. It struck me as very strong proof that so far as free trade in news was concerned, it was a matter worth bringing out.

I have been listening with great interest to the testimony of the witness who has just preceded me, and I have some little knowledge, as Senator Blair knows, of the general condition of industrial education.

## INDUSTRIAL EDUCATION.

By Mr. PUGH:

Q. We should like to hear your statement on that subject. Give us any information you have.—A. I have done considerable work in the last few years both for magazines and the Bureau of Education, and paid great attention to that subject. I find, in discussing the question and hearing people discuss it, that there is a general mixing of two things in regard to the public schools and industrial education. One is the idea of trade schools, specialist schools, to learn a trade. Nearly every educator to-day, so far as I am able to remember, objects to the idea of the public schools being made a vehicle for teaching trades. I think myself that such an objection is an entirely valid one; but industrial education does not necessarily mean, as applied to the public

Digitized by Google

schools, an education in a particular craft or trade. It may be and it should be an education in the principles and applications in a general form which control that particular trade or that particular occupation. In conversation once with Mr. Kittle, who was formerly superintendent of public schools in this city, some years ago, when I was engaged in the preparation of a paper for the Bureau of Education, the idea he broached, if I am not mistaken, was, that after passing beyond the primary and secondary and grammar school, where the pupil wanted to go to the high school, instead of studying what the old teachers called the "humanities" and we "accomplishments," the languages, the high school should practically in all great cities or counties be divided so that a boy who was going to sea should be able to go from the primary schools to that school which would teach him navigation, commercial law, and one or two languages perhaps; that another boy or set of boys going to learn the building trades should not be taught to put plaster on walls, or to take a stone out of winding, as the masons call it when they square one, or to lay bricks in course, but that he should be taught all the scientific knowledge which could be practically applied to these pursuits, and so all through. None of these things are taught except in the vaguest and most general way in the public-school system, and a good many years of continued observation have made me believe that the public-school system of America is in danger of being doomed by an antagonism arising on account of too vague intelligence, a want of training in these directions. In my observation and investigation there are only two States in the Union that teach industrial drawing, and only one that practically makes a specialty of it. Those States are Massachusetts and Pennsylvania to some extent. I do not know of any others.

Q. There is a school in North Carolina.—A. All the schools teach a certain amount of line and figure drawing, but I mean that kind of direct training in a certain direction which will bring about certain results. I think the schools of Massachusetts do that. There is a law on the statute book of Massachusetts allowing every town of 10,000 inhabitants to establish free drawing classes in the schools for that purpose, and I think that there has been great progress made in Massachusetts in that direction, progress which is being found very effective in the practical application of designing to industrial art in the machine-shops, among the boys, and in print-works, among the women and girls.

In Philadelphia there is a very marked improvement in all these directions both, in the public schools and in private schools since the centennial exhibition there. Some three years ago I made some inquiries about it, and I have not lost sight of the threads that were in my hands at that time, but have followed them up. There has been a great increase of interest and actual practical work in the direction of ceramic designing on porcelain and in the direction of furniture designing. I was told two or three days ago that so great has been the increase in designing and painting as a commercial matter among private families, for sale, that it is the practice of several of the great potteries of Philadelphia to set aside a day or two in a week to bake the porcelain articles decorated by ladies in that city, which are made, not for private use but for sale, and that General Tyndale's store does a large business in it. He is the largest dealer in fine porcelain there.

I believe it is possible to largely improve the welfare of the workingmen and women in this country, for instance, by legislative endowment and supervision over industrial education by State, community, and nation. This country has given, through its legislation in Congress, a vast body of public lands to agricultural and mechanical colleges. Un-

Digitized by Google

mistakably none of these colleges, or hardly any of them, have done anything for women. There are four or five in the West that have systematically endeavored to educate women industrially, but for want of intelligent supervision, as it seems to me, or for some other reason, until recently there has been no achievement, except in the direction of agriculture, equal to the endowment they have received. I think Cornell University, in this State, ought to be required to establish the very school the preceding witness has urged; it ought to be so required by the State and nation; it has had enough money, it has gained enough out of the grant it has received to do just that thing.

The English system of aiding education largely tends to supplement personal and private effort or municipal effort. It does not proceed so directly in the way that we do, by the levying of taxes for a direct purpose. All through the English system you will find during the last fifteen years the most strenuous effort made to educate its artisan class. I think there has been no movement whatever from a public source in this country equivalent in any degree to that which has existed in England for the last fifteen years.

In France you will find industrial schools, agricultural, forestry, veterinary, weaving, watchmaking—a hundred different occupations—scattered all through the country, while in Paris that which is equivalent to our Patent Office is made the basis of instruction, free for the mass of the artisans of that city who choose to avail themselves of it.

In Belgium the entire country is overrun with special, technical, and trade schools; and so in Switzerland, and largely in Germany, though the system in Germany comes more near what I think should be adopted in this country, that is, the training of the mind in the direction of the avocation that the boy or girl is likely to pursue, rather than the training of the hand in the school-room. I think labor has a right to complain of the indifference of wealth in this country to all things of that kind.

By the CHAIRMAN:

Q. You have been speaking of the opportunities to receive instruction in the direction of industrial qualification of the head, at least so that that of the hand may be more readily acquired later on. I should like to know whether there is a greater or a lesser disposition among the wealthier classes abroad to help the poorer classes to the acquirement of trades and occupations for their maintenance in later life—what is the disposition of wealth abroad as compared with wealth here in that regard?—A. In some respects, if you take England and France as examples, especially England, an older state of society, in which there is accrued wealth, and in which there are thousands of persons who have not had to fight to get it, and who have not had their sympathies blunted with the struggle of trade, there are thousands of persons, large social forces, that are on the side of the social progress of labor. I suppose when we get along a little further, if we get on with the present system, and there are people who inherit great fortunes and have not been blunted in the acquisition of them, we shall probably find a lot of persons who have that feeling. There are some who do it now, it is true. I think the struggle for wealth is so new and so fresh here that people do not bother themselves, do not trouble themselves except to give out of their hand a sum of money when any wrong comes to them, rather than give their time and intellect to the correction of that wrong. I think this city is an illustration of that. Individuals in America are more liberal than public spirit is, but they do

Digitized by Google

not want to be bothered by directing their personal efforts in any direction. They will give money largely.

Q. They value their time more than their money?—A. Undoubtedly. They value their time and their energy of brain far more than they do the money they have in their pocket; and, if you go to them with any reasonable thing, thousands of persons will give you means toward that end, but you cannot get their supervision, their care. It is quite a wonder, for instance, to find a firm like the Pullman Car Company, and it is heralded all over the country that it is building a village with proper sanitary conditions, building dwellings for their employés, putting up halls having libraries, and doing various things of that kind. These cases are not uncommon in England; they are not so uncommon as to excite, as the Pullman car village enterprise does, the astonishment of everybody who comes across it. I do not say that in disparagement of Americans, because I am an American by choice and by brain, feeling, conviction, but simply as a matter of fact. I think it grows out of an older life, settled wealth, older conditions of social order more than anything else. It grows there out of the fact that the struggle of labor and capital has been severer. I was born in the midst of it, and I have followed it up all through my life. There is a struggle in England with the trades unions and the labor organizations; the fights and strikes have been severer; they have been closer together, and the men of wealth and influence in England have been obliged to do things they perhaps would not otherwise have done; they have been forced to them by the contest.

In England there is no question that the interest in industrial education took its initiative movement in the belief of the English manufacturers and of the English government that they were falling behind in the manufacturing race in competition with Switzerland, France, Germany, and Belgium. It was a purely selfish thing on their part. We have got that to go through with.

It is quite possible to supplement our public shool system—to increase its usefulness, I should rather say, than supplement it—by techical industrial training, which need not prevent at all the general intelligence that is now its chief characteristic.

Q. How, generally, would such a system as that need to be localized?—A. If we were to modify and adopt the objective mode of teaching, Froebel's, we probably should begin it with the primary school in every township in the land—if we adopted the objective process of teaching instead of the subjective; if, instead of memorizing, we taught the eye and the hand. I am not a teacher, and never have been, and so I do not want to speak technically, but I have been on boards of education, have been trustee of common schools, and know something about them.

By Mr. CALL:

Q. You said that educators were generally opposed to special industrial education, teaching the trades. What are the reasons for that?—A. They think it makes the school too much of a specialist form and not general enough. That is my judgment about it. Of course my judgment is formed chiefly upon observation and not upon practical teaching as a teacher, and upon a very careful and long-continued study of documents accessible in the Bureau of Education. I have prepared a number of reports at different times that have been published by the Bureau.

Q. Would trades have to be taught in some way by somebody?—A. Yes, sir; my idea is that the schools should prepare the boy or girl to

Digitized by Google

go to the practical learning of his or her occupation. If a boy wants to go to sea it would be a very good thing that he should learn navigation and that he should learn the elements of ship-building and various things of that kind, all of which might be taught him without teaching him to be a sailor.

Q. It would be only one step further to make a sailor of him.—A. Yes; I was, however, speaking of the public school system, not of any special school that might be adopted or set in motion by any community, because I recognize the fact that a city may have a school-ship, for instance, or a State may have a special agricultural college or a school of forestry. I am speaking of adopting the present common school system, paid for by the common school taxes of the country and open to everybody in the land.

Q. I understood you to say that in France and Germany they had adopted as part of their public system industrial schools teaching trades and the arts?—A. Germany has a very elaborate system. My more thorough knowledge would go back almost to the beginning of the present German Empire. Prussia, Saxony, Bavaria, Westphalia, and other German States will have a very elaborate system, nearly all of them, in connection with the Government. They will all have a school of forestry, they will all have a school in connection with the postal system for teaching logistics and many things connected with that. They now have in Prussia, and I think there are imperial schools in connection with the railroad system, as most of the great through railroad routes have passed under the control of the Imperial Government. Then different States and different communities will have in connection with their system of primary and secondary schools, special schools for teaching different avocations or different semi-professional pursuits. In France, as as far as I now understand, the system seems to have been more communal and local, more civic than national. In Besançon, for instance, they will have a very elaborate watch school. They make a great many watches. At Mülhausen, before it passed under German rule—I was there in 1873—there were seven or eight very fine institutions or schools for teaching the different branches of weaving, designing, and everything connected with it.

Q. Established by the communal authority?—A. Established by the commonalty in two or three instances. There were two or three great schools there started by manufacturers, but in every instance they were supplemented by communal appropriation. Two years ago in assisting to prepare the report on agricultural colleges which has recently been printed by the Bureau of Education, I had occasion to go over the French laws and I found that the appropriations made by the national assembly include large sums of money for that purpose, national appropriations for forestry, for agricultural, for mechanical, for mining, and for distinct and separate schools in various details.

Q. Are those schools confined to either sex, or do they apply to both sexes?—A. I think the larger proportion of them belong only to the men, but in France there are schools specially for women in various occupations, and there is no exclusion, so far as I remember, but I shall not be positive of that.

Q. Do you regard that system favorably; do you think well of it?—A. I do. I think it is the duty of the States in this country, and I should like to see the United States aid by a general large appropriation the progress of some system of that kind. I think it is the duty of the States to endeavor to utilize and direct more practically the enormous advantages that our public school system gives us. Take

Digitized by Google

your own States, Senators, would it not be better for the negro to learn something of the land?

Mr. CALL. Decidedly.

The WITNESS. Of the rotation of the seasons, of the crops, all of which could be taught without taking him into the field. That is my idea. Taking labor agitation, in every instance I have found all labor organizations that have stepped out beyond the mere aggressive or protective form of the lower germ of the union, supporting some idea of this kind, and I do not think that there has been that discussion and that respect paid to their wishes which, considering their number, and that this is a country run by the majority, or supposed to be, there should have been.

Q. I understand you to say that there has just been published by the Bureau of Education an elaborate report of yours on this subject?—A. I helped to make it. I do not say it is mine. I am simply speaking of that as an investigation. The reports are by the chief of the bureau. I worked for some considerable while over the latest report that was made on agricultural colleges. It was not finished by me, and therefore is not my report. I was simply employed because I paid great attention to this thing. Some years ago the bureau did print several papers of mine with my name attached to them.

## HOURS OF LABOR.

I have believed in relation to this very thing that it was absolutely essential also to shorten the hours of labor by legislation, I think, both as regards the opportunity of labor, of all toilers to achieve better knowledge, and also as one of the minor equities. Machinery has increased production immensely; it has also increased the strain upon those who attend it. I cannot give you now from memory the exact figures, but in 1870, I think it was, the New York World was publishing a series of remarkable papers on these questions, and, among others, they printed a letter from George Icarius, a tailor of London, then known as the secretary of the famous International Workingmen's Association. In that letter George Icarius stated, what I have looked up for myself since and verified to some extent, something like this—I do not give it as accurate, but I think near enough—that the vital statistics of the factory districts of England, as well as the statistics of the inspectors of factories, a system which has been in vogue for about forty years in England, Government inspectors showed, first, that production had increased to something like, relatively speaking, 80 per cent. within thirty years, or, that the profit of production, I should say, had increased, relatively, something like 80 per cent.; that machinery had quadrupled its power of production; that the cost of living had increased for labor about 28 per cent.; that the increase of wages was about 18 per cent.; and that the increase in mortality in those occupations was something about 23 per cent. That is the relative proportion; I do not give it as absolute fact.

The explanation is that forty years ago a girl or a man earned a day's wages by attending to a spinning jenny with 400 spindles, and that now he or she attends one with a thousand or fifteen hundred, and there is a greater strain. They have just as many hours of labor, or within half an hour of as many hours of labor, as they had thirty-five years ago; they do a larger amount of work; their wants have largely increased, because society has changed its form; what were luxuries forty years ago are now necessities largely; the cost of living is nearly double

Digitized by Google

what they have gained in wages; and the strain upon them in the attendance upon machinery becoming more vitalized, if I may use that term, more nervous, finer, is much greater. I think it is demonstrable as a matter of health that in all occupations where machinery is the basis of the tools, less hours of labor is a matter of absolute necessity.

Then, as to the question of profit-making, there seems to be in the present form of economic life no other way of reaching an equity in distribution so much as to lessen the hours of labor and pay the same rate of wage for it, because the profit has increased largely.

Q. Does it occur to you that that is possible to be done under our economic system as it exists?—A. It has been done in England. It may not be done by the nation, but it is possible to be done by the States.

Q. Is it done in England by legislation?—A. It is done in England by imperial legislation.

Q. Do you mean to say they pay the same rates of wages?—A. As a rule, yes, sir.

Q. There is no law prescribing that?—A. No; they make a legal day by legislation, and the organization of labor is sufficient in England, and I would it were here, to compel the payment of the same wage for the day. We have got a law on the statute-book of the United States which every administrative officer in this country thinks it is his right to violate whenever he chooses to do so. It has been violated two-thirds of the time; every quartermaster on the frontier violates it, every naval officer in a navy-yard violates it at his own choice, and nobody interferes with him. Every now and then when there is a political agitation. they go to work and enforce it.

Q. You do not apply your argument to quartermasters on the frontier. They are not machinery men?—A. No; but the eight-hour law as passed is the law of the land for all work done for the United States; the eight-hour law standing on the statute-books of the United States is the law of the land so far as the mechanical work of the United States is concerned.

Q. But what the necessities of the military or naval service may require is foreign to your argument?—A. Certainly, it is only an incident; it is not necessarily attached. The point I want to make is simply that industrial organization is being organized into higher forms everywhere; it is almost in everything; it is assuming the shape of making the units employed in it, the individuals, mere cogs in a wheel, parts of a machine, and unless the community in some way comes in to protect those units against the undue pressure brought by the action of any machine, they will simply be ground to pieces.

Q. I understand you to say that in England the prevalence of these ideas and their moral force and effect and the existence of the organization of labor have been sufficient to produce this result to a large extent.—A. It has been sufficient to undo legislation which hindered it. For instance, my father was president of a trades union when I was a lad eight or nine years old. I have heard him tell that at that period there was not a night that he initiated any member into the union that he was not in danger under the combination laws of Great Britain of transportation, of being made a convict. Agitation in England has been strong enough to break down the combination laws; it has not been quite strong enough to prevent some governors in this country proposing equally as vile combination laws here within a few years past. It has also been strong enough, as in the coal mining, within forty years to abolish old codes and customs which existed, partially local and par-

Digitized by Google

tially national, in regard to coal mining. It has swept them out of the way and it has secured for all these great trades legislation of a protective character against known evils that existed; it has secured an inspection of factories so that safety from fire and sanitary conditions are under regulation, and manufacturers who should undertake to employ persons in buildings that were unsafe in any direction would be liable to punishment; and it has lessened the hours of labor by direct enactment.

Q. Have you no such laws in the States here which are manufacturing States?—A. We have to some extent. I think the Massachusetts law provides eleven or twelve hours a day, I forget which, and has some very general provisions in regard to fire-escapes and sanitary conditions, but there is no inspection. The moment a workman or any *doctrinaire* proposes to do this, that moment there is a howl about "paternal government."

Q. "Paternal government" cannot relate to the States, though.—A. The same argument applies in the same direction—an interference with competition and private action.

Q. But how is it that in England, where the people have not near so direct and immediate an influence on the power that governs as here, they have brought about these results and our people have not here?—A. Because in the earlier days of this agitation in England everything assumed a revolutionary aspect. From 1810 until about 1850 the labor agitations were more or less revolutionary in character, property was disturbed, the country was small, there were great political evils in the state, and it was very easy to raise a row. They could not afford it, they had too strong competition, and they concluded it was cheaper to do these things. It was purely on selfish grounds.

Q. It seems to me that many of the evils you complain of are easily within the reach of labor in the State legislation of the different States.—A. I think they are, and I am glad to know that labor everywhere is endeavoring to reach these points; but so far as my observation has gone in nearly all the great manufacturing States it is the capital that controls the legislature and opposes these things. They are successful in their opposition chiefly because the average middle-class American who does not work for wages is led by the nose into believing that this is all some sort of a European howl that has been got up; some sort of communism. They all look back to the days when they were born in some little American village where, if a man had $50,000, he was supposed to be a magnate, and penury was not a common thing. They have seen their time and opportunity of getting on in the world, and they think that is the condition of society to-day, when it is totally a different condition. I met an old gentleman some days ago, who was berating the ignorance and the vice and intemperance of labor and its extravagance, and telling how he lived on so much, and I happened to know that he used to wear leather breeches when he was a young man. I asked him how long he wore the leather breeches. He said several years. I asked him if he would like to wear leather breeches now. No, he would not. Said I, "it costs a great deal more now to get enough breeches to cover your nakedness for the period you would use a pair of leather breeches, consequently you have to spend more; it costs more." Nearly all the people of middle age that I come across in the United States, American-born I mean, who are not of the labor class, seem to me to be men who have some totally different form of industrial organization from that which is now evolving in other men, certainly from that which exists in the great cities.

Digitized by Google

By the CHAIRMAN:

Q. It is quite natural they should hardly be conscious of the revolution developed by the introduction of labor-saving machinery.—A. Of course it is.

Q. You must remember that almost everybody who governs the country comes from the rural districts, and these men naturally bring with them the recollections and associations of youth and it takes them some time to ascertain the deviltries of city life.—A. I agree with you.

By Mr. CALL:

Q. Do not what you call "labor," or the people that labor, constitute a vast majority in every State? These evils of legislation must be because capital influences the laboring people in their votes.—A. Limitedly, I suppose the term "labor class" is generally employed to represent the trades and labor occupations for which a day's wages are paid.

Q. Take Rhode Island. There must be a large majority of the men of Rhode Island who work at trades. I suppose the agricultural portion of the community constitutes very few. In some of these States the trades, confining the word to the trades alone, must constitute a majority of the people.—A. Undoubtedly.

Q. And particularly when you regard them in point of intelligence, they are a very intelligent class of people.—A. Yes. I should personally dislike to see any political organization or political movement, as such, started that was based on a class issue. I should very much regret that. I should think it anti-republican, anti-democratic, and destructive. The greater body of these people are identified with the old organizations; most of them are men who have gone through some experience in regard to them. We have gone through considerable of a revolution in the last twenty years, and we are approaching, I think, another one, only of a different type and character. They are constantly being added to in numbers by new immigrants, who are not thoroughly informed, however desirous they may be of becoming so, as to American methods and means and ways. They very seldom have any newspapers of their own, and very naturally the village and town and city newspapers are under the control of the dominant forces—the respectable money-holding and money-making people.

Q. Still I should suppose that such legislation, so very evident in its necessity and propriety, as proper sanitary regulations for a factory and proper conditions of health and life in it, would meet with the general approval of any community when urged by a large body of men interested.—A. They do undoubtedly. I remember when I was connected with a Boston paper, being interested with others and going before a legislative committee where bills were passed; but most of the legislation, State or national, of that character in this country is passed in general terms without any special means of enforcing it; without any officer whose business it is to take it up, and it is very easy for men of means to manipulate, and everybody is too busy also to stay long in the channels of an agitation directed towards any special purpose.

Q. Those are only evils of detail.—A. But there is not in any statute-book of any State in the Union that I know of, any proper, complete, operative sanitary and protective legislation worthy of the name in regard to the protection of life either from fire or improper sanitary conditions. There may be, but I have no recollection of it at this precise moment. I have not looked it up during the past two years, but two years ago I do not think there was anything of that sort. Labor has a right to complain of these things.

Digitized by Google

Q. No doubt of that. I should think it would be the interest equally of the employer and of the laborer to have such legislation.—A. One would think so, but they do not seem to proceed on that basis.

PAY OF MANUFACTURING LABOR.

By Mr. PUGH:

Q. What is the extent of your information as to the compensation of labor in this country employed in manufacturing?—A. I doubt whether I have that definite information which would be valuable to Congress. I have examined the census; I have looked over various sources of information.

Q. That are accessible to everybody?—A. Yes, sir. I have inquired and talked—I have never been a labor agitator, but I have always talked with everybody who had anything to do with that sort of business.

By the CHAIRMAN:

Q. How generally have you circulated among manufacturing people and in factories and among workingmen?—A. During the past three years but little; before that a great deal.

Q. Have you knowledge in regard to the labor agitations in Europe, and perhaps of the secret organizations there?—A. Not much as to the secret organizations. I have a good deal as to the English trades unions, and as to the co-operative movements on the continent.

Q. And the relative condition of laborers there and here?—A. I have.

Q. You have associated much with the laboring people there as well as here?—A. I have corresponded, and written, and seen. I have not associated as much because I have been here for most of the last thirty years.

Q. I understood you to say you had been across the water several times.—A. Yes, sir, and always with that idea in my mind.

Q. And on the continent?—A. Somewhat. I have been in Germany, Austria, France, and Spain.

The committee adjourned until to-morrow morning at 10 o'clock.

---

NEW YORK, *Saturday, September* 15, 1883.

The committee met at 10 o'clock a. m.

PAY OF OPERATIVES.

RICHARD J. HINTON'S examination continued.

By Mr. PUGH.

Question. You were to give us your information on the subject of the wages paid to manufacturing operatives in this country.—Answer. So far as I am able to judge by statistical information, and conversation with various leading labor men, I should estimate the average wage to a man in manufactures in this country at not over $450 per year. The census would seem to show a considerably less sum, but, of course, that takes in the women and children.

Q. You exclude the women and children from your average estimate.—A. When I put that estimate of $450 it is for adult males. I find by the last census that there were 2,742,595 persons, men, women,

Digitized by Google

and children, employed in manufactures in the United States. I find that there was $947,953,795 paid in wages for the year 1880; and my calculation would show that that is a little over $300 per capita. I put it at $321, and estimating the difference between adult men and women and children I should calculate that the average wage would be about $450 a year for adult males. The average employment could not exceed in most trades from nine to ten months per year; in many trades less than that.

Q. Is there any difference in the pay of operatives in cotton and woolen mills, and in silk manufactures?—A. I cannot tell that. I have not recently gone into these figures. There is a difference between operatives employed in factories of any kind and those employed in iron foundries and occupations of that character favorable to those employed in iron manufacture. They get large pay.

Q. That is a much harder work, is it not?—A. Yes, sir; they get larger pay and, as a rule, more steady employment. The coal miners in this country, I think, do not average over seven months' work in the year. They certainly did not in 1871, 1872, and 1873, when I was familiar with them by being sent there to investigate the strikes. My recollection is that at that time the average of a good miner, his own pay, irrespective of what he paid his laborers, would be about $85 or $90 a month.

EFFECTS OF MACHINERY.

Q. I understood you to say yesterday that the management and running of machinery was a greater draft upon the physical powers of the operatives than was made before the invention of machinery?—A. Not quite that; I was comparing earlier machinery—more imperfect in character at the beginning of the factory system—with later machinery. You will remember that I said that I referred from memory only to an article which appeared in the New York World and had myself verified afterwards.

Q. Is that the fact in reference to the machinery now in use?—A. My statement is that the machinery now in use is of a finer and more nerve-wearing character than that which was in use forty years ago, and it makes a greater draft on the vitality of those employed now.

Q. What machinery do you refer to?—A. I was speaking at that time, because the figures and illustrations that were in my hand were those, of cotton factories. I used this figure, you will remember, that a girl would attend a spinning jenny or mule, whatever the technical term is, on which there would be 500 spindles years ago, whereas she would now attend one in which there would be 1,500.

Q. I was in the cotton mill at Ashton, R. I., last week, went all through it and females were mostly in charge of the spinning-jennies, as they are called, and my attention was directed to the fact that those females were in charge of two and four spinning-jennies and most of them were sitting down comfortably and merely watching the running of the mule. There did not seem to be any strain on them whatever. As long as I was there they were sitting down comfortably and the machines were doing their part very intelligently and perfectly, and those who were attending them were seated there merely viewing the work. That fact struck me.—A. I made my statement from the recollection of this argument, which I have not examined recently, but which could be obtained, I suppose, from the files of the New York World. It relates, of course, to English manufactures in the main, and it is sustained by the vital statistics and the factory inspectors' statistics of that

Digitized by Google

country. It was used there with great effect I know in arguments before a committee of the House of Commons to secure a further shortening of the hours of labor and to prevent the employment of young persons. My recollection of the discussion is—of course I may be mistaken after the lapse of ten years—but it seems to rest in my mind that the argument of Mr. Icarius, backed up as it was by the figures, was a very considerable factor in securing the passage of the present law existing in Great Britain whereby no child under fourteen years of age can be employed unless it has gone to school a certain period in the year, and then only for certain hours, less than the average, and none under twelve years can be employed at all, even by parents, in steady, continuous labor.

Q. The machinery for the manufacture of silks and silk velvets I understand is more complicated and requires more attention. Is that the fact?—A. That would be my impression. I have not personally examined it for a long period. I have been through silk factories, but I have not made any special examination of them.

## EDUCATION IN THE UNITED STATES.

By the CHAIRMAN:

Q. You have been connected with the Bureau of Education, at Washington, and have prepared a great deal of special matter. Will you take a few minutes to give us your understanding as to the actual condition of education throughout the country. I have got sick of divisions of the country into North and South on the educational question myself. I look upon the condition of the Northern States by reason of the dominance of great cities, especially in those States and their condition, as quite as dangerous in that direction as the condition of the Southern States; and I am sick of the distinction of the country into North and South on the educational line or issue. I want you to go over that matter of the condition of education in the United States, as you understand it, and what is being done; what is the existing public sentiment on the subject; whether alert and powerful, as it ought to be, whether it is aware of dangers, if there are any, that seem to be approaching and threatening; and what is not only the tendency of thought but the tendency to the adoption of particular measures in the promotion of the interests of education throughout the country, either State or national?—A. Taking twenty-five years of observation, I should say that there was not in the rural districts of the country any less personal and direct interest in the welfare of the common school than formerly, but that in the growth of the large cities and the large towns, and the increase of the modern system of industrial activity, profit-making, and competition, there is a decided lack of interest exhibited by what are so often termed the better classes, because they have more money. I have found that in my journalistic experience in cities where I have lived, from this city and Boston to California, and in the South somewhat, though not to so great an extent there. Among the labor and middle class, if we may use those terms, there is as much interest as ever, but the interest seems to me not to go deep enough and to pay but very little attention to the administrative details of the system. In the large cities one tendency that I have found, especially in new cities growing rapidly in the West, is towards a shoal system of education, to pay large salaries to principals and small salaries to teachers; to make the high school of great consequence and the primary school indifferent; to build fine buildings and furnish them well for the higher class and care very

Digitized by Google

little for the condition of the children who belong to the primary division.

I believe that whatever corruption there may be in the administration of the school system rests in isolated circles and circumstances in that direction; in the building of the schools; in the payment, compared to other salaries, of extravagant salaries to principals; in the encouragement, in Western cities especially, of studies that are not really vital to the fundamental idea of the common-school system. I should instance San Francisco for one, and other places might be named where that sort of thing is to my mind very apparent, where it has become a sort of advertisement to build a very expensive school-house for the grammar and the high schools, and to care but very little for the character and condition of those that are to accommodate the primary scholars.

Q. What have been your opportunities of knowing in regard to San Francisco?—A. I was there for three and a half years as editor of one of the daily papers, and paid very considerable attention to the working of the school system, made personal examinations, wrote these criticisms, and applied them to the community while I lived in it.

That objection is seized upon, particularly there, by church and tax-paying interests to oppose and deride in a large degree the whole system of common schools, to try to reduce them to a mere teaching of the "three r's," as it is so often said, and I think a wasteful administration in many of these directions is a potent instrument in the hands of sectarian and capitalistic influences that are indifferent to the schools, and also to those with old associations who have not had much interest in past years in public schools at all. I have seen it in other States and other sections. I have seen it in Massachusetts even, in less degree, in the same way.

I find generally throughout the country, in the towns and cities I am speaking of, largely a lack of proper and complete accommodation in the primary departments. I have seen the statement made as to this city that there are a number of thousand children who cannot obtain accommodation in the public schools. If I had my own way I would not allow a dollar to be expended in any species of education till there was a desk and a seat for every scholar in the country in a primary school. After that I would educate up to the university, if it were necessary, but I would not allow a single dollar of public tax to be expended anywhere under any circumstances, for any purpose except that of first providing for the accommodation of scholars in the primary department.

Q. I suppose you would consider an essential part of that system the education of competent teachers to instruct them?—A. Of course. I want to say there that I found by my observation recently in Texas, and by travel at different periods during the last fifteen years through the South, a very great and a very beneficial change, a desire on the part of the ruling forces in the Southern States to establish normal schools and schools of higher training for teachers. Texas has eight or ten normal schools proper for the whites and four or six for the colored people. I think it has that number of institutions. It has two or three large ones, and there are smaller ones that are put aside in divisions of the State. During the last summer it has maintained what it calls normal classes at different points in the State during the vacation of the public schools, for the training and education of teachers. I think it is doing more in that direction than it is really doing in the direction of establishing full and complete primary education, but whichever way

Digitized by Google

they begin I am perfectly willing they shall go forward, because I understand that it will bring about the same result.

Q. They might begin at both ends?—A. That is what I would do. The State administration before the present one in Texas was under the control of a very estimable old gentleman as governor, who had a very strong opinion, and he was able enough to impress it on the legislature, in opposition to the public schools, and during his administration—Governor Roberts I speak of—the establishment of schools through the State was greatly hindered. Under the present administration I am satisfied that every effort is being made in that great State of Texas to organize the common schools of the State as rapidly as possible. The newspapers of Texas—and they are quite able—are universally strong advocates, without much regard to politics, of the establishment and maintenance of a proper common-school system. I found the same thing, I think, in Arkansas, and not to so marked a degree in Louisiana, but still marked. That is my more immediate observation in the South, because I have been in the Southwest in years past. I saw the beginning of it, and watched it go along as an observer by traveling from Washington occasionally to the South and by studying their documents.

I have believed, and still believe, that there ought to be a wider and deeper interest felt among all the people in the maintenance and proper conduct of the common-school system. It seems to me that there is a lack of that in many directions. That is the first thing I found.

The second thing, I should say, was that there is less interest felt in the primary departments than there should be, and more interest in the upper schools, with their accomplishments; that in all our cities there is a lack of room and proper accommodation for the primary and secondary schools, especially for the primary; that the growing pressure of the present system of combination in all occupations—and when I say "combination" I do not decry it, because I understand the economic law tends in that direction, but it is now entirely applied only for the selfish side of individual profit-making, and without any protection to the mass of the people whatever—has a tendency to fasten labor more and more into grooves and classes, as has been done in the Old World; more and more to make the cobbler's son a cobbler and the tailor's son a tailor in the cities, and that the pressure of the struggle tends to make workmen take their children away earlier from schools; that as it goes on they go less to school than they did formerly, and they learn less, and they have less interest in it, grow up more ignorant; they are satisfied with a very superficial amount of reading and writing. I think, to a very great extent, the columns of illiteracy in the census are misleading, because practically a very much larger proportion of persons is illiterate; they know but little; they are a little like the Prussian peasants, who are forced to go to school for a certain period, and yet when they come to be thirty years of age can hardly read and write. I think there is a good deal of that sort of superficial education. My correction of it as to labor would be to give labor a greater interest in the schools by training in the direction I said yesterday, by making labor feel that the years spent in the school-room were spent more distinctly for purposes which would help them in their struggle of life, to give them the opportunity of developing in the direction of the occupations that the boy and the girl will be likely to follow. Most boys of the wage class at ten or twelve years of age have a very distinct idea of what business they are going into, and they would have a still more distinct idea, in my judgment, if they knew that in the public

Digitized by Google

schools they could get a training in certain directions. I think that is one of the things needed.

Q. In order to accomplish that it would be necessary to have teachers qualified and therefore previously instructed in the normal and other schools, so as to be able to adapt instruction in such a way as to be suggestive of the application of the principles that appertain to the avocation to be followed?—A. Yes, sir; teaching is a wage-labor system and requires training just as much as iron-making and perhaps a good deal more. The teachers need to be taught and trained, and therefore the normal school is a necessity in all its directions. Intelligent supervision is one of the very great features, as it strikes me, of a proper school system. I think particularly in the South the greatest mistake that was made when certain political changes occurred a few years ago was the dropping almost universally in the Southern States of the idea of superintendence; whatever the motive was, I think it has been generally resumed in almost very State. State and district superintendents are now elected or selected and are kept in place. I think some years ago they pretty generally dropped them out of existence. Everywhere wherever there is intelligent and close supervision there will be found to be better and more active teachers and more interest among pupils.

I should like to say for the Bureau of Education at Washington, in which I have been personally greatly interested, that I think it has done during the period of its existence a great service by its gathering of statistics from all the various school systems, by its presentation of the different and differing laws of the States, by enabling educators and teachers through the documents that have been issued to see the points of excellence and the points otherwise, and so to compare, and that without any operation of law whatever, simply by the evolution of common sense, comparison, and observation—not a uniformity, but a certain regularity or interchange of systems is going on all through every State in this Union in the machinery and administration of the public schools, a result which I think is due almost entirely, probably entirely, to the systematic gathering of statistics, the comparisons which have followed, and the distribution of the documents which the Bureau of Education has been authorized to publish. I have talked with a great many educators, superintendents of cities, on that point at different times. I have always had a considerable interest apart from any work I was doing, and wherever I was working whenever I could I have talked with men interested in the administration of the public schools, and I found that statement generally accepted by them, that the publications of the Bureau of Education at Washington have greatly facilitated their work in enabling them to see the points of excellence in other systems and so to enable them to adopt them. It has been a sort of national exchange of ideas and facts in regard to education. It has been done without any interference with any State system, because there was no power to do it. It has been done simply by knowledge acquired.

Q. I might say myself on that point that I have been brought in contact within the last two years with the superintendents of education of nearly, if not quite all, of the Southern States and many of the Northern States, and the warmest supporters I have ever found of the Bureau are the superintendents of public schools in the Southern States at the present time with not a single exception.—A. That is my own judgment. I was at an educational convention in Kentucky and one at Saint Louis within a few years, and I met a number of gentlemen in Texas interested in the school system, and I found that.

There are two hostile feelings apparent, it seems to me, to any ob-

Digitized by Google

server towards the public school system almost everywhere, neither of which I regard as absolutely formidable, provided there is proper attention in every detail to making it as broadly useful as possible. Those two hostilities are sectarian feeling in certain directions, the belief that the secular school is a Godless school among large and important sects, not simply one, but several; there is no occasion to mention or to particularize. The other is that there is a distinct indifference among people who own large quantities of property that necessarily bear heavy taxation, as real estate, who wish to avoid their share of the obligation, who cavil at the taxes, and make points against the system. That selfish side of the capitalistic influence is in many places growing, and is more distinctly exercised against school taxation. I do not believe that either of them is formidable enough to seriously injure the school system of this country, except by its own laches, its own neglect, and the indifference of large bodies of citizens towards the welfare thereof.

I should myself insist, first, as I said, upon the fullest and most complete accommodation for the primary departments, upon giving a more practical training to the education achieved there, and to preserving with rigid power the inspection and supervision, first, of the municipalities, secondly, of the State, and, if not unconstitutional, wherever the power of the National Government would come in there. I would like to see in every State of this Union a State university like that of Michigan open to the scholars of the public schools, free when they have the wit and the courage and the energy and the capacity to go there. While I want the primary school as broad as the country itself, I should like to see it crowned with the free university so that everybody can go to it, and I should like to see the State support that too. I think the tendency is directly in that direction in all the Western States.

I have had occasion during the last two years, by the examination of documents and otherwise, to look into the condition of the agricultural colleges, and it strikes me that the larger portion of them are not doing as well as they ought to for the endowment they have received from the country. One reason, perhaps the main reason, for that is that there is no intelligent or positive supervision through the officers of the power that endowed them. You cannot enforce a report from an agricultural college. They send a perfunctory sort of statement once a year to the Secretary of the Interior, I believe, who sends it over to the Bureau of Education; but unless that college is actively and vigorously managed the report is not worth anything. One-half of them are below the average of private college schools in the information they contain. Some of them are very fine. I remember the Cornell University for one, which was organized on the basis of the agricultural land grant; I remember the Minnesota University for another, the Michigan University, the State Agricultural Colleges of Iowa and Kansas especially, as presenting reports which I examined with very great interest and very great care, because they were so full and so complete. There were other reports—I would not like to be invidious, but I remember those distinctly as showing that the benefits they had derived dwelt in the minds of those who were making the reports as something that they had to be grateful for and they wanted it known what they were doing.

It seems to me that the agricultural colleges with their large endowments might be made a great deal more popular and a great deal more accessible and far more useful to women than they are. There are not more than half of them that really heartily and openly admit women to their advantages and benefits. There are some of the other half that pretend to do it, but they practically administer against it, and a large

Digitized by Google

proportion of the one-half refuse to receive women students at all. I think it would be perfectly within the purview of every college in this country that has received public lands from the United States to be compelled by the law of the United States to have a school of industrial art to which women could be admitted. The agricultural colleges, for instance, were organized so as to aid the military development of the country, and I observed that many of the presidents in making their reports argued against the admission of women because they were incapable of military duty. Those of us who went through the war know that there is a large amount of military service, though not of arms, that women can do more effectually. If we happened to get shot we were very glad to have women in the hospitals, and it would not be a bad thing to train them for nurses. They can make lint and do a thousand things. If it is necessary to maintain the military idea in the agricultural colleges there are duties that women can perform should a necessity arise in the care of the wounded and a thousand other things that belong to war.

The CHAIRMAN. They are called "colleges of agriculture and the mechanic arts" usually, are they not, taking in, in fact, the whole circle of industrial occupations? But speaking of agriculture especially, there is the scientific side too, what woman does upon the farm as well as what man does. The products of the dairy fall under her manipulation before they are actually consumed, quite as much as that of man; she prepares the food that is raised on the farm and its preparation is as essential to its use as its growing. The same observation applies to the productions of the dairy, animal life that is subjected to human uses for sustenance and the like. In that direction it seems to me the agricultural colleges might do as much for woman as for man and be within their just purview.

The WITNESS. There are some of them that do. I think the Michigan Farmers' College, which is the recipient of the agricultural grant does. I know personally that the Kansas Agricultural College at Manhattan does, and the College of Iowa. Those three are notable for the very close and comprehensive and complete way in which they train the women students for all domestic duties and for all the work and the knowledge that underlies farm life. They pass through a course in regard to fruit, for instance, not only the preservation of the fruit, but also as to the cultivation of fruit; all the small fruits. In the Iowa college there is a regular class of women students, and has been for several years, who are trained especially to the cultivation of small fruits. They learn all that relates to the dairy and the chemical and other scientific studies that belong to it, and they have classes in household economy and household science and household decoration. I have seen in the Kansas college the women students take carpenters' tools and repair articles of furniture, light work, things that have to be done around the house, with quite the same skill, and more so perhaps, than the men, being less clumsy. This is taught to them. In addition to that they learn printing and telegraphing in these colleges, if they wish. The system in the colleges I speak of is very thorough in regard to all the duties of a woman on a farm. They take lessons in landscape gardening and also attend lectures on farm architecture, ventilation, sanitary science, and duties of that kind.

It seems to me there ought to be no difficulty whatever; but there will be as long as there is no sort of supervision, because the agricultural colleges are not under State supervision and there is no supervision by the nation which gave them the endowment.

Digitized by Google

By Mr. CALL:

Q. Why are they not under State supervision?—A. Nominally the grant was given to the States, but practically the school superintendent of the State does not undertake to regulate the agricultural colleges or to examine them.

Mr. CALL. The State has authority to regulate them by law. The land donations were made to the States and the States have ample authority to regulate the matter.

Mr. PUGH. The Agricultural and Mechanical College of Alabama is under the control of a board of trustees appointed by the governor of the State, and I happen to know personally that they are very efficient men, all of them. The agricultural and mechanical college at Auburn, in Alabama, is now under the wisest and ablest and most intelligent supervision and management.

The WITNESS. Possibly so. I am not speaking of any one State, you will understand me.

Mr. PUGH. I only mention that as to Alabama.

The WITNESS. I speak generally, simply as a result of the study of hundreds of documents.

Mr. PUGH. I do not object to what you have stated; it is very correct wherever it applies.

The WITNESS. I remember as an illustration in one State how difficult it was to obtain a correct statement of the exact amount of funds that belonged to the agricultural department. It took me three weeks of correspondence to get it. There had been some changes of bonds, and the amounts were differently stated, and nobody seemed to know. I got it finally within a few dollars. Even in Massachusetts, where organization of that character seems to be higher than in most of the other States, I found something of the same difficulty. I found a difficulty there in getting the exact account between the Technological Institute of Massachusetts and the college at Amherst. They have divided the fund, given a portion to the agricultural school or college at Amherst, and the balance to the Boston Institute of Technology, for the mechanical department. It was difficult, and it is still difficult, to ascertain exactly what the amount of money that has accrued from the United States grant as between that and the various grants and benefactions that have been given by the State and individuals to these institutions. That is one thing.

I should like to see what I believe a public feeling is generally tending to favor, I should like to see the Government of the United States devote a certain portion annually for some period of time to the several States or direct, whichever way the wisdom of Congress might finally determine that it could be done most properly, in aid of the removal of illiteracy. It is an appalling fact to see 49 per cent. and 53 per cent. of the population of a State reported as illiterates, and to see of a special class, as in your own State, Senator, 74 per cent.

Mr. PUGH. Yes, sir.

The WITNESS. And I think we owe it to them; I think the people of this country owe it to the South, and especially to the colored people, that they should do something collectively to help that thing. I believe that every step of this kind is a help to labor; it certainly is a help to education, and the solution of all the troubles that seem to be pending in this agitation is largely through a larger intelligence practically directed, and to bring out every part of it into the light of day and discuss it. I do not know any reason why a man who holds the opinion that it is possible by law to abolish poverty should be denounced through

Digitized by Google

a land where there is free discussion as a mad dog would be followed, be termed a "crank," a "communist," or something else, as in old days we used to term in one section a man who entertained one opinion an "abolitionist" and another a "secessionist," and deride and denounce him. I know no reason why the narrow, intense, strongly-thinking man who perhaps has not had the broad opportunity of seeing all sides of a question, is to be set down as an enemy to public order because he does not happen to believe in the conceived notions of society. It may be that his doctrines would bring disorder, but the best way is to bring them into the light of day and discuss them as you are doing now, and as the newspapers throughout the country, as a rule, are not willing to do.

By the CHAIRMAN:

Q. They will be more willing by and by?—A. Oh, yes.

Q. The world starts slowly, but it goes after a while. You have been living for a while, recently and considerably during the last quarter of a century, on the Pacific coast and in the Territories of the Southwest and Texas, and that part of the country. If you have had occasion to know anything about the land-grant system in its practical operation, I should like you to give us an account of it, and what you know especially in regard to its existing condition and operation in the Southwest.

RAILROAD LAND GRANTS.

A. I have just come from the border of Mexico, and have spent some eight or nine months in the Southwest; have been there several times before and spent a considerable time. During the present visit my attention has been called very distinctly to the condition of that portion of the public domain that might be called the arid region, the dry zone.

Q. Are you acquainted with the "Guide to Arizona," or some book published, giving information largely on that Territory?—A. I wrote some years ago and published myself a hand-book to Arizona.

Q. That work is an authority, I know, among mining people. Are you the author of that book?—A. Yes, sir.

Q. I recollected in regard to it, and the name was the same, but I did not know whether you were the author.—A. Yes, sir. I have been in New Mexico and Arizona and Texas—of course Texas is outside the public land system of the United States—as well as in other portions of the central West. I find that whatever may be the causes, in my own judgment it is the rectangular system of surveying and of laying off public lands, which is so admirably adapted to the prairie States, which is the cause to a very large extent of a system of unlawful monopoly of the land in the cattle or grazing regions, the dry regions of the Southwest, especially in Arizona and New Mexico. There is a great scarcity of water, and the man or men who can get possession of the water holes, the springs, and the very infrequent running streams can, of course, command the entire control of the vast dry lands upon which the cattle graze. They will go 15 or 20 miles to water. The whole of that mountain plateau region—for it is that—at an altitude of from 3,000 to 7,000 feet above sea-level, putting aside the peaks, is covered with nutritious grasses or feed for cattle everywhere, speaking in the broad sense. There are, of course, large fields of rock and lava, as on the upper part of the Colorado plateau there is a basalt field, the result of some great volcanic eruption, running from 300 to 400 miles east and west, and an average of nearly 200 miles north and south, which is

Digitized by Google

almost utterly and entirely a desert. Below it and above it and largely throughout the whole region, this land is covered with sun-cured grasses, the black gama and others, on which cattle feed. If they can get water, it is the most nutritious possible of food for them. Now, in Southern New Mexico at the present moment, and largely in Southern Arizona, there is a system manipulated by shrewd men. A California firm very well known on the Pacific coast is said to be one, and two or three companies or syndicates of Englishmen, who are not citizens of the United States, who are aliens, and who, under the public land laws, cannot hold, occupy, or possess, are practically the controllers of enormous areas of land in Arizona and Southern New Mexico. I have names and dates, which I am about to send to the Commissioner of the General Land Office with a view to use by his special agents, and would, therefore, rather withhold them from public statement.

The *modus operandi* is this: Silver City, N. Mex., for instance, is the headquarters of a large field of operations. The agents who are there of the California or English syndicates—and among the English syndicates are sons and nephews of members of Parliament, whose names are known to me, and whose persons are also known to me—will obtain knowledge of the existence of a spring or water-hole or running stream or a little body of water that they would call a lake, but we should scarcely call a pond. They will find the whereabouts of these bodies and approach some impecunious and accessible man and ask him why he does not pre-empt. The answer will be that he has no money. They say, "Well, that can be overcome; it will be a good thing for you to pre-empt such and such a place; it will be valuable to you. How much money do you think you need? I want to help you." I am speaking of an actual occurrence. "Well, I cannot go on there and complete my pre-emption under $500." The pre-emption laws presuppose that the man goes on, occupies the land in good faith, builds his house, makes improvements, turns up the sod, builds fences, and does other things to show that he intends to live on that 80 or 160 acres of land. The 80 or 160 acres pointed out to him will cover the water. There is no water in the particular instance I am speaking of within 12 miles in one direction and 16 in another—no water on the surface. Five hundred dollars would be loaned, a note of hand taken, and to it added an obligation that at the end of seven months any property of which the person to whom the loan is made should be seized or possessed should be held as security for that loan. The pre-emption would be made, the person would go on, build an insufficient and make-shift cabin, put up a temporary and make-shift line of fencing over a few acres of ground, do something, spade it up or have it dug up, and put some cattle, perhaps, on it, and wait for the time to expire, which, I think, is six months. At the end of six months he appears before the land office and swears that he has entered on that land in good faith, that he intends to make it his home, that he holds and occupies it as an agricultural or pastural holding. He then proceeds to complete his pre-emption and pays his money. He is in possession of the money. There has been no direct perjury so far as the operator is concerned. He has not told him that he wants him to pre-empt for him, but he has suggested to him a means by which he could better his fortunes and has kindly loaned him money to do it with. As soon as the pre-emption is completed, of course the agent appears upon the ground to know what the man will take for his place. In the case I am thinking of a thousand dollars was asked. There was an intimation that $500 would be added to the first $500, and the $500 in money was paid, and the note returned canceled. The spring or body

Digitized by Google

of water, quite a valuable body of water, passes into the hands of a firm of California land-owners, who in that way are holding to-day, as far as I have been able to ascertain, not less than 8,000,000 acres of public lands in Southwestern New Mexico and Southeastern Arizona.

Q. A single firm?—A. That single firm in different bodies and patches.

Q. Have you any objection to giving the name of the firm?—A. I would rather not do so, as I intend to do so to the legal authority that can examine into it. The Commissioner of the General Land Office has special agents, and one whom I know is making a very effectual examination of these things, and it would be better for me not to give the names here.

Q. This information is valuable to the Department and therefore withheld by you?—A. Yes, sir. It will probably appear officially in the reports of the agents. I am only speaking as a citizen.

Q. Very well.—A. I have been told—I do not know it of my own knowledge by any verification—that at the present moment agents are in London endeavoring to sell the possessory title, so called, of about 2,000,000 acres of land for a cattle ranche in Southern New Mexico, the only title to the possession of which is this moral perjury obtaining some three or four water rights by pre-emption.

The condition of the land there is such, its topographical features, the climatic conditions are such that the system of public lands now existing does not, in my judgment, properly belong to that region. I think we might with considerable profit study some features of the Mexican land laws in regard to that. They allow renting from the State governments or the denouncing, as they call it, of a certain area, about 4,000 acres of land for a cattle ranche. It has been found in the general formation of the Sierra Madre region, which is not very greatly different from that of our Colorado plateau and Rocky Mountain region, that where a water-hole or spring or surface water of any kind can be accessible to a moderate number of persons for their cattle, holding areas of that kind—I forget the Mexican term—the use of the water is regulated.

There is another thing of very considerable importance that I might mention. This system of obtaining through the water rights control of vast bodies of land for grazing purposes upon the northern frontier of Mexico has during the past two or three years tended considerably to bringing about breaches of the peace, and might, had there been any unwholesome or ill-feeling between the two republics, have been very readily blown into causes of war. I went out into that country in the employ of the United States Treasury this last time, charged with an inquiry into the cattle-smuggling, which was, of course, all the Treasury could do. I made as large an inquiry under the orders I received as I could. I found that, far more than cattle-smuggling, cattle-stealing from Mexico was the great danger; that this unlawful possession by men who had no personal interest in the community encouraged the lawless actions and profit of the cow-boys and the rowdies of that region; that they made a place for the disposal of cattle. I formed a judgment after considerable observation and a great deal of travel and inquiry, that in one valley, so called, Cienega, or Crazy Plain, where the water lies near the surface, it is more green than the average land, that in that valley alone there could have been rounded out not much less than a score of thousands of stolen cattle from Mexico, none of which, or very few of which, had paid any duty to the United States. I do not know whether the remedy is a local one or a Congressional one. I talked with the governor of Chihuahua and the governor of Sonora, the present governor—he was then secretary of state—and with consular officers and customs

Digitized by Google

officers on both sides of the line. The remedy seemed to be in the system of patrols, which are largely maintained on the Mexican side, and in the preparation and interchange of cattle-brand books, as in Texas, so that the officers of either community could follow up these cattle. General Crook's operations against the Apaches and the Apache raid undoubtedly put an end to this smuggling and stealing for the time being on the border, but when things are quiet again, unless there is some force, it will come up again.

This grasping and grabbing of the public lands in this way has in those regions an incentive, because it is a measure of profit. Men who will get public lands in that way will not be over-anxious to investigate whether brands have been recently removed from the shoulders of the cattle that they buy. They do not do it.

There has recently been investigated in New Mexico a system of homestead settlement that is used in the same way for the interest and the advantage of large land-owners and not for the purpose the law was passed for. I believe there is a very valuable report recently sent to the General Land Office on that subject. Mr. Eddy, the agent, has prosecuted a number of the fraudulent settlers and broken up a good deal of it. In one county in New Mexico he has restored sixty or seventy thousand acres of land to the public domain as being unlawfully occupied under the homestead act.

Q. In regard to the wholesale appropriation of vast bodies of land which results from getting control of the water, what change in the land laws do you think should be made—some by which the water rights should be made common to the entire tract that naturally depends on them?—A. That is certainly one and, perhaps, the primary condition. The Territory of New Mexico has attempted to deal with that question legislatively, and provides that there shall be no shutting off of cattle from water, but from long observation, from great travel over that region—I went to Kansas during the free-State struggle and from there to Colorado, and across the continent to California, and I have been up and down that mountain region 20,000 miles; I know something of topographical engineering, have observed and watched it all I could—my own feeling and judgment about it is that the water rights in that dry country ought to belong to the community, to be public property under the care and direction of the public, the counties, or States, with proper engineering direction, so that the supply now existing could be utilized for all the people there; and the constant study which would follow in relation to the sources of water would tend greatly to increase that supply. There is something of that sort, though not in as positive a form, existing in the State of Colorado. There is a system of water supply and irrigating-ditches, &c., which is largely benefiting that State, a step in the right direction, and it has resulted very greatly in increasing the water supply, because the persons employed to superintend have given study to the subject and have learned all the peculiarities.

Q. To what extent has this appropriation already gone relatively to the amount of land remaining that is valuable?—A. In some portions, some restricted portions, of New Mexico and Arizona it has gone to a great extent. Taking the whole area of those Territories, of course it is comparatively small.

Q. The whole area of land which may be improved in that way would ultimately become valuable?—A. Southeastern Arizona is for all cattle and settlement purposes very much better than other portions of the Territory, except along the valleys of the few rivers, and it is there where, of course, the more obvious evils prevail. Southwestern New

Digitized by Google

Mexico, on the east side of the Chiricahua Mountains, is also very much of the same character, and there are large mining interests and considerable small camps and towns through there, and it makes the land valuable for that purpose.

Q. Is that country available or open to profitable employment except by the investment of large sums? Is it a natural home for men of small means?—A. I have said that I do not believe the present land system is adaptable to that region. I think, first, that the water should be preserved to the public, and, second, that the divisions of the grazing land should be larger than now exist. I think we might with some profit make modifications of the Mexican laws on that subject.

Q. If that is done you think it would be available for settlement by men of small means?—A. Comparatively small means, not so small as the settlers who have gone on to the prairies of Kansas.

Q. To what extent is the railroad land-grant system an element in the land problem of the southwest of this country, if at all?—A. In the Territories of New Mexico and Arizona two land grants lay claim to nearly two-thirds of the territory, and the best of it—the Atlantic and Pacific and the Texas-Pacific. The Atlantic and Pacific is being built, and I observe that under the law and custom commissioners are now receiving the last sections to the Colorado River, or are now examining to see whether the Government will receive them, so that the land grant can be turned over. If you had a map of the Land Office here you would see what an enormous area those grants cover. In the southern part of those Territories the Texas-Pacific grant, if it has any existence, would take away at least fifteen million acres of land.

Q. How valuable is that land?—A. As it stands now, the larger part of it is of very little value; that is, a considerable portion of it would apparently have very little value. From the town of Yuma, on the Colorado River, to Maricopa Wells, on the line of the present Southern Pacific Railroad, a distance of about 194 miles, the road passes along a gravelly mesa, or a secondary mountain plain, which is covered greatly with scoria from volcanic eruption. There is grass on it for miles and miles, and cattle could make a living there, but it is not very valuable. On the north side of the road the grant would take in a portion of the valley of the Gila, a valley running from its cañon origin to where it empties itself into the Colorado for a distance of nearly 400 miles, ranging from nearly 2 to 12 miles in width, which is so fertile that a chemical analysis of it shows it to possess more fertility than the soil of the Nile, on which any grain, fruits, or sugar-cane can be raised. That grant would take in nearly the whole of that valley not yet occupied by settlers. The Pimos and Maricopa Indians hold a long tract just beyond Maricopa Wells, in fee-simple for their tribe, about 24 miles long by 12 wide, I think. They have been there ever since the memory of the white man runneth and long before, according to their own traditions, and always cultivated the land, always raised grain and fruits. Beyond Maricopa Wells the land assumes a different character; it has heavier grass, and for a considerable portion of the way there are broad stretches of what I have just called cienega, crazy plains, beneath which water can be reached at a moderate distance. There are long stretches of it. Then again, there are great stretches of apparently perfectly dry and mountain plateau, but there is not a mile of it that cattle cannot feed on and get fat if they get water. So through New Mexico there is the same general appearance.

I know something of the building of the Southern Pacific Railroad through that region. I have no doubt that the book I wrote—though

Digitized by Google

I did not write it for that purpose—on Arizona was used by the Central Pacific syndicate and managers to get their first loan in Germany of $12,000,000. It was the first book that had gathered all the facts as far as they were accessible in relation to that region, and it was utilized to show that it was a region worth running a railroad through. I have been told by men connected with the California Central Pacific that that was the fact, that they utilized my book in Germany. I had mining interests at that time in Arizona, and I, of course, was greatly interested. I followed the line of the road down, went up it to Yuma, on the first train across to Tucson, on the first train that crossed the entire Territory, on the first train that crossed with passengers. I have ridden on horseback through and through it, and in coaches and sometimes have gone on foot. My own belief is that the road has been fairly built by the money of the company, and that it is to a large extent in a fair way of paying its way without the need of a single acre of public land. There are miles of it that were built in California for no other purpose whatever than to keep the Texas-Pacific out of California. Proper engineering would have turned the Southern Pacific of California almost due west from Colton to the Colorado River, where a branch is now running, or above on the Mohave Desert, to where it now runs to meet the Atlantic and Pacific. The California people have built a road from a station on the Mohave Desert clear across that desert and over the mountains and through to a point called The Needles, on the Colorado River, where the Atlantic and Pacific runs, and to which it is now completed. They have built to the California side, the Atlantic and Pacific having built the bridge across the Colorado River. The object of that is to keep the Atlantic and Pacific corporation out of the State of California. When they first built the Southern Pacific in California they built from Mohave or Colton, through the Colorado desert, the bed of an extinct sea, for about 260 miles to Yuma, and across that gravelly region, of which I have just spoken, for one hundred and ninety-odd miles. The general impression among railroad men whom I have talked with is, that the whole of it was built unnecessarily for the simple purpose of keeping the Texas Pacific or any other road from reaching the Pacific coast at San Diego. It accomplished that purpose for the time being.

Q. I suppose you are aware that the Southern Pacific and the Texas-Pacific were chartered about the same time, that the enterprises were undertaken about the same time, and that the Southern Pacific was built within the time limited to the point it was understood it should reach, and that it expected connection with the Texas-Pacific, whereas the Texas-Pacific had failed to obtain its funds and was in fact started far from the eastern portion of Texas?—A. The California railroad builders are, to my mind, the greatest railroad builders in the world.

Q. You think they built theirs a good deal faster than other people had reason to expect they would?—A. Yes, sir; I do not think they are the best railroad administrators.

Q. I did not ask the question with the idea of raising the old controversy between Huntington and Tom Scott, which was a big thing and is now over. The railroads are now built and hunting up the land grant. I want to know in what way the administration of the land-grant system conflicts with the public interests, whoever gets it?—A. In that region it certainly would conflict with the public interest, because if they get that land grant they have built their road; they are not going to lose; no fair investigation of the condition of that road under the most favorable interpretation of the land-grant policy and the railroad system of

Digitized by Google

the country, in my judgment, would result in proving that the Southern Pacific will be a loss to its managers and owners. Therefore I am in favor, and believe it to be public policy, putting aside all questions of theoretical principle, of restoring that land grant to the public domain in the public interest, because no harm is done to the railroad, and a great benefit will accrue to the public. I would give all the doubts on the side of the people, all the legal doubts that exist there. I think there is one most decided legal point, from what little law training I have had.

Q. No matter; that will be decided by the Department and by the courts and by Congress.—A. Certainly, I did not mean to go into it.

Q. I want, without dragging that controversy in here any further, to know in what way the possession of these land grants, or the administration of the rights of railroads under these land grants, interferes with the proper occupation of the public domain in accordance with the general public policy of giving it to the poorer people of the country who choose to settle upon it, if there is any interference?—A. In that particular case unmistakably there would be.

Q. If the Southern Pacific gets possession of 18,000,000 acres of land that otherwise would remain in possession of the public, and be better administered through the public functionaries for the people at large, of course as a great public evil it ought to be guarded against. That we will assume. Now take other cases where grants have actually vested and the roads are disposing of the lands, controlling them, are they withheld from settlement when poorer parties are ready to take possession if they have the opportunity; or are the roads, as a rule, ready to transfer titles to small quantities, and to facilitate the transportation and location of families upon them?—A. It is charged in California most distinctly that the policy and operation and administration of the land grants given to the Central Pacific has been in the past used to prevent public settlement, except as the railroad could complete its own systems, such as where they required irrigation to obtain control from the legislature of the water supply, and so make a double monoply, first of the land, and then of the water, that they could thereby control the country and prevent public settlement until such time as a larger profit would result to themselves.

Q. Is it or is it not a fact that the peculiar topographical condition you speak of enables the corporations possessing the water to control practically the entire land on both sides—that retained by the public as well as that granted to the corporations?—A. As a practical fact the corporations that control the water will be generally the corporations that control the land.

Q. I suppose on the other hand the private individual who obtains the possession of water located on land reserved to the public would be able to obtain the corporation land, unless the corporation and individual combined?—A. Unless the interests were combined.

Q. This topographical condition obtains as to most of the land grants along the Southern Pacific in California, I understand you, or does it not?—A. I do not think it does to so great an extent, because a large portion of that grant must be in the San Joaquin Valley.

Q. How about the San Joaquin Valley?—A. The water course is accessible and utilized for the public to a great extent.

Q. Then through the San Joaquin Valley the railroad lands and public lands are available to small settlement, are they?—A. I think largely so.

Q. How is it along the line of the Central and Union Pacific?—A. It would be different. Largely there that is the grazing region again, and

Digitized by Google

again dependent upon water. It is charged in California that it is the policy of the Central Pacific not to take out patents for its land so as to avoid payment of taxes.

Q. That is a very familiar charge, and we know they do not pay taxes; but I want to know with reference to actual settlements. Do settlements take place under the existing system?—A. No.

Q. Do you think it would be well to modify the land laws in such way that these land grants and the intervening sections of country lying back of the granted strip on either side of the railroad could be improved for grazing grounds by the proper protection of the water courses and water supplies?—A. Unmistakably.

Q. You think legislation is needed in that direction?—A. I think so.

Q. And in the grazing regions the present land system is very hurtful, you think?—A. I think that legislation is also needed for such investigation of that dry area as would settle the question somewhat as to whether or not further water supply can be obtained. It is a theory out there among engineers and explorers that there are large bodies of sunken waters through great portions of that area. It is known that there must be in the melting of snows and other sources of supply greater bodies of water than appear on the surface, so that they must be sunk.

I was interested myself in a valley in Southern Arizona, had a small interest in what was claimed to be a Spanish land grant, as well as in some mines, and I made some study of the valley. It was a small valley—very rich. It runs from a mountain range in Sonora, just over the Mexican line, north for about 78 miles to Tucson, and 9 miles above Tucson it disappears, and from there to the Maricopa Wells, about 100 miles, you evidently pass over the surface of this sunken river which finally empties itself into the Gila. It is perfectly within the purview of good engineering to take that water at its head and to save every drop of it, prevent its passing away. If it could be saved, there is water enough there to transfer that valley and a large portion of the lower plains by the side of it into a perfect garden. If it is done by any private company it will be sure to work evil in the long run, though at first it may be advantageous. It seems to me that that belongs to the community to do; that that is public property; that that is one of the things where the distinction lies between public and private property.

## TRADES UNIONS.

The CHAIRMAN. You have studied the organization of trades unions in connection with this discussion. Will you tell the committee the result of your examination of the nature of trades unions, what are their characteristics here and in Great Britain, where the limitations come in, in your judgment, as to the abrogation of contracts by strikes, and any other facts or suggestions you may be able to offer. Please go on in your own way, and let the committee have the results of your study and observations.

The WITNESS. In regard to English trades unionism, my study up to a few years since has been quite ample. As a rule the aggressive and protective organization of labor passed out of the rudimentary stages, in which it still remains in many parts of and with many trades in the United States, nearly thirty years since. Any careful study of these associations will prove conclusively that the larger they are the less likelihood is there of the adoption of hasty, violent, or unlawful methods. For illustration let me recall what is known of the Sheffield grinders

Digitized by Google

and the Birmingham brickmakers' outrages, which were a few years since so thoroughly exposed by a royal commission of inquiry, asked for and obtained from Parliament by the persistent request of the representatives of the great amalgamated and federated trades. The nature of the offenses committed by the small local unions named, which had always refused to affiliate or federate with trades councils and the annual trades congress, have become as widely known as the English language, from the fact that Charles Reade's novel, "Put Yourself in his Place," was based on the Sheffield atrocities. Mr. Reade sullied his genius by making these local crimes the crimes of a class, when all the evidence was in the other direction. After the failure in 1848–'49 of the political agitation to secure the "charter," the English workmen and the mechanic class generally turned their attention to their trades organizations. In 1850 there was a great strike of the iron workers and engineers, under the direction of the "amalgamated engineers'" union. It failed, but the workmen made it cost their employers so much, as it was complicated by as extensive a lockout, that nearly all the demands of that trade were soon after granted. Some ideas of organization and of class separateness were gathered by English leaders during the World's Exhibition year from foreign friends, and became the basis of distinct action. In 1857, I think, the first trades congress was held, representing a considerable number of trades in large and small unions. They have been held ever since, and from 1866 or 1867 every year.

There were two motives behind the action of the promoters; first, that of compelling recognition, through unity, of their demands for corrective and other legislation; and, second, but more remotely, to bring about such a oneness of movement as must eventually secure the suffrage and other political reforms. This latter aim was not made prominent at first, but of late years, notably since the reform agitation of 1866–'67, it has become of prime importance. The great English trades unions are the National Miners, numbering over 200,000 members. One of its leaders, Thomas Burt, a member of Parliament, is now visiting this country. This union is rich, and out of its funds have successfully managed without ostentation a large emigration movement. It has purchased large bodies of land, principally in Illinois, and settled colonies thereon, which are understood to be very prosperous. Mr. Burt is visiting them. Mr. Alexander Macdonald, now deceased, the former president, used to come over every year. The coal miners have become, from a degraded class, one of the most intelligent and best paid bodies of wage laborers in Great Britain. They have a strong political influence, acting, as they do, almost as a unit. They are very democratic in their tendencies. It cannot be denied that the greater portion of the beneficial changes they are now feeling is due almost entirely to the unceasing agitation of their trades unions, local and general. The miners are always represented in the English Trades Congress. The amalgamated engineers, the two great unions of the carpenters, the stone masons, and others belonging to the building trades, the several large unions that represent the different classes of factory operatives, the printers, bookbinders, the lockmakers, the boilermakers, the shipwrights, the sailors, and other trades are all represented. In the manufacturing centers and cities, there is a network of trades councils, bodies delegated to represent the local several trades. Within the past seven years the agricultural laborers, theretofore the most depressed laboring body in England, have organized under Joseph Arch and others, and now form one of the most important of trade associations. It is estimated that the several amalgamated unions of Great Britain embrace

Digitized by Google

at least 2,000,000 adults. Women are admitted to membership in many and are always represented in the congress. So important is this representation that some of the ablest members of Parliament are the avowed friends of the unions. There are a number of papers published in connection with the labor movement. Among public men who are known and esteemed, springing from its ranks, may be found Ludlow, Lloyd Jones, Burt, Broadhead, G. D. Howells, George Potter, Arch, Applegarth, and scores of others still alive.

The CHAIRMAN. Can you tell us succinctly what are the leading characterists of these unions and what is the nature of the legislation they have obtained and still demand?

The WITNESS. I will try, premising as to the latter part, that for two or three years I have not followed their movements as closely as in times past. In the first place, the English trades unions, like those of America, are protective in character. Secondly, they are largely beneficial in purpose and action. Their protective function is often aggressive in nature. They proceed upon the idea that while competition prevails, as at present, labor must combine. Their only capital is labor, and it perishes every hour. It cannot accumulate by nonuse, as the purchasing power of money often does by reason of a fall in prices and a depression in trade. Combination alone, it is argued, can enable them to compete. To this end all else bends in trades unions. The English ones, as a rule, eschew sentiment in their councils as rigidly as the employers do in their counting rooms. In trades unions labor does not believe in co-operation, industrial partnerships, political nostrums, &c. As individuals their members are generally active in all these directions. In combining for wages the union argument is that the strong and facile must sacrifice something for the benefit of the average. They claim that it is easy to strike the equitable average in a day's work, and that this average is what they are after securing. Nearly all the so-called vexatious shop rules and regulations insisted upon by trades unions have for their motive what they consider this desirable end. They claim that the employers and society at large should recognize the justice of an average rate of pay for a day's work for the average workman. Piece-work, then, is generally pronounced against, because the effect would be to permanently lower the average rate, but temporarily raise that for exceptional men.

The idea underlying the regulation of apprenticeship, which it is claimed prevents the learning of trades, is to bar the way to flooding trades with cheap and but partially-trained workmen. It is said that the workmen must be the teachers of the apprentices; that they get no extra pay for training rivals; that machinery has so broken up trades that in very many the learning of only part of an occupation enables an employer to seriously cut down the rate of wages of all the rest. The methods in use in securing the power of competition by labor are more or less of the nature of coercion. The comradeship of the workshop is used, and it is a powerful agency. Men are marked down. Some English unions publish for their membership a "black list," containing names of defaulters in dues and "rats" or "scabs" in action.

The smaller the union, as I have already said, the more likely are the methods to be violent. And here let me say that I have heard leading English unionists who have been in this city express their surprise at the crudely coercive measures in use among certain trades, especially the building ones. Of course all trades unions resort to "picketing" and personal influence on non-unionists when a collision occurs. There are some well-defined provisions of law in England on this sub-

Digitized by Google

ject, such as not allowing pickets within a certain distance of a "job," and prohibiting the entrance of visiting committees on the works without the employer's consent. These provisions are the result of severe conflict, and being accepted, if not suggested by the unionists generally, are proven to be necessary safeguards on all sides. The common and ordinary statute laws are sufficient to deal with such a thing as conspiracy, if it exists. As to contract or its breach, there is no trades union in this country or in Great Britain with which I am acquainted that does not provide for strikes as one of its means of aggression or defense. No employer who hires a member of a trades union can plead ignorance of the fact that such unionist is under obligation to his fellows to "turn out" or "strike" at the demand of the authority he and they recognize as competent to issue orders.

Here let me say that no unionist I have ever met defends strikes *per se;* they regard them as a weapon only. The general drift is that there can be no breach of contract where the union obligation is understood or implied; further, that while employers can dismiss without notice and enter on a lock-out at will, the right of a striking combination is the right of self-defense. It must also be remembered that the feeling against strikes is steadily on the increase. Workingmen generally denounce conspiracy laws, and in England they have as such been expunged from the statutes. There are stringent police provisions against interference and violence, and that's all. The protective side of English trades unionism is found in the efforts of the unions to not only make steady or increase the rate of wages, but to aid in the distribution of labor by aiding the laborer to seek and obtain work through assistance while on the road or by the dissemination of information as to where labor in any craft is needed, and where it is overdone, and by giving accounts of the general condition of trades. Some of the unions, as the Amalgamated Engineers, the carpenters, ironworkers, and a few others, are international in character. In the offices of their secretaries are filed monthly and other reports from every union and branch, so in such trades a bird's-eye view of their conditions can always be obtained. This is a function that might profitably be utilized for the public benefit through State and national bureaus of labor statistics.

The beneficiary features of English trades union are very important. Funds are raised for accidents, sickness, and deaths. The expenses of funerals are usually paid. In a number of the larger unions the guarantee or mutual insurance principle is applied for funds to be paid to families, or in some cases to be applied to support in old age. The rule is to divide by classes, according to accepted life-assurance principles, and make stated assessments when deaths occur, besides also drawing from funds regularly paid in. The legislation of Great Britain recognizes and protects these funds, and returns are annually made to a Government actuary, as in the case of co-operative and benefit societies proper, such as Odd Fellows, Foresters, and scores of others, large and small. English legislation, in its relations to the labor of that land, recognizes the beneficent character of the principle of mutuality or guarantee and endeavors, by stringent laws and Government reports and publications, to protect and make secure the efforts of the struggling classes to escape the horrors of dependence and poverty by and through their own exertions. It took a long time for trades unions to secure legal protection in Great Britain for their funds. By that failure they stood always in the attitude of quasi-illegal organizations. Just in the degree this is done as to all such movements are they dangerous. Inclusion within

Digitized by Google

and recognition under the law, in the spirit of equity, strips anarchy of danger and renders conspiracy almost impossible.

As to legislative measures in Great Britain, it would be impossible for me to recall all the great remedial measures which since 1840, say, have been passed by the British Parliament, chiefly through labor agitation and of late years, almost wholly through the well organized and directed movement of the trades unions as embodied in the annual trades congress. This body has a regular parliamentary committee, whose business it is to watch legislation, opposing or shaping, as the case may be. It is safe to say that no such measure ever passes, indeed is hardly ever offered, in Parliament, without this committee's advice and, in general, approval. But the English labor agitation has caused the entire abolition of female labor in the coal mines and other unhealthy employments. It has reduced the hours of labor, brought about rigid factory and workshop inspection, both as to sanitary condition and the means of saving life, &c.; it has curtailed the labor of children, prohibiting altogether under certain ages; it has brought about compulsory education and greatly aided the establishment of national schools; it has secured the entire abolition of the truck or "tommy" shop system; it has obtained the passage of laws to compel the payment of wages in money and at stated intervals; it long ago caused the abolition of those relics of competitive barbarism called conspiracy laws; it has secured the legal recognition of their own societies and of their funds; it has brought about several important commissions of inquiry into the condition of labor; it has become strong enough to elect its own representatives to Parliament; it has aided materially from time to time in securing the passage of more general legislation of an ameliorative character, and of remedial measures such as those Mr. Plimsoll fought for in regard to shipping and its inspection and measurement.

The system of arbitration in England is largely another fruit of the labor agitation. That of co-operation is another branch of this question, but it has been enormously increased in useful importance by the continued growth in intelligent influence of the British trades unions.

I must add also that the large unions have of late years openly exercised a beneficial influence in the direction of technical education and trade schools. It is easy to perceive what must be the effect in a country like Great Britain, amid the attrition of class and privilege of the growing intelligence and power of such compact organizations as those embodying over 2,000,000 picked men, represented in closed trades unions, open trades council, and a federated and representative parliament like the annual trades congress. This last is the channel by which the general sensus is affected; the union proper is that which directly reaches the employing interest.

The CHAIRMAN. Mr. Hinton, can you give us any points of interest in regard to trades unions in any other country besides Great Britain and our own?

The WITNESS. There has been of late years some great changes in the laws of European countries, the full details of which I have been unable to follow. Ten years since trades unions, as we understand them, were under more or less prohibition in France, Spain, Germany, Austria, Italy. They were as free as here in Belgium, Switzerland, the Scandinavian countries, Holland, but, except in Belgium, they were unimportant. Labor, both in Great Britain and the United States, finding that cheaper labor could be brought into competition with them, have gone to work to insure solidarity by aiding the organization of agitation in continental countries.

Digitized by Google

I was told once by a nail manufacturer of Western Pennsylvania that owing to Belgian competition he was drawn with his confreres into ruinous efforts to bring about a reduction of wages. At last, acting upon a suggestion made to him by a leading trades unionist, they aided in a work of propaganda and finally brought about an equilibrium of competition through strikes in Belgium which brought higher wages to the workmen there.

There are now legalized trades unions in Italy, France, Austria, and to some extent in Germany and Spain. Those Governments, however, all keep more or less control, and councils of conciliation or boards of arbitration, under law, take away and remove many minor disputes and difficulties. Still there have been of late years some very formidable strikes, especially in France and Belgium. In all cases, when such agitation is organized, the long result is a distinct improvement in the condition of labor. The immediate result may be depression and suffering, but capital finds by every collision that quarrels with labor "don't pay." These "paternal" Governments would be likely to interfere with the robbery of the consumer, which is sometimes carried on here by means of "suspensions" of work or forced "lock-outs," brought about to reduce stock at the cost of labor and to increase cost to the consumer.

The CHAIRMAN. What is the condition of the trades unions in our own country? Give us any information you may possess.

The WITNESS. It is not an easy task for me to give a clear idea of American unions, and it has been done so much better by the forty or more labor witnesses you have had before you already. I would say, however, that there is apparent a decided tendency to the amalgamation and federation of trades organization, which I hail with pleasure, because in the first place it is a tendency sure to give labor and its needs a wider and more righteous recognition at the hands of employers, the capitalistic, corporate, and commercial classes, the press, which is now so generally and ignorantly against them, from legislative bodies and political parties, and finally because it educates and makes better members of the social order of the workmen themselves. Secondly, I see in this tendency the speedy suppression of uneconomic and violent methods. Strikes are not entered upon with readiness where the local demand has to be submitted to the searching investigation of a superior body. There are several large labor organizations that are not simply protective in character. I am not sure, but I believe the Locomotive Engineers' Brotherhood is more distinctly beneficiary than protective and aggressive. The Knights of Labor is not a trades union organization, though it embraces such bodies in its federation. It does not have a strike fund, and I am told that at its recent national assembly, held in Cincinnati, a proposition to levy a regular assessment of five cents per capita each week was voted down. A fund to assist workmen who should be "locked out" was created on the same plan. There are a number of great trades societies in this country. The international unions of England have a large membership in the United States. The largest societies here are the iron-workers, typographical union, Sons of Vulcan, carpenters, painters, miners, coopers, shoemakers, railroad hands, and others. The Knights of Labor are now said to have 150,000 members. There is no direct political affiliations among trades unions proper. However, all open trades and labor societies have distinct political purposes. My own idea of their function is that of agitation, impressing their need and the character of their demands.

The CHAIRMAN. Have you any remedial or other suggestions to offer?

Digitized by Google

The WITNESS. Hardly. The first point is to insure public discussion. Surely it is of importance, in a conservative sense, to know what the majority of the people are thinking and saying. It is exactly this that the press of the great cities and all others follow and deliberately seek to ignore. It certainly is a problem worthy the profoundest thought—that of endeavoring to ascertain the existence or not of a practical law of equity in the distribution of production, of the results of toil, energy, and capital. That is not civilization, but anarchy veneered, plus force, wherein seven out of every ten persons would very soon become paupers if an accident deprived them of the means or the power to win their bread by labor usefully applied. That is the condition of our industrial life and social order to-day.

I am myself a believer in the possible evolution of such a law of equity as I suggest. I think it can be found in the right understanding of the relations of public functions and natural property to private property, and the function of individual profits. But if there be not such a principle that can be worked out through law, then there are the gravest of duties for the successful and powerful to meet and discharge. There must be put in motion by and through them ameliorative and remedial measures, legislative, social, and philanthropic. If it be true that the growing pressure of industrial life organizes poverty as well as profits, then the holders of the latter have a serious task to meet, a vital problem to solve. It is nothing less than the maintenance of order amid the growth of a keen sense of personal injustice, and a vivid increase of acute intelligence, not vivified by an equal ethical influence. If the laborer is not to revolt when penury is declared to be the remorseless fate that pursues him, take care not to learn him the alphabet. If you do, be sure that he is made to know that the rich man feels he is only a steward to alleviate and relieve, not a master to grind and oppress. Hence I plead for publication and discussion in the fullest sense. It brings the chimeras to the daylight; it invites anarchy to debate; it brings anger to reason, and for what is just it is bound to insure a full hearing. This is my plea for a bureau of labor statistics. I would provide for the incorporation of trades unions, insuring security for their funds. I would have a standing committee on labor in every legislative body.

I would abolish all conspiracy laws, recognizing the right of peaceful combination in all respects. If there must be a law of contracts, it should be made equal, the employer to have no more right to summarily dismiss than the laborer to summarily leave. If otherwise, let it be nominated in the bond. I would have established in every State councils of conciliation and boards of arbitration, making them as voluntary as possible between interests, but providing that a magistrate or public functionary should preside. I would prohibit by penalty the existence of a truck or goods payment system. I would agree heartily to the establishment of proper, even rigid, police law and punishment for all attempts to control non-unionists by threats and acts of violence. To this all active and intelligent unionists would agree, I believe.

I have named in other parts of my testimony what in the more general aspects of this great question might be done. I desire to say that I claim no special merit for any suggestion, except that they are the outcome of serious study, candid thinking, sober purpose. I am an evolutionist, not a revolutionist. I know how complex are the questions involved. I attack no property, assail no institutions. Much of evil is the offspring of good design. I only urge that what concerns the well-being of the large majority, and the peace and order of our social civilization—namely, the vast and momentous changes produced in

Digitized by Google

the past half century by the introduction of machinery and the creation of corporate forces with vast capital at their hand—shall be honestly dealt with, openly considered, fairly treated. Without this, free government cannot live.

ELECTRICAL ENGINEERS.

The CHAIRMAN. We have received a letter from Henry Greer, who, I understood, is a gentleman of some character, whose expression on the subject of which he writes is really reliable and important. I will read the letter:

*To the Senate Committee on Education:*

GENTLEMEN: I have the honor to inform you that during a recent trip in Europe, I learned that young men and gentlewomen were studying electrical engineering, which profession has not yet become overcrowded, and great fortunes have been made in its pursuit. The enormous extension of the telegraph, telephone, electric light, electrical railroads, fire-alarm telegraphs, district telegraphs, &c., into all parts of the world will create a great demand for skilled electrical engineers. We have too many doctors, lawyers, ministers, &c., in America, and the great need and cry here is technical education. We especially need practical electricians or electrical engineers. By causing this letter to be published in the printed testimony, reports, and in the daily papers as soon as possible, you may be doing the young men and women of America a great amount of good, and if printed in the reports, the United States Government may look into the matter. America is far behind Europe in *technical* education. If I can give the young men of America any fuller information through you, I shall be pleased to do so.

Receive, gentlemen, my distinguished consideration.

HENRY GREER,
*Pataskala, Ohio, or 73 Madison ave., N. Y.*

September 12.

The Committee adjourned till Monday next at 10 o'clock a. m.

---

NEW YORK, *September* 17, 1883.

The committee met at 10 a. m.

ALBERT FINK sworn and examined.

By the CHAIRMAN:

Question. Your residence is in this city?—Answer. In New York City; yes.

Q. You were born in Germany?—A. Yes; I was born and raised in Germany.

Q. You have been in this country many years, however?—A. About 34 or 35 years.

Q. What is your profession?—A. I was educated as a civil engineer.

Q. Did you acquire your profession in Germany?—A. Yes; I was educated at the Polytechnic Institute at Darmstadt.

Q. You may state what you have done since you came to this country, in the exercise or prosecution of the duties of your profession?—A. I was first engaged on the construction of the Baltimore and Ohio Railroad from Cumberland to Wheeling as an engineer in 1850, and my special duties were then to design and superintend the construction of the bridges and buildings. I made that a specialty for some years. Then I was engaged in the construction of roads in the West—in Western

Digitized by Google

Virginia—in the extension of the Baltimore and Ohio road to Parkersburg, as engineer in charge of construction. After that I was engaged on the Louisville and Nashville Railroad, also as engineer on the construction of the road. I remained with that road for eighteen years. After the road was completed I became connected with the management of it in charge of the road and machinery department, and finally I became its general manager and vice-president. After that I was called to my present position.

Q. That was about how long ago?—A. About six years ago.

Q. Since then, have you been in the same position that you now occupy?—A. Yes.

Q. What is that?

NECESSITY FOR CO-OPERATION OF RAILROADS.

A. I am the head of a bureau established by a number of railroads—about forty—which are endeavoring to work together in all matters which require co-operation, for example, and particularly the establishment and maintenance of uniform tariffs; that is the principal object for which the bureau is established. The railroad system has become so extended and the business relations of so many roads to each other have become so complicated that it became necessary that there should be organized co-operation. The tariff of one road influences the tariff of many others. It would not do for so many companies to operate each road separately from the other. They have to arrange with each other to form connections, to establish through lines of transportation and tariffs for such through lines. It is a very complicated question, to make these tariffs uniform on many competing lines, and to arrange them so that they bear equally upon different localities, and to avoid unjust discrimination, and it is still more difficult to see that the tariffs properly established over so many roads are maintained alike to all shippers receiving like service. To accomplish this is the object of the Bureau, which is established in the interest of the public as well as in the interest of the railroads. It is a union of railroads for the purpose of conducting the transportation business in a business-like way and in the best interest of the public and the companies.

The commercial management of railroads has become very much complicated by the great number of competing roads. If there was only one road or if all the roads belonged to one company it would be comparatively an easy matter to manage the tariff question, but when there are so many roads, each operated separately, having separate interests, there would be nothing but confusion and chaos as far as the tariffs are concerned.

Q. How many roads are there?—A. I suppose there are upwards of twelve hundred roads, even counting many roads that have been consolidated as one road.

THE ASSOCIATION OF ROADS EAST OF CHICAGO.

Q. You said there were about forty roads in this association composing the bureau of which you are the head. Will you mention the particular lines?—A. There are the five trunk lines—the Grand Trunk of Canada, the New York Central, the Erie road (or the New York, Lake Erie and Western, as it is now called), the Pennsylvania road, and the Baltimore and Ohio. These are the main lines. Then come their connections—the Lake Shore, the Michigan Central, the New York, Penn-

Digitized by Google

sylvania and Ohio—in fact, all the principal east and west roads as far as the Mississippi River, and as far as Chicago, and as far as the Ohio River—all the principal roads in that territory—the Cleveland, Columbus, Cincinnati and Indianapolis, the Indianapolis and Saint Louis, the Vandalia, the Ohio and Mississippi, the Pittsburgh, Fort Wayne and Chicago, the Chicago, Saint Louis and Pittsburgh, the Indianapolis, Bloomington and Western, the Lake Erie and Western, the Canada Southern, the Boston and Albany, the Fitchburg, the New York and New England——

Q. The Grand Trunk of Canada, is included?—A. The Grand Trunk is one of the roads; yes, sir, and a very important one.

Q. With all its connections?—A. Yes. They have a road to Chicago. Their main road runs from Chicago to Portland, Me.

Q. This combination or association, if I understand you correctly, does not include any roads west of the Mississippi, or at least none west of the Missouri?—A. None west of the Mississippi. West of Chicago they have separate organizations of the same nature. They also have a similar organization in the South. These associations are formed pretty much on the same plan and for the same purpose.

Q. These are the roads that naturally take the produce from the interior of the country to the Atlantic seaboard?—A. Yes; east and west roads. There is a system of roads between the Mississippi and Missouri Rivers, and others, running north and south. They are separately managed.

Q. By a like combination or association?—A. Yes, as far as rates of transportation are concerned.

Q. As to this association of which you are the head, what are the principal westerly points and connections of your roads, and what are their principal points of outlet on the Atlantic seaboard?—A. The principal points west are Chicago, Saint Louis, Cincinnati, Indianapolis, Toledo, Detroit, Cleveland, and other intermediate points. The eastern outlet is the Atlantic coast from Portland, you may say, to Baltimore, including Boston, New York, Philadelphia, and Baltimore.

Q. Would it include the outlet of the Chesapeake and Ohio?—A. They have an outlet here at these points, also one at Newport News, Va., but are not part of the association, although they work together with the association as far as tariffs are concerned.

Q. They abide by the regulations and decisions without being actually bound by them?—A. Yes, they agree to them, but they need not abide by them if they do not choose to do so.

Q. So far as actual results are concerned they are practically part of the association?—A. Practically, yes.

Q. Are there any other lines of importance that carry through products from the interior to the Atlantic coast—is there any outlet for the South—at Brunswick, or anywhere?—A. There are outlets at the South by some railroads, but not very important ones as far as export traffic is concerned. There is a route from the West to Brunswick, Savannah, Charleston, Port Royal, and Norfolk. The Chesapeake and Ohio have their terminus at Newport News. Then there are other roads, besides these I have named, from the West, from Saint Louis and Louisville and Memphis—the Norfolk and Western, the East Tennessee and Virginia, the Memphis and Charleston, called the Virginia Air Line, with its terminus at Norfolk. This is an important east and west road. It is, however, more particularly engaged in the Southern business, the cotton business; it connects with roads to Saint Louis, Louisville, Cincinnati, Memphis, Nashville, and other points, and does business there.

Digitized by Google

THE ASSOCIATION OF ROADS WEST OF CHICAGO.

Q. West of this system is one lying between the Missouri and the Mississippi Rivers, I understood you to say?—A. Yes.

Q. What is that called, and who is at the head of that association, and what roads are in it?—A. That association comprises the roads running from Chicago west—the Chicago and Alton, the Rock Island, the Chicago, Burlington and Quincy, then the Chicago and Nortwestern and the Chicago and Milwaukee roads.

Q. Who occupies in that association a position similar to yours?—A. Mr. J. W. Midgley.

Q. Further westward, what are the principal railroad connections? Is there any association among the railroads to the west or south of those you have mentioned?—A. There are associations, called the Iowa and the Colorado Associations, that take in all the roads to Colorado west of Chicago. The same roads that I have named are engaged in the traffic to Colorado, and the same commissioner is at the head of the bureau.

Q. This same Mr. Midgley?—A. Yes, sir.

Q. Then his system takes in the Colorado roads?—A. Not the Colorado roads, but the roads between Chicago and Saint Louis and the Missouri River.

Q. And the roads that reach to New Mexico and Arizona and the Territories?—A. Not the roads as far south as that, but of course it takes in the traffic to those points.

Q. They all feed into and connect with each other?—A. They all compete with each other.

THE SOUTHERN RAILWAY AND STEAMSHIP ASSOCIATION.

Q. What other like associations among railroads exist in this country?—A. There is an association called the Southern Railway and Steamship Association, the first one established upon the present plan. It was established in 1875. It comprises nearly all of the southern roads south of the Ohio and east of the Mobile and Ohio Railroad, and the Atlantic coast.

Q. Mention some of the principal ones.—A. The principal ones are the Georgia Central road, the Georgia road, the Western and Atlantic road, the Louisville and Nashville system, the Richmond and Danville system, the Norfolk and Western, the Memphis and Charleston, the Savannah, Florida and Western, the East Tennessee, Virginia and the Georgia system. These are the principal roads.

Q. Does this system cover the Mississippi Valley?—A. No; it does not reach the Mississippi Valley. There are some other roads in that territory east of the Mississippi; they run north and south. They have no joint interest with the other roads which are east and west roads—such as the Illinois Central and the Mobile and Ohio.

Q. Under what system or arrangement, if any, are those roads you now mention comprised?—A. They are not under any particular system. There is no organized system under which they operate; they co-operate with each other. There are only two or three roads, and it is an easy matter for them to co-operate without any organization.

Q. Then to recur to this system of the South, of which you have been speaking, which was organized first of any, and in 1875, under what gentleman having the same powers or like powers to yourself were these roads organized?—A. The organization was made after I left the

Digitized by Google

Louisville and Nashville Railroad. I had then been connected with the Southern system of railroads, and there was so much confusion and strife in regard to the establishment and maintenance of tariffs that it was utterly impossible to conduct the transportation business in a proper way. It caused a good deal of ruinous competition and unjust discrimination, each road making its own tariffs and underbidding the other. The result was, generally, that the roads worked for almost nothing, or at a loss, and it was almost impossible to control the tariffs. I was then the general manager and vice-president of the Louisville and Nashville Railroad, a road that was in contact with both the Northern and Southern systems of roads—a sort of connecting link between these two systems, and I had to do business with between fifty and sixty different roads, and when it was desired to make an agreement of any kind the parties could not be got together, and when some of them came together others were missing, and nothing could be done. But if they should all happen to come together they could not agree, or if they did agree there was no organization or executive department to see that the agreements were maintained. This state of affairs led me to suggest the plan of an organization of railroads with a central bureau through which the different roads could readily transact business with each other, instead of so many roads endeavoring to do business separately with one another, making it almost impossible to accomplish anything. All these complications were avoided by transacting business through the head of the bureau, who understood the relations of the roads to each other, and knew what was required, and through whom the roads could communicate with each other, and negotiate on all subjects requiring co-operation. The representatives of the roads would hold meetings and discuss matters. If they could not agree, the head of the bureau was to decide the questions at issue, and act as the executive, it being also his duty to see that the agreements were carried out. In this way the roads would be enabled to transact business promptly and to establish uniform tariffs and to see that they were maintained. This is the object of this and like associations. They are in the nature of clearing houses, where the parties, instead of settling the money balances, settle their differences and their little quarrels (or their big quarrels, as the case may be). A definite way is provided in which business can be successfully transacted. It is simply accomplishing by organization what was ineffectually attempted by a mob under the old system. I made it my special business for about six months to organize the association, and since then it has been successfully carried on by others. The plan has been found to work so well that it has been adopted elsewhere. Mr. Virgil Powers is the present commissioner.

THE PACIFIC RAILROADS.

Q. Please explain to the committee with reference to the railroad systems lying west of the organization which you have described—what they are, if any.—A. West of those associated roads I have mentioned are the Pacific roads.

Q. They are known generally as the Pacific roads, are they?—A. Yes, the Union Pacific and the Central Pacific. Then comes the Texas Pacific and the Southern Pacific. They are now in operation. The Northern Pacific has been added lately.

Q. And the Atlantic and Pacific?—A. The Atlantic and Pacific is another one, connecting with the Southern Pacific.

Q. Is there any association or practical plan of operation existing

Digitized by Google

between these roads, or any of them?—A. There is no association between them—no organized association, although they are working together under some agreement regarding tariffs.

Q. All these three lines to the Pacific have some understanding as to rates, etc., among themselves, by which they abide?—A. Yes.

Q. Do you include the Northern Pacific?—A. No; they have only just been opened; they will be included, no doubt, in the course of time.

Q. If there is no organization, who are the men that substantially control those Pacific roads and harmonize their interests by these agreements between themselves?—A. In the first place, the presidents of the roads; but they do not pay much attention to the practical details. These are left to the general superintendents or traffic managers of each road; who make arrangements, under the direction, of course, and subject to the approval of the presidents of the roads.

Q. Have you now in a general way outlined the entire railroad systems of the country?—A. I have mentioned the main systems. I should have mentioned the southwestern system, comprising the roads west of the Mississippi River to the Gulf—the Texas and Arkansas and Missouri roads.

### THE WATER ROUTES OF TRANSPORTATION.

Q. Will you now mention the water-routes, whether by river or canal connection, that have to do the transportation of the country, either by connection with the railroads themselves or otherwise?—A. The principal water-lines engaged in the East and West traffic are via the lakes and the Erie Canal in the North, and the Welland Canal in Canada. The Mississippi River to New Orleans forms another important water-line.

Q. How important is that water-line in connection with the transportation interests of this country?—A. The water-lines that I have mentioned are very important factors in the transportation business of the country. They not only secure cheap transportation themselves, but they have the great advantage of regulating the railroad tariffs.

Q. Please explain how that is; that the water-lines regulate, or can regulate, the railroad charges.

### HOW THEY ACT AS REGULATORS OF RAILROAD CHARGES.

A. The cost of transportation upon the water-routes being cheaper, the railroads have to carry freights as cheaply, or nearly as cheaply. They can only increase their charges over the charges made by water-routes to the extent that they offer additional advantages; while somewhat higher rates can be charged by the railroads, the basis of their charges are the charges made by the water-lines. If they charge more than a certain amount above the water-rates, the business would all go by water. Not only is this the case where railroads come in direct competition with the water-routes, but the effect of these water-routes upon the rail transportation rates is felt throughout almost the whole country. This is the result of the great competition between the railroad companies themselves. As to the Erie Canal and Lakes, the railroads that directly compete with those routes between Chicago and New York must conform to the low water rates; but it is also necessary that, say, for example, from Indianapolis, which has no water connection with New York, the rates should be made upon the same basis as the Chicago rates—that is, the same rate per ton per mile, or nearly so.

Digitized by Google

CHICAGO RATES THE BASIS FOR RATES FROM AND TO OTHER WESTERN POINTS.

That rule is almost a fixed rule now, adopted by the railroad companies; that whenever the Chicago rates are lowered the rates throughout the whole territory east of Saint Louis, Louisville, Cincinnati, Peoria, Columbus, etc., are lowered proportionately. There are so many roads that run from those points direct to the East, under independent management—they want a share in the business of the country. If they were to try to exact proportionately higher rates, say from Indianapolis or Saint Louis, than from Chicago, there would be enough margin left between the Saint Louis or Indianapolis rate and the Chicago rate to New York that freight could be sent from Indianapolis to Chicago, and then by railroad or canal from Chicago to New York. In order to prevent this the railroads that run direct from Indianapolis, Saint Louis, etc., to the East make the rates so low that the business must go over their roads, and cannot go to Chicago. While the water-routes only exist between Chicago and New York, the effect upon transportation rates is felt all over the country by reason of the competition between the railroads.

NOTWITHSTANDING COMBINATION, RATES ARE FIXED BY COMPETITION.

No combination of the railroads can suppress this competition. It could only be done if the railroads were all owned by one party and were operated in one interest. But as it is they have all separate interests, and each one guarding its own interest keeps up this competition, and even in agreeing between themselves upon rates, those rates are fixed by competition. This unfortunately, is not understood by the public. It is generally believed that when competing railroads agree upon uniform rates, that this excludes competition. This is not the fact. The effect of water competition is not only felt in the territory east of the Mississippi and Ohio Rivers, but is felt south of the Ohio River. For example: The low rates from Louisville, under the influence of the Chicago low rate, are felt at Memphis, Nashville, and farther south. Freight from Memphis is shipped to Louisville and gets a low rate from there, and the people of Nashville and such places get as much advantage from the low rates as if really located on a water course; so that the influence of the water transportation is felt almost throughout the whole country. That is the influence of the Erie Canal. To the south there is the water-route from New York to New Orleans via ocean, and from New Orleans freight is carried to Memphis and Saint Louis and the West via the Mississippi. In order to meet these low rates, the east and west roads from Louisville and Memphis or from Memphis to Norfolk east have to conform again to the low rates made by the Atlantic Ocean and the Mississippi River.

Q. That has reference to goods from east to west, as well as from west to east?—A. Both ways. In this way the water-courses are really regulating the railroad transportation rates throughout, you may say, the whole country. Of course the low rates from here to the Mississippi River are enjoyed by the people west of that river. Rates generally are higher west of that river, but the people west of the river get the benefit of the low rates east. In many other ways the water-routes help. The Ohio River, the Tennessee River, and the Cumberland River affect the railroad rates at the interior. There is plenty of competition that regulates the rates and keeps them at an exceedingly low figure.

Digitized by Google

NO COMBINATION PRACTICABLE ON WATER-LINES.

Q. Will you please state how it is that there can be no combination of transportation interests by water as well as by land? Why can there be no combination so as to put up water rates as well as land rates?—A. It is hardly possible. The competition is only between canal-boats or steamboats; the water-ways are free to all. If any one boat or a combination of boats should try to charge too high rates, it would require a comparatively small capital to start new boats.

Q. I suppose that combination would be possible if the lines of steamers and canal boats were under one or two or three ownerships, just the same as by land-routes. Is not that so?—A. No; that could not be, because it is an easy matter to put on additional steamboats.

Q. It is easier to put on another vessel than to build a railroad?—A. Yes.

Q. That is the reason why competition can be established at so much less expense by water than by land, is it not? That is the reason combination is not possible over the water-routes?—A. Yes; I mean combinations for the purpose of charging excessive rates. Nor is it possible for railroads to combine for that purpose, because, as I have shown, the railroad charges are controlled by the charges on water-ways. The water-ways are free; nothing is paid for their use, and it requires very little capital to start competing steamboat lines. I may remark here that this competition between steamboats or water-ways is practically also restricted. For example, certain lines of steamers really control in a measure the river or lake transportation. Take, for example, the Hudson River, or the lake, and you will find that there are certain established regular lines of steamers. When a new line comes in, of course the old lines try to work it out, and make rates very low, and destroy it if they can. By that means, in the course of time, only one or two regular lines survive, and they carry the business. This is rather a benefit to the public, because the public have responsible parties to deal with instead of dealing with a great many irregular lines. These lines, however, can only charge reasonable rates, otherwise they would invite new competition, and it is the fear of that competition that keeps the rates within very reasonable limits.

COMBINATION OF LAND-ROUTES WITH WATER-ROUTES.

Q. What tendency is there to combination between the capital invested in water routes and in land-routes—that is, between the railroads and the water-lines?—A. There are certain arrangements by which railroads run in connection with steamship lines.

Q. I mean as to unity of ownership and interest, as, for example, in the case of railroads purchasing water lines, so that they may control the rates of both?—A. The Pennsylvania Railroad owns a steamship line from Erie, Pennsylvania, to Chicago. They have control of what is called the Anchor Line. The New York, Lake Erie and Western Road owns a water-line absolutely—the Union Steamship Line—running between Buffalo and Chicago. There is another steamship line between Buffalo and Chicago, that, while not owned separately by a railroad corporation, runs in connection with the New York Central Road. All these water-lines, while working with the railroads, are subject to competition, and their rates must be as low as by other water lines.

Q. The only continuous, uninterrupted line from the West to the East is by way of the Mississippi River and the Atlantic Ocean, is it

Digitized by Google

not—the Erie Canal being frozen for a part of the year?—A. Yes. Sometimes navigation on the Mississippi is interrupted by low water, and sometimes by ice north of Cairo.

Q. But that is quite temporary, is it not—for a month or so?—A. Sometimes for a couple of months, and sometimes longer; and during some winters not at all.

Q. Do those interruptions come when the Erie Canal is closed or otherwise?—A. The interruption by ice comes during the time the Erie Canal is closed. In some years, however, there has been no interruption by ice. The low water generally comes during the summer months, when the Erie Canal is open.

### WATER TRANSPORTATION THE REGULATOR OF RAIL RATES.

Q. The real water regulator of the prices of fares and freights is the Mississippi River and the Atlantic Ocean, is it not?—A. And the Erie Canal.

Q. But the Erie Canal is liable to interruption?—A. During the interruption of navigation the Erie Canal still influences rail rates, although during the winter months the railroad companies are able to charge higher rates.

Q. Would they not be able to get still higher rates than they do but for the Mississippi River?—A. The Mississippi River is another check on rail rates; but it has not been felt very seriously yet in the grain business, however; it makes itself felt more now since the jetties were built at the mouth of the river. Since that time the grain exports from New Orleans have somewhat increased.

Q. I suppose the same is true of cotton?—A. Yes. If the railroads were to make very high rates it would throw more of the business over that route.

Q. You consider the improvement of the Mississippi River as a transportation route very essential to the advantage of the transportation business, do you not?—A. Yes.

### RAILROAD RATES COMPARED WITH WATER RATES.

It is the general impression that when the Erie Canal closes the railroads have it all their own way, that the railroads can then charge what they please. This, however, is not the fact, nor would it be if there were no Mississippi River. If the railroads were to attempt to charge high rates during winter time, business men would endeavor to throw most of the freight on the canal during the summer time, leaving the railroads nothing to do in winter. The railroad companies cannot increase their charges over the transportation charges by water more than the advantages are worth which the shippers receive by getting their goods promptly forwarded at all times. That is all the additional charge that railroads can impose, even in the winter time, over the transportation rates charged by the canal.

Q. Still that would make necessary the holding back of the crop?—A. It would, but the railroad companies do not want the crop held back, and they must offer such inducements that will move the crop during the winter season; and they do so.

Q. But are not the necessities of the farmers such as to oblige them to send the crop forward?—A. At present they have become accustomed to sending their crops forward, but before the railroads undertook to carry this low-priced freight the farmers had to hold their crop. Now

Digitized by Google

the advantages of the railroads over the canal are such as to induce them to move the crop, and of course the railroads offer every inducement to them to move it.

Q. I suppose the capital in the grain-shipping business would be able to hold it back in mass, even if the farmers would not?—A. They would bring more in the summer time and store it at the seaboard or store it in the West, and keep it for the opening of navigation. There are seven months of navigation and only five months when there is none on the Erie Canal. I mention that to show that it is to the interest of the railroad companies to give reasonable rates even when navigation is closed.

Q. If there was a disposition on the part of railroads to exact heavy freights, is it a fact that the canal remains open for a sufficient length of time to move, if necessary, nearly all the crop to the seaboard during the closure of the canal?—A. A great portion of it. I suppose the entire crop could not be moved.

Q. There is not capacity enough?—A. No; and then it would not suit to get all ready in the seven months. The canal carries now about from 40 to 60 per cent. of the grain that comes to New York during the navigable season. It carries only about 20 per cent. of the total grain receipts at Boston, New York, Philadelphia, and Baltimore during the year.

### THE FIXING OF RAILROAD CHARGES.

Q. Will you explain as fully as you can to the committee the actual *modus operandi* or method by which this association arranges the fares and freights among the different roads—upon what general principles do you act—and, in fact, give us as correct an inside view of its operations and its useful or beneficial tendencies to the general public as you will?—A. It would be very difficult for me to explain fully to the committee the operation of this association, as the committee would have to be in a great measure familiar with many details in the management of this railroad transportation. I can only give, perhaps, a general outline of it. As I said before, the principal object of this association is to establish equitable and uniform tariffs over the roads represented on the committee as far as their competitive traffic is concerned. It has nothing to do with the local business of the roads. When two or more roads come into competition with each other for the same business, then it becomes necessary to have some understanding between these two roads as to the rates that should be charged for the same service. If one road were to charge one rate and another another rate, of course the road that would charge the lowest rate would do all the business and the other could not do any.

Q. That is competition, it it not?—A. Yes, but it don't work well in the transportation business. If there was no agreement as to uniform rates, shippers who would want to ship by one road would have to pay higher rates than shippers by another road. If these rates were kept secret the shipper would not know what the rates of the different roads were, and one shipper might thus get his goods shipped cheaper than the other. That would be unjust discrimination. It has become the practice of all railroads, and I think of all steamship lines, when they compete with each other, to agree upon a certain charge to be made by all routes for the same service, and let the shipper select his own route. That is generally called combination, and it is assumed generally that this combination is made for the purpose of exacting unreasonable compensation. But this is not necessarily so.

Digitized by Google

Q. That is, as you say, generally called combination, and we hear, under the existing system of transportation, that competition is the natural regulator of fares and freights; and the natural protector of the interests of the public in that regard. Is not then the direct purpose of this association to prevent that natural competition which is supposed to protect public interests?—A. These associations cannot control the natural and legitimate competition, as I have already stated.

Q Right there, I wish you would make your explanation as clear and full as possible.

LEGITIMATE COMPETITION DISTINGUISHED FROM RUINOUS COMPETITION.

A. We have to draw a line between legitimate competition that is the life of trade, and competition that results simply in the ruin of the parties that are engaged in the competition. The object of these associations, besides that of giving uniform tariffs, and arranging through tariffs for the whole country, is to prevent ruinous competition. I think the competition between railroads is somewhat different from the competition in other business. Competition between private parties soon comes to an end when prices get so low that they cannot carry on any business. A railroad company, however, can carry on competitive business for a long time at non-paying rates, and either not find it out, or else make the traffic for which there is no competition pay for the losses incurred in the competitive business.

Q. I suppose an instance of that is where they make up on local charges what they lose on the through charges?—A. Yes.

CHARGES ASSESSED ON THE VALUE OF SERVICE.

The proper plan is to assess the railroad charges in accordance with the value of the services rendered. Nobody should ask services for less than cost. The tendency of this railroad competition is, that by one road underbidding the other on the competitive business, the rates soon become so low that the business is worth nothing. They have often carried it, and sometimes carry it yet, at less than cost, and this is not to the advantage of the public. The public can always afford to pay reasonable rates for the service. It is not to the advantage of the public at large to do otherwise, because if you send all these railroad companies into bankruptcy, and thus ruin the people (who are really the owners of the railroads), you ruin the credit of the country, and you ruin the industries that are dependent upon railroads, such as the iron industries and the other manufacturing establishments which furnish supplies to the railroad; you also necessarily reduce the wages of the laborers. When railroads cannot earn any money, the laborers employed on the roads have their wages reduced, or frequently lose their pay altogether. I may refer to the difficulties which arose in 1877, during and after a long railroad war, when so many of the employés rose and "struck." This was the result of low wages or reduced time of labor during the railroad wars.

EFFECTS OF COMPETITIVE STRIFE BETWEEN RAILROADS.

In fact, it is hardly necessary to demonstrate that it is not to the interests of the people to have the railroad companies do work for less than cost; and this would be the inevitable result if they engage in competitive strife (as I will call it to distinguish it from legitimate competition). The nature of the business is such that when one railroad

Digitized by Google

underbids another in order to secure a little more business, as soon as the other finds out that it has been underbid, it has to underbid its rival still further, and so rates go down and down, until, as in 1881, freight was carried from Chicago to New York (1,000 miles) for 8 cents a hundred. This is a loss of from 8 to 12 cents a hundred in doing the mere work, not to say anything of interest on capital invested.

Q. What is the actual cost?—A. Anywhere from 16 to 40 cents—Chicago to New York. It depends upon what you count in the cost. The mere additional cash cost of moving 100 pounds of freight from Chicago to New York may be estimated at about 16 cents on grain. The average cost of all classes of freight, taking in general expenses, would be about 24 cents; and taking in interest it would be about 40 cents per 100 pounds. I will have to explain this subject more particularly later on, but upon the lowest estimate, the charge of 8 cents, made in 1881, was about only one-half the actual outlay of money, not to say anything about investment. But apart from the ruinous result to the railroad companies, these railroad wars are objectionable as far as public interest is concerned. During these wars each road makes its own tariff without any agreement with its competitors as to uniform rates. It may make changes from day to day in these rates, and the shippers do not know what the charges will be for twenty-four hours to come. One man may have laid in his supplies at the regular tariff, to-day, and in a week from now the tariff is down to one-half of what it was then, and he is at very great disadvantage compared with his neighbor who lays in his goods a little later.

### RAILROAD WARS.

The results of these railroad wars are most injurious to all interests, and the shippers understand this well enough. They are most satisfied when they have uniform rates, and when these rates are permanently maintained. Although, strange to say, while they want uniform rates permanently maintained, they also want competition between the railroads; that is to say, they want the railroads to underbid each other. It is clear that they cannot have both peace and war between the railroads at the same time.

### OBJECTS OF COMBINATION.

Now, it is for the purpose of establishing uniform tariffs, and to maintain the same without great fluctuation, to prevent ruinous wars, and the bankruptcy of railroads, which would necessarily follow, that these railroad associations are established; it being their object to agree upon the proper tariff to be charged, and to have that tariff made known to the public, to prevent railroads from making reductions secretly in these rates, and to make charges alike for the same service. That is the object of these associations. And it is a very important object; in fact, if fully obtained, we would have reached the solution of what is generally called the "railroad problem." In my opinion it is only upon this plan of association, now adopted by many railroad companies in this country, that the evils of the transportation business, heretofore experienced, and of which the people so much complain, can be remedied.

### PRUSSIAN SYSTEM—STATE-GOVERNMENT OF RAILROADS.

In Europe, especially in Prussia, this object has been obtained by the purchase on the part of the Government of all the railroads in the country. This puts them all under one control, and enables the Government

Digitized by Google

to make uniform tariffs and strictly maintain them. This plan, however, could not be followed in this country.

### AMERICAN SYSTEM—SELF-GOVERNMENT OF RAILROADS.

Here we must accomplish the same end by voluntary associations of roads under what may be called a self-government. Between the two modes of dealing with the railroad problem, I think the one adopted here is much more suitable to the spirit of our people and the character of our Government. I merely wish to call attention here to the necessity and importance of the work which these railway associations are to accomplish. The difficulties encountered in endeavoring to accomplish this work are as great as is its importance. How are some twelve hundred independent railroad companies, each having separate interests, to govern themselves so as to secure to the people, over 120,000 miles of railroads, throughout this immense country, uniform tariffs—tariffs that operate justly upon all sections of the country, justly between commercial communities, between rival cities, and between individual shippers? That is the problem to be solved. It can not be solved by each individual road following its own course and making its own tariffs without reference to the tariffs of other roads. The work to be done can only be done by the joint action of all roads that are jointly interested in the same traffic and that can influence each other's tariffs.

### HISTORY OF ATTEMPTS AT JOINT ACTION.

Ever since there have been competing roads, efforts have been made, arising from the nature and necessity of the case, to act jointly in all matters of joint interest; and this for the reasons above stated. But the methods that were frequently adopted for such joint action were defective and inefficient. Representatives of railroads would hold conferences and discuss the subject matters that required joint and uniform action on the part of many roads. They could hardly ever be all got together, and if they came together they could hardly ever agree; but if they did agree, the agreements were hardly ever carried out, at least not for any length of time. There was no authority to see that the agreements were enforced. Considering the complicated transactions covered by the agreements, it was impossible that these agreements could carry themselves out, without supervision or control. Yet, strange to say, that was expected. The history of railroad management in the past records the complete failure of these efforts; and nothing else should have been expected.

In 1874 the first effort at some sort of organized co-operation was made by the roads, which are now represented on the joint executive committee. I refer to the agreement known as "The Saratoga compact." Some seven commissioners were appointed, whose duty it was to control the rates. The organization was imperfect, and it soon fell to pieces. But it taught its lesson.

### SOUTHERN RAILWAY AND STEAMSHIP ASSOCIATION—METHOD OF OPERATIONS.

In 1875 the Southern Railway and Steamship Association was organized. (I have already referred to it.) It provides for a complete government of the subject matter with which the association has to deal. The representatives of the roads come together and form a legislative

Digitized by Google

department. There is an executive officer who carries out the resolutions of the legislative department. If the representatives of the roads do not agree there is a judicial department that decides the question at issue between the contending parties. Majority does not rule. All questions of difference are to be settled judicially. They are to be submitted to arbitration. The interests of each individual road can thus be protected, which would be impossible under a majority rule. This is the principle upon which the Southern Railway and Steamship Association was established, and the joint executive and other associations have adopted the same principles. The only defect in these organizations is that there is no authority to legally enforce agreements. The voluntary consent of all parties is necessary, and it may be considered surprising that under these conditions the government of the railroads by these associations has been as successful as it has proved to be; although it is still very imperfect, it is a great improvement upon former methods.

The difficulty is not so much in arranging the joint tariffs, because there are certain principles that guide this work. The tariffs are generally determined for the railroads by other conditions and competition such as the water routes. These latter are really the tariff makers for the whole country.

Q. Are they included at all in this association, or in any association?—A. Some of these connecting steamship lines are included in the Southern Association, but none are included in this association—no water lines.

Q. This association, however, owns some water-lines themselves?—A. Some of the roads in the association own water-lines, but those lines are operated distinctly and on their own merits.

Q. But they have no connection whatever with the easterly end of the Erie Canal?—A. No; they carry freight to the canal as well as to the railroads. They are operated entirely as independent organizations.

### THE ERIE CANAL—ITS TARIFFS, BOATS, AND NUMBER OF BOAT OWNERS.

Q. How are the tariffs on the Erie Canal fixed?—A. That is simply a matter between the boatmen. The supply and demand fixes that from time to time.

Q. The canal boats are owned largely by individuals, are they?—A. Altogether, I believe.

Q. And how large ownerships in number of boats are in a single man?—A. I could not tell you, but my information is that they are mostly men that own one boat.

Q. And they are mostly in competition with each other?—A. Yes.

Q. There is no combination that you are aware of between the boatmen or owners of canal boats?—A. No; none that I am aware of; they make their rates according to supply and demand.

Q. Have you any approximate information or impression as to the number of boats?—A. My recollection is that there are about five thousand; but I could not be quite sure.

Q. The ownership is divided between two or three thousand men, I suppose?—A. Perhaps so. I have no exact information, but my impression is that they are generally owned by men who own only one or two boats.

Q. Do you know whether, as a matter of fact, there is a sharp competition among them for freight?—A. I do not know how they manage

Digitized by Google

among themselves, but in Buffalo they operate through brokers, who make the rates for them generally, and that depends upon the amount of business that is there. There are, of course, certain limits below which they cannot go.

Q. Do railroads come into business connection with these brokers?—A. No; they are canal brokers. They deal with the shippers mostly.

Q. Not with the railroads?—A. No; not with the railroadss, but with the shipper of grain that comes into Buffalo by lake.

Q. Have any of the railroads capital invested in the grain trade as shippers?—A. Not that I know of—not as railroad companies. Private managers may, but I do not know any that have. Railroad companies are never interested in the grain business.

Q. You do not understand that any prominent or heavy railroad managers are also interested as shippers?—A. Oh, yes. There is David Dows, one of our heaviest shippers in New York, who was President of the Rock Island Railroad for many years, although he is not now.

Q. But is it in such way that there could be combination between the railroad managers and the shipping interest?—A. Oh, no; I never heard of any. They are put on the same footing as others, and there are none that I know of interested in the trunk lines.

### FURTHER REASONS FOR ASSOCIATION OF RAILROADS.

I was going to proceed in response to the main question, however. I think I have explained why it is necessary that there should be an agreement between railroad companies as regards the establishment and maintenance of tariffs. Of course, I could say a great deal more to show the reason for that.

The CHAIRMAN. It is well to say all that occurs to you, because this is a vital part of the subject.

The WITNESS. The business of the country could not be carried on without these agreements between the railroad companies. For example, at present the railroad companies agree together to make a rate to Chicago. There are, perhaps, three or four roads that constitute one through line to Chicago. They have to arrange among themselves for the through rate; how it shall be divided among the roads, and how the cars shall be distributed, and how many cars shall be furnished by the different roads; and there are a great many different things entering into the question that it is not necessary to state. I wish to show here the necessity for the railroads co-operating, or as is generally called (to make it odious), "combining," in order to furnish these facilities to the public. There was a time when they did not do this, and if a man wanted to make a shipment to Chicago, he had to ship first to Buffalo to a commission merchant there, who took charge of the goods there, and then transferred them to some other road, until, the goods finally reached their destination. Now, in order to get over all these difficulties, the railroad companies "combine," and assume to give a through bill of lading to Chicago, and they guarantee a through rate. Under the old system you could never be able to know what you had to pay for your freight. One charge was made from here to Buffalo; another from Buffalo to Erie; another from Erie to Cleveland, and so on until you reached Chicago. You can understand at once what a tedious and unsatisfactory way of doing business that must have been. In order to facilitate the business of the country and accommodate the public, the railroads "combined" to make these through arrangements. The initial road—that on which the freight originated—gives a through bill of

Digitized by Google

lading and receipt, guaranteeing to deliver that freight in Chicago, and it assumes all the responsibilities of a forwarder beyond the line of its own road.

Q. You are speaking now of freights going west?—A. Yes, or freights coming east; not only to and from Chicago, but to and from all the little villages and hamlets of the country, even where there is no railroad communication.

### ADVANTAGE OF THROUGH BILLS OF LADING.

The railroads are now in the habit of issuing through bills of lading, guaranteeing the delivery of goods at destination, collecting the charges from each other, so that the shipper has nothing to do but to ship his goods to the consignee at the point of destination who, upon receiving the freight, pays the full charge. This saves a great deal of labor to the shipper.

That system is now in full operation throughout the country. Perhaps in no country in the world is it so perfect as here. You can get a rate to any point in the country and get a through bill of lading.

Now, in order to give a rate to a shipper to any point in the country, it is necessary that the railroads should come together and establish the rate, and that it shall be understood and made known to the public. It is one of the objects of this association to do that. In other words, instead of a shipper having to deal with forty or one hundred railroads, these roads are practically operated as if they were a single road, so far as the accommodation of the public requires. Taking the several roads from here to Chicago constituting one route, not only is it necessary that they should agree among themselves, but there are about fifty different routes or combinations of routes, by which goods can be shipped from here to Chicago, and in order to give people one uniform rate from here to Chicago all the roads constituting these routes have to come together and agree upon uniform rates. The question is what shall that uniform rate be.

### FACTORS IN FIXING RATES.

The idea generally entertained is that railroad companies can ask anything they want. But, there is the competition with water routes, the competition in the markets for the articles to be transported, and other conditions influencing rates. The point is for the managers of these roads to come together and study the conditions under which they have to do business, and to adapt their rates to these conditions so that they may induce shippers to ship by the railroads. That is the problem. What the rate shall be is a matter of judgment and experience. If you make a rate that does not bring you any business, it is very soon found out.

Q. Is the result of that, practically, that all have to ship at that rate at which the route having the greatest advantages can do it?—A. All roads have to conform to the rate that is charged by the road that can or wants to make the lowest rate.

Q. But still the road that can carry at the lowest rate wants to get all it can?—A. Of course it does, and so do all the others, but the rates are limited by competition and condition of trade.

Q. And is there not, on the other hand, a tendency among the other roads to hold the charges as high as possible, and is it not to the interest of that road having the greatest facilities to conform to that higher

Digitized by Google

rate, and make all the more profits?—A. It is to the interest of all to get as much freight as possible; it is for their interest to make such a rate as will induce freight to move. If you charge too high rates you get very little business, and it is better to encourage business and get more at reasonable rates. Of course there are certain limits to which only you can go, below which the business becomes unprofitable.

Q. Here are four routes, one of them a weak route, but having, by far, the greatest natural advantages, and able to carry really cheaper than any other; and the other a very strong route, but likely to be injured in its business if the cheaper and weaker route is used as the carrier. How would the rates be fixed in that case?

THE CHEAPEST ROUTE FIXES THE RATE FOR COMPETING ROUTES.

A. In that case, as a rule, the cheaper and weaker route would not care about the others. If they could make a rate so low that they could make a profit on it, and the other road would lose money, they would make the low rate.

Q. It is a matter of calculation of interest, of course, but I would like to know what the fact is in the operation of this calculation. Do these weaker roads, with greater facilities, practically fix the rates at such a figure as they can carry and do the business, or do the stronger roads who would be injured by low rates succeed in fixing the rates? Take the New York Central, for example, and suppose (without discussing whether that be the fact or not) that it is a very much stronger road than the Baltimore and Ohio, but that it cannot do such business as would naturally come to the Baltimore and Ohio route at the same rate at which that business can be done by the Baltimore and Ohio road—then would not the stronger route fix the higher rate, and would not the weaker route, carrying out the higher rate, be able to make more money than if it had a larger proportion of the business and carried that at as low a rate as possible; and to avoid that might not the New York Central say, "We will fix it at this rate?—A. I do not think the New York Central would have any influence, in such a case upon the Baltimore and Ohio. The principle upon which they all act is that each road wants to make the most money that it possibly and legitimately can make. The question is, what rate will do that? If the rate is too high, they won't get the business, and if too low, they won't make much money. It takes a good deal of experience in order to fix the rates properly.

Q. Is it or not a matter of fact, in the operation of this pool or association, that the road able to carry at the lowest rate fixes the rate?—A. Yes, it is. It fixes the rate for all the others. That is the rule and the fact, and the rule is established simply because the other roads which want to charge higher rates cannot help themselves. Whenever a road wants to make a low rate nobody can keep it from doing so.

Q. If that is so, why is there an advantage in the combination?—A. The advantage of the association is, that all competitors know what that rate is and can conform to it.

Q Simply for publicity as to what the charge is?—A. Yes; but, of course, the roads consult together. Each one has studied the existing conditions; each has agents all over the country, who know what rates are necessary in order to move the business; there are hundreds of agents all over the country that get information from shippers and merchants as to what is necessary in order to move the freights, and they report

Digitized by Google

this information to their chiefs, and these come together, compare notes, and determine what the proper rates should be.

### THE ASSOCIATION A CLEARING-HOUSE FOR RAILROADS.

Q. Is it true, then, that in its primary capacity your office is a great "intelligence office" for the railroads?—A. It is, as I said before, a clearing-house, in which the railroads come together and compare notes and adopt the necessary measures to meet the ever-changing conditions.

Q. These rates are published, I suppose?—A. All the rates agreed upon in my office are published.

The CHAIRMAN. I do not know but that I broke in upon the current of your explanation, and you may proceed with that.

The WITNESS. I had answered, I think, the first part of your inquiry, the reasons for the existence of this office, and the methods employed in it.

### ITS COMPARISON TO THE FEDERAL SYSTEM FOR STATES.

I might explain further, that the relation of this office to the various railroads having established it is pretty much like the relations of the Federal Government to the several States. It attends to the general business in which all the roads are interested, the same as the Federal Government transacts the business in which all the States have a common interest. If, for example, each State were allowed to make its own tariffs, and levy tolls and duties on commerce, without any restraint or agreement between all the States, it would lead to a terrible condition of affairs; and so, likewise, it would if all the railroad companies should do the same thing each for itself. To compare the railroads under the organizations which I have explained with the States under the Federal Government, each road would represent a State. If each road, acting for itself, would make its own tariff, levying its own duties, you can see that it would lead to a great deal of confusion, just as it would if the separate States of the Union were to establish tariffs and collect duties separately, each for itself. The railroads have established a general government; all roads come together and legislate as to the uniform tariffs and freights that should be charged, and appoint an executive officer to see that these tariffs are complied with. The fact that in all countries where there are railroads there are these institutions in a more or less organized form, indicated the necessity for them.

### "RAILROAD UNIONS" IN GERMANY.

In Germany they have what they call the "Railroad Unions," dealing with the same questions that we deal with here in my office.

Q. Something like a trades union?—A. The trades unions are of the same character.

Q. It is a trades union among the railroads?—A. A trades union, whether among railroads or among the merchants, such as the chamber of commerce or produce exchange, or a union among the merchants or laborers. All have the same object, to improve the condition of the members composing the union.

Q. You can hardly attack the principle upon which one is founded without assailing the principle of the other?—A. I am in favor of all unions for the purpose of effecting good for the people, no matter what they are called. The same principle underlies them all. Sometimes, of course, the execution is different from what the theory is.

Digitized by Google

Q. Abuses might arise out of a good system?—A. Yes. But the principle is right.

### RAILROAD CLEARING-HOUSE IN ENGLAND.

In England the railroads have what is called a "clearing-house," which is an incorporated association formed by all the railroads, or nearly all the railroads of England. In that clearing-house they deal with the same questions that we do under different rules and organizations. The English clearing-house makes the money settlements between the different roads, instead of each link in the chain of routes settling with the other; they settle through the clearing-house. The clearing-house is incorporated by the Government and it has worked for the last twenty or thirty years very satisfactorily.

Q. Do I understand you that its functions and action are very much the same as those of your association?—A. Yes; its practical working is the same, except that it takes into account the settlement of money matters, which is not yet done here. And here I may say that it is very unfortunate that these railroad associations here, in this country, have been called "pools." This a very misleading term. What might more properly be called a "pool" is an entirely different thing, and I will explain this further on. You might just as well call the association of merchants, known as "chamber of commerce," or "produce exchange," or the "Government of the United States" a "pool."

Q. This association is a purely voluntary association, while that in England is an incorporated one?—A. Yes. They have the right to collect debts and enforce rules among themselves, which we have not here.

Q. That is, they may do so through the courts of law?—A. Yes. It is a very excellent institution.

Q. This is a voluntary association here?—A. Yes, altogether.

Q. Yet is it so far a matter of contract that the agreements might be made subject-matters of litigation in case of breach?—A. This question has never been tested. I think myself that it ought to be made so. And, I also think, an institution like ours ought to be incorporated in order to make it so. We find a great deal of difficulty in carrying out our arrangements, because any man can withdraw from it who sees fit, or violate the established rules without being punished.

Q. It is simply now an arbitration which cannot be enforced by law?—A. I suppose it might be enforced by law even now, although it has never been tested. I suppose any legitimate agreement between parties might be enforced.

### RAILROAD PROGRESS LIES IN CONSOLIDATED MANAGEMENT.

I have shown the necessity, and the benefits to be derived from the railroad companies working together in this way. In fact, it ought not to require much argument to show the necessity of it. I think the general drift of public opinion has long been that the railroads should all be under one government—and under the National Government—and that arises from the fact of difficulties coming up in the management of so many different railroads which makes it almost impossible to carry on the transportation business in a proper way. The same difficulties were experienced in all countries. In Prussia all the railroads are operated now under state control. Prussia has purchased all the railroads of the state. The reason for that is precisely the same as the reason for our associating together, and trying to work the different railroads

Digitized by Google

as one railroad. The experience of the whole world is in the direction of uniform and consolidated management—at least of the commercial part of railroads.

Q. The "commercial part"—what other part is there?—A. There is the technical management of railroads. That, of course, might be left to each separate corporation as they would most intelligently and readily attend to it, although co-operation in that is desirable.

Q. That is, the care of their road bed and rolling stock and their corporate existence, etc.?—A. Yes; and also the management of their local affairs. This association only takes cognizance of competitive business, when more than one road are interested in the business. The local business can be best done under the management of the local authorities. They can understand it better, and it would be a very bad plan to have the management of all the railroads of the country centralized in one office. It ought only to be centralized to the extent necessary to conduct the general business of the country, in which all or many roads are interested, so as to prevent confusion and war, and all the consequences that would follow war. The local development and management ought to be left to the local interests, as the management of purely State affairs is left to the separate States; the General Government of the country attends only to affairs in which the States have a joint interest. So with the railroads. Let each road manage its local affairs according to the circumstances of the case, and only co-operate in the general government in establishing tariffs that affect business beyond their line of road and which affect other roads than their own.

The CHAIRMAN. Were you going on to other matters?

### REASONS WHY RAILROADS CANNOT FIX RATES ARBITRARILY.

The WITNESS. Having shown the necessity for this association, I want now to remove the impression that exists—although I think I have already partially done so—that these combinations could control rates in such a way as to exact more than a fair compensation for the services performed. This is also a very broad question, and if you should think I go too far into detail I wish you would stop me.

The CHAIRMAN. We would like to go as far into detail as you have the slightest inclination to do. The more explanation of these matters we get the better we can understand them.

The WITNESS. The rates of transportation are not in the power of the railroad companies to fix, arbitrarily. They are regulated by so many conditions and influences that there is no danger that the railroads can exact unreasonable compensation. The danger, I think, is rather the other way. The question is whether the railroad companies can carry on business at such low rates as are forced upon them. Not only the water-way, as I have explained, control the rates almost completely—limiting them, at any rate, within very narrow limits—but the competition of the markets for the products that are to be carried is another great factor in fixing railroad transportation rates. The price of grain, for example, is not fixed by railroad companies; but is fixed in the markets of the world. That price is generally regulated now by the Liverpool market, and if railroads want to carry any grain they have to carry it at a price that will enable the producers to compete in the Liverpool market with the markets of the world. The East India wheat, and Black Sea wheat, have even become factors in making railroad rates from Chicago to New York. There is therefore no danger

Digitized by Google

whatsoever of any excessive charge being made. The object of this association, as I have said before, is to fix upon a uniform rate. The limit of the rate generally is very closely fixed. This is the case with every commodity. Take, for example, sugar. That article is now being carried for 25 cents per 100 pounds, from New York to Chicago. That is a quarter of a cent a pound, which is a very small charge upon that article for its transportation over such a distance, nearly 1,000 miles. The reason for this low rate is that sugar is carried to the West by the Mississippi River. New Orleans is a great sugar market, and if the railroads of the East want to compete with this market the rates must be fixed so low as to meet that competition. There are other articles that require very low rates in order to be transported at all. For example, coal and iron, and all like heavy and cheap articles. The tariff is fixed by the market price for the products in different places in the country. The railroad transportation charges can never be more than the difference between the market value of the articles in different markets—that determines for the railroad companies their charges in a great measure. And therefore this cry about the railroad companies, or a railroad combination exacting arbitrarily from the people unjust compensation for their services is all gotten up for other purposes than to tell the truth.

### RELATIVE IMPORTANCE OF LOCAL AND THROUGH BUSINESS.

Q. I wish to ask you a question now, which, if it interferes with your continuous answer, you may let pass for the present and take it up later. I want to learn from you in which way the country pays most to the railroads—whether in the form of rates or charges such as are arranged through your association, or for local rates or charges? That is, which is the greater source of income to the roads of this country, as a whole, the through business or the local business?—A. That is very different on different roads.

Q. But, I say, take the country as a whole. Do people pay more as local charges, or as through charges?—A. You mean in the aggregate?

Q. The aggregate.—A. I could not tell you that without looking further into the matter.

Q. Could you tell what it probably is over the roads that are in your association—which is most important to them, in other words—the through business or the local business?—A. The local business is the most important. The through business is a mere incident of the business of a road.

Q. Is not the effect of all this to sacrifice the interests of people who live along the line—paying these local charges—to the interests of those who make long shipments between these competitive points?—A. I think the effect is quite the reverse; the through business is more often the protection of the local business.

Q. Including passengers and all?—A. Yes.

Q. In that connection I would like a full explanation of this apparent conflict between the through and the local charges.

### LOCAL CHARGES AFFECTED BY THROUGH CHARGES.

A. The local charges are, in a great measure, affected or regulated by the through. In the case of a railroad war, where the roads lose money on the through business, they would of course try to make it up on the local business; and the local charges would in comparison

Digitized by Google

with through charges be much higher and unjustly discriminating. Hence, the operation of the association is to maintain a paying through rate, as high as it can be got (which is never very high), and in that way they can rather lower the local rates and properly adjust them to the through rates. The principle that is adopted by most railroads is, that when a proper, a reasonable, and profitable through rate is established, they graduate their local rates by it.

Q. What is the relation between them?—A. For example, the Pennsylvania Railroad would not charge more to a place 50 or 100 miles this side of Chicago than to Chicago, and they might charge less—not, perhaps, in full proportion to the mileage, but to some extent so. They would graduate the rates this side of Chicago on the Chicago rate. But, when there is a war of rates—when they charge only 10 cents to Chicago, they cannot reduce their local rate in proportion; then rates to the local points are comparatively higher. That constitutes one of the greatest objections that people have to railroad tariffs when rates are comparatively so much lower to competitive points than to local points. This can all be done away with. When the through rates are maintained reasonably high, then they can adjust their local rates accordingly, and keep the local tariffs in line with the through tariffs so that there will be no unjust discrimination—so that a man 20 miles this side of Chicago will not have to pay more than a man at Chicago, which he would have to do in case of a railroad war. In a properly regulated tariff that does not occur. That is the reason why through rates should be maintained. It protects the local shipper. It does not make so much difference to shippers what the absolute rates are, the comparative rates are of more importance.

### GRANGER LAWS.

The low rates at competitive points, compared with high rates at local points gave rise, I think, some years ago to the Granger legislation in portions of the West. In the State of Illinois, for example, the roads were crossing each other at every 10 or 12 miles, and wherever two roads crossed they went into a fight with each other, and put the rates down to almost nothing, while on each side of the competing stations they kept them up; and that led to a great dissatisfaction among the people, and justly so. The railroad managers have learned something by that experience, and are trying to keep up the through rates and adjust local rates in proportion. This unjust discrimination formerly practiced, has now, in a great measure, been done away with. That is one of the advantages of these associations, regulating the competitive tariffs. Whenever a tariff is fixed from one point—for example, from Chicago—those to other points are adjusted accordingly and kept in harmony with each other; this prevents unjust discrimination.

### RELATION OF RATES ON LONG AND SHORT HAULS.

Q. Are there instances where more is charged for the shorter haul than for the longer one? For instance, more charged for drawing freight from Philadelphia to some point between Philadelphia and Chicago than from Philadelphia to Chicago?—A. No; they are not when through tariffs are maintained. But there are instances where a rate to an intermediate point may be higher than a rate for a longer distance. For instance, from here to New Orleans the rate may be 40 or 50 cents per hundred pounds, and to Atlanta perhaps a dollar; but this is not unjust discrimination, and does not operate against Atlanta. Points that

Digitized by Google

are not on water-courses have to pay more than points that are; that is in the nature of things, and railroads, of course, have to conform to the settled state of affairs. Railroads do sometimes engage in carrying business from here to New Orleans for 50 cents, in order to compete with the steamship lines, while they charge a dollar or more to Atlanta, an intermediate point.

Q. What is your view of it? Ought not these railroads to leave the business to the water-routes?—A. They will not do that, and it is better for the public that they should not. They keep the steamship lines in order. This sort of competition is constantly going on.

KEENNESS OF LAND AND WATER COMPETITION.

We had an example the other day of a case where a line running from here to Savannah went into the Louisville and Cincinnati business. In order to secure business from here to Cincinnati, they took it to Savannah first; the goods are then about as far from Cincinnati as when they started from New York. That is the kind of competition that is constantly going on. If roads cannot do the business for one price, they will do it for another as long as they can do the business without actual loss of money.

Q. I suppose that as the interior is absolutely dependent upon railroad communication for its shipments (before those shipments can reach any sort of water communication), the railroads must be able to make such charges as will enable them to exist; otherwise, they could not do the business at all?—A. Yes; of course, they must make higher charges; but they are even limited by the water competition. Atlanta is an interior point, and the rates are higher to that place, perhaps, than to other places. Yet, there is water communication from here to Savannah and from here to Charleston, and a very short rail line from there to Atlanta, so that the water-routes again control the direct railroad lines. The road running from here direct to Atlanta cannot charge more than is charged by the steamship company running to Savannah or Charleston; and so that fixes the rate again. So, you see, that at every point you can mention there is some restraining influence.

Q. Do you believe that rates are cheaper between New York and New Orleans by water than if there were no railroad communication between New York and New Orleans?—A. I know that there was a war between railroads and steamship companies for months and months, and they were cutting freights down almost to nothing—25 cents a hundred to New Orleans.

Q. Do you think those wars have increased the cost of railroad transportation to the interior?—A. Oh, no. Those wars are only carried on temporarily. When the war is over they come back to paying rates. Still, the steamships and railroads keep each other in check. If the steamship company can make a low rate, and they always can make much lower rates than railroads, they won't make it profitable to a railroad company to come in and take away business. Their object is to keep the rate so low that the railroad company cannot do business, or at least make it unprofitable for them. That is an influence that operates constantly in fixing the rates.

TENDENCY OF RAILROAD CHARGES TO A REDUCTION.

Q. What has been the effect on the course of transportation charges since the organization of this association of yours?—A. As I said before, all these railroad charges are entirely independent of these asso-

Digitized by Google

ciations. It can be shown from the experience of these associations that the tendency of rates is to go down constantly if not arrested by them. When the Southern Railway Association was first formed the rate from New York to Atlanta was $1.60 on first-class goods. Now it is $1.25; and I think that in a very short time it will be $1. These rates are always regulated by other factors than by the association. The association simply conforms to the conditions under which the rates must be made; but if you would go through these statistics you would find that the tendency of rates is constantly to be lowered. The rates, for example, to-day, on grain are much less than they were three or four years ago, but can never be as high again.

### SUFFICIENCY OF TRANSPORTATION MEDIA.

Mr. PUGH. Are the railways and water-ways combined able to furnish transportation sufficient for the surplus food crop that seeks market?

The WITNESS. At this present time?

Mr. PUGH. Yes.

The WITNESS. Oh yes, sir; more than sufficient. I think we have some facilities to spare.

Q. You mean that the means of transportation are sufficient for the surplus food crop of the West?—A. Yes, sir. So far they have been. In fact, there are two new Eastern trunk roads built that carry that business now, in addition to the five that existed before, and they are not only sufficient to carry the amount of the crop that is raised both for the domestic consumption and for export, but they have not enough work to do.

### PROPORTION OF FREIGHTS CARRIED BY RAILROADS AND WATER-WAYS, RESPECTIVELY.

Q. You say that about 60 per cent. of this freight is carried by the water-ways?—A. I said that of the grain coming, during the summer months, to New York; about from 40 to 60 per cent. of it comes by canal.

Q. When the canal is open, it carries about 60 per cent.?—A. Yes, of the grain that comes here to New York.

Q. The bulk of that crop comes over the railroads before the canal is closed up by the ice?—A. I suppose 20 per cent. of the total receipts of grain at the Atlantic seaboard would be carried during the year by the canal; but it differs in different years. Sometimes the canal carries less, and sometimes more, and from 40 to 60 per cent. of the grain received at New York would come here by the canal during the navigable season.

Q. From 40 to 60 per cent. is carried by the water-ways while in competition with the railways?—A. Yes, to New York; and only 20 per cent. of the total shipments to the Atlantic seaboard during the whole year.

Q. The balance of the crop, then, that is on hand for shipment, when the water-ways are closed up by the ice, is left to come by the railroads alone, and they have to furnish the means of its transportation?—A. Well, not alone. There is the Mississippi River, you know.

Q. But I mean for eastern ports and markets?—A. Yes.

Q. Now, are the freight rates the same in the summer months, when the roads are in competition with the water-ways, as they are when the ice closes up the water-ways and the railroads enjoy a monopoly of the

Digitized by Google

freight—do the tariff rates continue the same?—A. Rates are generally, if not always, lower in summer than in winter.

Q. Then, in the absence of the competing power of water-ways the freights are raised by the railroads?

SUMMER AND WINTER RATES—REASONS FOR THEIR DIFFERENCE.

A. The freights are raised by the railroads, yes—if they can—if the market is so that they can raise them.

Mr. PUGH. We understand the reason. It is the absence of competition.

The WITNESS. May I suggest another reason?

Mr. PUGH. Certainly.

The WITNESS. During the summer time the railroads carry the grain to the East for less than it costs them to do the work, if interest on capital is included in cost. In the winter time they try to charge a little more.

Q. To make up?—A. No; to charge more nearly what it costs them to do the work. Even in the winter time they do not charge more than it costs. I think they generally charge less. Grain transported to the East at a 25-cent rate, for example, at present does not pay the railroad companies enough to pay the interest on their investment, or a proper proportion of it; and, therefore, whenever the competition allows, they put in rates that will pay them something. That is the reason they raise the rates in the winter time. There is another reason that could be given, namely, the increased cost of operating roads in winter—though this is not the real reason—the real reason is that they can get pay for their work in winter time; in summer time they have to do work almost without profit. If you take the difference in cost of transportation for grain, I mean of doing the work in the winter time as compared with summer, I think it would alone justify the increase made in the charges. In winter time, when the snow is on the roads, perhaps five locomotives may be required to haul a train, while in the summer time it can be hauled with one; and the extra cost on account of delays and stoppages and interferences by snow, etc., would justify an increase in the charge for transportation. If the charge in the summer time was a proper one, it might, in the winter time, be higher, and still be a proper one; or if the charge in summer time was too low, an increase in winter time would still more be justified. But this, I say, is not the reason for making the advance. The reason is that the roads can get more for the service, and they are entitled to more as long as the rates charged are perfectly reasonable.

Q. I understand you to say that the water-ways are the real regulators of the tariff rates on your railroads?—A. Yes.

Q. And that, notwithstanding this combination of the trunk-lines and their connections, the rate of freight is regulated by the water-ways?—A. Regulated, yes.

RATES FIXED WITH A VIEW TO MOVING THE CROPS.

Q. Now, when the water-ways are not in existence, of course that cannot be the fact?—A. Oh, yes; they have an indirect influence in regulating the rates. I thought I had explained that.

Q. Yes; that the crop lies over and waits?—A. Yes.

Q. Well, would not the crop suffer if it were kept on hand; would not grain and meat suffer?—A. And so would the railroads suffer if they had nothing to carry. This is the reason why the railroads furnish

Digitized by Google

facilities and make rates under which the people can market their goods. The railroads never charge so much as to prevent the movement of the crops. The companies are interested in moving the crops, and must conform their rates to the market value of the articles they carry. If they would make a rate that would shut out the farmer from the market in the winter time, or would ruin his business, they would also ruin the railroads.

Q. Well, when the ice closes the water-ways there is a large portion of the crop to ship, and that is entirely dependent on the railroads for transportation?—A. Immediate transportation, yes.

Q. And when that condition of things exists as to that portion of the food-crop unshipped, the railroads are masters as to the freight rates?—A. I beg your pardon, they are not masters. As I have explained, if the prices of these articles are low in the market that obliges the railroads to give such a rate as will move the crop. That is a consideration that enters into the making of rates. The roads cannot charge what they please.

Q. They are restrained?—A. Yes; by the market value of the articles seeking transportation; that is, by the competition of the grain in the markets, and that influence exists during the whole year, in winter or summer. This is the limiting condition in making transportation rates. The competition in the markets regulates the rates, and that competition cannot be shut out by any combination of railroads whatever.

Q. You leave, then, a margin of profit, in order to induce shipment?—A. Of course.

Q. If the producers and merchants could not make anything by shipping it to market, of course there would be no shipment?—A. No.

Q. Then you look to the profit in the market to determine the amount of your freight rates?—A. Not so much to the profit as to the values of the article in different markets.

Q. Of course; but the market price decides the amount of profit to the producer?—A. Yes.

Q. And the producer has to take out the freight rates, of course, and then what is left him in the market is the inducement which he has for shipping?—A. Yes. The producer and the railroads have to work together. The producer or merchant confers with the railroads and states what is needed to carry on his business; and it is a matter of barter between the shipper and the railroad company what rates shall be charged. Both are anxious to move the crops, and both are dependent on each other to move them. The railroad man and the shipper, it must be supposed, are both intelligent men, and they will make an agreement that will be to their mutual advantage. That is the way all commercial transactions are conducted.

Q. What is the present rate on a bushel of wheat from Chicago to New York by railroad?—A. Fifteen cents a bushel—25 cents per 100 pounds. It is nearly 1,000 miles of transportation, and, as I said before, it does not pay the cost of moving the grain, if a proper compensation for the investment in the roads is considered.

Q. In the winter time what would it be—when the canals are closed?—A. Last year the highest rate was 30 cents, and the year before it was 35 cents. During the whole winter, when there was ice on the canals and on the lakes, the railroads charged last year 30 cents, which was not more than they charged in the summer of 1882. The grain was not moving very freely, and hence the very low winter rate. The rate was 35 cents in the winter before, and it is not five years ago since it was 45 cents in the winter and 35 cents in the summer. Everything is going

Digitized by Google

down. The rate this last winter was 30 cents, only 5 cents per 100 pounds higher than the summer rate.

Q. From your general information, how much profit would that 5 cents per 100 pounds make in the aggregate business of the railroads?—A. That 5 cents is only upon grain. Unfortunately, I have not the figures with me, but I would like to give you that information.

MISCONCEPTION AS TO RAILROAD PROFITS.

A gentleman, who is now no longer living, estimated a short time ago that the exactions of the railroad companies by increasing the railroad rates 5 cents per 100 pounds would amount to $900,000,000 a year, while at that time the truth was that the total earnings of all the railroads of the country for all the freight and passengers transported over them were only about $500,000,000. I would like very much to give you that information, as I made the calculation at the time to show that the estimate was slightly overdrawn, as it is hardly possible that you can make an overcharge of $900,000,000 out of total earnings of $500,000,000.

By Mr. CALL:

Q. You said that $900,000,000 were realized by imposing an additional charge of 5 cents?—A. That was the estimate presented to the Anti-Monopoly League when that League was first organized, two years ago.

TOTAL ANNUAL RECEIPTS AND EXPENDITURES OF AMERICAN RAILROADS.

Q. And your calculation showed that the gross receipts were only $500,000,000?—A. Yes; the gross receipts of all the railroads in the country were then only $500,000,000. Of course, out of that about three or four hundred millions were paid out for working expenses.

Q. Have you in your mind at present what the gross receipts are now?—A. Yes; last year the gross receipts were about, in round figures, $700,000,000 for both passenger and freight business. The freight receipts were about $500,000,000 last year; that is on 112,000 miles of railroads which reported their earnings.

Q. What are the net receipts; have you any idea?—A. The net receipts were about $300,000,000, the gross receipts being about $700,000,000. The dividends and the interest on the bonds had to be paid out of about $300,000,000. I think the stockholders got about $100,000,000 of that. It is about 3 per cent on the stock.

Q. On the capitalization?—A. No; on the stock. And the bondholders get about 5 per cent. The whole railroad capitalization is $7,000,000,000, and about half of that is stock and half bonds.

Q. You mean that there are $7,000,000,000 invested in railroads?—A. Yes. Of which about half is represented by bonds and the other half is represented by stock.

Q. And the whole amount of dividend on the bonds is 5 per cent.?—A. Yes; and on the stock 3 per cent.

INDEBTEDNESS OF RAILROADS, STOCK AND BONDS.

By the CHAIRMAN:

Q. Are the railroads of the country bonded to as large a sum as their capital stock?—A. The total indebtedness of the railroads is represented one-half by bonds and one-half by stock, in round numbers. Out of

Digitized by Google

the $7,000,000,000 there is about $3,500,000,000 in bonds and about an equal amount in stock.

Q. Then the bonded indebtedness of the railroads is the same, or substantially the same, in amount as their stock capitalization?—A. About the same; I only give the round figures.

Q. Do you call that indebtedness?—A. Yes.

Q. It is an investment on which they are entitled to dividends, perhaps, after the interest is paid upon the bonds; but do you mean that the stock is a debt except in the sense that it is entitled to a dividend?—A. Well, it is a liability of the company to the individual stockholders. I do not know that it makes any difference what you call it. There is about one-half bonds and one-half stock that makes up the whole capitalization of the railroads; very nearly so.

Q. First, the bond is the prior claim, and that is entitled to its interest, and if there is anything remaining of the net profits it is distributed in the form of a dividend to the stockholders?—A. Yes, and that dividend is 3 per cent. A great many roads do not pay any dividend, but the average dividend paid is about 3 per cent. on all the roads. I think if any proof is wanted to show that the stockholders do not get excessive profits, that would be enough to establish that fact.

By Mr. PUGH:

Q. Before going back to the subject about which we were inquiring, I will ask you in connection with this point this question: You say that the capitalization of the road is divided into stock and bonds?—A. The capital invested in the railroads of the United States is represented partly by stock and partly by bonds.

Q. Now, in making up the amount invested, how do you get at it; do you add the stock and the bonds together?—A. Each railroad company's indebtedness is shown by its reports.

RATIO OF STOCK AND BONDS TO ACTUAL COST OF RAILROADS.

Q. In ascertaining the cost of a road, you combine the stock and the bonds?—A. You can hardly call it the cost of the road.

Q. That is what I want to inquire into, and how this combination of stock and bonds compares in the aggregate with the actual cost of the road?—A. That I do not know. I could not tell.

Q. Have you no judgment on that? Have you never thought of that enough to give us an estimate?—A. I have thought of it a good deal.

Q. What is the difference between the actual money cost of the roads to the present holders and the amount of the stock and bonds that you mention?—A. I think that you could not replace the railroads for the present capitalization—for the amount that is now charged against them in stock and bonds.

Q. You think that the railroads could not be built to-day for what is summed up in stock and bonds?—A. I think they could not.

By the CHAIRMAN:

Q. That is they could not be built for $7,000,000,000?—A. They could not be built for $7,000,000,000 as they are, with all the improvements and the rolling stock, etc. My reason for saying so is that when you examine in detail the cost of the roads you find that the capitalization is about $60,000 per mile. The question is, could you now duplicate or replace the railroad system for $60,000 per mile.

Digitized by Google

AMERICAN RAILROADS CANNOT BE DUPLICATED FOR $60,000 PER MILE.

Q. Including the rolling stock and all?—A. Including rolling stock and all; and in my estimation (and I think I know something of the cost of railroads, for I have built a great many) you could not replace them for $60,000 per mile to-day. While there is no doubt a great deal of watered stock, yet, on the other side, there are a great many railroads that have gone through bankruptcy, and their stock has been wiped out, and if you put one against the other you will find that $60,000 per mile is not enough to build the present railroad system of the country.

Q. How many miles of railroad are there in the country?—A. One hundred and twelve thousand miles. Some of those miles cost two or three millions of dollars per mile; others only $20,000 a mile, which is perhaps the least that you could build a railroad for. The rolling stock alone of these roads is worth perhaps six or seven thousand dollars per mile. Then you have to take into consideration the interest that you have to pay on railroads while they are being built; that is a proper charge against the cost. Some railroads have been building ten years, and had to pay interest perhaps on half their cost during that time. I think a small computation of the interest on railroads while building is about four or five thousand dollars per mile. Then there is the discount when you have to sell bonds perhaps at 60. Some roads have been fortunate enough to sell at par while building, but very few. That item of discount may amount to from four to six thousand dollars per mile. Then the terminal facilities cost a great deal—the shops, depots, water-stations, and the ground for depots, shops, etc. When you count all that up, I am satisfied you could not to-day build the railroads of the country for less than $60,000 per mile, and all this talk about stock-watering—while that is a very objectionable feature of our present railroad system, so far as it affects the cost of the roads—is greatly over-estimated. You always hear talk about stock-watering, but never about bankrupt railroads, whose stock has been altogether sunk. Some of the railroads have gone into bankruptcy two or three times, and some will go through it again no doubt.

By Mr. PUGH:

Q. Then you state it as a general fact that the stock and bonds in the aggregate fall short of the actual market value of the roads?—A. You have to make a difference between market value and cost.

Q. I mean what they are worth in the market now?—A. Some of our roads are worth nothing and the present capitalization may be all wrong, so far as their market value is concerned. These roads that pay no dividend have only a prospective value and are worth nothing to-day in the market.

Q. They are dead capital?—A. Dead capital. That is, to the stockholder—not to the bondholders, or to the people who use the roads and get the benefit of them.

Q. In your judgment what per cent. do the freight rates pay upon the capital—on the amount invested?

RAILROAD EXPENSES 60 PER CENT. OF RECEIPTS.

A. The operating expenses of the railroads are about 60 per cent. of the earnings. The railroad companies pay out in cash in operating the roads 60 per cent. of what they take in. That leaves 40 per cent. to pay

Digitized by Google

the interest on the bonds, and the dividends on the stock. This 40 per cent. amounts to 4½ per cent. on the capital. That is, the railroad companies by their present charges make enough net money to pay 4½ per cent. upon $60,000 per mile of road, or 3 per cent. to the stockholders and about five per cent. to the bondholders. They pay more on the bonds; they have to pay first the interest on the bonds, and that leaves for the stockholders but 3 per cent. on their investment—on the stock as it is now reported. That is the result. On the $700,000,000 that they take in for passengers and freight, 60 per cent., or about $400,000,000, they pay out to their workmen and officers and employés and to the manufacturers who furnish the material and supplies, and to the manufacturers' workmen.

Q. What is the proportion of that 60 per cent. that is paid to the actual laborers in the service of the roads without regard to the officers—what percentage of that 60 per cent., I mean, goes to the employés?—A. I could not tell you that without referring to statistics and papers, but I can tell you nearly enough. Nearly all of it goes out to laborers; if not to the railroad companies' laborers, then to the laborers of the manufacturers that are engaged in furnishing supplies to the company. It is all labor really, except the profits to manufacturers. The amount paid to officers and clerks is but very small, perhaps about 1½ per cent.

Q. I mean the railroad hands in the service of the company, those employed in running the road and keeping it in repair?—A. You mean the laborers on the track and the engineers, firemen, and conductors?

Mr. PUGH. Yes, and roadmasters, and so on?

The WITNESS. I will make a rough guess. Fifty per cent. at least goes to the immediate laborers; but I leave that answer subject to correction. Nearly the whole of it, however, really goes to labor of one kind or another.

Q. You say that the freight rates are regulated by business rules and considerations that govern all investments and industries?—A. Yes.

Q. You meet together and consider these rules in making a decision?—A. Yes.

Q. You think that they are reasonable, of course, for the service?—A. I think, from the facts I have stated, one would be justified in forming that opinion.

### SHIPPERS NEVER SATISFIED WITH RAILROAD CHARGES.

Q. What does the shipper think of it?—A. The shipper is never satisfied as long as he has to pay anything. You will find this the case here and all over the world. The shipper's business is to get the rates down as low as possible, and to get as much service as possible for the least money. The middlemen, the merchants and shippers, stand between the railroads and consumers, and whatever deduction in charges the railroads make the middleman generally puts in his own pocket; hence they are always trying to get lower rates.

Q. He pockets it?—A. He pockets it, and that is the reason why he is so interested in getting the rates down. He generally represents himself, however, as doing it for the benefit of the people, when it is really for the benefit of himself. The people at large are generally satisfied with the transportation rates, and have reason to be so.

### FREIGHT ON BARREL OF FLOUR, CHICAGO TO NEW YORK (1,000 MILES), 50 CENTS.

To illustrate: See what it costs a man to get a barrel of flour from Chicago to New York; the railroads charge now 50 cents for carrying

Digitized by Google

200 pounds of flour 1,000 miles. I do not know how much a man generally consumes, but suppose a man eats a pound of flour per day, and if he does, he pays in the year for the transportation of his 365 pounds of flour about 80 cents, 25 cents per 100 pounds. If he eats a pound of meat per day, the charge on that is 30 cents per 100 pounds.

By the CHAIRMAN:

Q. Have you not made a mistake in your calculation as to the flour; a man will eat a barrel and a half per year if he eats a pound a day?—A. The cost of its transportation is a quarter of a cent a pound.

The CHAIRMAN. Ninety-one cents, I make it.

The WITNESS. Call it 91 cents.

The CHAIRMAN. That is saying nothing of the price of the flour itself.

The WITNESS. So that a man pays about $1.90 for the transportation of all the meat and flour that he eats in a year. A laboring man earns that by a day's work. Now, I do not think that is an unreasonable charge when you come to consider that for one day's work a man can get the farms of Illinois brought right before his door.

## PROFITS OF MIDDLEMEN.

But some of these middlemen go before the working people, especially when they want to establish an anti-monopoly league, and talk of the exactions of the railroads, and yet I have no doubt that the grocer makes a profit of a dollar when the railroads get only 50 cents for carrying a barrel of flour 1,000 miles. The middleman merely for buying and selling gets more than the railroad for transporting it that distance. Yet the middlemen that produce nothing are the men who arouse dissatisfaction among the workingmen by telling them that the railroad companies are their enemies, and are ruining them, and are taxing them to death, while the fact is that the railroads have been instrumental in supplying the laboring men with cheap food.

## CHEAPNESS OF RAILROAD RATES.

If you go through the whole list of articles of consumption, you will find that the item of railroad transportation is very small compared with the cost of the articles. Take a suit of clothes, for example, shipped from New York to Chicago, weighing, say, 10 pounds. That is transported for 7½ cents (75 cents per 100 pounds); the suit may cost anywhere from $20 to $50. I do not think there can be any complaint of such a charge as that on such an article for 1,000 miles of transportation. Then take a silk dress that weighs perhaps three pounds. The charge for that is ¾ of a cent per pound, making 2¼ cents for the transportation of a silk dress 1,000 miles; or take a pound of coffee—I do not know what a pound of coffee costs now, but we carry it to Chicago for ⅓ of a cent. If coffee costs, as I am just informed, 11 cents per pound, the railroad company out of that 11 cents gets one-third of a cent. That is not a very extravagant charge, and I think nobody would object to paying that amount for the service rendered. Then take sugar. We carry sugar for a quarter of a cent from here to Chicago, and if the price of sugar is 14 cents per pound, I do not think the proportion which the railroad company gets for transportation is very large. The railroad charges really are a very slight proportion of the whole charge for these articles of consumption. If the railroads carried them

Digitized by Google

for nothing the price to the consumer would be very little affected thereby.

By Mr. PUGH:

Q. I understand you to say that the main object of this railroad co-operation, or the system adopted by the railroads, was to regulate freight rates—the tariff of freights?—A. To establish proper and uniform tariffs.

By Mr. CALL:

Q. On through lines?—A. Yes. Each road could establish its own tariff without an association, but these tariffs could not be made uniform and properly adjusted to each other without co-operation.

By the CHAIRMAN:

Q. You include passenger traffic as well as freight traffic?—A. Yes.

By Mr. PUGH:

Q. You arrange the tariff rates or fares for passengers and freights?—A. Both passengers and freights, yes.

RAILROAD "POOLING" SYSTEM: ITS RAISON D'ÊTRE.

Q. The amount of freight and the number of passengers that each road is to get is not a part of the object, or not a subject of regulation by the combination, as I understand?—A. That brings us to another branch of the question. I know the object of your inquiry. It is one of the objects of the railroads in coming together to establish rates; but another object which they have in view, and a much more difficult one to carry out, is to have all the railroads maintain the rate so established. The practice of railroad companies has been that after agreeing upon rates with other roads, one or more, or all of them, make lower rates secretly; and after a while it is found out that every road has its own rate and every shipper has his own rate; so that one shipper does not know what the other shipper is paying, and the agreed tariffs are not maintained. Now, for the purpose of maintaining rates, there are certain means adopted by railroads which are the only means that can be adopted at present, or until the Government gives some help in the matter—and that is what is called the system of pooling.

Mr. PUGH. That is what I want to get at.

The WITNESS. Yes, I understand. That system is adopted merely for the purpose of maintaining the established rates by withdrawing the motive of the different roads to cheat each other.

Q. Underbidding?—A. Yes; cheating, rather, I should call it.

Q. Violating their agreement?—A. Yes; but still I will call it cheating.

By the CHAIRMAN:

Q. They do that, then, do they?—A. Yes, unfortunately.

By Mr. PUGH:

Q. It is hard to restrain the competing power, is it?—A. Yes. The competing power is stronger than honesty. If they only did it openly, there would be no objection. It is the secrecy that is objectionable.

ITS PLAN OF OPERATION.

To explain what is meant by pooling: Take, for example, a number of roads, say four of the trunk lines here. They come together and say, "Let us restrict our business to a certain amount for each com-

Digitized by Google

pany—each only doing so much when there is not enough for all to do, and guaranteeing that much to each other, so that we may have no motive to cut rates." And they compare notes, and see that for the last five or ten years each road has done relatively the same proportion of the total business. There must be a law—I do not myself know what it is—that regulates this railroad business, for each road receives each year, whether they fight or not, almost a certain proportion of the business. Now, they agree with each other instead of fighting for the freight and giving rise to all the difficulties that are consequent upon a war of rates that each road shall get, say one fourth, if there are four roads, and if that be the proportion in which they have heretofore carried the business. They simply say to each other, "Let us stop this underbidding, let us maintain the same rates for the same service, and get some compensation for our work instead of ruining each other." If one road gets more than its proportion, it agrees to hand it over to the others; or it goes out of the market for a while until the others catch up. There are a number of methods by which they could bring about the agreed distribution of the traffic.

Q. That is all done to maintain the freight rates?—A. The rates that all have agreed to—after full consideration as to the proper rates to be charged. That is done to stop friction and cutting of rates and discrimination among shippers and open war between the roads; and it is done so that the railroad companies can get some money for the work they do.

Q. I have a memorandum here, noted down from the testimony you have been giving, that the combination has nothing to do with local rates, except where two or more roads compete for freight?—A. Yes. The organization takes no cognizance of local rates. It is only when a number of roads come in contact with each other that some uniform rate must be agreed upon. The question of rates from New York to local points does not come before the association.

Q. Where there is no competition, the road is left free to make its own charges?—A. Yes.

### RAILROADS BUILT PRIMARILY FOR LOCAL TRAFFIC.

Q. Through business, you have said, is a mere incident of the road, and the local freight is the paying freight?—A. Yes. Perhaps I ought to qualify that expression—"incident." On some roads it may be one-half, and on other roads it may be nothing at all. But the mainstay of all roads is, or ought to be, the local business, because they were built for the local business, and not for the through business. Thus far, then, it may be said the through business is an "incident." But I desire to modify this expression, because it might be misunderstood. The road should get along without any through business; the road is primarily built for local traffic. That is the traffic which they can rely upon; but when they see some way of entering another market, of course they go into it. But as the competitive business is a shifting business, you cannot rely on any through business to sustain you, and it is not a safe investment to build a road that could not be sustained to a great extent by its local business.

By the CHAIRMAN:

Q. Many roads that are built are merely connecting lines, links, or roads which have become links in long lines?—A. Yes.

Q. You do not mean that those should be compelled to pay the same

Digitized by Google

as passengers and freight fed into them from other sections?—A. Oh, no.

By Mr. PUGH:

Q. They do, though. They charge until they make the connection.

AVERAGE INTEREST ON RAILROAD INVESTMENTS NOT OVER 3 PER CENT.

A. I think every road should be allowed to charge enough to pay the interest on its cost; but the average interest earned by the roads in this country is not more than 3 per cent. to the stockholder.

By the CHAIRMAN:

Q. But when a great many roads are making nothing, and the income on other roads is such that the average result is a good compensation or return upon the entire capital—waste capital and all—does it not follow that there must be overcharge somewhere?—A. No, not overcharge.

Q. If one road pays nothing, and another roads pays so much that the two taken together pay 5 or 6 per cent. on their investment?—A. Yes.

Q. Then, does it follow that, since one pays nothing, the other must pay 10 or 12 per cent.?—A. It does not follow that because a road makes 12 per cent. it makes unreasonable charges; it only shows that it has a more profitable business than a road that pays only 3 per cent.

The CHAIRMAN. I will not follow that up now so as to interrupt the current of your narative. I will come to it later. You say that there is no combination on water-ways, and that there never can be any combination; I mean such combination or arrangement as the railroads are able to make.

WATER-WAYS: NO INDUCEMENT TO COMBINE.

A. Oh yes, they can be made; but the water-lines are in such a position that they cannot make exorbitant charges. Neither can the railroads.

Q. The water-ways among themselves are unable to combine?—A. There is no inducement for water-ways to combine. They are never competitors in the sense in which railroads are. For example, the Erie Canal is not a competitor with the Mississippi River; that is to say, not an immediate competitor. They are competitors in a certain sense—as, for the export business; but they do not come into direct competition with each other. For example, the Hudson River runs through a certain section of country. There are only certain people that can be furnished with accommodations by the Hudson River. But with the railroads it is different; the railroads cross each other in every direction. The rivers do not. The net-work of railroads makes competition very active; one road competes with many others. There is no competition between the several water-ways; there is only competition between the boats on each water-way; but the railways compete with each other all over the country, and in every direction. This makes railroad competition so much more widespread, leading to so many complications that it makes it difficult to prevent competition from becoming ruinous.

EFFECT OF THROUGH RATES ON LOCAL RATES.

You may get a wrong impression when I say that railroads agree upon rates to competitive points only, and leave the local rates to be made by each company as it may see fit. Whenever a through rate is estab-

Digitized by Google

lished, that, in a great measure, establishes a local rate. Take Mattoon, in Illinois, for example. The Mattoon rates are regulated by the Chicago rates, although Mattoon has no canal. In that way Mattoon gets the benefit of the cheap water rate which is given to Chicago. Now, a railroad could not afford to charge a station 10 or 20 miles this side of Mattoon more than it charges to Mattoon; and so all these local rates in that way get the benefit of competition, and the shipper 10 miles this side of Mattoon gets the benefit of it just the same as if he were at Mattoon. He may have to pay a little more from his station to Mattoon than a pro rata, but from Mattoon on he gets his proportionate rate on the thousand or more miles. Every local rate is really influenced by the low through rate. The local shipper gets the advantage of the through rate as soon as he reaches the competitive point; and in Illinois, you know, there is a competitive point almost every 10 or 20 miles.

### STATE BOARDS OF RAILWAY COMMISSIONERS.

By Mr. PUGH:

Q. In your judgment, how has the supervision of State boards of commissioners acted upon the railroad interests and the rates of transportation? That is a broad question, but I want to get your judgment as to the wisdom of supervision of railroads by State boards of commissioners, so far as a judgment may be formed by experience of the operation of that control.—A. There are different commissions in the different States, with different powers, and I would have to speak, perhaps, separately of each. As a rule the commissions are only advisory, and I think that is a most excellent feature, and a very good thing—to have these commissions—because you can explain to commissioners a great many things that you cannot explain to the people at large. It is desirable that the people should have some tribunal to which they could go and make complaints and get them investigated. They make their complaints to these commissioners, and the commissioners confer with the railroad companies. That is a very excellent plan, and if the commissioners are the proper sort of men they will do a great deal of good. The defect of that system, however, is that its work can never reach very far beyond their own State. A great many of the railroad questions are national. Railroad operations are not confined within State lines; and these commissioners, having jurisdiction only within the State, their operations are very much limited and very much hampered, because most of the questions that arise are of broader scope; still, when the commissioners are fair men, they do a great deal of good. For example, the Massachusetts commission has done a great deal of good, and I think the New York commission is composed of good men. They have been getting along very well so far.

Q. Do you not know that commissions exist also in South Carolina and Georgia, and that they have given satisfaction?

### THEIR POWERS.

A. In reference to Georgia, particularly, they have a different system; and I believe Alabama has a system like Georgia; in Georgia the railroad commissioners are the controllers of the railroad property. While they have no earthly interest in the railroad, nor in its property, they fix the rates of compensation. That means they actually control that property. They need not care whether the roads make money or not. They have much more interest in making themselves popular

Digitized by Google

with the people, to secure re-election, or promotion to some higher office by cutting down the compensation of railroads. This may be satisfactory to the commissioners and to the people, but it is not to the railroads; it is not just.

Mr. PUGH. My information, however, is that the railroads in Alabama are very well satisfied with the work of the commission there.

The WITNESS. In Alabama, I do not think the railroad commission has interfered with the rates yet. They have, however, power to do so. In Georgia the commissioners have actually prescribed the compensation which the railroad companies shall receive for their work, the fares for passengers and rates for freight; and that is something that I think is unjustifiable, because property ought to be controlled by the people who own it, as long as they control it in a legitimate and proper way; and there are always means of making them do that without prescribing fixed charges. I believe the general idea of the commission is that they would regulate the charges so that the railroads would get 8 per cent. on the investment. That is what they tried to do; but there are some cases where they have cut down the railroads far beyond that, because they cannot tell in advance what the railroads will get, nor what will be the effect of any specific tariff. I think the principle is entirely wrong, that a State, or a commission appointed by the State, should fix absolutely the charges for the services rendered by a railroad company, because that is controlling the property of other people. The State should own the roads if it wants to control them absolutely.

### RAILROADS BELONG TO THE PEOPLE WHO PAY FOR THEM.

Q. You do not agree with Judge Black, that railroads belong to the public?—A. No; I think the railroads belong to the people who pay for them and who take all the risk of the investment. If the State would also guarantee the railroads against losses, then they could fix the compensation. Some of these railroads may have worked for years for nothing without any profit, and the State has never offered to make good their losses; but as soon as a road commences to make some money then the State claims the right to restrict its profits. I do not think this is right. A good rule must work both ways. The State ought to pay the debts of the railroad when it loses money if it wants to control the road when it makes profits.

The CHAIRMAN. If you have any matter in your mind that you want to state to the committee, you may proceed to state it now.

The WITNESS. I was going to give some figures that Senator Pugh called for.

The CHAIRMAN. You may state what you wish to say about those.

### AN ANTI-MONOPOLY EXAGGERATION.

The WITNESS. Senator Pugh asked me what an advance of 5 cents in the rate would amount to in the winter carriage on grain. There was an estimate made by Judge Black in his speech before a meeting of the Anti-Monopoly League in New York City, in February, 1881, to which I have already referred. This estimate, however, was given to Judge Black by others. He is not responsible for it. It was put into his hands by the leaders of the Anti-Monopoly League before he went on the platform to speak, and he simply put his name to it. His statement was that an increase in the rate of transportation of 5 cents per 100 pounds on grain alone would amount to $75,000,000 in the course of a year, and

Digitized by Google

upon all freights carried by the trunk lines to $900,000,000. That estimate, however, is based on the ridiculous assumption that the whole grain crop of the country, 2,400,000,000 bushels in the year 1880, was carried for export by the trunk lines. Accordingly not a bushel of grain would have been left in the country, none for home consumption, not even enough to feed the men and animals that were employed to raise the crop, and none even for seed. These are the supposed facts upon which estimates are made by anti-monopolists for political purposes. At 5 cents a hundred pounds or $1 a ton that 2,400,000,000 bushels, which would weigh about 75,000,000 tons, the additional charge for transportation would be $75,000,000, and as he estimated other freights carried, including grain, at 900,000,000 tons, the increase of 5 cents in the rate would amount to $900,000,000. The fact is, however, that the total amount of grain and all other kind of freight, for the time he estimated, that was transported east of the western termini of the trunk lines during the year 1880 was only 11,500,000 tons, instead of 900,000,000 tons. Of these 11,500,000 tons there were only 8,500,000 tons of grain and provisions carried by the trunk lines. At an advance of 5 cents for 100 pounds during the four winter months, the additional charge would amount to $2,800,000 only, instead of $75,000,000, and this sum was collected by some forty roads, and does perhaps not represent more than the additional cost of operating the roads in winter time as compared with the cost of operation in summer time.

By the CHAIRMAN:

Q. Is that on the amount that is carried across the water, or all that is brought to the east and carried abroad also?—A. All that is brought east—for home consumption as well as for export—the whole quantity of grain and provisions brought by the trunk lines to points east of their western termini. The grain is about 70 per cent. of all freight that is carried east. I desire to impress these facts upon the committee. That ridiculous estimate, based upon the supposition that the whole grain crop of the country was carried by the trunk lines, and that they could extort such tremendous amounts of money, was published very extensively all over the country. Many people actually believed it, and I suppose believe it now, and of course feel very much aggrieved, and they advocate that proper restrictions should be put upon railroad charges. The estimate of the anti-monopoly leaders, however, was based upon a statement made by Senator Windom in his report on transportation to the seaboard, and which was extensively copied in the press throughout the country. He stated that there were four men who could put up the rates of transportation whenever they pleased, and could tax the people to any amount. He then made an estimate of the whole grain crop of 1872 and 1873, which was 1,500,000,000 bushels. An increase of 5 cents per 100 pounds would at that time amount to $45,000,000. The later estimate was based on 2,424,000,000 bushels, being the grain crop of 1880, which would weigh about 75,000,000 tons, and 5 cents per 100 pounds, or $1 a ton, would amount to $75,000,000. That is the increased amount which they would get if they carried the whole grain crop and provisions at a rise of 5 cents.

## INCREASE AND DECREASE OF RAILROAD CHARGES.

The idea seems to be that the railroads always increase their rates and never make reductions. The fact is, that there are always reductions after an increase, and for the last ten years reductions have been

Digitized by Google

permanent and increase temporary. As I have said, last summer the rate was 30 cents a hundred pounds, while this summer it is only 25 cents a hundred pounds. But, inasmuch as that is in favor of the shipper, the railroads get no credit for it. The same reasoning applied by the anti-monopolist should give credit to the railroads for having made a present to the people of $75,000,000 when they reduced the rate. The rates fluctuate within very narrow limits now, but have been reduced, upon the whole, in the last few years. I suppose the railroads will never be able to charge more than 35 cents as the highest and 25 cents as the lowest rate. The average will be 30 cents, perhaps; and I do not think they will ever get more, if they get that much. Formerly they received 45 and 60 cents per 100 pounds. In reducing the rates from 60 to 25 cents, the railroads have benefited the people at the rate of $525,000,000 per year, if we adopt the anti-monopoly methods of estimating.

### FAIRNESS OF RAILROAD CHARGES CONSIDERED WITH RELATION TO CAPITALIZATION OF ROADS.

Q. Your statement seems to lead to the conclusion that railroads are not receiving from the people any higher charges for freight and for passenger fares than they ought to have. I observe that you aggregate all the bonded indebtedness with the capital stock, assuming that that represents the actual value or the cost of duplicating the railroad facilities of the country. You say that the aggregate is about $7,000,000,000, and that the gross earnings upon that sum are about $700,000,000 annually, the net earnings about $300,000,000, and that the $300,000,000 net earnings are divided between $3,500,000,000 bonded debt at 5 per cent. and $3,500,000,000 of the stock at 3 per cent. That, in your judgment, is only about a fair compensation to be paid by the people for the use of these railroads, because their fair valuation is about $7,000,000,000?—A. I say it is rather low—less than it ought to be, rather than more.

Q. Do you think that that is a fair statement to put to the country as indicative of the relations of the public to the various individual railroad interests as they exist in the country, and which, all aggregated, make up this great whole?—A. I think we have to look at this railroad system as one system and as a whole. You may pick out a great many railroads, of course, and find that some make 8 per cent. and some even 12; but, on the whole, I suppose that we have to deal with the effect of the whole railroad system upon the whole country; this seems to me legitimate.

Q. Do you not think that one-half of this mileage of 112,000 miles could be reproduced, as it actually exists, for a sum not exceeding $15,000 or $18,000 per mile?—A. That is impossible. You can hardly get your track down for that; your track and ditching done.

Q. As it actually exists, I mean. Take your southwestern roads, for example, and those in the undeveloped parts of the country—take many of those that have been most cheaply and flimsily built—do you not think that there are thousands of miles where the entire actual expenses would be more than covered by $15,000 to $20,000 a mile?—A. You only take into consideration the track and the road bed of a railroad. This forms only a part of the work.

Q. I speak now of the rebuilding of the roads, assuming that they did not exist, taking actual money and going on the ground surveying it, getting your road made, putting on the sleepers and constructing depots as they now actually exist; do you not think there are a great

Digitized by Google

many thousands of miles of road now in the country that could be reproduced for from $15,000 to $20,000 per mile?—A. I hardly think as cheap as that; but there may be some built for $25,000 per mile.

FAIRNESS OF "AVERAGING" GOOD AND BAD ROADS FOR DIVIDENDS.

Q. With regard to these corporations as they exist, and to their dealings with the public and the dealings of the public with them individually, do you not think it might mislead the public mind to lump them all together?—A. You have to deal with the merits of each road by itself if you desire to determine whether charges are reasonable or not. But if you deal with the railroad question as a whole, you have to take the results of the whole system.

Q. Is it precisely the fair thing, Mr. Fink, to make a New York, or a New England, or an Illinois community pay upon their railroad traffic, respectively, rates that should give a good income upon so many worthless enterprises comprising so many thousand miles of railroad?—A. That is not proposed. I do not propose to do that. Each road must be dealt with upon its own merits. But from general results you can at least come to the conclusion that the roads in the aggregate have not overcharged, when the aggregate results are those that I have mentioned. Single roads may have done so, but they must be in the minority; otherwise the aggregate results would be different.

Q. That is as to the whole railroad construction of the country. But, if capitalists have built railroads into the wilderness, is it fair that the generation doing business to-day in other sections of the country should be taxed enough to make all railroads, as a whole, pay the rates you have mentioned?—A. But I do not intend to do that. That is not intended at all. I only state results; they are not to influence the charges to be made by any particular road.

Q. Yet the net income which the people pay as a whole for railroad service, amounting to what you have stated, and that amount being paid by comparatively few localities—geographically—is it not a fact that they are actually taxed to the extent of paying a large income upon the entire railroad investment of the whole country?—A. Oh, no; that does not follow.

Q. It amounts to 5 per cent. upon the bonds and 3 per cent. upon the stock, does it not?—A. Well, the people of the whole country are taxed to that extent.

Q. Yes. But it is the people of a small portion of the country, relatively, that are taxed to pay upon roads that have been built into a wilderness, and which would not otherwise pay for years to come?—A. Each road is operated upon its own account, and gets what it can get. One road does not charge more to make up the losses of another.

Q. Well, in that way, a road operated here, where there is a wealthy community, must take 6, 10, 12, or 15 per cent.; otherwise it cannot make an aggregate dividend upon the entire amount invested, stock and all, including those roads that pay absolutely nothing. Does it not follow, then, that some roads tax the community 10 or 20 per cent.?—A. When you can show that the roads, all taken together, can pay only 3 per cent. on their stock, I think the conclusion is a fair one that they are not making too much—when all the roads pay only 3 per cent. If there was a preponderance of excessive charges, if that were the rule instead of the exception, it would show in the final result.

Q. I suppose you assume that a great many of the roads (it may be 50,000 miles of them altogether) hardly pay 2 per cent.?—A. A great

Digitized by Google

many of them pay nothing, and if one-half pay nothing, and the others pay 6 per cent., 3 per cent. would be the average.

### WHAT ARE EXCESSIVE RAILROAD CHARGES?

Q. Assuming that to be so, is it not a fact that some of the railroads pay as high as 10 to 20 per cent.?—A. That may be so, but it would not follow that these roads charge excessively.

Q. Yes; but do not those who support the railroads that pay so much, pay more than they ought to?—A. No, not at all. The question is whether their charges are reasonable. I don't think you ought to judge that by the dividend which the road pays.

Q. Does not the fact that a road pays 20 per cent. show that that road charges its customers too much?—A. No. When you find a road paying 20 per cent., it is not in itself proof that it charges too much. You have first to examine what these charges actually are, in order to form an opinion whether they are exorbitant. If, for example, you should find that grain is carried for 25 cents from Chicago to New York, that certainly would be reasonable; and if a road making such reasonable charges could earn 20 per cent., what is it to you what profit the road makes? Whether the charge is reasonable or not is the question only which can concern you. People never inquire into the losses of railroads. If you were willing to make up the losses, then it would be equitable to complain of profits or to restrict them.

Q. Can that be a reasonable charge which enables a railroad company to make 20 per cent. profit?—A. I don't say that it is; I only say that this fact alone is not sufficient evidence of exorbitant charges.

Q. Is it not sufficient evidence?—A. No, not at all.

Q. If uniformly, year by year, they make 20 per cent. on their service, is not that conclusive evidence that they make exorbitant charges?—A. No; the evidence of the reasonableness of the charge is the charge itself, not the profit that a road makes.

Q. If the charges give 20 per cent. profit each year for years in succession, is it not clearly evidence of too much profit?—A. Not necessarily; but as a practical question I do not know any case where they do that.

Q. But I am supposing a case where they do?—A. Well, that only would show that it is a good paying road, and I would like to have some stock in it.

### HOW FAR IS A RAILROAD A PUBLIC TRUST?

Q. Do you not understand that a railroad is a public trust, and that it is established for the public good?—A. Certainly, but not exclusively so; it is also undertaken for the good of its promoters.

Q. The corporators of a road of that character you think would do well?—A. Yes; to make 20 per cent. profit.

Q. But a corporation is a franchise that exists by a grant from the public at large, is it not; and is not every such franchise granted upon the fundamental condition that it shall promote the public good?—A. Why, of course.

Q. Very well; then, when that franchise goes to the extent of taxing the public so as to make an unreasonable dividend, so as to produce an unreasonable income, does it not involve the very condition upon which it is granted?

Digitized by Google

LARGE DIVIDENDS NO EVIDENCE OF UNREASONABLE CHARGES.

A. If the road makes unreasonable charges, it would; but the question is what is an unreasonable charge, and I say that the profits of a road cannot prove by themselves whether charges are reasonable or not. If there is a condition in the charter limiting the profits of a road, of course that settles the question. But if there is no limit in the charter, then the railroad company has a right to charge, within the limits imposed by the common law which obliges them to carry at reasonable rates; within that limit, they have a right to make whatever profit they can. I don't think anybody has a right to interfere with the profits, if the profit was 100 per cent.; of course I do not know any road that makes that profit, but the fact that a road pays large dividends does not show in itself that it charges unreasonable rates.

Q. Not that fact itself?—A. No; not that fact itself.

Q. Suppose the charter contains an express limitation of 10 per cent.; then you would not allow a road to go any further?—A. No.

Q. Why so?—A. Because that was the bargain; it was the contract.

THE COMMON-LAW RESTRICTION ON RAILROAD CHARGES.

Q. Suppose it contains no stipulation, is not the common law a part of the contract or charter?—A. The common law says that common carriers must carry for a reasonable rate. It does not say that you shall make only 6 per cent. or 10 per cent. profit.

Q. But it does say that you must carry at a reasonable profit?—A. Not at a reasonable profit, but at a reasonable rate.

Q. Then there is in every charter, as a part of the charter—because it is part of the common law of the land—a limitation to the charges, to what are reasonable charges, that being the common law. It is, in other words, a part of every charter?—A. Yes.

Q. And it is not necessary to write it into a charter?—A. No, it is not.

A CASE FOR A JURY.

Q. Then, let us start in that way. Assume that a railroad charges to those who patronize it, rates of carriage that enable it to pay a profit of 100 per cent.; and suppose that a man refuses to pay such rates, or pays them in the first instance as matters of necessity, but brings his action against the road for extortion, upon the ground that the company makes it a condition that he should pay 100 per cent. profit or that they would decline to take his freight; and suppose, as a consequence of his refusal, they fail to transact the business of common carriers and he brings this suit at law and goes to the jury; the question would then be whether they are imposing an unreasonable charge; is not that so?—A. Yes.

Q. Now, by what rule is that jury to act upon the question whether that was a reasonable or an unreasonable charge?—A. I suppose the question of interest might then be an element in the consideration, but only an element. It would not be proof in itself.

Q. If they saw that a road made 100 per cent., do you suppose they would hold that to be a reasonable charge?—A. That depends upon a great many other conditions.

Q. Do you not suppose that they might think that a rate of profit something like what is sometimes written into charters—10 per cent.—would be reasonable?—A. Very likely.

Digitized by Google

Q. So it comes to this, then: that if 10 per cent. is a reasonable profit —and that it is such would seem to be a fair conclusion, because it is put into so many charters—would not the jury say that the common law, in writing into this charter 10 per cent., must control and limit you—or they might say 6, or 8, or 5 per cent.?—A. They might.

Q. If that is a fair compensation for capital, as capital is usually regarded, might not the jury look at it in that way?—A. They might.

Q. Then, if 8 or 10 per cent. is a reasonable reward for the service of a railroad, would it not seem that the profits ought to be limited so as to enable it to earn only 8 or 10 per cent.?

IF THE STATE LIMITS PROFITS, SHOULD IT NOT GUARANTEE AGAINST LOSSES?

A. Yes, if you also guarantee the road against losses; then, I think, it might be just. I think every limitation of profit should be accompanied by a guaranty against losses. The State gives only the right to condemn property. This costs the State nothing.

Q. It costs the people of the State something, however?—A. No; they get their pay for it, sometimes three or four times over. The State exercises its right of eminent domain, not for the benefit of the railroad builders, but simply for the purpose of making the construction of railroads, which the people believe are a great benefit to them, possible at all. Without this right of eminent domain being exercised by the State there would be no possibility of building railroads. That is all the State does. If no condition in the charter is made as to the limit of profits or charges, the railroads are operating under the law of common carriers. They can do nothing that is wrong if the law is enforced. They are simply common carriers like any other common carriers, whether he be a carrier on steamboats, a wagoner, or carries the goods on horseback, or on his shoulders, or in his pocket. The railroads can only be subject to the laws regulating all other common carriers, and these laws contain no limitations of profits. The only question is whether the charges are reasonable, and that must be considered and decided in each particular case. There can be no general law applicable to all cases. As long as the companies conform to the law of common carriers I don't consider that the State or anybody else has a right to limit their profits. It so happens, as we have seen, that there are very few companies that pay 10 per cent., which, as you say, is generally considered a reasonable interest on risky investments like railroads, and that there are limitations in the trade and business and geography of the country, which make all other limitations unnecessary. The average profits of the railroads are only 3 per cent. In the new Territories, where there are only a few railroads and light business, it is possible that some of the companies may make local charges comparatively high, as they necessarily have to be under such conditions; but in this settled country, where there are so many roads, high charges, much less unreasonable charges, have now become impossible. There is no danger that the railroads will charge more than reasonable rates. Corporations, like individuals (a corporation is only an aggregation of individuals), when they carry on the business of common carries, have a right to make all the profits that they reasonably and legitimately can.

Q. I don't quite see that—under the operation of the common law?—A. While acting strictly in conformity to the common law their profits cannot justly be limited. This principle is acknowledged with regard to private individuals when acting as common carriers, and should be

Digitized by Google

recognized with regard to corporations. If you desire to restrict profits, also guarantee against losses, and I will not object to restrictions. But the question we have discussed is really not a practical one. No road ever makes 20 per cent. or 100 per cent. profit.

### RAILROADS NEVER MORE PROSPEROUS THAN NOW.

Q. How long have the roads made the income you have mentioned, or substantially that?—A. They make as much now as they have ever made. They have never been more profitable than at present. As a whole, the investment in railroads has not been profitable. Much is said of the right granted to railroads by the Government and of the great benefits the right of eminent domain has conferred upon railroads, but I am sure that there are many stockholders that wish they had never availed themselves of their rights. The question whether a railroad to be built will be of any benefit to the stockholders or not remains to be decided in the future. The parties that build the road take all the risks.

### THE STATE TAKES NO RISK.

The State takes no risk whatsoever, but always gets the benefit of the railroad. Whether any profit comes to the stockholders or not, the railroad is there and the property of the people who live along the line is greatly enhanced. Then they get their crops to market where they could not go before. The benefits are all on the side of the State and the people; the burdens and responsibilities and risks are borne by the stockholders, and to them the profits ought to go, if there be any, without interference or restrictions, as long as they comply with the common law. From the records of our experience we find that almost every railroad in the country has gone through bankruptcy. For the five years succeeding the panic of 1873, 20,000 miles of railroads went into bankruptcy; that is, more than 20 per cent. of all the railroads that have been built since the beginning of railroads.

Q. What proportion of the railroads, including those of the Southern States, is comprised between the Mississippi on the west and the Southern States (as they were before the war) on the south, Canada on the north, and the Atlantic seaboard on the east—what proportion of the mileage?—A. I could not give you that information at present. I would have to refer to statistics. Poor's Manual contains this information.

### PROFITS OF DIFFERENT ROADS.

Q. My question was designed to lead to another—that is, whether you do not think that the people who live along the roads within the space I have mentioned pay at least three-quarters of the income that is collected from the American people for railroad service, while, outside of those limits, would there not be at least one half of the railroad mileage of the country?—A. We can very easily find that out. We have statistics that give exactly the earnings of each railroad. I could not estimate it. I only know that there are very few roads that pay large dividends. What you are trying to get at is, whether there are not some roads that obtain excessive compensation and others not?

Q. Yes; and whether it does not follow that although some of the railroads pay nothing, yet the whole of the railroads of the country get very good compensation—quite equal to the compensation received for capital in any other line of investment—whether that fact is not evi-

Digitized by Google

dence that some of these railroads get too much?—A. We would have to take up the individual railroads and see which of them get too much.

Q. Do you know them?—A. We have a record of nearly every road in the country, compiled by Mr. Poor in a manual which gives exactly the amount of money that each road makes and the dividend it pays.

Q. What is the highest rate of dividend that you know of?—A. I don't know of any road paying higher than 8 per cent., which is paid by the New York Central Railroad. There are some others that pay as much.

SURPLUS EARNINGS.

Q. What becomes of the surplus that is not distributed?—A. There may be a deficit.

Q. Yes, but it is not always so; sometimes it must be pretty high?—A. When a road is borrowing money, I don't think it is evidence that there is a surplus.

Q. Do they borrow money to pay the dividends and to pay the interest on the bonds?—A. Sometimes, it is said, they do. But a railroad is never completed. It has to increase its rolling stock, and it is constantly adding to its facilities for doing business. Railroads are generally borrowers of money.

Q. Is not that calculated for in the $400,000,000, called operating expenses?—A. No.

Q. Do you mean that the roads are improved out of the $300,000,000?—A. No.

Q. The $300,000,000 go in the form of interest and dividend, do they not?—A. Yes. The net income is paid over to the stockholders and money is borrowed for improvements. Different railroads pursue different policies. Some put their net earnings in improvements.

Q. You do not know any other railroad that pays over 8 per cent?—A. No, not that I can remember now.

Q. What extent of railroad is there in this country that pays substantially nothing, or a very low amount?—A. I could not tell without referring to statistics. The information is all compiled and can be readily procured.

THE HIGHEST RAILROAD DIVIDEND.

Q. A memorandum has been sent up to me from somebody in the audience present to the effect that last year the New York, New Haven and Hartford road, and several other railroads and divisions, all paid 10 per cent. on their net investment.—A. I believe they did. I did not think of the New Haven road. They paid 10 per cent. I believe.

Q. Did the New York Central pay 10 per cent.?—A. They paid only 8 per cent.

Q. Do you know whether they reserve any surplus that goes to a sinking fund?—A. Oh, yes; every road has to do that, if there is a sinking fund.

Q. In that way, if there is an excessive charge, it is rather concealed from the eye of the public, is it not; and failing to be distributed, it adds alike, nevertheless, to the wealth of the railroads, does it not?—A. I don't know that it is concealed. It is legitimate to apply the net earnings to the cancellation of your debt.

Q. It is derived, however, from the charges made to the public?—A. Oh, certainly.

Digitized by Google

ARE RAILROADS A RELATIVELY GOOD INVESTMENT FOR MONEY?

Q. I suppose you hear the somewhat usual statement that goes around every year, that money invested in mercantile business generally results in a failure, sooner or later. It is said that at least 95 per cent. of those who go into business—that is, merchants—fail at some time in their lives.—A. Yes, I have seen some such statements.

Q. Do you know any way in which capital can be invested in which it will pay a better average than 3 per cent.?—A. Well, I think our railroad mortgages pay more than that.

Q. I mean to say, outside of railroads?—A. Oh, I suppose there is a good deal of bank stock that pays better, and gas stock; a great many other enterprises, I think, pay more.

FAIRNESS OF CHARGES IN VIEW OF ADVANCED RAILROAD-BUILDING.

Q. It may be that they get more than they ought to get, and it may also be that some railroads do. But the point I aim at is, whether it is a fair presumption for the railroad interest to make to the country to aggregate all the bonds and all the capital stock, and to say that its whole system only pays 5 per cent. on the bonds and 3 per cent. on the stock, when we all know that a great part of this mileage is anticipating business to come, and capital has gone into enterprises that are depending on the business of the future for compensation. If, now, those who are paying for railroad service have got to make a good investment for the future, don't you think they are being taxed too high?—A. I think you have misunderstood me. You think it was proposed that the railroads that do not earn much now should be made to earn the average.

Q. No; that their receipts should be made so much as that there should be, on the whole, a certain average?—A. That would be very desirable, but it is impossible.

Q. You don't get, quite, my idea. I don't say that it is distributed to them all; but for the very reason that it is not distributed to them all, does it not follow that those who get so large a profit get too much?—A. No; you have always to go back to the foundation, and that is: "What are the charges? Are they reasonable in themselves?" The amount of dividend paid does not enter the question at all. It might come in when you find that the charges are very unreasonable. Then, I think, excessively high dividends would be an additional argument to show that the charge is unreasonable. But of itself it is of no importance. If you carry grain from Chicago to New York for 25 cents per hundred, you cannot ask any more than that, and if a railroad does pay 12 per cent. on such work it should not be objectionable to the people.

PROFITABLENESS OF INVESTMENT.

Q. But suppose such work as that pays 20 per cent., is not that too high?—A. I think not. I think that when you take into consideration the charges made by canal, and other considerations, it can be shown that the charge of 25 cents is reasonable; though I don't think any such case as you assume will ever happen.

Q. Suppose it be only 12 per cent. Business men only make 6 per cent., and here is a public franchise out of which men are making 12 per cent. Is not that too much?—A. You have to go back and examine into the history of the enterprise. Perhaps a road has been operated twenty years and made no money; and then, perhaps, it commences to

Digitized by Google

earn a large dividend; the high dividend would not prove that its charges are unreasonable. Unless you are willing to pay the past losses you must allow the road to make large profits now.

ON WHAT BASIS SHOULD DIVIDENDS BE DECLARED?

Q. But I am willing that they should have something like fair compensation upon the capital that is invested, provided that the same men who have put the money in now own the road. If I came along and bought it at a very low rate, I don't think I have a right to tax the public in such a form as to produce a large profit upon the original amount.—A. You don't take into consideration the rate of transportation.

Q. Well, I don't think I ought to tax the people to pay interest on the debts of my bankrupt and defunct predecessor.—A. I don't think that the people have anything to do with how you got the railroad, and what you paid for it. The only question is, whether you make reasonable charges.

Q. But you are arguing that the State has nothing to say as to the rates which should be charged by a railroad until there has been paid 5 or 6 or 8 per cent.—or a fair compensation—upon all the capital that has gone into it from the beginning, no matter whether the road is now in the hands of the same persons that went into it originally?—A. No, I do not say anything of that kind.

Q. I so understood you. In that way you would throw all the losses on the present generation?—A. Well, the railroads cannot collect more at any time than a reasonable charge. If you will always limit the railroad charges to that point, I don't think either the losses or profits have anything to do with the question. But if you want to limit present profits, it is proper that you should consider past losses, and this from the very beginning of the enterprise, no matter whether it is in the hands of the original proprietors or not. The *personnel* of the owners plays no part in these considerations.

"REASONABLE CHARGES," HOW SHALL THEY BE DETERMINED?

Q. Is not the very essence of a reasonable charge such that it should yield only a reasonable return on the capital invested by the present owner of the road?—A. I deny the right to limit the profits, no matter who owns the road, as long as the charges are reasonable. As I said before, the dividends paid by a road may form an element in determining whether charges are reasonable; but the previous losses must also be considered.

Q. Suppose the question of corporate ownership to disappear just now, and you individually build a railroad, and you build it for $1,000,000, and for some reason you fail and the road breaks down, and I buy that road for $100,000 and go on and run it, ought I to be allowed to charge the public such rates for freight as to give me 6 per cent. or 10 per cent. on your million?—A. I think so. It is perfectly proper if your rates are reasonable, and it is very improper if they are unreasonable.

Q. You don't think that that is an element at all?—A. The fact that you bought the road cheaply is not an element at all. Whether you paid six prices or got it for nothing is not the question at all.

Q. Is not the proper criterion just what you said this morning—that I be allowed to charge the public upon that amount of money—upon what it would cost to replace the road at the present time?—A. I don't

Digitized by Google

think the cost of the road or the cost of the service has anything to do with it. All you have to see is, whether the rates charged are reasonable. Of course, to determine this there are many elements that have to be considered.

Q. What other?—A. If you show that you carry freight as low as the canal carries it, that, I think, would be satisfactory proof that your charges are reasonable, whether you make 100 per cent. or more.

Q. Suppose that by the invention or discovery of some new power better than steam, and that by the application of that power one-tenth part of the present expense would be sufficient to carry freight cheaper than by water, do you think that this new power should be utilized by the railroad without any benefit to the public at large?—A. Everybody could use it who wants to use it. But the forces of nature are of no use unless you spend money and labor to develop them.

The CHAIRMAN. You hardly answer my question, Mr. Fink.

The WITNESS. I have intended to do so.

Q. What I mean by that question is this: You said that if a railroad carried freight as cheaply as the water routes carried it, that would be an element to you to prove that it is a reasonable charge?—A. Yes.

Q. And I have asked you this question: Suppose a new power or force is discovered by which the railroads can make a living and a profit for one-half of what it now costs to transport goods by water——

The WITNESS [interposing]. That would be a new element in the consideration of what would be reasonable.

Q. In that case you would eliminate the water-route?—A. Yes; in that case you would.

Q. Why should you do it then any more than now?—A. Because we now know that the water transportation is the cheaper.

### THE LOWEST RATE IN EXISTENCE SHOULD BE THE CRITERION.

Q. Do you mean that because water transportation is cheaper than railroad transportation the railroad should, for that reason, carry freight and passengers at less than a living profit?—A. No. I would simply state that you take the lowest rate that you find in existence, and if you feel satisfied that it is a low rate, then take that as a measure for a railroad rate, and if you find that the railroad rate does not exceed the water rate largely, or not at all, then that would be conclusive evidence of its being reasonable; because we all know that railroads cannot be operated as cheaply as water routes; water routes are generally free to the public; the Government keeps them in repair, free to every one who wants to use them, while the railroad companies usually have to spend a great deal of money, and have to do many things at their expense before they are ready to use their roads; hence, in the nature of things, railroad transportation must always be more expensive than water transportation. I merely cite that because, when you come to consider what is reasonable and unreasonable, you may use the lowest cost for which the work can be done as a comparison. This is one way in which you may ascertain the fact whether the charges made by railroads are or are not reasonable. If they are reasonable, you have nothing to do with the profits a railroad may make.

Q. Do you think that those are elements that must be considered in determining whether the rates are reasonable?—A. The cost of the work is, of course, an element, but it is not the only element, and may not have to be considered at all if you can establish by other means that rates are reasonable.

Digitized by Google

Q. I think I understand your views in that matter. Now, you suggested once or twice in your testimony that your association was doing as well as it could until there might come some national legislation. Did you mean to suggest any that might be helpful?

CHARTERING OF RAILROAD ASSOCIATIONS SUGGESTED.

A. I have always thought that if the Government wanted to regulate the transportation business it should charter associations like ours, under restrictions, of course, to see that it would do the proper kind of work and nothing else. This would greatly aid the railroads in conducting the transportation business more satisfactorily to the public.

Q. Do you think that a bill embodying your idea could be put through Congress?—A. I hardly think that the people sufficiently understand the subject as yet. I suppose the railroads will have to go on for some years yet as best they can before anything can be done in the way of legislation. I would not advocate any law as yet on the subject, except that when a number of roads establish a proper and reasonable tariff and publish it, no one road shall be allowed to deviate from it. It is very difficult, though, to detect the violation of agreed tariffs. The railroad companies themselves can do it better than the Government. If our association were legalized and the rules of the association could be enforced, it would aid us very much in preventing a great many abuses in railroad management; but I hardly think it is time for this as yet, and I do not recommend any legislation at present. The roads will have to fight it out with one another, and learn by experience, and establish a higher standard of honor in dealing with each other.

THE REAGAN RAILROAD BILL CRITICISED.

Q. I suppose you have heard of the Reagan railroad bill?—A. Yes.

Q. I would be glad if you would give the committee the benefit of your criticisms on that bill; what you think would be the effect of it on railroad charges and the prices of commodities.—A. I think it is so impracticable a measure that it could not be carried out for one day. It is one of the most impracticable measures that has ever been proposed. Mr. Reagan evidently does not understand the practical working of the transportation business. His intention and the principles upon which the bill is based are all right; there is no difference between us about that; but the carrying out of these principles as he proposes is utterly impracticable. It would simply impede the whole transportation business of the country.

The leading idea of his plan is that each railroad should make a fixed charge for the transportation of any commodity, and that should be the charge under any and all circumstances. For example, if you were to carry lumber over the New York Central Railroad, from Buffalo to New York, and make a certain charge for it, that charge should be for all other lumber, no matter where it came from. The effect of it would be that it would exclude the New York Central from competing for business west of the terminus. When the lumber comes from other places than Buffalo, there are now made different rates from different shipping points, according to the distance and length of other competing roads from the same point of competition.

Just as many competing points as there are, just so many different rates would there be from Buffalo, and the New York Central has to take a prorate of the total rate beyond that point. For example, lumber

Digitized by Google

comes from Louisville and goes to New York. Now, according to the Reagan bill, the rate that the New York Central can charge for lumber coming from Louisville to New York would be the same as lumber that comes from Buffalo. The Louisville route to New York is a great deal shorter via the Pennsylvania road than the New York Central route, and if the New York Central wants to do any of the Louisville business, it must carry it for the same total rate as the Pennsylvania Railroad, and this can only be at a less charge per ton per mile than it makes from Buffalo. If it does not make as low a rate as the Pennsylvania road, the Pennsylvania Railroad will carry all the lumber to New York, instead of the New York Central carrying a portion of it.

Q. You think that a road that has to carry the material twice as far as another road should be permitted to compete for it?—A. It may be in some cases to the advantage of the people that it should be done that way, but it is certainly not to the advantage of some of the railroads.

Q. Would it not be better to limit each road to the business that naturally comes to it, and by legislation, if necessary, compel the road to carry for reasonable rates, and then let each road take the business that nature seemed to design it for, and if it succeeds let it succeed?—A. That would no doubt simplify matters, but each road claims a right to do business anywhere that it can.

Q. They claim that, but do the public concede it?—A. Yes; the public rather encourage it. It leads to a great many complications, to be sure, and ultimately I do not know that the public profits by it.

### THE RATES FOR LONGER AND SHORTER HAULS.

Q. There is another feature in the bill which I desire to mention. It provides that no road shall charge more for the shorter haul than for the longer?—A. Yes.

Q. How would that operate?—A. That is a very correct principle, but there are many cases where it could not be carried out advantageously to the people and the railroads. You will find that in this transportation business you cannot pass a law that will apply universally to all cases. There are so many exceptions that they would be more than the rule.

Q. If that were applied in all cases would it not work well?—A. It would stop competition.

Q. Yes; and what is lost on the cheap rates between the competing lines would be made up on the local?—A. There ought to be no loss on the cheap rates; there ought to be some little profit, otherwise the roads would not engage in the cheap business.

Q. You think, then, that that measure would not be a practical one?—A. Oh, it is perfectly impracticable. It would ruin the railroads, and it would ruin the business of the country completely. You would have no competition, and you would have only local rates.

Q. Does it make any provision for fixing the rates—limiting the rates?—A. No; it only fixes the rates so that you cannot vary them to suit the exigencies of competition.

### GOVERNMENT CANNOT FIX TRANSPORTATION RATES.

Q. If the bill were so amended as to vest in some national tribunal the power to fix the rates, would that be an improvement?—A. No, it would not; you cannot fix transportation rates. We carry grain this

Digitized by Google

season for 25 cents a hundred pounds, while last year we were paid thirty cents. Now, if you had fixed the rates at 30 cents last year you would still have to pay 30 cents, and at that rate you could not now carry any grain.

Q. I take it, from what you say, that you think the Government should have nothing to do with the railroads at all?—A. Oh, no; I think they should see that the railroads are properly operated in accordance with the laws regulating common carriers.

Q. But I mean with the management of them—the fixing of the fares and freights?—A. No; I think that is better arranged by the railroads than it could be by the Government. It is a very complicated question, and the Government is entirely unfit to attend to it.

### HOW GOVERNMENTAL CONTROL WORKS ABROAD.

Q. In some countries the government owns the roads and contrives to fix the fares and freights?—A. Yes.

Q. And they seem to fix the rates satisfactorily?—A. Just as unsatisfactorily as here. I was reading a German paper only last night, in which there were bitter complaints on this very subject. If the German people want to get a rate changed they have to go first to the chamber of commerce, which has to take action, and then present the case to a council, and then to another council, and so on, and perhaps they have to wait for two or three years before they can get an answer. We do this kind of work here in a day.

### RAILROAD CHARGES NEARLY TWICE AS HIGH IN EUROPE AS IN AMERICA.

Q. Let me inquire whether, relatively to everything else, railroad rates are dearer or cheaper in this country than abroad?—A. I can state positively that rates are nearly twice as much in Germany and in England and in other countries as they are here. In 1880 nine-tenths of one cent per ton per mile was the average charge in the State of New York for freight transportation, while in Belgium, which has mostly level roads, it is one and sixty-five hundredths cents per ton per mile, and in France one and a half cents per ton per mile.

Q. Does that apply to all the roads?—A. Yes; and in England it costs as much to carry dressed beef from Glasgow to London as it costs here to bring it from Chicago to New York—double the distance.

Q. What are the corresponding rates in this country?—A. The average here is not more than nine-tenths of one cent.—at least as to the eastern roads, I am sure—of the roads east of the Missouri.

Q. Nine-tenths of a cent per ton per mile?—A. Yes; nine mills per mile.

Q. And how much is it in Germany?—A. In Germany it is double that rate. In Belgium it is 16½ mills; in France 15 mills. In this country we have the cheapest railroad transportation in the world. In the East Indies they have lately reduced the rates for wheat from the interior to the seaboard, so as to bring them nearer to our rates and better compete with our rates from the West to the seaboard. You see from this how widespread railroad competition is, and how ignorant people are when they say railroads have no competition and can charge what they please.

Digitized by Google

RAILROADS AS OWNERS OF COAL AND IRON MINES.

Q. Do you know anything of instances in which railroads own mines—whether coal or iron—which constitutes a large part of the freight of those same roads?—A. Yes; I know there are such roads, but I have no personal experience with their operation.

Q. Do you have occasion to arrange rates of freight along any such lines?—A. No. I believe the Pennsylvania road owns mines. But that is a local matter, and I don't come in contact with that part of the business. The Reading Road and the Lehigh Valley and the Lackawanna are roads that are interested in mining.

Q. What is your idea as to any extensive railroad building in this country in the future; is our system substantially complete, or shall we need more lines—considerably more filling up?—A. Of course our system will have to lengthen out as the population increases. I don't think we have come to a stop by any means. If the increase of population keeps on there must be an increase in the railroad facilities.

Q. Will you please repeat once more your statement in regard to the charge per ton per mile in this and other countries?—A. In the State of New York, on all the roads put together (I cite that because I have it in my mind now), the average in 1880 was 9 mills per ton per mile. In Belgium 16½ mills; that is, 7 mills more than the rate here. In France it is 15 mills, or 6 mills more than the rate in this country.

Q. Did you mention Prussia?—A. Prussia's rate is, I think, nearly twice as high as ours; I won't be sure of that, however.

Q. How about Great Britain?—A. Well, they charge as much from Glasgow to London for dressed beef as we charge from Chicago to New York.

Q. And what is the difference in distance between them?—A. From London to Glasgow is about 400 or 500 miles. The railroad charges in this country are the lowest of any.

COST OF RAILROADS, RELATIVELY, IN EUROPE AND AMERICA.

I ought, perhaps, to have mentioned, when speaking of the cost of railroads in this country, that $60,000 per mile is not too much, if you compare it with the cost of European railroads. You will find that for the most part the people in Europe have paid twice as much as we have paid here. The lowest of European roads in cost are those of Italy, and I think they cost about $90,000 per mile. In Germany they cost about $100,000 per mile, and that is about the average cost of a railroad in Europe—$100,000 to $120,000 a mile. But in England the cost is about $200,000 a mile. Our railroads are not built so substantially and ornamentally as theirs, but ours do the work required of them just as well, and cheaper.

By Mr. PUGH:

Q. What is the reason that there is so much difference in the cost of the road?—A. Because they build more substantially in Europe. They spend money uselessly in monumental buildings, where we get along here often with temporary work.

RELATIVE SAFETY OF EUROPEAN AND AMERICAN RAILROADS.

By the CHAIRMAN:

Q. Are they safer than ours?—A. No, I don't think that they are any safer. The roads of this country are now very much safer than they used to be. They have as many accidents in Europe as we have here.

Digitized by Google

GOVERNMENT PURCHASE OF RAILROADS.

Q. What is your belief as to the effect upon the vast interests of the country if the General Government should buy out the railroads—own them themselves—if they should pay for them a fair price and take control of the transportation business of the country?—A. My idea is that it would be a very sorry day for this country when this is done.

Q. What makes you think so?—A. Well, it is hardly necessary to explain that a Government constituted like ours cannot run railroads. In Europe they may do it.

Q. This Government runs the post-office, you know?—A. Yes, but railroad operation is much more complicated than the management of the post-office. The postal service is only a small branch of railroad business. It seems to me so self-evident that the Government should not own and operate the railroads, that I can hardly get myself to reason about it. I do not see any necessity for considering the question.

The CHAIRMAN. Some gentlemen who within a few weeks past have sat where you now sit have given many reasons why the Government should own them.

The WITNESS. Well, there are a great many reasons why railroads should be under one management. That would be an excellent thing to accomplish, but it cannot be accomplished under our Government. The gentlemen who advocate this don't know anything about railroad management, or they don't know anything about our Government, or don't know anything about both. In the old countries, where railroads are run by the state, the state establishes schools in which it educates the officers of all grades. The method of education and advancement in the service is similar to our Army system. After railroad officers are too old or disabled, they get a pension. Thus the state secures a corps of officers that devote their whole lives to the service. They get little to live on, but are satisfied. All this would be impossible in this country, from the very nature of our Government—its political character, with its changes in office, the rings, etc.

Q. I will not ask you to go into the metaphysics of the thing any further.

STRIKES.

I would like to ask you now whether you have had experience with laboring men?—A. I have had a great deal of experience for at least thirty years with the laboring classes.

Q Have you ever come in contact with strikes or any difficulties of that kind?—A. Yes, I have had something to do with strikes, and they are disagreeable things to have.

Q. As far as you have observed, what have been the influences leading up to them?—A. There are strikes to secure higher wages sometimes, and at other times for enforcing some particular rules on the employer—rules that I thought were not altogether fair—such as limiting the number of apprentices.

Q. The resolution of the Senate under which this committee is acting directs us to inquire into the causes and consequences of strikes, and to get any suggestions that we can that may be serviceable in preventing their renewal hereafter. I would like to have you give us your ideas in regard to this labor question and in regard to trades unions and the like.—A. Really, my experience with labor organizations has been limited.

Digitized by Google

### THE BROTHERHOOD OF LOCOMOTIVE ENGINEERS.

I have had something to do with the Brotherhood of Locomotive Engineers; when it was newly organized they were rather prone to exercise the powers which they had acquired by acting unitedly. They, however, were made to see their mistake, and acted more conservatively afterwards. The experience of the locomotive engineers led them to abstain from strikes, and to settle all their difficulties peaceably with their employers. I have not been actively engaged myself in managing railroads for the last five years, and have not been directly in contact with the workmen; but I think that organization on the whole has done a great deal of good among the men, and brought them up to a higher standard. When they have any difficulties or complaints they are very conservative in negotiating with their employers, and try to get what is wrong made right, and they are always met by their employers in the best spirit. The railroad officers have no reason for oppressing their workmen. They are in the position of mediators, rather than actual employers.

Q. Do you think that the great industries of the country, such as railroads and other industries, make the provision that they ought to make for their laborers in case of accident or disability, or perhaps old age?—A. They have not done much yet in this direction.

Q. What ought to be done in that matter, do you think?—A. The Baltimore and Ohio have set a good example by instituting an insurance company among their employés.

Q. Is that a contribution out of his wages, or does the company contribute?—A. The Baltimore and Ohio Company, I think, contribute one-half to the fund.

Q. To whom is that fund available?—A. That I cannot tell you, but generally it is for the old and disabled. In France they have had a similar system in operation, and I think it should be adopted more generally here.

### GOVERNMENT CONTROL OF RAILROADS IN FRANCE.

Q. Do you know the nature of the Government control over the railroads in France?—A. Yes.

Q. What is it?—A. Most of the railroads in France, really, I might say, belong to the Government. The roads are built generally by the Government guaranteeing a certain amount of interest on the investment—I believe 5 per cent.—to the railroad corporation. In that case, of course, it should have the right to regulate the rates, because it has to make up all the deficiencies in income. But it allows the railroad companies to earn as much more as they can, under the restrictions, however, of a tariff approved by the Government. The Government inspects and approves the tariff; the company only suggests it. The Government has not even the right to fix the tariff absolutely, but the initiative in making tariffs is with the railroad companies, and the Government can approve or not, as it pleases. Under the French control of railroads, the people are just as much dissatisfied with railroad management, and perhaps more so than they are here. Under the system under which French railroads were built competition has been almost impossible. They built railroads from Paris to each part of the country, the roads all centering in Paris. But they made no connections between those various systems, and so each road has a territory for itself. They do not come into competition with each other.

Digitized by Google

TRADES UNIONS—THEIR EFFECTS.

Q. Reverting again to the trades unions generally, what, in your opinion, is their operation on the laboring classes?—A. I think that they are very beneficial if they would restrict themselves within legitimate operations. They can do a great deal of good in advancing the interests of the workingmen and educating them to a higher standard of perfection.

Q. And as they do that, do they qualify them to demand and receive a higher rate of wages?—A. The wages are generally regulated by the merits of the men. The superior workman commands higher wages.

Q. Then if they improve the general condition of the workingmen as a class, the men would be likely to receive more pay, would they not?—A. I think that would be the tendency.

THE STANDARD OIL COMPANY.

By Mr. CALL:

Q. Do you know anything about the relations between the Standard Oil Company and the railroads on the lines having connection with that company?—A. I never had any personal connection with that business; but, of course, I know from general information a great deal about it.

Q. You know the charge has been frequently made in Congress that there was some arrangement or combination between those lines by which all private enterprise in that business was destroyed?—A. Yes; that may indirectly, perhaps, have been the result, but it was not contemplated by the railroads. This is one of the clearest illustrations that can be found of the bad effect of unrestricted competition between railroad companies and the good effect of such an institution as we now have. If there had been such an institution as the association that I am connected with, the Standard Oil Company could never, perhaps, have found an existence. They built up their fortune first by going to one company and getting a rate from them, then going to another company and getting a lower rate, and as the railroads were anxious to buy their business by one offering lower rates than the other, they were bidding for this particular business, while the regular business was made to pay higher rates. Now, if those three or four companies had come together at the time that this Standard Oil Company was ready to make their shipments and had fixed a common rate by all roads, or if they had "pooled" the business so as to remove all motive for making lower rates solely to the Standard Oil Company, all the difficulties complained of would never have happened.

THE DRESSED-BEEF MONOPOLY.

The same difficulty of building up monopolies by competition between railroads has occurred partially with other business. This railroad competition has helped to concentrate the live-stock and dressed-beef business into the hands of a few men. We have been able to improve somewhat upon these conditions. But the tendency of these competitive fights between railroads always has been to build up a few shippers, who by degrees can monopolize the whole business of the country. Instead of giving open and the same rates to everybody under like conditions, private contracts are made to secure certain individual large shippers on better terms than is given to the general public. It is this

Digitized by Google

injurious effect of competition that we desire to prevent by our combinations.

Q. Do you think any private arrangement or private association such as yours, having no authority in law, is strong enough to control a corporation against powerful pecuniary interests associated in the form of the Standard Oil Company?—A. After the railroads had built up that company they had no power to control it. On the contrary, the Standard Oil Company controlled the railroads. But they never could have got that power if the railroad companies had adopted a wiser policy instead of allowing themselves at first to be used one against the other, and instead had acted concertedly, and pooled this traffic—which they afterwards did, but too late. There is nothing to be done now, I suppose. The Standard Oil Company is independent of the railroad companies. They have their pipe lines and ship no crude oil by railroads. But at the beginning there was not any design or intention on the part of the railroad companies to help the Standard Oil Company.

RAILROAD ASSOCIATIONS PREVENT SUCH MONOPOLIES.

What they did was the result of competition between the railroad companies, each trying to secure this traffic for itself; buying it, as it were, by reduced rates. It was this sort of competition which worked the harm. The Standard Oil Company took advantage of this competition and got better rates than the public. The very object of our association is to avoid this.

Q. Your association, as I understand it, is one constituted by the voluntary adhesion of each railroad?—A. That is all. Each road can withdraw from it when it pleases. They can only be held together by motives of self interest.

Q. They have a fund, I suppose, to sustain the association?—A. Yes, they contribute to the expenses, each according to the amount of business it does.

Q. Have you found that system to be efficacious in the preservation of rates reasonable to the public at large and compensatory to the railroads as well?—A. Yes, it has been so thus far. Its operation has been by no means perfect, but a great deal of good has already been done. We have had only one of those unfortunate railroad wars, and that lasted some nine months. It was in 1881. Since that time we have avoided this strife and have maintained reasonable rates of transportation more uniform and permanent than before.

ADVANTAGES OF INCORPORATION OF RAILROAD ASSOCIATIONS.

Q. I think I understand that your idea as to Government control is in the fostering and encouraging of such an association as yours?—A. Yes, in making it a legal association—in incorporating it as they have incorporated a somewhat similar association in England.

Q. In order that it may have a legal effect for its agreements?—A. Yes, that is all. Whenever railroad companies enter into a legal agreement, it should be enforced by law as any other contract. At present, I suppose, most courts would say that it was against public policy to incorporate such an association. This is because they do not understand, really, the practical working and object of such an association; so we have to battle on in the best way we can, without the sanction of the law and against public prejudice.

Q. Your idea is that of a voluntary incorporation of railroads?—A. In

Digitized by Google

groups; there are certain groups of roads that work together, forcing nobody to join them but letting everybody who wants to come in; and whenever they do come in and make an agreement they should be compelled to keep it. There need be no compulsion to join in these associations.

Q. You think the advantages of such an association would be to have everybody join it?—A. Yes, that would be the natural effect. In England, I believe, they started with only a few companies, and now they have all the companies in England, I believe, or nearly so.

Q. You are further of the opinion that the existing roads could not now be built for the present capitalization—$60,000 a mile?—A. Yes; I don't think that that is an excessive amount of capitalization.

Q. And that the amount paid on that is about 3 per cent.?—A. Five per cent. to the bondholders and 3 per cent. to the stockholders.

### RELATION OF STOCK AND BONDS TO ACTUAL COST.

Q. What proportion of that stock is stock that represents any real value—stock paid for; stock that was not made by the credit of the franchise—by bonds issued and roads built upon a pledge of securities?—A. I don't think that the cost of railroads could have been much less than they are now capitalized at; that while some stocks have been watered, other stocks have been retired.

Q. What proportion of them are stocks that have been watered, as you call it?—A. I could not tell you that, and I believe nobody can tell; but I only judge from the average cost of roads that it could not have been otherwise than that the watering and retiring must have very nearly balanced each other.

Q. You feel very confident that $60,000 a mile would not be an excessive value for building a road at the present time, and equipping it?—A. The average road; of course some roads can be built much cheaper; but you must not forget to consider the cost of the equipment, of terminal facilities, of interest during construction and discount on securities.

Q. That amount you consider represented now by the present capitalization of the roads?—A. Yes, about $60,000 a mile.

### STOCK WATERING ON RAILROADS.

There is so much said about stock watering that I wish to refer to it. Of course, the capital stock of railroads may be increased legitimately and the term "watering" should not then be applied. There are many roads that when first built were unfinished. Generally when the rails are first laid the road is considered finished. But the expense has only commenced then. Most roads are only temporarily built, and in the course of a few years all the net earnings that the road makes, if any, are used to finish it. It is proper that the amounts so expended should be charged to capital. Stock may be issued either in the shape of dividends or otherwise, to represent the money that the road has earned and has put into the property to increase its value.

By the CHAIRMAN:

Q. You mean provided the original capitalization did not represent the value of the road after these improvements are made?—A. I take it for granted that the original road was built upon a stock subscription, and that it was finished by the time that the money realized from

Digitized by Google

stock subscriptions gave out. The road may have had, perhaps, to run several years before they earned anything, but all the net earnings were used in building and in finishing the road and acquiring rolling stock, etc. If they then issued stock to the extent of the amount of money thus expended, that would not be watered stock; it would not be wrong to issue such stock. It is difficult now to tell in each case under what conditions the stock was increased, and that is the reason why it is impossible to tell what stock is really fictitious and what stock represents property. Unfortunately, there has arisen lately the system of building roads on watered stock, when bonds are sold and a certain amount of stock thrown in as a premium. Some of these roads are built simply on speculation and for the purpose of making money out of people who are foolish enough to buy the securities, while the originators generally get out before the road goes into bankruptcy. Unfortunately, there has been a good deal of that sort of railroad building lately, and a stop ought to be put to it if possible. But really this is done by speculators. The old railroad companies do not like it.

By Mr. CALL:

Q. But the railroad is built?—A. Yes; there is some good in this. The railroad is built, and some people get the benefit of the roads, but others are punished.

## SPECULATION IN FOOD PRODUCTS.

By the CHAIRMAN:

Q. I suppose you must understand this question of the effect of the operations of the Produce Exchange and the speculators who deal in the prices of food?—A. Yes.

Q. That is quite a subject, and there is here a witness whom we expect to testify to-night, and it is quite inconvenient for him to come again. Can you come in again and give us your views on that subject?—A. I cannot give you any more light than you have. The New York legislature has investigated already this subject of corners.

Q. But it is contained in a volume of about a thousand pages, and we have not got a thousand years to read it in.—A. In my opinion this speculative mania is very much to be regretted.

Q. Please give as nearly a categorical answer as possible to this question, leaving it without explanation, or at least without much explanation: Whether you think that these operations are a benefit or an injury, on the whole, to the laboring class—the consumers of food?—A. I don't think they have any permanent influence on the price of the necessaries of life. They may cause temporary increase in the prices of food, but it is only to have a corresponding reduction to follow.

Q. Taking the whole year together, you think it has no effect?—A. It has little or no effect upon the whole year's transaction.

The CHAIRMAN. Is there anything else that you desired to say?

## "CHARGING WHAT THE TRAFFIC WILL BEAR": MEANING OF THE PHRASE.

The WITNESS. The only thing that I would like to state is in regard to the complaints made that railroads charge for their services all the traffic will bear.

The CHAIRMAN. Yes, that is the basis for an expression which I think has passed into general currency.

Digitized by Google

The WITNESS. Yes. It is a plank in the platform of the Anti Monopoly League. I would like to explain this matter if you have time.

The CHAIRMAN. You had better do so.

The WITNESS. This complaint arises from a misunderstanding of the principle on which railroad tariffs are made. It ought to be said that the railroad companies do not charge more than the article will bear—perhaps that would come nearer to the truth. Few articles are now carried at much more than the actual cost of transportation, if you take in consideration the interest charges. For example, take grain. If we were to charge the cost of transportation, we would have to charge at this time, perhaps, 35 cents per hundred pounds. That would cover the cost of doing the work, and at the same time allow for interest on the investment. Instead of that, we carry grain for 25 cents per 100 pounds from Chicago to New York. This is because we do not charge more than the article will bear. Of course we could not do otherwise if we intended to. On the other hand, we carry dry goods, for example, at 75 cents. We charge more upon dry goods than upon grain, simply because the article will bear it. There is no injustice in charging for that service that amount of money—the service is worth the money that we charge for it, if we estimate the service according to the value to the consumer. We cannot charge more than 25 cents for grain, and in order to average the earnings so as to cover the cost of operating the railroad, we have to charge more on other articles. A suit of clothes, for instance, weighing 12 pounds, is carried for 8 or 9 or 10 cents. That is a charge that it will very well bear. It does not cost very much more to carry a ton of dry goods than to carry a ton of grain. Of course it costs some more, but not enough to make so large a difference in the charges. It is necessary that we should tax the goods that will bear a larger transportation rate, in order to pay for those goods that we have to carry for an insufficient profit.

## "COST OF SERVICE" NO CRITERION FOR CHARGE.

This is the only way in which railroads can be made really useful to the country. This idea that the railroad company should charge the cost of the service is perfectly ridiculous in itself, because they cannot get the cost of the service now, as I have shown, and nobody wants to pay more than they pay now.

I hardly think that 3 per cent. is a sufficient compensation for the stockholders in railroads in this country for the capital they invest—taking into account all the risk of the investment—but if the people are willing to make up all the losses so as to give them 6 per cent. there would be no objection on the part of the railroads. The tariffs then could be made alike on silk, and grain, and coal, and every other article. If each service should be paid according to its cost it would be a most delightful way for railroad companies to manage their railroads. It would be so simple to make the tariffs on so much per ton per mile, whether silk, or grain, or coal.

But the effect of that tariff would be that most of the important articles now carried over the railroads could not be carried at all. The grain could not stand the average cost of transportation; and so with many other articles of transportation. I estimate that the average cost between Chicago and New York is perhaps 40 cents per 100 pounds on grain, perhaps 35 cents, but we carry the great bulk for less than that; so that the principle that railroad charges should be based on the value of services rendered rather than on the cost is, I think, the correct one,

Digitized by Google

and instead of this being made a point of attack on the railroads, I think it is the only principle that will lead to the full development of the country—the principle of carrying business at rates that it can pay. Some articles will yield no profit, while others, such as luxuries, will make up for the loss; all taken together will pay the cost of transportation. That is the principle that is followed not only here, but in every other country. Any other principle, if adopted—as the Anti-Monopoly League desire—would be simply ruin to the best interests of the country. You could not develop a country under it. This principle of charging according to the value of the service rendered is adopted in all countries, and is practiced, I suppose, by all individuals in all mercantile transactions.

I believe that in England, in olden time, on the turnpike roads and highways the tariff was not the same for all vehicles that passed over them. A pleasure carriage had to pay twice as much toll as a freight wagon, although it is lighter and does less damage to the roadway. That principle was recognized on the public highways there constructed by the Government. It was recognized on the Erie Canal, owned and managed by the State of New York—different toll for different articles, although the cost for use of the canal could not be different. For lumber and coal, for example, there was a lower toll than for other articles. On salt they had a toll one way which was higher than the toll the other way. All these distinctions are recognized on public roads owned by the Government. The attempt to show that the railroads are wrong in adjusting their tariffs according to the value of the service rendered is based simply upon the grossest ignorance of the correct principles upon which transportation charges should be made.

There is another subject upon which I would like to make some remarks, and as the committee desires to hear another witness this afternoon, I will be as brief as possible.

## COMPOSITION OF RAILROAD TARIFFS.

The charge is made that the so-called watering of stock has the effect of increasing the cost of transportation, and that the public is required to pay dividends upon this watered stock. I wish to explain that this is not true. It does not make the least difference what the indebtedness of a railroad company is in arranging tariffs. The policy of every road is, and must necessarily be so, to make the greatest amount of money that it can make legitimately. I have fully explained the conditions under which tariffs are made. They are commercial conditions entirely independent of the stock liability of the railroads. I have shown that the tariffs are not based on the cost of the service or on the indebtedness of the company. If the rule was established that the cost of the service should be the basis of all tariffs, then the watering of stock, increasing the capital of a company fictitiously and endeavoring to pay interest on that increased capital, would of course increase the transportation charges, and the complaint would be a just one. As it is, the the watering of stock may be done with a view to stock speculation, and may affect the interests of investors and speculators, but it does not affect the interests of the patrons of the road. The assertion that it does shows nothing but ignorance of the facts, and I challenge any one to produce a single instance where the watering of stock has been followed by an increase of transportation charges.

The anti-monopolists in New York are constantly asserting that the workingmen have to pay interest on the increased stock of the New

Digitized by Google

York Central Railroad, and this assertion is made in the face of the fact that since that increase took place the freight transportation charges on the New York Central Railroad have decreased nearly 50 per cent., showing how groundless these complaints are. I wish it understood that I am utterly opposed to stock-watering—that is to say, when an increase of stock is not based upon an increase in the cost of the property; but what I wish to demonstrate, and believe I have done so, when I spoke of the principles that underlie the making of tariffs, is, that the shippers or the patrons of the road are not injuriously affected by stock-watering. The investors in these properties may be deceived, and the watering of stock may be used as a means for illegitimate speculation, and transactions of this kind should be, and are in some States, forbidden by law, but the cost of transportation and the cost of supplies to the workingmen is not thereby increased one iota.

---

NEW YORK, *September* 17, 1883.

T. THOMAS FORTUNE sworn and examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. In the city of New York.

Q. What is your occupation?—A. I am a journalist.

Q. What is your connection with the press?—A. Editor and proprietor.

Q. Of what paper?—A. The New York Globe.

Q. To what special interests is that paper devoted?—A. It is devoted especially to the interests of the colored population.

Q. It is the organ of the colored interests of the North, or of this city?—A. Well, it was intended to be a newspaper devoted to the interests of the citizens of New York, but it has so extended that it may be said to cover the whole ground of the United States; so that it may be said to have no local habitation, but to be rather national in its character.

Q. You have seen the resolution under which the committee is acting?—A. Yes, sir.

Q. Will you now, in your own way, make such statements of fact and such suggestions as seem to you pertinent, bearing upon the condition and the improvement of the condition of the colored population of the country, and also in regard to its relations to the white population with which it is thrown in contact?

### THE COLORED POPULATION.

The WITNESS. According to the census of 1880 there were in the country 6,580,793 people of African ancestry. In 1790, according to the first census, there were only 757,208. The increase of population from 1850 to 1860, under the slave régime, was 22.1 per cent.; from 1870 to 1880, 34.8 per cent. The increase is and will continue to be healthy in the state of freedom, since human effort and propagation have their greatest expansion in a state of freedom from all tyranny and narrowness. If we were freer our growth and propagation would be vastly greater. As it is, we are fettered by the State and repressed by individuals and corporations. We are not free as other men to come and go, to make and spend, to enjoy the protection of the laws equally, or

Digitized by Google

to share as other men the rights and immunities of Government. Like the Irish subjects of Great Britain, we have received everything from our Government except justice in equal degree with others of our fellow-citizens. This she has always denied and still denies to us.

This large body of our population has, since the foundation of our Republic, been a subject of the gravest moment, of the most earnest contention in the home, in the halls of legislation, and on the field of battle. But in all the conflict the negro has never received full justice at the hands of the Government, State or Federal, and he does not receive it to-day in any portion of our vast territory.

At the close of the great rebellion the negro population of the country was thrown upon its own resources, so to speak; made men and citizens at one stroke of the pen. These men were poor, ignorant beyond conjecture, cowed and debauched by the foul iniquity of human slavery, and surrounded by a hostile public sentiment which vented itself in all sorts of intolerance, in assassination, intimidation, and open robbery. Assassination for political causes has ceased because no longer necessary; but intimidation and robbery remain; so that the negro population of the South is to-day, as it was thirty years ago, a disturbing element, requiring a wise statesmanship to properly adjust it. But instead of attempting to honestly adjust, the people and the press of the country constantly talk of eliminating it from political consideration and discussion, as if it were possible to heal a cancer by leaving it severely alone.

The greatest misfortune which the Government inflicted upon us up to the close of the war was the almost universal illiteracy of the masses—illiteracy which was designed and made irrevocable by the most stringent of statutory enactments. Our intellectual and material poverty, absolute bankruptcy, was caused by the Government, which closed the book of knowledge to us and denied us the common right to accumulate. We are not responsible even to-day for the widespread poverty which obtains among us. We have not the facilities and aptitude to amass large fortunes by speculation and peculation, but we are learning to emulate the virtuous example of our white fellow-citizens in this regard.

Considering honestly our lowly beginning, the following facts are of interest. From the Bureau of Statistics we find—

### SCHOOL ATTENDANCE OF COLORED CHILDREN.

Enrollment of colored youths, as far as reported by the State school officers for the year 1880, 784,709; per cent. of colored youth of school age enrolled, about 48.

Colored school teachers in the United States: males, 10,520; females, 5,314; total, 15,834.

Normal schools for colored youth, 44; teachers, 227; pupils, 7,408.

High schools, or academic, 36; teachers, 120; pupils, 5,327.

Universities and colleges, 15; teachers, 119; students, 1,717.

Schools of theology, 22; teachers, 65; pupils reported, 880.

Schools of law, 3; teachers, 10; pupils, 33.

Schools of medicine, 2, with 17 teachers and 87 pupils.

### STATE APPROPRIATIONS FOR COLORED SCHOOLS.

According to the census of 1880, there is in the South a total school population of 5,426,890—3,758,480 being white, and 1,668,410 being colored; enrolled, white, 2,013,684; colored, 685,942. The total appropriation for school purposes by these States is set down at $12,181,602,

Digitized by Google

being the beggarly pittance of $2.26 per capita. Only 31 per cent. of the white, and 26 per cent. of the colored children of Louisiana availed themselves of the advantages of the public schools, while the State appropriates the munificent sum of $529,065 for educational purposes, being $1.94 per capita; while the city of New York alone expends more than $3,000,000 per annum for the education of her youth. Four and two-tenths per cent. of the school population of New York State can't read, and 5.5 cannot write, while in Louisiana 45.8 cannot read, and 49.1 cannot write. Florida, with a school population of 82,606, appropriates only $134,880 for school purposes, being $1.63 per capita. The District of Columbia, with a school population of 38,800, appropriates $368,343, and 61 per cent. of the white and 73 per cent. of the colored school population are enrolled, the per capita being $9.49. In the District of Columbia, 5.7 per cent. of the school population cannot read, and 18.8 per cent. cannot write, while in Florida 38 per cent. cannot read, and 43.4 per cent. cannot write. These facts are suggestive.

### INADEQUACY OF SUCH APPROPRIATIONS.

Aside from the vastly inadequate work being done in the South by the States, it should not be omitted here that Northern churches and organizations and individuals contribute annually to the education of the freedmen quite as much as the States; but the contributions from these sources are uncertain and fluctuating. Yet, after all that is done is considered, it must be conceded that ignorance is growing in the South as rank as the weeds that choke her corn and cotton. Whether it be the poverty of the people of the States, or disinclination of the people to tax themselves for the rooting out of illiteracy and the vices it breeds, I am not prepared to say; but that the evil is vast and menacing, all must concede. The rural journals of the South, which are usually ignorant of the first principles of political economy, object to popular education, on the ground that the blacks pay no taxes, supremely oblivious that the laboring classes of every country always create capital, and pay in rental the taxes of the land-owner, who has no more inherent right in ownership of the soil than the laborer. What the State refuses to pay for education it gladly pays for penitentiaries, preferring a pound of remedy to an ounce of cure.

It must not be forgotten that the teachers employed in the South labor under many disadvantages, which react with fearful effect upon the pupils. Because of the miserable compensation and the shortness of the school term, together with social isolation and political intolerance of the South, competent teachers cannot and are not always secured. The school term in the South does not average more than four months of the year, and I doubt much if the salaries paid will average $30 per month, subject to further reduction on school warrants by regular scalpers, merchants, and others. At least, such was my unfortunate experience in Florida as a teacher. And, then, these school teachers are subjected to every species of persecution from school superintendents, trustees, and the white braggarts of the town. The position of a colored school teacher in the South is not a desirable one from any standpoint. Before I would teach again in the South I would drive a dray on the streets.

I do not believe in centralization of government. I know the evils which come upon the people by merging into the hands of the few men, who must of necessity administer government, more power than they should control, and yet I am thoroughly convinced that the education of

Digitized by Google

the people is a legitimate function of government—not in any sense a measure of centralization, but eminently one of self-preservation. We make lavish appropriations for harbors, forts, the Navy, and the Army, for the common defense, but illiteracy is a far more insidious foe from within than any that can or will assail us from without.

### A NATIONAL BOARD OF EDUCATION WANTED.

I would advocate the creation of a board of education, with four commissioners (one for each section), and I would advocate an annual appropriation of $25,000,000 to $30,000,000, to be applied according to the ratio of illiteracy. It could be applied through the superintendents of education of the several States, subject to the approval of the commissioner or commissioners, or by some other more effective and satisfactory method.

The desire of the black race of the South to take advantage of educational opportunities is too well known and too conclusively demonstrated by statistics to require more than a passing notice.

It may be pertinent to remark here that there are in this country 7,646 colored ministers of all denominations, and a church membership of nearly 2,000,000 souls.

### SLAVE LABOR AND FREE LABOR CONTRASTED.

It is often charged that the race is lazy, but I think the charge is absurd. If it is lazy now, what must it have been under the system of slavery? It is undeniable that the negroes of Georgia own 680,000 acres of land, cut up into small farms, and in the cotton States they own and cultivate 2,680,000 acres. Dr. Alexander Crummell, in his thoughtful reply to the misrepresentations of Dr. Tucker, of Mississippi, says, basing his statement upon accepted data, "Let us put the figures as low as 400,000 acres for each (meaning Southern) State—for the purchase of farm lands has been everywhere a passion with the freedmen—this 400,000 acres, multiplied into 14, *i. e.*, the number of the chief Southern States, shows an aggregate of 5,600,000 acres of land, the acquisition of the black race in less than twenty years." Again, I find that the Freedman's Bank, which opened in 1865 and closed in 1874, had no less than 61,000 black depositors, the aggregate of whose deposits was $56,000,000. Again, from 1857 to 1861, under slave labor, there were produced 18,230,738 bales of cotton; from 1878 to 1882, under free labor, 27,667,367 bales, being a balance in favor of free labor of 9,436,639 bales. There does not appear to be much ground for the charge of laziness to stand upon in this handsome showing.

A still more gratifying illustration is furnished in the products of South Carolina. In 1849 and 1859 she raised 654,313 bales of cotton with slave labor; in 1879 and 1882, she raised with free labor 1,153,306 bales, a difference in favor of free labor of 498,993 bales. In 1859 her wheat crop was 1,285,631 bushels, in 1882, 2,973,600—a difference of 1,687,969 bushels in favor of free labor. In 1859 her oat crop was 936,974 bushels; in 1882, 8,094,600—a difference in favor of free labor of 7,057,626 bushels. Speaking of these marvellous and satisfactory figures the Boston Herald of a recent date says: "Free labor, protected in its rights, improved transportation, better fertilization and culture, and the subdivision of the lands are at the bottom of this wonderful growth."

I have no doubt that if comparisons were made as to the production

Digitized by Google

of other States like favorable results would be shown. And yet there are men who seriously allege that the negroes are lazy. I am free to admit that a large percentum of the negroes squander much time and money in fishing, hunting and loafing; still the great mass of the people are honest, steady laborers. They must of necessity be, else how account for the steady increase of production in the South?

### COMPENSATION OF FARM LABORERS IN SOUTHERN STATES.

Now, in view of these facts, it will naturally be asked why the negro population continues poor and ignorant. The answer, in part, is a direct refutation of the statement made to your honorable committee on Thursday last by Mr. John C. Calhoun as to the rate of wages and how it is paid in the South. The average rate of wages of a farm laborer in the South is nearer fifty than seventy-five cents, out of which the laborer must feed and clothe his family. He seldom ever pays rent and he seldom ever sees a cent of currency. He is paid in "orders" on some storekeeper friendly to the planter. He cannot negotiate these precious "orders" at any other than the store indicated. Hence a system of fraud is connived at and practiced, to the utter demoralization and impoverishment of the ignorant, helpless laborer.

I remember an instance which strikingly illustrates the pernicious features of the "orders" system. At a place on the Suwannee River in Florida there is a large saw-mill, owned by a gentleman who also operates a large farm. This man owns the entire village and all the land for miles around, and he will not allow any one to sell on his land. He owns the only store within forty miles of his place. He pays his employés in "orders" on his store, white and black alike, and it is a rare occasion indeed when any one of them gets his hand on a real dollar bill. So expensive is it to live at this place because of the miserly monopoly of everything by the proprietor, that I have known men who had fallen out with the proprietor to walk away, having been unable, from the earnings of many months, to save sufficient to indulge the luxury of a railroad ticket. I once attended a panoramic exhibition in the little church at this place, when the bookkeeper of the firm, a very fine gentleman, stood at the door and "passed in" all his employés who desired to see the sights, noting the name of each in his little book. When they had all passed in he gave the showman an "order" for his money and told him to call at the office the following day and collect, which was done. This sort of thing breeds improvidence, but not thriftlessness, because to be improvident the "orders" must be obtainable, and they are only obtainable when the work has been performed.

### SHARE-LABOR SYSTEM ON FARMS.

The system of share labor is equally unsatisfactory to the laborer. He is compelled to give a lien on his unplanted or unharvested crop to be able to run his farm, and his account at the store at the end of the year usually brings him in debt. My father once kept an account in the liberal sense; that is to say, he kept an account of the things he "took up" at the store as well as the storekeeper. When the accounts were footed up at the end of the year the thing became serious. The storekeeper had one hundred and fifty dollars more against my father than appeared on the latter's book. Of course there was a wide difference of opinion, but my father settled the account according to his book and told the merchant he was at liberty to sue for the remainder. But

Digitized by Google

the merchant failed to do it, and his books will show a shortage of $150 to-day if he has not balanced the account to profit and loss. But of course the mass of colored men who farm on shares or labor by the year and keep an account do not, because they cannot, keep a record of every purchase; and it is by this means that they are swindled and kept forever in debt.

I have known honest but ignorant colored men who have lost large farms, magnificently accoutered, by such thievery. The black farmers, and those in other occupations at the South, are robbed year after year by the simplest sort of devices; and the very men who rob them are the loudest in complaint that the negroes are lazy and improvident. For my part, I am surprised that a larger number of them do not go to fishing, hunting, and loafing.

### ARTISAN LABOR—ITS COMPENSATION.

The artisans and laborers in the cities of the South fare better, but the wages they receive would be spurned by the white artisans and day laborers of any Northern or Western city. Masons and carpenters average not $2.50 to $5, as stated by Mr. Calhoun, but $1.50 to $3.25; other laborers receive from 75 cents to $1.25 per diem.

The statement has been made to your honorable committee that a better feeling between the whites and blacks is becoming more and more apparent, but I doubt it. There is an undercurrent of restlessness in the South which the newspapers and reform politicians attempt to smother, but nothing can smother it. The longer the blacks enjoy the state of freedom, the more education and property they acquire, the more restless they become; so that I am free to admit that the startling conclusions arrived at by Professor Gilliam in a recent article in the Popular Science Monthly will, in the main, be largely verified within the time specified by him. The man who thinks the blacks of the South will always patiently endure the wrongs heaped upon them, misapprehends that human nature which is the same in the Spartan helot, the Russian serf, and the Irish peasant.

### PENITENTIARY LABOR.

The penitentiary system of the South, with its infamous chain-gang and convict features, is not equaled in inhumanity, cruelty, and deliberate fraud in any other institution outside of Russian Siberia. Even the Charleston News and Courier and the Savannah morning newspapers, which no man will claim are oversensitive as to how much a negro suffers, have declared the convict system of Alabama, Georgia, and South Carolina a disgrace to civilization. When such papers as these cry out "horror!" it is high time for less hidebound papers to look into the matter. The penitentiaries of the South are full of honest men as well as thieves, for the law of the South has been purposely framed to convict the negro, guilty or not guilty. These men are sentenced to long terms of imprisonment upon charges and evidence which would not be entertained for a moment in any court of law north of Mason and Dixon's line, the object being to terrorize the blacks and furnish victims for contractors, who purchase the labor of these wretches from the State for a song. Of course this one-sided administration of justice demoralizes the ignorant blacks, as it is intended to do. The white man who shoots a negro always goes free, while the negro who steals a hog is sent to the chain-gang for ten years. During the past

Digitized by Google

month I noticed three instances of the acquittal of white murderers of colored men.

### RIGHTS OF COLORED MEN.

Colored men are, generally speaking, denied the right to serve on jury in the South. Hence they never expect justice, and they always receive the full extent of punishment cunningly devised to reach their case. They hold no offices by appointment under the State governments, and, because of open intimidation and violence and fraud, they hold very few through the suffrage of their fellow citizens. Their educational interests suffer in consequence. Respectable colored men refuse to travel in the South, because corporations sell them $25 worth of accommodation and force them to accept $10 worth when they can. They refuse to be thus outrageously robbed. They cannot receive shelter in hotels and inns, and places of amusement are barred against them. All these wrongs retard the progress of the race, and make the suggestion of amicable relations ridiculous. The condition of affairs in the South is volcanic in the extreme, and is becoming more so year after year, not less because of the apparent calm.

### POSTAL SAVINGS BANKS.

I think that the establishment of postal banks would benefit the poor class of people all over the country, and especially in the South. These banks would be scattered far and wide, and the positively known reliability of the Government would secure at once confidence and conduce to economy and comparative independence among the laboring poor.

I think that national aid to education would be a national blessing.

I think that the Government should refund to the freedmen the $4,000,000, with interest, out of which they were robbed by the Freedman's Bank harpies.

I think that it would be advantageous to my race if Congress would pass the bill introduced by Congressman Phelps, of Connecticut, creating a commission to thoroughly investigate the condition of affairs in the South with special reference to the condition of the colored people. I think the report of such commission would open the eyes of the country. The people who do not want any interference into the affairs of the South are the ones who have usurped authority and who tyranically use it. Hence the urgency of the necessity for honest investigation.

### PUBLIC SCHOOLS IN LOUISIANA.

I would like to call special attention to the following item from the New York Times, embracing a letter from the State superintendent of schools of Louisiana. It appears in this morning's edition of the Times:

NEW ORLEANS, *September* 15.

It has taken only six years of Democratic control in Louisiana to eradicate the public school system from its scheme of government. In the reign of carpet-baggers and negroes the school-house flourished in every country settlement. To-day not a public school is open in all Louisiana. The Hon. E. H. Fay, State superintendent of public schools, in explanation of the situation, has written a letter which was furnished to the press to-day. The letter is addressed to Ben. P. Edmunds, president of the school board at Sparta, La., and says:

"DEAR SIR: Your favor of the 6th instant reached me only last night, and I hasten to reply. You say people are constantly inquiring of me why they cannot have public schools, and ask me to state the reasons. This I will now do in as few words as possible. First. The general assembly of 1882 made little or no provision for their support, appropriating only $107,000 all told from July 1, 1882, to July 1, 1883, never

Digitized by Google

before having appropriated less than $300,000 since the public school system was first established. Out of this aforesaid amount they unconstitutionally appropriated $30,000 per annum for two years to three universities, one at Baton Rouge and two in New Orleans. Your superintendent enjoined this payment, but was nonsuited, the supreme court holding that he had no right to protect the interests of the public schools, even though he did it at his own personal expense. The apportionment of the State superintendent, made February 24, 1883, of the funds of 1882, was enjoined by the city school board of New Orleans, because they were not given so much as the parishes were. Owing to an error in reporting 'funds on hand,' the June apportionment of 1882 had to be canceled, but New Orleans had succeeded in drawing some 22 cents per capita of educatable children—some $13,000--before the error was reported to the superintendent's office. True, this overdraft of New Orleans was out of the funds of 1881, and would never be collected to pay the rest of the State 22 cents per capita held up from New Orleans funds of 1882 and apportioned to the rest of the State to make up the amount in July, 1882, by New Orleans. New Orleans claims that, notwithstanding the overdraft of the fund of 1881, she is entitled to a pro rata share of the funds of 1882; hence the injunction restraining the auditor from issuing warrants on the funds of 1882. The case was decided in the lower court in favor of the State superintendent, and was appealed by the attorneys of the New Orleans school board, returnable in February next. Your superintendent has proposed that if they will relieve those funds already apportioned from their injunction, and allow them to be paid out to the State, he will hold up from the appropriation sufficient to satisfy their claim if it is decided to be a valid one by the supreme court in February, 1884, but he can get no reply from them. Your superintendent has exhausted all means in his power to give what little appropriations have been made to the public schools of the State."

The effect of this litigation has been to close the doors of every public school-house in the State, and there is no prospect of their opening again until after the State election of April next.

Q. Is there any further matter that you would like to state to the committee?—A. There are some minor things that might be said.

CONDITION OF FREEDMEN.

Q. You may state anything that you would like the committee to know.—A. I think this commission should investigate the condition of the freedmen in the South, for many reasons. Of course I know this committee does not take into consideration the political condition of the people, and are dealing simply with the matter of labor and education. And yet as to the convicts in the South, who are mainly colored, I think the United States should appoint a commission to investigate their condition.

Q. Do you know anything about their numbers?—A. Not with any great exactness.

CONTRACT PRISON LABOR.

In Florida, South Carolina, Georgia, and Alabama, the contract convict system prevails, and the horrors that are there discovered occasionally indicate that there are more at the bottom, and we are not likely to hear anything favorable about our people.

The CHAIRMAN. Any facts that you know yourself we would like you to state. When the convict system comes into competition with free labor, that is a matter of legitimate inquiry, and that we will go into; but we do not care to go into the matter of purely political relations. Whatever pertains to the material and industrial condition of the people is of course legitimate.

The WITNESS. In the North an agitation has commenced, based upon the idea that prison labor is inimical to free labor; but I have always thought that the convict was in duty bound to work out the expense of his keeping. Consequently, when he does not work for the same wages that are given free labor, I do not think that condition is out of the

Digitized by Google

way or pernicious. The Charleston News and Courier, of South Carolina, states that the average lifetime of a man in the phosphate mines of the State is fifteen months, and that it is very seldom that a man who ever goes into them ever comes out. If that is so, it ought to be investigated. The legislature of the State has been appealed to to abolish the system, but without effect. From Georgia we have constant reports—and I feel sure that they can be verified—that convicts are frequently whipped to death. I have seen several authentic statements that males and females in the Georgia penitentiary stay together, and that children are born in that unholy manner. Consequently, the system as it is tends to the demoralization of the prisoners, if they have any idea of propriety when they go into prison. In the State of Arkansas grand and petty larceny have been compounded so that the term of imprisonment could be extended for the benefit of the contractor, who hires the labor. In fact, the whole system of contract labor is pernicious. I think the State has a right to teach the convicts trades; to make them pay for the expense of their incarceration by their work.

By Mr. CALL:

Q. How long is it since you have been in the South?—A. I was there four years ago.

Q. Not since four years?—A. No, sir; not farther south than Virginia. I was born in Florida and reared there.

Q. What part of Florida?—A. I was born in Jackson County and reared in Tallahassee, and lived the last eight years in Jacksonville.

Q. But you have not been there in four years?—A. No; still, what statements I have made in regard to Florida I have verified within the last few days, and I know them to be facts.

SCHOOL ATTENDANCE IN SOUTHERN RURAL DISTRICTS.

The school system of Florida is in a miserable condition. There is no doubt of that. And in the back counties it is as good as no condition at all. The poor whites suffer as much as the blacks. Four months is the average attendance at school, and what a man can learn in four months he can easily forget in eight. When I taught there, after the war, I found what they would learn in four months they would have entirely forgotten, or almost entirely, by the time they got around to school the next year; and one-half of the money that is expended in the rural school districts of the South is simply thrown away. A child cannot remember in eight or nine months what he has learned in three or four.

By the CHAIRMAN:

Q. You have stated that the average is four months?—A. Well, I make it that; but in the rural districts it is less. Jacksonville is a large, rich place, and the schools keep open seven or eight, and sometimes nine months, with the assistance of Peabody funds and other funds. The county and State appropriate six months' money, but in the outskirts of the county they only keep open for three months, and also in the country parts.

QUALIFICATIONS OF COLORED TEACHERS.

Q. What are the qualifications of teachers there?—A. In Jacksonville they are good, and in the accessible places they are good, but in the rural districts the people say: "We have got to keep this school open." Then

Digitized by Google

if they cannot get good teachers they put somebody else in; and, any way, a large part of the school teachers of the South are not capable teachers. A large part of the school superintendents take no great interest in the selection of the teachers. I taught in the country there, and the gentleman who was to examine me did not examine me at all. He said it was unnecessary to spend time in examining me; that I seemed to be a very intelligent fellow. He might have done the same thing if I had been much more ignorant.

THEIR COMPENSATION.

Of course there are good teachers in the South, but they will not go into the rural districts, because the wages will not support them. Where I taught, I taught three months, and I did not have a cent of money from the treasury up to the very last, and then I had my orders "scalped." I was to get $30 a month, which would make $90 for three months, and I had to "scalp" the whole thing. I got 15 per cent. less. If I had bought a plug of tobacco I had to pay 15 per cent. more for it than I would have to pay for it anywhere else. So that when I got back to Jacksonville I had actually only $10 out of the $90 for my three months' work. My experience in teaching in Duval County was very little better. I had to get my orders "scalped," and there it cost me 20 per cent.

By Mr. CALL:

Q. What year was that?—A. That was in 1878 or 1879. I am not positive which.

Q. Do you know whether they "scalp" orders there now?—A. I am not positive now, but the latest that I have heard of orders in Tallahassee and the back counties, they "scalped" them.

Q. You would not testify to that under oath, would you?—A. I would testify under oath that in the back counties of Florida they "scalp" the warrants to-day, and that it is a hard matter to get par for warrants. Even when the treasury had money it was a difficult thing to get money for the teachers. It was so when I was there in Tallahassee; and I have known white teachers to go in after colored teachers and get their money.

Q. And you have not been in Florida for four years?—A. Well, they had the same superintendent in Jacksonville that they have now; he was not an angel by any means.

A. We are speaking now of your knowledge. What knowledge have you?—A. That is my knowledge.

TAXATION FOR SCHOOL PURPOSES.

Q. Which taxes the most heavily, in proportion to its taxable property, for school purposes, New York or Florida? Do you know anything about that?—A. I guess I know something about it; yes, sir.

Q. Well, which?—A. I guess the city of New York is worth more than the State of Florida, and I should think that taxation is about equal, perhaps, and perhaps New York taxes more than the State of Florida on property.

Q. You have not any definite knowledge on the subject, then; it is a mere matter of opinion?—A. No, I have not got the figures here, and it is not very easy to tell. I could not give you a positive answer, because that is matter of statistics.

Q. Is it not generally understood that the taxation in Florida and in

Digitized by Google

the other Southern States has been as large as the people could reasonably pay, either black or white, for school purposes?—A. I don't think that is accepted in the recent discussions in the papers of the South on the subject. The matter was not accepted in that light.

### NATIONAL AID TO EDUCATION ON THE BASIS OF ILLITERACY.

By the CHAIRMAN:

Q. I understand you to say that you think it the duty of the General Government to make appropriations for distribution among the States on the basis of illiteracy?—A. Yes, sir; I think that would be just, and I think it would reach the case. The bulk of the illiteracy is in the South, and it is the illiteracy that we want to reach, and the best way to reach it would be by the ratio of illiteracy.

Q. You suggest a commission; I don't know that I quite understood what its function was to be.—A. Well, I don't prescribe what function it would have; I should leave that to the creating power. I thought, however, it would be a good thing to have a board of commissioners at Washington—though not necessarily there, but somewhere—to supervise the distribution of this money. Because, even if the General Government should create a commission and give this thirty millions of dollars, as I suggest, to the superintendents, they would need supervision to properly apply that money. That is my honest conviction.

Q. If these same superintendents of the Southern States were also appointed by the National Government to superintend or supervise the distribution of national funds, and should combine these funds with the funds in their hands from the States, do you not think the money would be reasonably well appropriated and distributed?—A. Well, if they were responsible directly to the General Government I have no doubt it would.

Q. Do you see any reason why they may not hold an office from the State and from the Federal Government at the same time, and thus combine the two funds?—A. I think that idea would meet the case. I think the money would be properly applied if they were made responsible to those commissioners for the proper distribution of it. But one of the greatest objections I would have to the aiding of education through the superintendents would be the recognition of separate schools, which should not be recognized by the Government. National aid to education, if placed through the State superintendents of schools, would be applied to the separate colored and white schools as they exist, and the United States do not recognize any colored or white schools.

### INDUSTRIAL SCHOOLS FOR COLORED YOUTH.

Then, I would urge the idea that I presented some time ago in an article to the Memphis Appeal—that each State should create an industrial college. We want more of that sort of colleges now than any other sort.

Q. You would not suggest that the National Government should appropriate anything for any but the common-school branches, would you?—A. I should not at this time.

Q. Unless it might be for industrial schools?—A. Unless for industrial schools. The only cost of running these schools would be in the establishing of them, because the industrial features would support them. I think a large number of people in the South would avail themselves of the opportunities to work their way through in that way.

Digitized by Google

Q. How would you get teachers immediately for those industrial schools?—A. Oh, there are plenty of teachers in the North who are doing other work, who would teach if they got decent wages. But of course they won't work for nothing.

Q. But I meant teaching in the industrial schools; such as farming, and otherwise.—A. There are good men, both white and colored, in the North, and in the South, too, who thoroughly understand the industrial systems, who would gladly take hold. There would be no trouble about teachers.

ILLITERACY AMONG WHITE AND COLORED.

Q. I understand you to say that this matter of education is one involving not only colored people, but white people?—A. Yes; I rode through the county of Madison once, on a mule, and I did not come across a school-house from the time I left until I got to Madison.

Q. How far was that?—A. Eighteen miles. I passed by, say, twenty houses, occupied by poor whites, during that time. The fact is, the poor whites in the backwoods of Florida are getting very little or no education. Each decade you will find negro illiteracy being cut down much more rapidly than white illiteracy, because these poor white people have always stood back, and do not improve any more now than they did twenty years or forty years ago. They have a mule and a cow, and own twenty acres of "piney" woods, and they never get any higher than that, as a general thing. They live in a clayey country, and a good many of them eat clay.

Q. What do you mean by eating clay?—A. I mean that they live in the "piney" woods in the clay country, and have a reputation for eating clay when they are young. They certainly have a very clayey aspect, even in their old age. In the New York Sun, a few months ago, I saw an article on this same subject of clay-eating.

By Mr. CALL:

Q. When did you leave Jackson County?—A. I was compelled to leave Jackson County in 1868–'69. I did not leave there because I wanted to; I was compelled to leave it.

Q. Have you not got a brother living in Jacksonville?—A. My father lives there.

Q. Has he not been marshal of the city there several times?—A. Yes; and he was a member of the legislature, from Jackson County, and a member of the constitutional convention, and for that reason he does not live in Jackson County any more.

Q. He is one of the men that made the constitution and imposed the existing taxes on the people by the constitution, is he not?—A. Yes; I guess he helped to make the constitution as it stands, but the constitution is not always carried out. I think that the counties now have a right to tax themselves as the county commissioners see fit to impose the taxes.

Q. In addition to the constitutional tax?—A. Yes; so that if the constitution puts it at too low a figure the county commissioners can put it up to a proper figure.

Mr. CALL. The tax, however, is as large in proportion to the taxable property of the State as any State in the Union, and is a very onerous and heavy tax, and is objected to by both white and black.

The WITNESS. I know the tax in Florida is very severe, and I have nothing to say about it. The land is not so valuable as it ought to be,

Digitized by Google

and taxes cannot be so great on it as they would be if it were better. I think therefore that every Southern Representative in Congress should be in favor of national aid to education. Some of the papers, such as the Louisville Courier-Journal, and especially some in Texas, are constantly talking on this subject. The school attendance in Texas is 75 per cent., and Texas gives a larger bonus to school work than any other State that I have read of.

### THE DESIRE FOR EDUCATION IN THE SOUTH.

By the CHAIRMAN:

Q Do you not think that within the last few years the desire to get educational facilities is stronger in the South than even in the North?—A. The struggle is harder in the South.

Q. But I mean the desire to get up?—A. Well, I don't deny that some papers, such able papers as the Charleston News and Courier, the Savannah News, the Atlanta Constitution, and the Louisville Courier-Journal are in favor of education and of aiding it, but the rural journals, generally, of the South object to education on the ground that the blacks pay no taxes.

Q. But they would not object if there could be some help from outside in the way of money, would they?—A. Oh, no; they never object to help.

Q. It is not that they object to education, but it is the expense which they feel hardly able to bear that troubles them; is not that it?—A. Of course they would not care how much education the colored man got if he got it from somebody else or from himself. If they could tax the State more for the education of the white people, perhaps they would do more of it than they do now, and they would have a better chance. But they object to taxing the white property holders for the education of the black.

### HOMESTEADS OWNED BY COLORED MEN.

Q. To what extent have the colored people got in the way of owning homesteads, real or personal property, or to what extent had they done so when you came away?—A. I was generally informed, as far as Florida was concerned, while there, and while I have been here I have read what is generally going on in that section, and I can only say that I believe the disposition to acquire homesteads is very strong among our people and always has been so. When they are intelligent enough they own their own farms largely.

Q. How valuable farms do you know of colored men owning there?—A. Well, I know several men in Florida who own farms worth $5,000. A man in Charleston, S. C., the other day bought a farm near there that he gave $20,000 for.

Q. Do you know the farm or anything about it?—A. I do not. It was in Colleton County.

Q. You speak of farms owned by colored men worth $5,000.—A. Yes.

Q. Can you describe anything of those farms, or of their productiveness, or where they are situated?—A. There is a man at a place called Medway, in Gadsden County, Florida, who ran three farms, and I should say that there are five hundred to a thousand acres in each. He has them all stocked, and employs about 150 to 200 men each year. And, aside from those that he runs himself, he runs other farms for other men that keep farms in Tallahassee and Quincy.

Digitized by Google

Q. Do you suppose that one colored man in ten owns the piece of land that he lives on?—A. Well, I would say one in twenty.

Q. Are there any other matters that occur to you to state to the committee?—A. Well, I think that I have mentioned the points that I wanted to mention. I have reduced them as much as possible. Of course the tendency now is, all round, to leave our side of the question alone, and we are suffering in consequence. But we like to get heard when we can, and we like to get it reduced as much as possible. The penitentiary system, the school system, and the Freedman's Bank matter should receive the attention of Congress. I think the postal bank service will be of great benefit to us, and I would advocate the creation of such an institution—not merely for the colored people, because I don't altogether limit things to one class. I think it would benefit the poor people in all small places and would not come into competition with the other banks either, because, as a rule, where the small banks would be there would not perhaps be any other bank. In large cities, of course, rich men would want the other kind of banks to do their business. I I don't think there is anything else that I desire to say, sir.

Adjourned.

---

NEW YORK, *September* 18, 1883.

The committee met at 10 a. m.

Rev. R. HEBER NEWTON, D. D., examined.

By the CHAIRMAN:

Question. Please state your occupation and residence.—Answer. I am a clergyman; my residence is at Garden City, Long Island. My church is in this city—"All Souls Protestant Episcopal church."

The CHAIRMAN. You are aware, I suppose, of the resolution under which we are acting here. You have read it, have you?

The WITNESS. I have seen it, but not very lately.

The CHAIRMAN. It instructs us to take into consideration the subject of the relations between labor and capital, the hours of labor, the condition of the laboring classes, both absolutely and relatively, as compared with similar classes abroad, the subject of labor strikes and the causes or agencies by which they are produced; and we are to take into consideration such legislation as may be adapted to modify or remove such causes. We shall be glad to hear from you anything that occurs to you on any of those subjects.

The WITNESS. In response to the invitation of your committee, I am here to give my views upon some of these questions.

### A LABOR QUESTION COMING.

The broad fact that the United States census of 1870 estimated the average annual income of our wage-workers at a little over $400 per capita, and that the census of 1880 estimates it at a little over $300 per capita, is the quite sufficient evidence that there is a labor question coming upon us in this country. The average wages of 1870 indicated, after due allowance for the inclusion of women and children, a mass of miserably paid labor—that is of impoverished and degraded labor. The average wages of 1880 indicated that this mass of semi-pauperized labor is rapidly increasing, and that its condition has become 25 per cent. worse in ten years. The shadow of the old world *proletariat* is

Digitized by Google

thus seen to be stealing upon our shores. It is for specialists in political economy to study this problem in the light of the large social forces that are working such an alarming change in our American society. In the consensus of their ripened judgment we must look for the authoritative solution of this problem. I am not here to assume that *rôle*. I have no pet hobby to propose, warranted to solve the whole problem without failure. I do not believe there is any such specific yet out.

### NATURAL LAWS AND MORAL LAWS.

While I await hopefully the broad study of these problems by trained specialists, and while I thoroughly recognize that vast natural laws are driving the world of industry and trade, yet I do not think we ought to make a fetish of natural law, and sit down before it with the impotence of despair.

The natural laws which adjust the affairs of man take up into themselves, as factors in their forces, reason, sentiment, conscience, and will. Man weights these laws by his ignorance and folly and selfishness, and can weight them on the other side by his wisdom and conscience and brotherliness. He can largely command the natural law of society just as he so largely commands the natural law of the physical world. My vocation leads me to study natural law as the expression of mind and will. And so in political economy I see the laws of man as he is, of the average existing man, and find at the core of the evils human fault, the errors and wrongs and imperfections of the beings who are the atoms in this social world, in the correction of which, things will be bettered. Tregarva, in "Yeast," summed up his conclusions of the imbruted state of the peasantry in an English village into one sentence—"Somebody deserves to be whopped for all this." Who ought to be whopped here? Like every other question of which I know anything, there are two sides to this question—as to where the fault lies of the present state of labor.

## I.

## THE FAULTS OF LABOR.

Plainly, labor's first fault must be found with itself.

### ITS INEFFICIENCY.

(1.) Leaving upon one side the class of skilled labor, a large proportion of our wage workers are notoriously inefficient. In the most common tasks one has to watch the average workingman in order to prevent his bungling a job. Hands are worth little without some brains; as in the work done, so in the pay won. Our labor is quite as largely uninterested—having no more heart than brains back of the hands. Work is done mechanically by most workingmen, with little pride in doing it well, and little ambition to be continually doing it better.

### LACK OF INTEREST IN ITS WORK.

(2.) There is too commonly as little sense of identity with the employer's interests, or of concern that any equivalent in work should be rendered for the pay received. In forms irritating beyond expression employers are made to feel that their employés do not in the least mind wasting their material, injuring their property, and blocking their busi-

Digitized by Google

ness in the most critical moments. Under what possible system, save in a grievous dearth of laborers, can such labor be well off, and incompetence and indifference draw high wages?

### ITS THRIFTLESSNESS.

(3.) Our labor is for the most part very thriftless. In the purchase and in the preparation of food—the chief item of expense in the workingman's family and that wherein economic habits count for most—men and women are alike improvident. The art of making money go the farthest in food is comparatively unknown. Workingmen will turn up their noses at the fare on which a Carlisle did some of the finest literary work of our century. I remember some time ago speaking to one of our butchers, who told me that workingmen largely ordered some of his best cuts. Now an ample supply of nutritious food is certainly essential for good work, whether of the brain or of the brawn. The advance of labor is rightly gauged, among other ways, by its increasing consumption of wheat and meat, but the nutritiousness of meat is not necessarily dependent upon its being from the finest cut. I should like to see all men eating "French" chops and porter-house steaks if they could afford it; but when I know the average wages of our workingmen and the cost of living on the simplest possible scale, it is discouraging to learn such a fact as that which I have mentioned, since all the elements of necessary sustenance can be had in so much cheaper forms.

The French artisans and peasants could teach our people many a hint as to how to make money go farthest in food supplies. Comparatively few of our workingmen's wives know much about real economy in the preparation of food. Quite commonly they do not bake at all at home, but buy bread, poor in quality and dear in price. They are, for the most part, ignorant of the art of making a soup, which, if so solid a figure can be applied to such a liquid object, should be the *pièce de résistance* of a dinner. Most of their processes, as I have learned of them in this city, are very wasteful.

### ITS HARMFUL INDULGENCES.

As in food, so in dress and other expenses, and notably in indulgences, such as smoking, drinking, excursioning, &c. Labor's drink-bill alone is enough to account for a considerable share of its present poverty. In this city there are some ten thousand licensed drinking places—ten miles of shops—one to every 115 inhabitants or to every thirty families. New York fairly represents other cities. Nor are our towns and villages much better in this respect. I know of one factory village where there is a liquor shop for every 80 inhabitants, that is, for every sixteen families, and nearly all these shops are thriving. The retail liquor trade of the United States in 1878 is given as over seven hundred millions of dollars, a large share of which stands for the wastage of our workingmen. Three drinks and three cigars a day, at the lowest prices, five cents apiece, would represent in the course of a year over $100, or one-third of the average wages of our workingmen, that is, one dollar in every three earned thrown away in such habits.

Then, the reckless multiplication in their families is a thriftlessness about which it is not pleasant to say much, while it cannot be ignored in the study of this problem.

These are but specimens of the thriftlessness of the average working

Digitized by Google

man. The same fault runs through his life in many other ways. The old-fashioned thrift, by which our fathers and mothers climbed the lower rounds of the ladder, and which all experience shows to be the secret of success in the first and hardest pull of life, seems quite gone out of vogue; and how without it men are to forge honestly ahead in this world —whatever may be true in other worlds—I for one do not know. The Franklin type of the *genus* workingman seems well nigh extinct among us.

### ITS LACK OF COMBINING POWER.

(4.) Labor must fault itself further, on the ground of its lack of power of combination and of its defective methods in combination. It has been by combination that the middle class has arisen, and by it that capital has so wonderfully increased. The story of the Middle Ages, familiar to us all, is the story of the rise of the industrial class by combination in guilds. Labor's numbers, now a hindrance, might thus become a help. In a mob men trample upon each other; in an army they brace each other to the charge of victory.

### TRADES UNIONS.

Trades unions represent the one effective form of combination won by American labor. Trades unions need no timid apologists. Their vindication is in the historic tale of the successful advances which they have won for workingmen. Called into being to defend labor against legislation in the interests of capital, in the days when to ask for an advance in wages led to workingmen's being thrown into prison, they have in England led on to the brilliant series of reforms which mark our century, as told so well in the articles by Mr. Howell (The Nineteenth Century for October, 1882) and by Mr. Harrison (The Contemporary Review for October, 1883). Doubtless they have committed plenty of follies, and are still capable of stupid tyrannies that only succeed in handicapping labor, in alienating capital, and in checking productivity—that is, in lessening the sum total of divisible wealth. Such actions are inevitable in the early stages of combination on the part of uneducated men, feeling a new sense of power, and striking blindly out in angry retaliation for real or fancied injuries.

Trades unions are gradually, however, outgrowing their crude methods. The attempts, such as we have seen lately, of great corporations to break them up, is a piece of despotism which ought to receive an indignant rebuke from the people at large. Labor must combine, just as capital has combined, in forming these very corporations. Labor's only way of defending its interests as a class is through combination. It is the abuse and not the use of trades unions against which resistance should be made.

The chief abuse of our trades unions has been their concentration of attention upon the organization of strikes.

### STRIKES.

Strikes seem to me in our present stage of the "free-contract" system entirely justifiable when they are really necessary. Workingmen have the right to combine in affixing a price at which they wish to work. The supply of labor and the demand for goods, in the absence of higher considerations, will settle the question as to whether they can get the increase. The trying features of this method of reaching a result

Digitized by Google

are incidental to our immature industrial system. Strikes have had their part to play in the development of that system. We note their failures and forget their successes; but they have had their signal success, and have won substantial advantages for labor. Their chief service, however, has been in teaching combination, and in showing labor the need of a better weapon by which to act than the strike itself.

The strike requires long practice and great skill to wield it well. Practice in it is more costly than the experiments at Woolwich. Mr. Bolles, in his new work on political economy, gives some statistics which abundantly illustrate the folly of strikes, although he only gives one side of the case, namely, the losses which fall directly upon the laborers themselves. If to these were added the losses of capitalists the aggregate would become colossal. In 1829 the Manchester spinners struck, and lost $1,250,000 in wages before the dispute was at an end. The next year their brethren at Ashton and Stayleybridge followed their example in striking and in losing $1,250,000. In 1833 the builders of Manchester forfeited $360,000 by voluntary idleness. In 1836 the spinners of Preston threw away $286,000. Eighteen years afterward their successors, seventeen thousand strong, slowly starved through thirty-six weeks and paid $1,200,000 for the privilege. In 1853 the English iron-workers lost $12,000 by a strike. Such losses marked, too, the strikes of the London builders in 1860 and tailors in 1868, and the northern iron-workers in 1865. The strike of the Belfast linen weavers, which was ended a few weeks since by the mediation of the British Association for the Advancement of Science, cost the operatives $1,000,000.

### THE COST OF STRIKES.

The cost of strikes is expressible only in the aggregate of the savings of labor consumed in idleness, of the loss to the productivity of the country, of the disturbance of the whole mechanism of exchange and of the injury wrought upon the delicate social organization by the strain thus placed upon it. The famous Pittsburgh strike is estimated to have cost the country ten millions of dollars. When so costly a weapon is found to miss far more often than it hits, it is altogether too dear.

Labor ought to have found out that a stunning blow between the eyes is not the best method of inducing a kindly feeling and a just judgment on the part of capital. It ought to have found out that the strike is a boomerang whose hardest blows are often dealt backward on the striker.

Trades unions in this country seem to me to be gravely at fault in clinging to such an obsolete weapon. They should have turned their attention to our modern improvements upon this bludgeon.

### ARBITRATION.

Arbitration is a far cheaper and more effective instrument of adjusting differences between capital and labor—a far more likely means of securing a fair increase of wages. It places both sides to the controversy in an amicable mood, and is an appeal to the reason and conscience—not wholly dead in the most soulless corporations. It costs next to nothing. It is already becoming a substitute for strikes in England, where the trades unions are adopting this new weapon. Mr. Frederick Harrison writes, in his address before the late trades union congress of England, as follows:

There are no men, I believe, in the country more opposed to a policy of strikes—more convinced of the suffering they cause—than the officers and managers of the great per-

Digitized by Google

manent societies. There is a fine passage in the admirable report before you: "The measure of value in a strong union lies not so much in the conduct of successful strikes as it does in the number of disputes its moral strength prevents. Their influence and that of your congress has been steadily exerted to substitute arbitration for strikes. Even now in this melancholy dispute [a local strike of some magnitude] it is the workmen who offer and the employers who reject arbitration. Your influence in favor of arbitration is shown in the steady progress of that principle, and in the steady diminution of actual strikes, until their cost does not reach to one per cent. [of the expenditures of the unions]; but you have done all that you can do, and you will continue to do all you can to insure that even this small percentage may be spared to you, and that arbitration may prevail in all labor disputes."

### PROVIDENT FEATURES OF TRADES UNIONS.

Trades unions ought, among us, to emulate the wisdom of European workingmen, and use their mechanism to organize forms of association which should look not alone to winning higher wages but to making the most of existing wages, and ultimately to leading the wage system into a higher development. The provident features of the English trades unions are commonly overlooked, and yet it is precisely in these provident features that their main development has been reached. Mr. George Howell shows that a number of societies, which he had specially studied, had spent in thirty years upward of $19,000,000 through their various relief funds, and $1,369,455 only on strikes. Mr. Harrison speaks of seven societies spending in one year (1879) upward of $4,000,000 upon their members out of work. He shows that seven of the great societies spent in 1882 less than 2 per cent. of their income on strikes; and states that 99 per cent. of union funds in England "have been expended in the beneficent work of supporting workmen in bad times, in laying by a store for bad times, and saving the country from a crisis of destitution and strife."

### EFFECTS OF TRADES UNIONS ON LEGISLATION IN ENGLAND.

Trades unions ought to be doing for our workingmen what trades unions have already done in England. Mr. Harrison, in the address already quoted, after enumerating some of the beneficial actions of the unions, says:

> Besides many others, too numerous to specify, I have no hesitation in saying that the labor laws passed within the last twelve years alone form a body of legislation for the good of the working classes of this country such as no other civilized country in the world can show. Not Germany, where the all-powerful chancellor has now taken labor under his special protection; not even France or the United States, with their republic and manhood suffrage. It cannot be denied that this great body of legislation is to a great degree directly due to the efforts of this congress.

It has been by the power of combination among the workingmen, developed through the trades unions, that this long list of beneficent legislation—factory acts, mines regulations acts, education acts, tenant right acts, employers' liability acts, acts against "truck," acts against cruelty to animals, &c.—has been secured. It has been wrested from reluctant parliaments by the manifestation of strength on the part of the laboring classes.

In comparison with this brilliant showing, what have our trades unions done to affect the legislation of our States? That legislation has thus far been notoriously and shamefully in the interests of one class as against another—in the interest of capital as against labor. We have had bushels of bills for the furthering of capitalistic schemes, with here and there a grain chucked in for labor.

### A MODEL BUREAU OF LABOR STATISTICS.

Our trades unions ought to be the means of securing one of the great necessities of labor in this country—accurate and generally diffused information concerning the state of the labor market. Were there any thorough combination in existence on the part of these unions in hard times there could be diffused through the great centers of labor in the East regular reports of the labor market in the different local centers of the country, such as would guide workingmen in their search for opportunities of work. Such information would be trusted, because it would come from their own class, and would be reliable because it would be given from those on the spot; and yet our trades unions, so far as I know, have made next to no attempt, even within their own peculiar spheres, to give to their members any such information in the hardest of times. In their hands is already existent—needing only to be used—the mechanism of the model of the labor bureau for which they cry so loudly.

### CO-OPERATION IN EUROPE.

Another action that our labor unions might take in the interest of the workingmen is in the development of co-operation. The story of European co-operation is one of the most encouraging tales of our modern industrial world. Germany, for example, had in 1877 some 2,830 credit societies; of which 806 reported 431,216 members; advances for the year, in loans to their members, $375,000,000, with a loss of one mark to every 416 thalers, or 23⅘ cents on every $297—an indication of soundness in their financial operations that many capitalistic corporations might well envy. The rapid growth of these societies is bringing the omnipotence of credit to the aid of the workingman in Germany.

We have within the past decade had a most encouraging growth of a somewhat similar form of co-operation in the building and loan associations, which are now estimated to number probably about 3,000 in the nation, with a membership of 450,000, and an aggregated capital of $75,000,000.

The co-operative stores have reached a wonderful development in England, with most beneficent results. There were 765 stores reporting to the congress in 1881, which showed aggregate sales of $65,703,990, with profits of $435,000; while Scotland reported 226 stores in the same year, representing sales of $17,423,170, and profits of $113,665.

### CO-OPERATION IN AMERICA.

Against this showing our workingmen have comparatively little to offer. We have, it is true, had a great deal more of experimenting in co operative distribution than is ordinarily supposed. Co-operative stores began among us between 1830 and 1840. The Workingmen's Protective Union developed a great many stores at this time, which together did a business in their best days ranging from $1,000,000 to $2,000,000 per annum. In the decade 1860–'70 there was an extensive revival of co-operative stores; plans for wholesale agencies being even discussed. A few of these earlier stores still live. Two great national orders have arisen, seeking to build up co-operative stores, among other aims.

The Grangers had in 1876 twenty State purchasing agencies, three of which did a business annually of $200,000, and one of which did an annual business of $1,000,000. They claimed to have, about the same

Digitized by Google

time, five steamboat or packet lines, fifty societies for shipping goods, thirty-two grain elevators, twenty-two warehouses for storing goods. In 1876 one hundred and sixty Grange stores were recorded. In 1876 it was officially stated that "local stores are in successful operation all over the country."

The Sovereigns of Industry also developed co-operative distribution largely. In 1877 President Earle reported that "ninety-four councils, selected from the whole, report a membership of 7,273, and with an average capital of only $884 did a business last year of $1,089,372.55. It is safe to assume that the unreported sales will swell the amount to at least $3,000,000."

There have been numerous stores started apart from these orders. The finest success won is by the Philadelphia Industrial Co-operative Society. Starting in 1875 with one store, it has now six stores. Its sales for the quarter ending February 18, 1882, were $51,413.63. A considerable increase of interest in such stores marks the opening of our decade. Stores are starting up in various parts of the country. The Grangers claim to have now hundreds of co-operative stores, upon the Rochdale plan, in successful operation. Texas alone reports officially (1881) seventy-five co-operative societies connected with this order.

Yet while we have had a great deal more co-operative distribution than is usually supposed, we have had nothing comparable with the splendid development in England.

In the line of co-operative production, which has been so successfully essayed in France, we have scarcely a handful of real successes.

We had an epoch of brilliant enthusiasm over co-operative agriculture in 1840,-'50, but little has been left from it. One form of agricultural co-operation, a lower form, has been astonishingly successful—the cheese factories and creameries. It is estimated that there are now 5,000 of them in the country. In co-operative manufactures, we have had many experiments, but few successes, from 1849 onward. Massachusetts reported twenty-five co-operative manufactures in 1875. All of them, however, were small societies.

### POSSIBILITIES OF CO-OPERATION.

Now, co-operation has its clearly marked limitations. It is of itself no panacea for all the ills that labor is heir to. But it can ameliorate some of the worst of those ills. It can effect great savings for our workingmen, and can secure them food and other necessaries of the best quality. If nothing further arises, the spread of co-operation may simply induce a new form of competition between these big societies; but no one can study the history of the movement without becoming persuaded that there is a moral development carried on, which will, in some way as yet not seen to us, lead up the organization of those societies into some higher generalization, securing harmony. It is constantly and rightly said that business can never dispense with that which makes the secret of capital's success in large industry and trade, namely, generalship. Co-operation can, it is admitted, capitalize labor for the small industries, in which it is capable of making workingmen their own employers; but it is said it can never, through committees of management, carry on large industries or trade. I can, however, see no reason why hereafter it may not enable large associations to hire superior directing ability, at high salaries, just as paid generals give to republics the leadership which kings used to supply in monarchies. There are in the sav-

Digitized by Google

ings banks of many manufacturing centers in our country amounts which if capitalized would place the workingmen of those towns in industrial independence; moneys which, in some instances, are actually furnishing the borrowed capital for their own employers. In such towns our workingmen have saved enough to capitalize their labor, but, for lack of the power of combination, let the advantage of their own thrift inure to the benefit of men already rich. They save money and then loan it to rich men to use in hiring them to work on wages, while the profits go to the borrowers of labor's savings.

But the chief value of co-operation, in my estimate, is its educating power. It opens a training school for labor in the science and art of association.

Labor once effectively united could win its dues, whatever they may be. The difficulties of such association have lain in the undeveloped mental and moral condition of the rank and file of the hosts of labor. The history of the various attempts at a higher association among our workingmen forms a sad story of ignorance, suspicion, timidity, irresolution, fickleness, and lack of self-control, by which wise plans and heroic labors have again and again come to naught. The several forms of co-operation present the best means of educating our workingmen in the qualities wherein they are most lacking, and thus of fitting them for that action of self help which must prove the first step to their salvation.

## TRADES UNIONS AND CO-OPERATION.

Now, of this effort at co-operation I find scarcely any trace in the trade organizations of our workingmen. Trades unions have until very lately passed the whole subject by in utter silence. What has been done by workingmen in this country in the line of co-operation has been done outside of the great trade associations, which form the natural instrumentalities for organizing such combination. They offer the mechanism, the mutual knowledge, the preliminary training in habits of combination, which together should form the proper conditions for the development of co-operation. Is it not a singular thing, considering the manifold benefits that would come to labor from such a development, that the attention of these great and powerful organizations has not heretofore been seriously called to this matter? It is a hopeful sign that two of our later trade organizations avow distinctively in their platforms the principle of co-operation. The Central Labor Union of this city and the Knights of Labor both profess to seek the development of co-operation. It remains to be seen whether there will be anything more than the profession.

Out of our trades unions, by combination among them, there might be already developed on our soil a power representing the labor element of the country which, with universal franchise, would be practically omnipotent. Could our trades unions enter the field of politics with reference to measures in the interests of their own classes, measures justifiable, necessary, and on which reasonable minds could be readily convinced, not many elections would be held in our various States before these reforms would be accomplished. Is there not a certain aspect of childishness on the part of so vast and powerful a body of men as is represented by those trades unions in their pitiful appeals to Government for the help which they have it already in their power to force from Government.?

The story of such attempts as have already been made in this direction is one of a sad and discouraging nature to all who feel the gravity of

Digitized by Google

this problem. Again and again great organizations have arisen on our soil, seeking to combine our trade associations and promising the millennium to labor, only to find within a few years suspicion, distrust, and jealousy eating the heart out of the order, and disintegration following rapidly as a natural consequence. The time must soon come, let us hope, when the lesson of these experiences will have been learned.

### THE CORRECTION OF LABOR'S FAULTS.

These are some of the salient faults of labor—faults which are patent to all dispassionate observers. The first step to a better state of things lies through the correction of these faults. Whatever other factors enter into the problem, this is the factor which it concerns labor to look after if it would reach the equation of the good time coming. No reconstruction of society can avail for incompetent, indifferent, thriftless men, who cannot work together. Self help must precede all other help. Dreamers may picture utopias, where all our present laws are suspended, and demagogues may cover up the disagreeable facts of labor's own responsibility for its pitiful condition, but sensible working men will remember that, as Rénan told his countrymen after the Franco-Prussian war, "the first duty is to face the facts of the situation." There are no royal roads to an honest mastery of fortune, though there seem to be plenty of by-ways to dishonest success. Nature is a hard school-mistress. She allows no makeshifts for the discipline of hard work and of self-denial, for the culture of all the strengthful qualities. Her American school for workers is not as yet overcrowded. The rightful order of society is not as yet submerged on our shores. There are the rewards of merit for all who will work and wait. No man of average intelligence needs to suffer in our country if he has clear grit in him. "The stone that is fit for the wall," as the Spanish proverb runs, "will not be left in the road."

## II.

### FAULTS OF CAPITAL.

But—for there is a very large "but" in the case—when all this is said, only the thorough-going *doctrinaire* will fail to see that merely half the case has been presented. There is a shallow optimism which, from the heights of prosperity, throws all the blame of labor's sufferings on labor's own broad shoulders; steels the heart of society against it because of these patent faults, and closes the hand against its help, while it sings the gospel of the Gadgrinds—"As it was and ever shall be. Amen."

Labor itself is not wholly responsible for its own faults. These faults spring largely out of the defective social conditions amid which the working man finds himself placed. Before we proceed to administer to him the whole measure of the "whopping" due for his low estate, we had better look back of him, to see why it is that he is as he is.

### (1.) SOME CAUSES OF LABOR'S INEFFICIENCY—HEREDITY.

The inefficiency of labor is by no means the fault of the individual laborer alone. Heredity has bankrupted him before he started on his career. His parents were probably as inefficient as he is—and most likely *their* parents also. One who sees much of the lower grades of

Digitized by Google

labor ceases to wonder why children turn out worthless, knowing what the parents were. General Francis A. Walker, in opening the Manufacturers' and Mechanics' Institute at Boston lately, said:

> There is great virtue in the inherited industrial aptitudes and instincts of the people. You can no more make a first-class dyer or a first-class machinist in one generation than you can in one generation make a Cossack horseman or a Tartar herdsman. Artisans are born, not made.

Our incompetents may plead that they were not born competent. It does not readily appear what we are going to do about this working of heredity against labor, except as by the slow and gradual improvement of mankind these low strata of existences are lifted up to a higher plane. Meanwhile we must blame less harshly and work a little more earnestly to better the human stock.

### LABOR'S ENVIRONMENT—TENEMENT HOUSES.

The environment of labor handicaps still further this organic deficiency. In most of our great cities the homes of the workingmen are shockingly unwholesome; unsunned, badly drained, overcrowded. The tenements of New York are enough alone to take the life out of labor. City factories often are not much better. The quality of the food sold in the poorer sections of our cities—meat, bread, milk, &c.—are defectively nutritious, even where they are not positively harmful. The sanitary conditions are thus against labor.

This could be largely rectified by the State and city authorities, and ought to be rectified in simple justice to society at large, which is now so heavily burdened by the manifold evils bred under such conditions. Government guards carefully the rights both of land and capital by an immense amount of legislation and administration. Has not labor a fair claim to an equal solicitude on the part of the State? Health is the laborer's source of wealth, but it is by no means so carefully looked after as are the resources of the other two factors of production. It is only within the last three years that in New York we have had a satisfactory tenement-house law, or a fair administration of any law bearing on this evil. There ought to be the exercise of some such large wisdom as led the city of Glascow to spend $7,000,000 in reconstructing three thousand of the worst tenements of that city, with a consequent reduction of the death rate from 54 per thousand to 29 per thousand, and with a corresponding decrease of pauperism and crime.

To this end our municipal governments should be taken out of party politics and made the corporation business that they are in German cities.

### DEFECTIVE LEGISLATION.

We have in none of the States of our Union any such legislation as that of the thorough system of factory laws in England, and we ought to supply the lack promptly. Whatever may be said as to interference on the part of legislation with the rights of capital, the sufficient answer is that the whole advance of society has been a constant interference on the part of legislation with the merely natural action of the law of supply and demand; and that only thus has England, for example, secured the immense amelioration in the condition of the problem of labor and capital which marks her state to-day.

It can be said also in this connection that if Government has one business more peculiarly her own than another it is to look after the

Digitized by Google

class that most needs looking after; and that not simply from the interest of the class itself, which would rarely supply a basis for governmental interference, but in the interests of society at large—of the state itself. The state's first concern is to see her citizens healthful, vigorous, wealth-producing factors; and to this end bad sanitary conditions, which undermine the "health-capital" of labor, imperatively demand correction.

### DEFECTIVE EDUCATION.

The deeper seated the roots of labor's inefficiency in heredity and environment, the greater the need for an education that will develop whatever potencies may lie latent. Inefficiency will rarely correct itself. Superior ability must train it into better power. Where is there any proper provision for such an education?

Inefficient parents can hardly be expected to teach their children better skill than they themselves have won. The old system of apprenticeship has almost completely died out, partly owing to the stupid policy of trades unions and partly owing to the change going on in most of the old handicrafts, through the introduction of the factory system and of mechanism. No other system of industrial training has come generally into use among us, to take the place of home training and of apprenticeship. The churches have of late years been carrying on certain forms of industrial education in many places, but the work has only been, for the most part, rudimental. Here and there they are now adopting kitchen gardens (as introductory to domestic service), sewing schools, and in some places classes for training boys in manual handicrafts. Philanthropic societies have been essaying the simpler forms of industrial education, chiefly for girls, as notably in the industrial schools of the Children's Aid Society of this city. In a few cities, through individual or voluntary associative action, art industrial education has been considerably developed, as, for example, in Philadelphia and Boston; and our own city has within a few years received fine illustrations of what individual capital can do in the line of industrial education in the schools of Mr. Auchmuty and in the noble Cooper Union.

### INDUSTRIAL EDUCATION.

State governments and our national Government have for a number of years been fostering certain branches of industrial education, chiefly in the line of agriculture. The late report of the Bureau of Education upon industrial education presents a very encouraging summary of what is thus being done under the guidance of the state. It reports concerning forty-three colleges aided by State grants to give agricultural and mechanical training, besides a large number of technical departments in other colleges, industrial schools, evening classes for such instruction, &c. Probably the finest example of industrial education that the country possesses is found in the Hampton schools in Virginia. Of attempts, however, to combine general and intellectual education with practical training and handicrafts we have few examples. The Hampton schools, already alluded to, present one of the best. Professor Adler's school in this city is very interesting in this respect.

### COMMON SCHOOL EDUCATION NOT PRACTICAL.

Our common schools have until lately signally passed by the whole field of practical education. Drawing is at last being generally intro-

Digitized by Google

duced, and sewing is also being introduced to a small extent, I believe, especially in New England. But the schools which are supposed to be intended for the mass of the people, and which are supplied at the public cost, have made next to no provision for the practical training of boys and girls to become self-supporting men and women—wealth-producing citizens; while the whole curriculum of the school system tends to a disproportionate intellectuality, and to an alienation from all manual labor.

### DUTY OF SOCIETY TOWARD EDUCATION.

It requires no argument, I think, to satisfy all but *doctrinaires* that a great mass of inefficient labor in a nation demands of its cultured and wealthy classes, of its churches and philanthropists, and of its government ample provision by which it may be trained to efficiency. Charity dictates this as the wisest help; self-interest suggests it to capital for its own increasing productivity. The true function of the state calls for this task, in the discharge of its duty to society at large, and in order to the exemption of society from the present onerous burden of taxation imposed by poverty and crime.

There is room in our country now for all these agencies. Churches can do no better work than by adding to their Sunday schools of moral and religious instruction industrial schools, which will train those boys and girls to habits of efficient toil—of toil wherein shall be the best safeguards against the temptations that infest life and that peculiarly appeal to the poor.

Individuals can find no more promising field for the use of their powers of philanthropy than in organizing and endowing such schools. Our manufacturers might well study, in their own interests, the example of the French firms which are successfully carrying on, in connection with their factories, schools for technical training. The story of the town of Mulhouse, one of the towns of Alsace, is a brilliant homily to all employers of labor.

### THE DUTY OF THE STATE TOWARD EDUCATION.

Above all it seems to me that it is bounden on the state to provide such training and education. The necessity of the state's entering the educational field is disputed by no one; but if it is to educate children at the public cost it is bound, I think, to so educate its wards that they shall return to society the taxation imposed for their education. Its justification in becoming school-master lies in the necessity of making out of the raw material of life citizens who shall be productive factors in the national wealth and conservators of its order. If, therefore, it is justified in teaching the elementary branches of education, if it is justified in adding to those elementary branches departments that may be considered in the nature of luxuries, how much more is it justified in training the powers by which self-support shall be won and wealth shall be added to society?

### NECESSITY FOR PUBLIC KINDERGARTENS.

What it may do and ought to do, as it seems to me, is, first of all, to lay the foundation of a complete education, which shall include the bodily powers as well as the mental powers—in the kindergarten system as the preprimary department of our public schools. While there

Digitized by Google

is no technical training in any handicraft in the kindergarten, as indeed there could not well be, owing to the age of the children, and should not be, since it looks simply to the symmetrical opening of all the powers of the human being, there is none the less an habitual training of eye and hand, of the taste and of the imagination, and of the originating power, which goes far to create a love of manual labor and to develop skill in it. Its clay-modeling and block-building and stick and strip combinations teach and train in the elements which lie at the basis of art industry. No better beginning than such an education can be conceived. It inspires in the child-mind that joy in work itself and that pride in doing work well which labor so sadly needs to-day. Upon this basis the state should rear a carefully graduated course of instruction and training, calculated to develop manual skill as an essential element of a complete education and as a general preparation for technical trade education. The means for this fall into the line of the specialist, and need not be entered upon here.

### TRADE SCHOOLS.

Finally it should in some way—though I am not myself clear what way would be best—foster the development of trade schools, either by supplying them as annexes to its general course or by granting subventions for the founding of training schools, or at least by the publishing of documents that would call the attention of manufacturers to the need and to the possibilities of such schools, and that would illustrate what is already being done in this line in the Old World. The story of any of the successful training schools of Paris would be a revelation to most of our manufacturers. There is the *École professionale*, for example, a printing establishment under the management of Messrs. Chaix et Cie. This school has some thirty apprentices connected with it. The apprenticeship lasts four years. The wages are paid on a rising scale. The teaching lays its foundation in a special primary course for those whose previous schooling had been inefficient. It then adds a technical course, which covers grammar and composition, the reading of proofs and correcting for the press, the study of different kinds of types and engraving, and the reading and composing of English, German, Latin, and Greek; in the two latter cases from a purely typographical point of view, without any attempt to understand or translate. Lastly it builds a supplemental course, which includes the history of printing, simple notions of economics, a little mechanics and physics, and a little smattering of chemistry, dealing with the materials they will have hereafter to employ, such as acids, oxides, oils, carbons, soda, &c.; the result of which on the general intelligence and interest of the workingmen employed in such an establishment must be striking, and the return from which to the manufacturer, in increased efficiency, must be equally noteworthy. (*Cf.* Contemporary Review, September, 1880.)

That such efforts to encourage industrial education would pay our Government is best seen in the example of England. The International Exhibition of 1851 revealed to England its complete inferiority to several continental countries in art industries, and the cause of that inferiority in the absence of skilled workmen. The Government at once began to study the problem, and out of this study arose the Kensington Museum, with its art schools, and similar institutions throughout the country, which have already made quick and gratifying returns in the improvement of the national art industries, and in the vast enrichment of the trade growing therefrom.

## (2.) SOME CAUSES OF UNINTERESTEDNESS OF LABOR.

Concerning the uninterestedness of labor and its too common lack of any identification with capital we must also look beyond labor itself to find the full responsibility of this evil.

The whole condition of industrial labor has changed in our century. Contrast the state of such labor a century ago with what it is now. Then the handicraftsman worked in his own home, surrounded by his family, upon a task, all the processes of which he had mastered, giving him thus a sense of interest and pride in the work being well and thoroughly done. Now he leaves his home early and returns to it late, working during the day in a huge factory with several hundred other men. The subdivision of labor gives him now only a bit of the whole process to do, where the work is still done by hand, whether it be the making of a shoe or of a piano. He cannot be master of a craft, but only master of a fragment of the craft. He cannot have the pleasure or pride of the old-time workmen, for he *makes* nothing. He sees no complete product of his skill growing into finished shape in his hands. What zest can there be in this bit of manhood? Steam machinery is slowly taking out of his hands even this fragment of intelligent work, and he is set at feeding and watching the great machine which has been endowed with the brains that once was in the human toiler. Man is reduced to being the tender upon a steel automaton, which thinks and plans and combines with marvellous power, leaving him only the task of supplying it with the raw material, and of oiling and cleansing it.

Some few machines require a skill and judgment to guide them proportioned to their own astonishing capacities, and for the elect workmen who manage and guide them there is a new sense of the pleasure of power.

But, for the most part, mechanism takes the life out of labor as the handicraft becomes the manufacture, or more properly, the *machino*-facture; and the problem of to-day is, how to keep up the interest of labor in its daily task, from which the zest has been stolen.

### HOW EMPLOYERS MAY HELP THEIR EMPLOYÉS.

Manufacturers ought to see this problem and hasten to solve it. Those who profit most by the present factory system ought, in all justice, to be held responsible to those who suffer most from it. They ought to be held morally bound to make up to them in some way the interest in life that has gone out with the old handicrafts. They could interest their hands *out* of the working hours, and in ways that would give them a new interest *in* their working hours.

### EXAMPLES IN EUROPE.

I give two examples of this wise action in Europe. The Messrs. Faber (of the celebrated pencil company), on their premises at Stein, Bavaria, have established kindergartens, schools, churches, libraries, archer clubs, and other institutions for the education and recreation of their men, while they supply provisions, &c., at wholesale prices. They sell lots of land and build houses for the men, which the men pay for through a term of years. They have founded a savings bank and a hospital, and pension their workmen in old age.

The famous *Bon Marché* establishment, in Paris, presents a fine example of what may be done to make life cheerier for employés. Three

Digitized by Google

thousand hands have their meals in the building. Concerts are given them, and lessons in English, German, instrumental and vocal music, fencing. The clerks have an amusement room, with billiard tables, chess, checkers, &c. The women clerks have a parlor to themselves, with a piano, &c. A physician is employed by the store, and his services are free; all are pecuniarily interested in the store, receiving a small commission on every article sold and delivered; and after a certain number of years each person receives an interest in the house, which increases yearly.

### EXAMPLES IN AMERICA.

Let me give two illustrations from our own soil of what can be done by employers to render life more attractive to their men. I take both accounts from a pamphlet by B. G. Northrop, Secretary of the Connecticut Board of Eduaction:

One of these "models" is the silk factory of the Cheney Brothers, in South Manchester, Conn., by far the largest and most successful factory of the kind in the world, making over 25,000 yards of ribbons and broad silks a day. This business, started here by the Cheney family in 1836, has steadily grown in extent and prosperity to the present time. The factory village covers about eight hundred acres of land and includes some two hundred houses. A fine lawn, laid out with winding concrete walks and adorned with shrubs and flowers, fronts the mills, and usually each of the houses. No fence or visibly dividing line separates the front yards from the roads. The Cheneys have encouraged their hands to build and own their homesteads, and to this end furnish the land, and loan money for building at a low figure, with a "liquor reservation" in the interest of temperance, and with the understanding that all houses shall be on a plan provided or approved by their architect and that all shall be neatly painted some neutral tint. Not a house in glaring white here offends the eye. The beautiful grounds of the Cheney mansions, of the operatives and of the factories all present the appearance of an extended park, and give a look of refinement, kindliness, and good neighborhood to the whole village, which is like a well-kept garden. No private yard is left in an untidy state. No *débris* or rubbish is seen around or near any dwelling. There is evidently a public sentiment in favor of neatness and order that pervades the entire community and allows no dirty nooks to be found. Creeping vines cover "the office" and some of the factory buildings and dwellings. No block houses are found here. The cottages stand apart and vary in style, giving an individuality to each place. A capacious aqueduct carries water to every house. This village seems like a community in the best sense of the term, with common interests, pursuits, and sympathies. The providing of a large and commodious lecture hall, costing $50,000, together with interesting and instructive lectures and entertainments and a free library and reading room, solely by the Cheney Brothers, shows their intelligent and liberal methods of promoting the well-being and content of their employés. The hands highly appreciate the liberality of their employers and feel a manifest interest in their work and a pride in the place. Hence strikes and alienation between capital and labor are here unknown.

The other model manufacturing village is that of the Fairbanks Company, at Saint Johnsbury, Vt. There is the largest manufactory of scales in the world, employing in the factory and branch departments elsewhere, over one thousand men, and manufacturing over 60,000 scales annually, the sales now amounting to over $2,000,000 a year.

There is a superior class of workmen in this establishment. All are males. Their work is proof of skill. Their looks and conversation indicate intelligence. They are mostly Americans, and come from the surrounding towns More than half of them are married, and settled here as permanent residents, interested in the schools and in all that relates to the prosperity of the place. Many of them own their houses, with spacious grounds for yard and garden, and often a barn for the poultry and cow. These houses are pleasing in their exterior, neatly furnished, and many of them supplied with pianos and tapestry of Brussels carpets. The town is managed on temperence principles, and drunkenness, disorder, and strife among the hands are almost unknown. Most of them are church-goers, many of them church members.

There has evidently been mutual sympathy and interest between employer and employed. The senior (Governor) Fairbanks used to say to the men, "You should always come to me as to a father." He maintained relations of kindness with them, visiting the sick, helping the needy, counselling the erring, encouraging their thrift, enjoining habits of economy. He taught them that it was their duty and in-

Digitized by Google

terest to "lay up something every month," and that the best way to rise in the social scale was to unite economy with increasing wages. He himself both preached and practiced economy. Yet his benefactions were munificent. The fact that so many of the workmen are "fore-handed," besides owning their homesteads, is due to his teaching and example. The worth and dignity of work he illustrated in theory and practice. The notion that labor was menial, or that the tools of trade or farm were badges of servility, he despised. His sons worked in the shop, and thoroughly learned the trade. Many workmen have been here from twenty to over forty years.

Years ago the men were aided in forming and sustaining a lyceum, and liberal prizes were offered for the best essays read. Recently Horace Fairbanks has founded a library, and opened a large reading-room, free to all. The Athenæum, containing the library, reading-room, and also a spacious lecture-hall, is an elegant structure, 95 by 40 feet, two stories high. The books, now numbering nearly 10,000 volumes, are choice and costly; 230 volumes have been drawn in a single day. In the reading-room, besides a good supply of American periodicals, daily, weekly, and quarterly, I noticed on the tables many European journals, including 4 English quarterlies, 6 London weeklies, and 10 monthlies. The library and reading-room are open every week-day and evening except Wednesday evening, when all are invited to attend the weekly "lecture," which is held at the same hour in all the churches. Having visited nearly every town of Massachusetts and Connecticut, and traveled widely in this country, I have nowhere found in a village of this size an art gallery so costly and so well supplied with painting and statuary, a reading-room so inviting, and a library so choice and excellent as this.

Thaddeus Fairbanks, one of the three founders of the scale factory, has liberally endowed a large and flourishing academy, which promises to become the "Williston Seminary" for northeastern Vermont.

These various provisions for the improvement, happiness, and prosperity of this people, coupled with liberality and fairness in daily business intercourse, explain the absence of discontent and the uniform sympathy, good-feeling, and harmony which prevail.

### GOOD RESULTS OF A HUMANE POLICY TOWARD LABOR.

Not a few of our manufacturers are already opening their eyes to these facts of the industrial problem, and, with far-seeing generosity and human brotherliness that will, according to the eternal laws, return even the good things of this world unto them, they are providing their workingmen with libraries, reading-rooms, and halls for lectures and for entertainments. They are encouraging and stimulating the formation of literary and debating societies, bands, and clubs and such other things as give social fellowship and mental interest. All this can be done at comparatively small cost. The men in the employ of a great establishment can be taught a new interest in their task as they learn to understand its processes and the relation of these processes to society at large, which can easily be done by lectures, &c. Such work as this is a work that demands the leadership, the organizing power which the employer can best furnish. At the last session of the Social Science Association an interesting paper sketched some of these efforts. In what wiser way could our wealthy manufacturers use a portion of the money won for them by the labor which has exhausted its own interest in its task?

### WHY LABOR IS NOT LOYAL TO CAPITAL.

Such personal interest on the part of employers in their employés leads up to a clew to that other branch of the uninterestedness of labor—its lack of identification with the welfare of capital—its lack of any feeling of loyalty toward the capitalist. How can anything else be fairly expected in our present state of things from the *average* workingman under the *average* employer. I emphasize the "average," because there are employés of exceptional intelligence and honor, as there are employers of exceptional conscientiousness, anxious to do fairly by their men. The received political economy has taught the average workingman that

Digitized by Google

the relations of capital and labor are those of hostile interests; that profits and wages are in an inverse ratio; that the symbol of the factory is a see-saw, on which capital goes up as labor goes down. As things are, there is unfortunately too much ground for this notion, as the workmen sees.

### RATIO OF WAGES TO PRODUCTION, 1875–1880.

Mr. Carroll D. Wright, in the 14th annual report of the Massachusetts Bureau of Labor (1883), shows that in 1875 the percentage of wages paid to the value of production, in over 2,000 establishments, was 24.68; and that in 1880 it was 20.23. This means that the workingmen's share of the returns of their own labor, so far from increasing, has decreased one-sixth in five years.

The workingman is disposed to believe in the light of such figures that the large wealth accumulated by his employer represents over and above a fair profit the increased wages out of which he naturally regards himself as being mulcted. He may be thick-headed, but he can see that in such a see-saw of profits *versus* wages the superior power of capital has the odds all in its favor. He learns to regard the whole state of the industrial world as one in which *might* makes *right*, and feebleness is the synonym of fault.

How, in the name of all that is reasonable, can the average man take much interest in his employer or identify himself with that employer under such a state of things as the economy sanctioned by the employer has taught him. This is aggravated by the whole character of our modern industrial system.

### THE FACTORY SYSTEM A NEW FEUDALISM.

The factory system is a new feudalism, in which a master rarely deals directly with his hands. Superintendents, managers, and "bosses" stand between him and them. He does not know them; they do not know him. The old common feeling is disappearing. And—this is a significant point that it behooves workingmen to notice—the intermediaries are generally workingmen who have risen out of the ranks of manual labor and have lost all fellow feeling with their old comrades, without gaining the larger sympathy with humanity which often comes from better culture. The hardest men upon workingmen are ex-workingmen. It is stated, on what seems to be good authority, that the general superintendent of the great corporation which lately has shown so hard a feeling toward its operatives when on strike was himself only ten years ago a telegraph operator.

### LACK OF HUMAN RELATIONSHIP BETWEEN CAPITALISTS AND THEIR LABORERS.

A further aggravating feature of this problem is the increasing tendency of capital to associated action. What little knowledge of his employés or sympathy with them the individual manufacturer might have is wholly lost in the case of the corporation. To the stockholders of a great joint-stock company, many of whom are never on the spot, the hundreds of laborers employed by the company are simply "hands"—as to whose possession of hearts or minds or souls the by-laws rarely take cognizance. Here there is plainly a case where capital—the party of brains and wealth—the head of the industrial association, should lead

Digitized by Google

off in a systematic effort and renew, as far as may be, the old human tie, for which no substitute has ever been devised.

To conciliate the interests of the classes, and identify labor with capital, individual employers must re-establish personal relationships between themselves and their men. What might be done in this way, and how, this being done, the present alienation of feeling on the part of our workingmen would largely disappear, must be evident to any one who has watched some of the beautiful exemplifications of this relationship which have already grown into being on our shores. I know of one large manufacturer, in a city not a hundred miles from this, who started to enter the ministry as a young man, but found to his intense disappointment that he had no aptitude for the work of a preacher, and turned his attention, on the insistant advice of those nearest to him, to active business. He took up the business which his father had left him at his death and had left largely involved. His first task was to pay off, dollar for dollar, all the debts which his father had bequeathed him, although in most instances they had been compromised by the creditors. He then threw the energy of his being into the development of the business, and, in the course of a few years, put it at the forefront of that line in his native city. Into his business he breathed the spirit of love to God and man which had moved him originally to take up the work of the ministry. He felt himself ordained to be what Carlisle would have called a "captain of industry." From the start he established personal, human, living relationships with his men. He taught them by deed rather than by word to consider him their friend. He was in the habit of calling in upon their families in a social and respecting way. In all their troubles and adversities he trained them to counsel with him, and gave them the advantage of his riper judgment and larger vision. In cases of exigency his means were at their service in the way of loans to tide them over the hard times. His friends have seen, more than once, coming from his private office, some of the hard-fisted men of toil in his employ, with tears streaming down their faces. He had called them into his office on hearing of certain bad habits into which they had fallen, and so impressive had been his talk with them, that they left his presence with the most earnest resolves to do better in the future. The result of all this relationship has been that during some fifteen years of the management of this large business he has rarely changed his men, and while strikes have abounded around him he has never known a strike.

I hold in my possession a letter from one of our leading iron manufacturers in this country, who, in response to an appeal for participation in a charity of this city, gave answer that it had been a practice of the firm to invest a certain portion of their profits in developing the comforts of their workingmen, and that they were obliged to limit their desire to give in charity in order that they may be able to build homes, club-rooms, reading-rooms, and all the *et ceteras* of a really civilized community in their work-village. These are examples, in our own country, of what might be done.

One of the most beautiful models that I know of in modern history is furnished by the town to which reference has already been made—the town of Mulhouse, where, after some thirty years, the spirit of brotherliness has so entered into the relationships of capital and labor that a firm would be disreputable which there attempted to carry on business as business is ordinarily done here. All the manufacturers plan out, organize, and carry on what to most of us would seem impossible schemes for the amelioration and uplifting of the condition of their

Digitized by Google

working people. No one wonders that, as he walks through the town which his large-hearted philanthropy imbued with this fine spirit, the workingmen salute the originator of these schemes as "Father Peter."

### INDUSTRIAL PARTNERSHIPS.

In addition to this personal, human, relationship, capital might and should, in all justice and humanity, identify the pecuniary interests of labor with its own interests. What is known as industrial partnership is simply a solution of this branch of the problem. The principle is simply that of giving labor a pecuniary interest in the profits of the establishment *pro rata* with its own wages. A *bonus* is set on frugality and industry and conscientiousness of work by making the hands small partners in the concern.

### ILLUSTRATION IN FRANCE.

Industrial partnership has been much experimented with in England, and still more largely in France. The fullest exemplification of the principle of which I know is furnished in the establishment of M. Godin, at Guise. He had been an early disciple of Fourier. Into his large establishment, which embraces a number of industries, such as iron, copper, &c., and which employs some 1,500 people, he has introduced this principle. A regular association was formed between himself and his employés. The accounts of the concern are duly laid before them. They are open to the inspection of a committee appointed by the workingmen. All is done openly and above board. They know the profits of the concern and their own share in those profits. In addition to this general principle of industrial partnership he adds that paternal care which lies in the power of a philanthropic employer. Buildings on a gigantic scale have been reared for the employés; stores are opened, in which the best produce is supplied to them at the lowest rates; reading rooms, a huge hall for meetings, festivals, &c., are furnished; nurseries, schools, and kindergartens are provided for them, and in every possible way their life is made pleasant and comfortable. The declaration of principles which opens the articles of association is nobly religious: "To worship God, the Supreme Being, the source of all life. To hallow life itself. To promote the advent of justice among men." (*Cf.* Pamphlet issued by New York Woman's Social Science Society, room 24, Cooper Institute, New York.)

### ILLUSTRATION IN AMERICA.

One of the best exemplifications of this principle in our own country is furnished to us in the establishment of the Messrs. Hazard, of Peacedale, R. I. A few years ago the firm presented their employés, as a Christmas gift, with a carefully drawn up scheme whereby the employés were to receive a certain share of the profits for the new year, if those profits rose over and above the average of the past five years. The division was to be made *pro rata* to the wages then received. The first year there was no dividend to be paid according to this scheme. The second year a dividend of 5 per cent. on the gross wages was declared, amounting to $5,824.40. The third, a dividend of 5 per cent. on the gross wages was declared, and the fourth year a dividend of 3 per cent. For that year, owing to the high price of wool and other additional expenses, the profits were cut down, but there were still $3,760.14 to be

Digitized by Google

returned as a dividend to the members of the company. Mr. Hazard writes concerning the experiment: "We believe that we can see an increase of care and diligence. As yet this increase is not so great as it should be, but the object to be taken into account in encouraging conscientious work is so important to the moral as well as the material good of the community, that we decide to persevere." In a letter written to me explaining more fully his experience, he declares that if no other good had resulted from the experiment it had demonstrated its capacity to act as a "lightning-rod," removing the electricity from the air and establishing a condition of peace.

### LIFE INSURANCE FOR EMPLOYÉS BY THEIR EMPLOYERS.

Our manufacturers might well carve over their doors the legend of one of the greatest shops of Paris, "The house for each, and all for the house." Corporations can apply this principle as well as individuals, and they need to apply it more than individuals. Some of the great railroad corporations in France regularly insure their men's lives from accident. If this had been done on our great trunk lines we might not have had the severe strike of a few years back. If the Western Union Telegraph Company had any such human bond between the corporation and the operatives would they have had the severe strike that recently occured, which must have largely crippled their resources while it has irritated the whole country? When will capital learn that an ounce of prevention is better than a pound of cure?

### ARBITRATION AS A SUBSTITUTE FOR STRIKES.

Capital may fairly be expected, moreover, to lead off in endeavoring to establish a better means of adjusting differences than the strike. Arbitration is less advanced in this country than in most of the countries in Europe. The forms of it are various in the Old World.

### IN ENGLAND, VOLUNTARY.

In England it is mainly voluntary. Arbitration committees or boards are frequently appointed by employers and employés of industrial establishments, which act together in cases of dispute. In some centers there are standing boards of arbitration. In France there is an interesting development of this system, which, following the genius of the country, is largely official.

### IN FRANCE, OFFICIAL.
